The causes of the maxima observed in the current-voltage curves for the oxidation of hydrogen at a black nickel electrode in basic solution and at a gray palladium electrode in basic and acidic solutions have been investigated and found to be due to the oxidation of two forms of hydrogen adsorbed on the surface of the electrode and hydrogen absorbed in the bulk of the electrode. The one maximum in the current-voltage curve for a nickel electrode plated in a Watts type bath is due to the oxidation of absorbed hydrogen. When certain organic compounds are added to a Watts bath, the concentration which produces the brightest deposit also produces the deposit containing the minimum amount of absorbed hydrogen. Curves relating the current efficiency of hydrogen ion discharge and the hydrogen

content of electrodeposits to the concentration of organic compound in the plating bath are similar in shape. The fact that the organic compounds affect the hydrogen polarization and nickel polarization differently explains the variation in the current efficiency and hydrogen content of the deposits when such compounds are added to the plating bath. COMBUSTION CALORIMETRY I. ORGANIC FLUORINE COMPOUNDS, by W. D. Good and D. W. Scott. Technical note on Contract RPSN 88-801A, ARPA Order no. 24-59, Task 3. 3 Aug 59, 37p. 17 refs. AFOSR-TN-59-698; AD-219 968
Order from LC mi$3.00, ph$6.30 PB 146 580

The contents of this Technical Note are to appear as a chapter in the book "Experimental Thermochemistry, Vol. II," being prepared under auspices of the Sub-Commission on Experimental Thermochemistry of the International Union of Pure and Applied Chemistry. The combustion calorimetry of organic fluorine compounds is discussed, and experimental procedures are recommended. A computation form is given for reducing the experimental results to standard states. Also discussed are factors influencing accuracy, choice of reference substances, and publication of results. (Author)

COMBUSTION CALORIMETRY II, ORGANOMETALLIC COMPOUNDS, by W. D. Good and D. W. Scott. Technical note on Contract RPSN 88-801A. 3 Aug 59, 33p. 47 refs. ARPA Order no. 24-59, Task 3; AFOSR TN-59-699; AD-219 970.
Order from LC mi$3.00, ph$6.30 PB 146 601

The contents of this note are to appear as a chapter in the book "Experimental Thermochemistry, Vol. II," being prepared under auspices of the Sub-Commission on Experimental Thermochemistry of the International Union of Pure and Applied Chemistry. The combustion calorimetry of organometallic compounds and other carbon compounds of metals is discussed. References are given to past work in the field. Limitations of static-bomb methods and advantages of rotating-bomb methods are pointed out. Other topics treated are: Corrections to standard states; comparison experiments; materials for the bomb, fittings, and crucible; containers for samples; problem of complete combustion; and publication of results. (Author) (See also PB 146 580)

THE CHEMILUMINESCENCE OF ETHYLENE FORMED PROBABLY FROM METHYLENE IN AN INERT MATRIX, by Theodore D. Goldfarb and George C. Pimentel. Rept. on Contract AF 49(638)1. 10 Feb 60, 13p. 10 refs. AFOSR-TN-60-182; AD-233 368.
Order from LC mi$2.40, ph$3.30 PB 146 718

An orange-red luminescence occurs when diazomethane suspended in solid nitrogen or solid argon is photolyzed and then warmed to permit diffusion. Spectrographic and visual studies of this thermoluminescence are reported. Conditions favorable for the production of the luminescence also result in relatively high yields of ethylene as a final product. Furthermore, a deuteration effect is observed.

Callery Chemical Co., Pa.
PHYSICAL PROPERTIES OF BORON TRIBROMIDE, by W. F. Barber, C. F. Boynton, and P. E. Gallagher. Rept. on Project Zip, Contract NOa(s) 58-454-d. 25 Mar 59, 18p. 10 refs. CCC-454-TR-306; AD-220 681.
Order from LC mi$2.40, ph$3.30 PB 148 374

The triple point of a sample of 99.96 mole percent boron tribromide has been found to be -46.482°C. Over the temperature range -20 to 90°C, the density values have been found to fit the equation $d(g/ml) = 2.6954 - [2.962 \times 10^{-3} t_{(°C)}]$. Over the temperature range 0° to 90°C, the viscosity values have been found to fit the equation $\log \eta$ (millipoises) = 331/t - 0.250. Over the temperature range 22° to 84°C, the surface tension values have been found to fit the equation γ (dynes/cm) = 31.9 - 0.128 t (°C). Over the temperature range 0 to 90°C, the vapor pressure values have been found to fit the equation $\log P(mm) = 6.9795 - 1311/[t_{(°C)} + 230]$. (Author)

CATALYTIC PYROLYSIS OF DIBORANE, by R. B. Beckman (Carnegie Inst. of Tech.). Rept. on Project Zip, Contract NOas-52-1024-c. 9 Dec 57, 21p. 4 refs. CCC-1024-TR-272.
Order from LC mi$2.70, ph$4.80 PB 149 191

The feasibility of catalyzing a directed pyrolysis of diborane to higher boron hydrides, by means of commercially available catalysts, was investigated. In general, the results indicate that the usual metal catalysts such as nickel, activated alumina, and platinum have some catalyzing properties. The data, unfortunately, are too meager to demonstrate whether or not this catalysis is directional for the desired liquid products. With the solid catalysts tested it was always found that solid degradation products eventually stopped the reaction.

Columbia U., New York.
ANOMALOUS RELAXATION OF HYPERFINE COMPONENTS IN ELECTRON SPIN RESONANCE, by Jan W. H. Schreurs, George E. Blomgren, and George K. Fraenkel. Technical note rept. no. 3 on Contract AF 49(638)520. 1 Jan 60, 27p. 20 refs. CU-3-60-AF-520-Chem.; AFOSR-TN-59-1326; AD-233 724.
Order from LC mi$2.70, ph$4.80 PB 146 749

Different hyperfine components in the electron resonance spectra of free radicals exhibiting proton hyperfine splitting were found to saturate at different rates, and it is pointed out that different sets of relaxation times must be used to describe the behavior of each component. An analysis is given of the experimental parameters which affect saturation measurements. An appendix is included on the work of Jen, et al. [Phys. Rev. 112:1169, 1958], on deuterium atoms trapped at liquid helium temperatures; this work shows that the anomalous intensities obtained as a function of r-f power is not the same as the phenomenon observed

for free radicals in solution, and cannot be adequately interpreted in terms of any currently proposed mechanisms. (Author)

METHYLENE DERIVATIVES AS INTERMEDIATES IN POLAR REACTIONS. XIX. THE REACTION OF POTASSIUM ISOPROPOXIDE WITH CHLOROFORM, BROMOFORM AND DICHLOROFLUOROMETHANE, by Jack Hine, Arthur D. Ketley and Kozo Tanabe. Technical rept. no. 5 on Contract Nonr-991(03). 13 May 59, 22p. 21 refs.
Order from LC mi$2.70, ph$4.80 PB 148 795

On reaction with potassium isopropoxide in isopropl alcohol, dichlorofluoromethane gives triisopropyl orthoformate as the only product detected, while chloroform and bromoform give, in addition, propylene diisopropyl ether, acetone, carbon monoxide, a methylene halide, and under some conditions dark-colored products of higher molecular weight. Mechanistic interpretations are given for some of these and related observations. (Author)

METHYLENE RADICALS IN SOLUTION, by Jack Hine, Arthur D. Ketley and others. Final rept. on Contract Nonr-991(03). 16 June 59, 4p. AD-218 179.
Order from LC mi$1.80, ph$1.80 PB 147 263

Studies were made of the reactions of alcohols and alkoxy and aryloxy anions with dihalomethylenes generated from haloforms and bases. The Riemer-Tiemann reaction proceeded via a dihalomethylene intermediate, but dibromomethylene, dichloromethylene, and chlorofluoromethylene reacted with potassium isopropoxide in isopropyl alcohol in a different manner. Isopropyl difluoromethyl ether, prepared by the action of potassium isopropoxide in isopropyl alcohol on chlorodifluoromethane, was inert to potassium isopropoxide at 0° and 50°C. A new method for drying and determining the water content of isopropyl alcohol was developed, and from this data the true second-order rate constants for the hydrolysis of an ester by hydroxide ion in alcoholic solution were calculated. Potassium isopropoxide reacted with dichlorofluoromethane to give high yields of triisopropyl orthoformate and with chloroform and bromoform to give methylene halides, carbon monoxide, propylene, diisopropyl ether, and acetone.

INVESTIGATION OF THIN SHEETS OF HIGH-QUALITY, SINGLE-CRYSTAL SILICON, by F. T. Fitch. Technical summary rept. no. 1, 1 Sep 59-29 Feb 60, on Contract DA 36-039-sc-85242. 10 Mar 60, 30p. AD-234 238.
Order from LC mi$2.70, ph$4.80 PB 148 551

Due to its high surface tension, molten silicon forms a liquid lens of about 4 mm equilibrium depth on a lead surface. The saturation concentration of lead slightly above the silicon melting point is about 17% Pb. Lead is definitely volative at these temperatures and difficulties are encountered in controlling the lead vapors and losses from the system. Lead does not form a solid solution with silicon. When detected at definite levels in the samples, the lead was present as a finely dispersed metal phase. Silicon single crystals have been pulled with lead additions up to 5% in the melt. Their lead content was very low (<0.01%). Polycrystalline material was obtained at a lead concentration >10% in the melt. This appeared to reflect a need for improved pulling techniques as much as the possibility of a limiting lead concentration at which a single crystal may be obtained. A high-temperature furnace suitable for the study of the Si-Pb system has been assembled and checked through initial operation

THERMODYNAMICS OF THE EQUILIBRIA BETWEEN Ni(DBH) AND A SERIES OF NITROGEN BASES IN BENZENE, by Luigi Sacconi. Final technical rept. no. 2, 1 Apr 59-31 Mar 60, on Contract DA 91-591-EUC-1105. [1960] 19p. 11 refs.
Order from LC mi$2.40, ph$3.30 PB 148 360

The equilibria in benzene between NiDBH and 20 nitrogen bases has been studied. From the spectrophotometric data the values of log K at different temperatures have been obtained. From the temperature dependence of the formation constants, the heats of reaction and free energy and entropy changes were calculated. The data are discussed in terms of structural and electronic factors. In the equilibria with cyclic polymethylenimines the existance of a competition between front- and internal strain is revealed. The double bond of unsaturated amines (mono- and diallylamine) causes lowering of the donor affinity of these bases. The introduction of a phenyl group in the alpha position into alkylamines results in -I effect and steric hindrance. The donor affinity of NH_2-, CN- and $COOCH_3$-substituted pyridines roughly parallels the polarity ($-\Sigma\sigma^*$) of these bases.

Little, Arthur D., Inc., Cambridge, Mass.
IONIC-MODEL CALCULATIONS: I. THE LITHIUM HALIDES, by Alfred Büchler. Interim technical rept. no. 2 on Study of High-Temperature Thermodynamics of Light-Metal Compounds, Contract DA 19-020-ORD-4829. 20 Apr 60, 11p. 17 refs. OOR rept. 006. 2-C.
Order from LC mi$2. 40, ph$3. 30 PB 148 430

The effect of the introduction of the higher multipole polarizabilities of ions on ionic-model calculations has been investigated. In the case of the lithium halides, the agreement between the observed and calculated vibration-rotation constants that is obtained when only dipole polarizabilities are used is destroyed when higher polarizabilities are introduced. The agreement between the observed and calculated dissociation energies is not affected. (Author)

Little, Arthur D., Inc., Cambridge, Mass.
IONIC-MODEL CALCULATIONS: II. THE BENDING FORCE CONSTANTS OF THE GROUP II HALIDES, by Alfred Büchler. Interim technical rept. no. 3 on Study of High-Temperature Thermodynamics of Light-Metal Compounds, Contract DA 19-020-ORD-4829. 15 Apr 60, 19p. 14 refs. OOR rept. 006. 3-C.
Order from LC mi$2. 40, ph$3. 30 PB 148 431

The bending force constants of the Group II halides have been calculated for three versions of an ionic model of these molecules. The first version treats the ions as point charges; the second includes their dipole polarizabilities; the third is based on a multipole expansion that includes all terms up to the charge-(induced octupole) term. The calculations show that the ionic model cannot account for the observed magnitude of the bending force constants. (Author) (See also PB 148 430)

FARADAIC RECTIFICATION WITH CONTROL OF ALTERNATING POTENTIAL VARIATIONS. APPLICATION OF ELECTRODE KINETICS FOR FAST PROCESSES, by Hiroaki Matsuda and Paul Delahay. Technical rept. no. 38 on Contract Nonr-300(00). Sep 59, 17p. 9 refs. AD-233 311.
Order from LC mi$2. 40, ph$3. 30 PB 148 575

The potential of an electrode at which a fast charge transfer process occurs is varied about the equilibrium potential according to a sinusoidal function of time. The resulting alternating current includes a rectification component because of the asymmetry of the current-potential curve. An equation is derived for the faradaic rectification current and is compared with a previous result obtained on the assumption of current control for $t \to \infty$. A correction for the double layer structure in the solution of the boundary value problem is also derived. (Author)

KINETICAL PARAMETERS IN PREMIXED LAMINAR FLAMES, by A. Van Tiggelen, R. Corbeels, and H. Vandenabeele. Technical note no. 2 on Contract AF 61(514)1245. Feb 60, 41p. 17 refs. AFOSR-TN-59-1149; AD-234 580.
Order from LC mi$3. 30, ph$7. 80 PB 146 640

Activation energy and reaction order in CH_4-O flames: Experimental burning velocities, obtained at different fuel-to-O ratios, dilutions with N, and initial temperatures of the fresh gases, are almost perfectly represented by a formula where the classical kinetic parameters of a chemical reaction are present (activation energy (38 kcal) and reaction order with respect to O (1. 4), and to CH_4(-0. 4)). The empirical formula corresponds exactly to the theory with a chain-mechanism including the formation of a peroxide radical (CH_3O_2). Reaction order in acetylene -O flames: The activation energy obtained was 31 kcal. The reaction order with respect to O varies between 2 and 0. 8 and between -1 and 0. 2 with respect to acetylene; the sum of both orders was always equal to unity and the negative value with respect to acetylene was valid at the rich side. A chain reaction with the formation of a peroxide must also occur in acetylene-O flames. Flame propagation velocity: CH_4-H-O mixtures: Burning velocities and flame temperatures in stoichiometric ternary CH_4-H-O mixtures at different dilutions with N were measured. These mixtures seem to correspond to a case of weak interaction between the 2 separate reactions. The activation energy is about equal to the value given by a linear interpolation between the 2 extreme values (18 kcal for pure H and 38 for pure CH_4).

TWO-DIMENSIONAL GASEOUS DETONATIONS I. THE VELOCITY DEFICIT, by James A. Fay. Rept. on Contract Nonr-1858(25). Mar 59, 24p. 15 refs. Proj. Squid Technical rept. MIT-21-P.
Order from LC mi$2. 70, ph$4. 80 PB 146 596

The measured velocity of gaseous detonation waves is less than that predicted by the Chapman-Jouguet plane wave theory. The velocity deficit (difference between theoretical and measured velocities) has been found to vary inversely with the tube diameter and initial pressure. A quantitative explanation of this effect is advanced by determining the growth of the viscous boundary layer on the tube wall and its effect upon the flow in the reaction zone of the detonation front.

NUCLEAR AND ELECTRON SPIN RESONANCE, by John E. Wertz. Final rept. on Contract AF 18(600)479. 29 Feb 60, 86p. 63 refs. AFOSR-TR-60-69.
Order from LC mi$4. 80, ph$13. 80 PB 147 917

It is shown that for magnesium oxide electron spin resonance spectra may be used to detect and to give detailed descriptions of many of the known types of defect centers. It has been possible to make numerous correlations with other physical properties.

Noyes Chemical Lab., U. of Illinois, Urbana:
A CRITERION FOR ORBITAL HYBRIDIZATION AND CHARGE DISTRIBUTION IN CHEMICAL BONDS, by Martin Karplus and D. M. Grant. Technical rept. no. 21 on Contract Nonr-1834(13). 29 June 59, 11p. 21 refs. AD-220 346.
Order from LC mi$2. 40, ph$3. 30 PB 147 259

A theory is advanced which suggests that electron-coupled nuclear spin interactions, when interpreted in terms of the theory of localized electron pairs, can serve to measure the extent of orbital hybridization and bond polarization. Applications of the theory were made to systems of high symmetry in which hybridization and/or bond polarities are known, including BH_4^-, CH_4, and NH_4^+. Some non-tetrahedral systems were also studied whose nuclear magnetic resonance spectra were analyzed and whose X-H coupling constants were determined. The results obtained with the localized electron pair theory indicated that the coupling constant, $A_{NN'}$, was a useful criterion for the study of bond properties, since it is sensitive to the amount of hybridization and covalency in the wave function.

Ohio State U. Research Foundation, Columbus.
THERMAL FUNCTIONS AND HEATS OF FORMATION OF SOME OF THE MAJOR VAPOR SPECIES IN THE BORON-OXYGEN-HYDROGEN SYSTEM AT ELEVATED TEMPERATURES, by David White, Patrick N. Walsh and others. Technical rept. 4 on Contract Nonr-495(12). July 59, 25p. 10 refs; AD-225 417.
Order from LC mi$2. 70, ph$4. 80 PB 147 086

The thermodynamic properties of the gaseous molecules B_2O_3, B_2O_2, HBO_2 and $(HBO_2)_3$ are discussed in the light of the results of a spectroscopic investigation of the B-O-H- system. Extensive tables of thermal functions for these molecules are given. The heats of formation of these species, as well as others in the B-O-H system, are summarized, and the uncertainties discussed. These thermodynamic properties have been used to compute phase equilibria and partial pressures of the vapor species in the oxidation of boranes at various temperatures and stoichiometric ratios. (Author)

Pennsalt Chemicals Corp., Wyndmoor, Pa.
POLYMERS CONTAINING COORDINATED BORON, by C. R. Bertsch and H. C. Miller. Technical rept. no. 9 on Contract Nonr-2687(00). 10 Sep 59, 16p. 24 refs. AD-227 931.
Order from LC mi$2. 40, ph$3. 30 PB 148 569

Attempts were made to form linear polymers with tetracoordinated boron as the backbone element and using oxygen or CN groups to link the boron atoms. Inorganic bidentate ligands were used to block the two other coordination positions of the boron atom. No stable polymers were formed when sulfamate, aminomethanesulfonate, methanedisulfonate, or carbonate were used as the ligands. (Author)

Pennsylvania State U. Coll. of Mineral Industries, University Park.
ON THE BURNING RATE OF AN H-ATOM PROPELLANT, by Howard B. Palmer. Rept. on Contract Nonr-1858(25). Mar 59, 8p. 8 refs. Proj. Squid Technical rept. PSU-4-P.
Order from LC mi$1. 80, ph$1. 80 PB 146 595

The recent success of Windsor (Chem. and Eng. News, Jan. 12 (1959)) in trapping pure H atoms as a solid prompts added interest in the possibility of using H atom recombination for propulsion. For this reason, an attempt to calculate a priori the one-dimensional burning rate of an H-atom propellant seems worthwhile.

Princeton U., N. J.
ABSOLUTE INFRARED INTENSITIES OF THE AMMONIUM ION IN CRYSTALS, by C. C. Ferriso (Doctoral thesis) and D. F. Hornig. Technical rept. no. 2 on Contract Nonr-1858(27). 15 June 59, 18p. 20 refs. AD-220 137.
Order from LC mi$2. 40, ph$3. 30 PB 146 408

The absolute intensities of the 2 IR active fundamentals of the ammonium ion ν_3 and ν_4, were studied in several environments. Dilute solid solutions of NH_4^+ ions in KCl, KI, CsCl and CsI were studied and compared with pure NH_4I. After separating the effect of the net charge, the apparent bond moments ranged from 0. 63d to 0. 80d (ave. 0. 71) and the bond dipole derivatives, $/\partial \mu / \partial r$, from 2. 06d/A to 3. 59d/A (ave. 2. 80d/A). The bond moment is substantially the same as in NH_3. (Author)

FUNDAMENTAL STUDIES OF THE CHEMISTRY AND PHYSICS OF ORGANIC MATERIALS ADSORBED ON METAL SUBSTRATES, by Hilton A. Roth, Ralph F. Lumb, and C. M. Doede. Rept. on Surface and Interface Phenomena of Matter, Contract AF 33(616)3882. Apr 60, 149p. 22 refs. WADD Technical rept. 59-23.
Order from OTS $2. 75 PB 161 840

This research was an experimental exploration into the nature of the overall chemical and/or physical forces active at the interface between a continuous solid surface and an adsorbed thin film. In Part I disubstituted siloxane oriented polymeric films were synthesized lineally and normally on the surface of steel. Tensile strengths of these films were measured. Efforts were made to synthesize semi-inorganic and organic phosphorus containing polymers on this surface. The efforts demonstrated that the reactivity of phosphorus containing monomers with the

surface is uncontrollable. The work involved an experimental study of the film forming properties of the surfaces of saturated aqueous selections of omega hydroxyundecanoic acid.. It also included an exploratory attempt to synthesize a thin film of oriented polyamide. In Part II a photochemical method was adapted to evaluate the energy required to break interfacial adsorption bonds. Radiotracer techniques were used. The adsorption systems consisted of stearic acid and octadecanol on steel. (Author)

OXYGEN OVERPOTENTIAL IN MOLTEN CARBONATES, by George J. Janz and Francisco Colom. Technical rept. no. 4 on Contract Nonr-591(10). Sep 59, 25p. 8 refs. AD-226 419.
Order from LC mi$2.70, ph$4.80 PB 148 566

The overvoltage of the oxygen evolution reaction on Pt electrodes in a ternary mixture of molten Na_2CO_3-Li_2CO_3-K_2CO_3 has been studied from 420°C to 1000°C. The overvoltage—log current density relations exhibit two well distinguished regions over the entire temperature range. At high c.d. (greater than 10^{-3} amp/cm^2) the slope of the Tafel line is maintained in accord with the overall process; $CO_3^{=} \rightarrow CO_2 + O + 2\bar{e}$ with the value of 10.4±1.1 kcal mol^{-1} for the heat of activation for oxygen evolution. At low c.d. the overpotential appears to be a more complex problem with marked temperature dependence. A portion of the relation in this region of c.d. in the high temperature range (above 600°C) may be understood with reference to the properties of the Pt electrode as a reversible CO_2-oxygen electrode in such melts. Rochester U., N. Y.
ENERGY TRANSFERAL IN POLYATOMIC MOLECULES AND PHOTOCHEMISTRY IN THE LIQUID AND SOLID PHASES, by W. Albert Noyes, Jr. Final rept. on Contract AF 18(600)1528. 1 Mar 60, 13p. 30 refs. AFOSR-TR-60-38.
Order from LC mi$2.40, ph$3.30 PB 148 090

A study of several years has shown that light and radiation produce free radicals in some instances and rearrangements to complete molecules in others. The reactions proceed mainly through two states, one of which is short lived and one of which lasts much longer. The rearrangements to complete molecules seem to come mainly from the short lived state and reactions which arise from reactive intermediates such as radicals start mainly from long lived states. Finally the powerful radiations from radioactive substances produce effects which in many cases resemble those formed by visible or ultraviolet light. (Author)

Rutgers State U., New Brunswick, N. J.
A STUDY OF THE PROPERTIES OF MATTER BY MEANS OF NUCLEAR MAGNETIC RESONANCE TECHNIQUES. Technical rept. for 1 Dec 55-31 Dec 31 Dec 59 on Contract AF 18(603)6. 26 Jan 60, 22p. 7 refs. AFOSR [TR]-60-17; AD-232 674.
Order from LC mi$2.70, ph$4.80 PB 146 334

Absorbtion of energy from radiofrequency fields was measured by nuclear magnetic moments at resonance; the effects were studied on such absorption signals of the internal motions of atoms in simple systems, especially in such systems as metal hydrides, liquid water, and gaseous and liquid Xeon. In other experiments enhancements of normal nuclear spin polarizations were induced by exciting resonances electron spins coupled to the nuclear spins by dipolar interactions in several liquids and solids. The shapes and intensities were studied of continuous steady-state nuclear resonance signals as affected by application of pulsed radio-frequency power. Under some circumstances considerable improvement in sensitivity results from proper combinations of such sources. Under other circumstances it may be possible to obtain very narrow band filtering. INTRAMOLECULAR FREE RADICAL ARYLATION AND RELATED REACTIONS, by DeLos F. DeTar and Chin-Chiun Chu (Doctoral thesis). Rept. on Contract AF 49(638)88. [1960] 24p. 27 refs. AFOSR-TN-60-157; AD-231 250.
Order from LC mi$2.70, ph$4.80 PB 147 346

A study has been made of the reactions of the 2-o-terphenyl free radical. Cyclization to triphenylene (IX) occurs to the exclusion of the intermolecular reaction with benzene or with carbon tetrachloride. However, bromine abstraction from bromotrichloromethane does compete with cyclization. The peroxide of o-(1-naphthyl)-benzoic acid (VI) was also investigated, but the acyloxy radical failed to decarboxylate. The main product found was the lactone (VIII) of o-(2-hydroxy-1-naphthyl)-benzoic acid. (Author)

THE MEASUREMENT OF THE VAPOR PRESSURE OF ATOMIC SPECIES FROM SPECTROPHOTOMETRIC MEASUREMENTS OF THE ABSORPTION OF RESONANCE LINES. I. TEST OF THE METHOD ON THE VAPOR PRESSURE OF SODIUM, by Guido L. Vidale. Rept. on Contract AF 04(647)269. May 60, 49p. 20 refs. Technical Information Series R60SD330.
Order from LC mi$3.30, ph$7.80 PB 148 206

A method has been developed for studying the equilibrium vapor pressure of atomic species over refractory ceramics. It consists of measuring the absorption coefficient of the hot equilibrium vapor at the center of an atomic resonance line. A resonance line of known oscillator strength for the atomic species under examination is generated in a liquid nitrogen cooled, hollow cathode discharge tube, and the absorption of this line by a known length of equilibrium vapor present in an isothermal cell is measured using spectrophotometric techniques. After correcting for the various causes of line broadening of the resonance line, the measured absorption is used to calculate the density of the atomic species. The experimental and theoretical techniques are described, and the results of a reinvestigation of the vapor pressure of sodium metal at 400°K are given. It is shown that the individual vapor pressure measurements have a root mean square deviation of 12%, and that their average differs from

the best literature values by less than 3%. The various sources of error are discussed quantitatively, and it is shown that pressure of 10^{-8} to 10^{-9} atmospheres of atomic species can be generally measured with an accuracy of ± 20%. (Author)

THE MEASUREMENT OF THE VAPOR PRESSURE OF ATOMIC SPECIES FROM SPECTROPHOTOMETRIC MEASUREMENTS OF THE ABSORPTION OF RESONANCE LINES. II. THE OSCILLATOR STRENGTH OF THE Cu_{3247} LINE, by G. L. Vidale. Rept. on Contract AF 04(647)269. May 60, 32p. 10 refs. Technical Information Series R60SD331.
Order from LC mi$3.00, ph$6.30 PB 148 207

The oscillator strength of the Cu_{3247} resonance line has been obtained from the experimentally determined absorption coefficient at its center. This resonance line was generated in a hollow cathode discharge tube operated at liquid nitrogen temperature and its absorption by an amount of copper vapor of known length and density was measured spectrophotometrically. The value of f was calculated from this measured absorption by taking into account the effect of Doppler and pressure broadening and of the hyperfine structure of the line. The copper vapor consisted of the equilibrium vapor over copper in an isothermal cell, in the presence of a sufficient density of inert gas to diffusion limit the effective cell length. The reported result f = 0.32 is compared with literature values, and its probable error is estimated. (Author) (See also PB 148 206)

THE DIFFUSION OF ATOMIC HYDROGEN THROUGH MULTICOMPONENT MIXTURES, by Henry Wise. Rept. on Project Squid, Contract Nonr-1858(25). Sep 59, 7p. 7 refs. Technical rept. SRI-4-P; AD-225 795.
Order from LC mi$1.80, ph$1.80 PB 148 588

The diffusion coefficient of atomic H through a mixture of Ar and H was determined at 30 x 10^{-3} mm Hg. The atomic H concentration along the center of the reaction tube was measured with a microcalorimeter consisting of a pyrex probe coated with a thin layer of vacuum-evaporated Pt. With increasing mole fraction of Ar, a marked reduction occurred in the ratio D_{123}/D_{12}. D_{13} had an average value of (2.88 ± 0.11) x 10^4 sq cm/sec at 30 x 10^{-3} mm Hg, which corresponds to an effective momentum-loss collision diameter $\sigma_{H, Ar} = 2.92 \times 10^{-8}$ cm as compared to $\sigma_{H, H_2} = 2.55 \times 10^{-8}$ based on a model of rigid elastic spheres.

HETEROPOLAR AND HOMOPOLAR BOND ENERGY, by Ingvar Lindqvist. Technical note no. 8 on Contract AF 61(052)43. 1 Mar 60, 10p. 3 refs. AFOSR-TN-60-127; AD-234 583.
Order from LC mi$1.80, ph$1.80 PB 146 742

A concept, heteropolarity, has been defined which permits the division of the bond energy of a localized electron pair bond into a heteropolar and a homopolar part. The variations of these two energy parts with respect to shifts of the heteropolarities of the bonds in binary molecules are discussed. It is suggested that the description of the bond energy proposed is well suited for discussions of inductive effects. (Author)

Uppsala U. (Sweden).
INDUCTIVE EFFECTS ON CHEMICAL BONDS, by Ingvar Lindqvist. Technical note no. 9 on Contract AF 61(052)43. 1 Mar 60, 37p. 24 refs. AFOSR-TN-60-126; AD-234 582.
Order from LC mi$3.00, ph$6.30 PB 146 743

Inductive effects on a given chemical bond, caused by substitution or addition reactions, have been discussed using an approach which divides the bond energy into a heteropolar and a homopolar part. It has been possible to give a unified treatment of experimentally established effects of the order of 0.01 Å. The nature of the donor-acceptor interaction has been discussed with consideration of the inductive effects on all the bonds in the donor and acceptor molecules. The consequences in halogen bridged compounds and in complex ions have also been treated briefly. (Author)

Uppsala U. (Sweden).
OXIDE CHLORIDES AND ORGANOMETALLOID OXIDES AS DONOR MOLECULES, by Ingvar Lindqvist. Technical note no. 10 on Contract AF 61(052)43. 1 Mar 60, 12p. 9 refs. AFOSR-TN-60-125; AD-234 581.
Order from LC mi$2.40, ph$3.30 PB 146 744

A model of an idealized structure has been suggested, which can be used for the discussion of adducts of oxide chlorides and organometalloid oxides. No safe distinction between single and double bond structures can be made with the experimental data available at present. The results show, however, the importance of inductive effects in donor-acceptor reactions, and some predictions can be made about other adducts than those studied. (Author) (See also AD-234 582)

INFRARED SPECTRAL EMISSIVITIES AND INTERNAL DISTRIBUTIONS OF CARBON DIOXIDE AND WATER VAPOR AT HIGH TEMPERATURES, by Richard H. Tourin and Paul M. Henry. Final rept. on Contract AF 19(604)2223. Dec 59, 109p. 42 refs. AFCRC-TR-60-203; AD-238 493.
Order from LC mi$5.70, ph$16.80 PB 146 636

Infrared spectral emissivities of hot carbon dioxide and water vapor were determined by measurement of the infrared absorption spectra of gas samples heated under controlled conditions. The measurements are described and are discussed in relation to molecular energy distributions, theoretically calculated emissivities, and flame radiation. (Author)

Washington State U., Pullman.
THE INTERACTION OF ACTIVATED ATMOSPHERIC GASES WITH SOLID SURFACES, by Daniel G. Bills. Rept. no. 15 (Final) on Contract AF 19(604)1897. 31 Dec 59, 35p. 22 refs. AFCRC-TR-60-255.
Order from LC mi$3.00, ph$6.30 PB 148 742

This paper reports experimental investigations of several new effects connected with the adsorption on solids of nitrogen and hydrogen molecules which are not in their normal energy state. The new work reported here primarily concerns: (1) studies of the thermal decomposition of glass and its relation to 2 below; (2) studies of the chemical sputtering produced by activated molecules impinging on glass surfaces; (3) studies of means of reducing ionization gauge pumping; and (4) identification of the activated species in molecular nitrogen as non-ionic.

INTRODUCTION TO TABLES ON PYROLYSIS OF ESTERS. PYROLYSIS OF CARBOXYLATES, by Grant Gill Smith and Frank D. Bagley. Rept. on Contract AF 49(638)615. June 60, 87p. 320 refs. AFOSR-TN-60-590; AD-238 726.
Order from OTS $2.25 PB 161 866

This is the first table of a series summarizing the temperatures, yields and references for the pyrolysis of esters of organic and inorganic acids and closely related nitrogen and sulfur analogues. Only esters which contain a β-hydrogen on the alkyl group and could possibly pyrolyze to olefins are included. Some of the esters, e.g. unsaturated esters, do not pyrolyze to give olefins even though they have a β-hydrogen and might be expected to produce olefin, but produce other substances such as rearranged products; esters of this type are also included. No distinction is made between studies primarily interested in the products of pyrolysis and those studies for theoretical interest.

Wayne State U., Detroit, Mich.
THE DETERMINATION OF SIZE DISTRIBUTION CURVES BY LIGHT SCATTERING AND RELATED INVESTIGATIONS, by Morton L. Wallach. Doctoral thesis. Technical rept. no. 34 on Contract [Nonr]-736(00). 1 Aug 59, 82p. 70 refs. AD-226 072.
Order from LC mi$4.80, ph$13.80 PB 148 184

An investigation was undertaken in an effort to develop a method of determining particle size distribution curves in emulsions. Most of the conventional, well established methods of determining size distribution curves are not particularly suited to the analysis of emulsions. In contradistinction, light scattering should, in principle, be well adapted to the study of size distributions in emulsions. In general, a measurable contribution is made to the total observed effect even for very small colloidal particles. Five per cent differences in size can be detected for particles as small as 100 mμ in diameter. Experimental techniques established for monodispersed systems should serve equally as well in the case of heterodispersions. (Author)

ELECTRICAL CLEANUP OF GASES, by R. E. Fox and J. S. Knoll. Final rept. 15 Mar 59-14 May 60, on Contract AF 49(638)591. 14 May 60, 23p. 10 refs. Research rept. 403FD428-R5; AFOSR-TR-60-72.
Order from LC mi$2.70, ph$4.80 PB 148 404

The short term re-emission studies have been extended down to times approaching 1 sec. These studies indicate that even at these short times, re-emission follows a 1/T dependence. Further studies are needed with a modified tube to carry the times to shorter intervals. Temperature dependence of the re-emission rate, as well as the pumpdown rate, has been carried out over a temperature range from room temperature down to liquid nitrogen (-200°C) temperature. This effect is significant and should be accurately controlled for re-emission studies. The studies of the dependence of ion energies on the re-emission rate were inconclusive due to the nature of the tube construction. The results indicate that the effect of ion pumping at the filament and/or its supports is more important for a tube of this geometry than had previously been suspected. (Author) (See also PB 136 138)

RESEARCH ON LATE-PLEISTOCENE ENVIRONMENTS OF SOUTHERN CHILE, by Calvin J. Heusser. Semi-annual status rept. on Contract Nonr-641(04). 11 May 59, 11p. AD-218 165.
Order from LC mi$2.40, ph$3.30 PB 147 448

A reconnaissance study was made to determine southern Chilean late-Pleistocene environmental changes, particularly climatic fluctuations, and to construct chronology of these changes for comparison with chronologies from the northern hemisphere. Five methods were applied to gather data: (1) the palynology (pollen analysis) of the deposits formed in the lakes and bogs on and beyond the prominent Laguna de San Rafael moraine; (2) limnology of the water bodies associated with the above deposits and the geochemistry of those sediments; (3) glacial geology, since glacier variations, as indicated by moraine sequences, are governed primarily by climate; (4) glacier variations of the last several

centuries are measured and dated from the ages and growth patterns of woody plants established on recessional moraines and outwash, as well as along the trimlines of the glaciers; and (5) by means of radiocarbon dating, additional dates ranging from hundreds to thousands of years of the Late Pleistocene are obtained from organic remains associated with past events. The foundation for most of the chronology is based on ages determined by radiocarbon analysis. (Author)

Naval Ordnance Test Station, China Lake, Calif.
ATMOSPHERIC REFRACTION IN THE VISIBLE SPECTRUM, by R. J. Stirton. 1 Dec 59, 23p. 12 refs. NOTS TP-2357; NAVORD rept. 6614; AD-234 066.
Order from LC mi$2.70, ph$4.80 PB 146 995

The refraction of the atmosphere causes the apparent position of an object to be higher than its true position. The correction for this angular position is obtained in the form of an explicit integral. A computing program for the IBM 704 was written to handle the numerical work. A wide range of observer and object positions and some generality in the atmospheric properties are indicated. In particular, consideration is given to including local temperature and pressure observations in the functions representing the atmosphere. (Author)

OCEANOGRAPHY AND METEOROLOGY OF THE GULF OF MEXICO, by Hugh J. McLellan. Annual rept. for 1 May 58-30 Apr 59 on Contract N7onr-48702. 1 May 59, 36p. 12 refs. Reference 59-16A, AD-220 441.
Order from LC mi$3.00, ph$6.30 PB 146 534

The project is now being oriented towards the problem of predicting oceanographic conditions. There are several aspects to these studies including sea state prediction and water mass characteristics. The placing of a telemetering weather buoy in the central Gulf during the summer of 1958, is the major item in these studies. A thermistor array is now being constructed for use in the buoy to report temperatures from 18 depths down to 300 m. Negotiations were made for the fabrication of an instrumented chain to make under-way measurements of thermal microstructure from the research vessel, and experimental measurements of radiation balance from the ship were carried out. AN INDEX OF IONOSPHERIC STORMINESS, by H. S. Marsh, W. H. Cameron, and R. A. Swirbalus. Dec 59, 22p. 3 refs. AFCRC-TR-59-365; AD-233 816.
Order from LC mi$2.70, ph$4.80 PB 146 358

An index of ionospheric storminess is needed to describe objectively the conditions of the ionosphere accompanying magnetic disturbances. Quiet-day recordings of the standard frequency transmissions from WWV and CHU are used to derive average monthly MUF (maximum usable frequency) and LUF (lowest usable frequency) contours. An index of storminess for a given day may be derived from the degree to which elevation of the LUF and depression of the MUF cause shrinkage of the average useful frequency spectrum for the day. Charts show the use of deviations from the average hours-in value for a given frequency to extrapolate equivalent percentage changes in MUF or LUF contours. Correlation with magnetic data is illustrated. (Author)

Air Force Cambridge Research Center, Bedford, Mass.
MILITARY APPLICATIONS OF SUPERCOOLED CLOUD AND FOG DISSIPATION, by Currie S. Downie and Bernard A. Silverman. Dec 59, 51p. 117 refs. Air Force Surveys in Geophysics no. 118; AFCRC-TN-59-635; AD-234 550.
Order from LC mi$3.60, ph$9.30 PB 146 673

The physics of the dissipation of supercooled fog and stratiform clouds is examined briefly. The results of the Geophysics Research Directorate dry-ice seeding investigations are presented. Four seeding missions are discussed in detail as examples of the meteorological conditions to which the technique is applicable and the results which can be anticipated. On one mission the below-minimum weather conditions at destination were modified to allow a safe and routine VFR landing. Military and civilian applications include the clearing of weather at airfields for landings and takeoffs. (Author)

A NUMERICAL MODEL FOR THE PREDICTION OF HURRICANE FORMATION, by Louis Berkofsky. Mar 60, 100p. 102 refs. Geophysical Research Papers no. 67; AFCRC-TR-60-220.
Order from OTS $2.25 PB 161 889

A nongeostrophic flow model, in which the latent heat of condensation released through pseudo-adiabatic processes is the only heat source, is devised. An attempt is made to formulate initial conditions which resemble, as nearly as is known, the conditions existing prior to the formation of a hurricane. Using these initial conditions, the equations are solved on the IBM 704 electronic computer. Solutions are obtained with and without the latent heat of condensation in order to assess the importance of the heating for the development process. Solutions are obtained for three time steps (21 minutes). Even during this short period there are clear indications of the importance of latent heat. The vertical motions are about an order of magnitude larger, the horizontal temperature gradient is about one and one-half times as intense, and horizontal convergence is increasing much more rapidly, than when no heat is added. The pressure changes about the same amount in the case when heat is added as when no heat is added. This indicates a lag in the reaction of the pressure field to the addition of energy. It is estimated that the pressure field will react in 15 or 20 time steps. (Author)

Allied Research Associates, Inc., [Cambridge, Mass].
AN ESTIMATE OF THE POTENTIAL TRANSMISSION LOAD OF WEATHER RADAR DATA ON THE WEATHER SYSTEM 433L, by Robert C. Copeland. Scientific rept. no. 4 on Contract AF 19(604)5204. 14 Oct 59, 21p. 2 refs. AFCRC-TN-59-616; AD-233 825.
Order from LC mi$2.70, ph$4.80 PB 146 330

To evaluate the potential transmission load on the weather radar data handling portion of the weather system 433L without initiating an extensive radar climatology study, the average and maximum number of the weather radar network installations which would see precipitation at a given time was estimated from a consideration of the precipitation analyses of surface weather maps. Fifteen maps for each month from May 1958 to May 1959 were considered, and allowances were made for the typically lower altitudes and reflectivities of snow than of summer convective storms. Also, for 8 dates, the percentage of the area of each radar PPI scope that would be covered by precipitation echoes was estimated. The results suggest that 37% of the radar installations would be detecting precipitation at the given map time, on the average; however, it appears that as many as 75% of the radars would simultaneously detect precipitation of a few occasions. Although the echo coverage indicated on individual radar PPI scopes varied from zero to 100%, 20% or less coverage was dominant. (Author)

A DESCRIPTION OF THE WINTER WEATHER AT THULE AIR BASE, GREENLAND, by David H. Slade. 15 May 59, 19p. USASRDL Technical rept. 2034; AD-216 880.
Order from LC mi$2.40, ph$3.30 PB 146 550

Most of the winter storms affecting Thule, an air base on the northwest coast of Greenland, originate as disturbances in the mid-latitudes. During their trip into the Arctic, their nature changes greatly. The effect of these storms at any particular location on the Greenland coast depends, to a great extent, on the local topography at that point and on the relationship between the position and path of the storm and the Greenland icecap. An investigation of surface stability and lapse conditions at Thule during the 1957-1958 winter shows some of the relationships between such structures and weather. (Author)

A LIGHTNING COUNTER FOR POSITIVE AND NEGATIVE STROKES, by Lothar H. Ruhnke. 15 Apr 60, 24p. 4 refs. USASRDL Technical rept. 2111.
Order from LC mi$2.70, ph$4.80 PB 148 543

An electronic instrument is described which records on a strip chart recorder the rate of occurrence of lightning strokes, differentiating between positive and negative strokes. Two channels, one for the negative and one for the positive lightnings, are provided. The electrostatic component of a lightning is formed into an impulse of constant amplitude and length by means of a filter network and a monostable multivibrator. The pulses are integrated in a relay network and the result is recorded on paper. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
A MANUAL METHOD FOR SOLUTION OF THE HYDROSTATIC EQUATION, by Abraham Golden. 15 Jan 59, 13p. 3 refs. USASRDL technical rept. 2006; AD-226 687.
Order from LC mi$2.40, ph$3.30 PB 146 347

The development of an atmospheric sounding system, Rawin set AN/GMD-2, created a need for a manual method of computation for the hydrostatic equation of the atmosphere. A graphical and tabular method is presented when (1) the data are correlated values of geometric height, temperature, and humidity; and when (2) it is necessary to find the geopotential heights of standard-pressure surfaces and the pressure at a given geometric height. Army Signal Research and Development Lab., Fort Monmouth, N. J.
THE RECORDING OF ACOUSTIC WAVES FROM HIGH-ALTITUDE EXPLOSIONS IN THE ROCKET-GRENADE EXPERIMENT AND CERTAIN OTHER RELATED TOPICS, by William R. Bandeen. 1 July 59, 69p. 13 refs. USASRDL technical rept. 2056; AD-231 943.
Order from LC mi$3.90, ph$10.80 PB 147 997

The instrumentation and operation of the sound-ranging installation for the rocket-grenade experiment at Fort Churchill are discussed. Schrodinger's equation for the transmissivity of sound in the atmosphere is applied to empirical data illustrating the upper altitude limit of the experiment. A modified method of correcting for the finite-amplitude-propagation effect in the grenade experiment is discussed. An analysis is made of the specific problem of measuring angles of arrival of sound waves in the grenade experiment. The effect of the re-entry ballistic wave on grenade sound arrivals is discussed, and a method of determining the times of such obscured arrivals and also of weak sound arrivals is presented. (Author)

RF FREQUENCY DRIFT OF RADIOSONDE TRANSMITTER T-435/AMT-4B, by A. A. Coppola. 15 May 59, 17p. USASRDL Technical rept. 2035.
Order from LC mi$2.40, ph$3.30 PB 146 549

This report illustrates the RF drift characteristics of Radiosonde Transmitter T-435/AMT-4B during a balloon flight and discusses the factors contributing to the general drift pattern. During a routine flight the radiosonde transmitter can be expected to drift in frequency by as much as 4.5 mc, the variation being from about 1 mc below to as much as 3.5 mc above the initial frequency. The RF drift can be attributed to two causes: temperature effects on the RF cavity, and a sharp decrease in battery filament voltage near the end of a flight, the latter having the greater effect. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
THEORY AND PERFORMANCE OF STREAMLINE NEOPRENE BALLOONS, by M. Sharenow. 15 Apr 59, 46p. 7 refs. USASRDL Technical rept. 2026; AD-220 785.
Order from LC mi$3.30, ph$7.80 PB 146 654

The theory of the motion of streamline balloons is developed in a manner analogous to that of spherical balloons. Ideally, expansible streamline balloons will accelerate continuously to burst if they do not reach the critical Reynolds number. In the case of the balloons investigated, this was reached near 50,000 feet where a sharp drop in ascent rate occurred. The ascent rate up to this altitude falls short of the theoretically computed rate because of balloon deformation and deviation from ideal shape. Comparison is made between two types of balloons. The newer one, fabricated by a new method known as the gel-adhered process, is lighter in weight and simpler to inflate and handle than the older type which is assembled by a cementing process. The two types provide approximately equivalent performance (75,000 feet at 1,800 feet per minute) when inflated with the same volume of gas. In practice, a smaller volume of gas is used to inflate the newer type, with an accompanying increase in bursting altitude and decrease in ascent rate. Methods of obtaining increased ascensional rates by roughening balloon surfaces in accordance with aerodynamic flow separation theory are suggested. (Author)

California U., Los Angeles.
TRANSOSONDE PROJECT, by M. G. Wurtele. Final rept. on Contract Nonr-233(21). 30 Sep 59, 19p. 14 refs. AD-228 833.
Order from LC mi$2.40, ph$3.30 PB 148 592

A study of the relation of the fields of pressure and wind are shown by an analysis of trajectories of transosonde balloons. The research included: (1) a complete synoptic study of the days of trajectory flights to be analyzed; (2) a theoretical study of the relation of the flight trajectory to the observed pressure field, and (3) an evaluation of the analytical and forecasting value of transosonde flight data in the absence of data from radio sonde and wind sonde networks. (Author)

NAVY IMPROVEMENT IN FORECASTING, by H. Riehl. Final rept. for 1 Oct 51-30 Sep 59 on Contract N6ori-02036. [1959] 4p. 22 refs.
Order from LC mi$1.80, ph$1.80 PB 148 223

The main areas of interest were: (1) tropical circulations, especially hurricanes and typhoons; (2) general circulation of the tropics and coupling between low and high latitudes; and (3) jet streams, especially in the subtropics. The report lists 22 journal articles completed on this project.

Chicago, U., Ill.
SOME COMPUTATIONS OF THE INFLOW ANGLE IN HURRICANES NEAR THE OCEAN SURFACE, by Miriam Ausman. Rept. on Contract N6ori-02036. Sep 59, 22p. 3 refs. AD-228 931.
Order from LC mi$2.70, ph$4.80 PB 148 582

Ship wind reports around 6 hurricanes in 1954 and 1955 were used to obtain the inflow angle in these storms as a function of distance from the storm center and the angular distance from the direction of storm motion. The mean inflow angle averaged around radius circles seemed to be unrelated to the radius of the circle used or to storm maturity. The size and location of the areas of outflow, however, were well-defined at constant values. Outflow took place in an area about 140 angular degrees wide and approximately centered on the direction of storm motion. (Author)

Chicago U., Ill.
SYNOPTIC COMPARISONS OF JET STREAM AND GULF STREAM SYSTEMS, by Chester W. Newton. Technical rept. no. 1 on Contract Nonr-2121(10). Feb 59, 36p. 47 refs.
Order from LC mi$3.00, ph$6.30 PB 146 355

Comparisons are made between typical examples of oceanic and atmospheric current structures. These indicate that the lateral dimensions of the Gulf Stream are about 1/25 those of the jet stream; the shapes of the current profiles are almost identical, with equivalent lateral shears. In the vertical, the dimensions are nearly in the ratio 1:10, which also characterizes meander sizes. Striking similarities are found between thermal structures in the two systems. In both, variations from pronounced frontal concentrations to more gentle and broad barocline structures are observed over short distances or time intervals. Frontal slopes are equal, as are the vertical shears observed within frontal layers. Marked axial variations of speed, and of lateral and vertical gradients of current speed and temperature, are present in both systems. Ageostrophic motions are prominent. Some comments are made on possible interpretations of these variations, in regard to transverse circulations and to inertia oscillations in the current systems. (Author)

WARM FOG AND STRATUS CLOUD DISSIPATION.
Final rept. on Contract DA 36-039-sc-64569.
4 June 56, declassified 28 May 57, 91p. 19 refs.
Order from LC mi$5.40, ph$15.30 PB 149 401

The investigations, both theoretical and experimental, have been directed toward the development of methods for dissipating warm fog and stratus clouds. Most of the work has been concerned with various possible electrical techniques for causing electrostatic precipitation of cloud particles and for promoting the formation of precipitation. Dissipation systems based on the evaporation of droplets have also been considered.

MacDonald Physics Lab., McGill U. (Canada).
THE MOTION AND EROSION OF CONVECTIVE STORMS IN SEVERE VERTICAL WIND SHEAR, by Walter Hitschfeld. Rept. on Contract AF 19(604)2065. July 59, 50p. 15 refs. Stormy Weather Research Group Scientific rept. MW-29; AFCRC-TN-59-447; AD-225 398.
Order from LC mi$3.30, ph$7.80 PB 146 536

Radar data displayed in the form of precipitation maps at constant altitude above ground were used to portray the structure of storms and their anvils. Well developed storms even in the presence of severe wind shear, were observed to remain essentially vertical through their active phase. Instead of being strongly bent by the shear, parts of the storm appeared to be carried off by the wind, forming extensive plume patterns or anvils which trailed down to levels as low as 10,000 ft while evaporating. Size and shape of the plume suggested that its particles had fall speeds ranging 0.75 to about 5 m sec^{-1}, and were of precipitation size. A statistical analysis of the precipitation patterns of two of the days analyzed is presented. This work includes a statistical measure of echo distribution as a function of height, and the derivation of a correlation index (probability of finding echo at a specified horizontal range and bearing from a point with echo). ON THE PROBLEM OF INITIAL DATA FOR THE PRIMITIVE EQUATIONS, by Norman A. Phillips. Technical rept. on Numerical Weather Prediction Project, Contract Nonr-1841(18). Sep 59, 20p. 11 refs. AD-225 878.
Order from LC mi$2.40, ph$3.30 PB 148 578

An analysis is presented demonstrating that in a forecast with the primitive equations, pure geostrophic or purely non-divergent initial wind fields results in noticeable meteorological noise, especially in a baroclinic atmosphere. In a linear example this noise is shown to be suppressed if the divergence of the initial wind field is set equal to the divergence implied by the usual geostrophic theory of numerical weather prediction. The absence of noise in Charney's 1955 test computation with non-divergent balanced initial data is explained. The quasi-geostrophic expansion is used to define initial data for a non-linear forecast with the primitive equations. Two cases are considered; that where only the geopotential is known from observations, and that where only the non-divergent part of the wind is known from observation. The initial tendencies computed from initial data of this kind is shown to preserve the assumed geostrophic character of the flow, and making possible to get more accurate forecasts with the primitive equations. QUESTIONS CONCERNING THE ENERGY OF STRATOSPHERIC MOTIONS, by Victor P. Starr. Scientific rept. no. 1 on Planetary Circulation Project, Contract AF 19(604)5223. Dec 59, 13p. 5 refs. AFCRC-TN-59-665; AD-233 568.
Order from LC mi$2.40, ph$3.30 PB 146 567

The theoretical conclusion is reached that the vertical transport of kinetic energy in the atmosphere from one horizontal layer to another is effected solely by an area integral multiplied by the vertical velocity. Speculations are made as to whether the kinetic energy in stratospheric levels is maintained against friction through such a vertical transport from other levels, or whether the needed supply is derived from convective sources in situ. SOME RADAR OBSERVATIONS OF TROPOSPHERIC CELLULAR CONVECTION, by Reginald E. Newell. Research rept. no. 33 on Weather Radar Research, Contract AF 19(604)2291. Nov 59, 57p. 66 refs. AFCRC-TN-60-205; AD-233 832.
Order from LC mi$3.60, ph$9.30 PB 146 320

Small-scale cellular convection is a mode of motion whose role in the vertical transport processes in the troposphere is not established. The dimensions of cellular convective motions are obtained from a range-height display of a 3-cm AN/CPS-9 radar together with estimates of the frequency of cellular vs non-cellular echoes. The observation of cell spacing and depth, for cells which do not exceed about 6 km in depth, vary in a manner which is similar to that predicted from the Bénard cell theory of Lord Rayleigh. The motions may be transporting heat upwards. Other properties are doubtless simultaneously transported vertically; as an example, some estimates are made of the vertical flux of horizontal momentum at the radar site (42°N). (Author)

CHARTS FOR DETERMINING ATMOSPHERIC DENSITY BETWEEN ALTITUDES OF 24,000 and 100,000 FEET, by Paul H. Miller. 18 Feb 59, 13p. NOTS TP 2184; NAVORD rept. 6464; AD-216 098.
Order from LC mi$2.40, ph$3.30 PB 146 681

Charts have been developed at the Naval Ordnance Test Station for the rapid and accurate determination of atmospheric densities between the pressure-altitude levels of 400- and 5-millibars in units of slugs per cubic foot. From these charts the density is determined as a function of pressure (in millibars) and temperature (in degrees Centigrade), with the assumption that the relative humidity is 0% at all levels under consideration. The range of densities considered is from 115 slugs/$foot^3$ x 10^{-5} to 40 slugs/$foot^3$ x 10^{-6}. These charts eliminate the necessity of mathematically computing atmospheric densities aloft for any combination of pressure and temperature typically encountered at the latitude of NOTS. (Author)

THE MEASUREMENT AND SIGNIFICANCE OF DEW, by William C. Robison. Sep 59, 20p. 30 refs. Research Study rept. RER-28; AD-230 370.
Order from LC mi$2.40, ph$3.30 PB 146 468

Dew is a micrometeorological phenomenon that was studied sporadically in many countries. Methods of measuring amounts of dew at observing stations are not standardized on a world basis or within the U. S. For laboratory study, drosometers, based on the difference in weight of a receptor before and after exposure, are most suitable, and are often used in conjunction with a recording cylinder. For observations at field stations, an optical method has considerable advantages. (Author)

DETERMINATION OF THE MODULUS OF ELASTICITY OF ARTIFICIAL SNOW-ICE IN FLEXURE, by Leif K. Halvorsen. Master's thesis. Feb 59, 27p. 5 refs. Research rept. 31; AD-216 681.
Order from LC mi$2.70, ph$4.80 PB 148 474

This study was initiated to determine the modulus of elasticity for artifical snow-ice, and to arrive at some method of making flexural tests on snow and ice. The testing was done at the Keweenaw Field Station, Houghton, Michigan. Fifty-eight snow-ice beams were tested with variation in density and loading rate. Results show that both loading rate and density influence the value of the modulus of elasticity (E). A variation in density from 0.621 to 0.719 g/cm^3 gave a variation of E from 1.35 x 10^4 to 2.22 x 10^4 kg/cm^2. A variation in the relative time of deflection from 42 sec/0.0200 to 23 sec/0.0200 cm gave a variation of E from 1.22 x 10^4 to 1.45 x 10^4 kg/cm^2. The modulus of rupture was found for different conditions and the effect of the density variation computed. For the density range studied, the modulus of rupture varied from 7.79 to 11.54 kg/cm^2. The failure appeared to be a combination of shear and flexure. (Author)

RECOMMENDED STANDARDS FOR SMALL-SCALE ICE STRENGTH TESTS, by T. R. Butkovich. Nov 58, 9p. 4 refs. Technical rept. 57, AD-211 569.
Order from LC mi$1.80, ph$1.80 PB 146 560

The effects of specimen size and shape on the strength values obtained with small-scale unconfined compressive tests are shown. Results are given that show that a loading rate of 0.5 kg/cm^2-sec is required for all small-scale strength tests to minimize plastic effects which accompany slow loading of ice. The ring test, which is a useful new type of test to measure the tensile strength of ice, is described. Recommended standards for specimen size, shape, and configuration along with loading rates and equipment are discussed. (Author)

SOME PHYSICAL PROPERTIES OF ICE FROM THE TUTO TUNNEL AND RAMP, THULE, GREENLAND, by T. R. Butkovich. May 59, 21p. 7 refs. Research rept. 47; AD-225 569.
Order from LC mi$2.70, ph$4.80 PB 148 475

Strength, density, elasticity, crystal size, bubble size, and fabric of the ramp ice and 5 types of tunnel ice were studied, and ice temperatures and ceiling deformation in the tunnel were measured. Crushing and ring tensile strength tests were made in a tunnel room at -5C on cylindrical cores (3 in. diam and 9 in. long) taken horizontally and vertically in the tunnel and vertically in the ramp, and flexural strength was

measured on horizontal and vertical beams from both the tunnel and the ramp. The crushing strength of tunnel ice showed slight differences among ice types, but not between horizontal and vertical samples: and fitted the empirical equation relating crushing strength to density. The equation did not hold for ramp ice of average density, probably because of layering. The results of ring tensile tests were similar to those of crushing tests, except that the equation relating ring tensile strength to the density of high-density snow gave values about 20% higher than for tunnel ice. The flexural strength of ramp ice was about half that for tunnel ice and comparable to. but consistently lower than, ring tensile values. The static modulus of elasticity was about 1/5 the average dynamic modulus, and increased with increasing rate of load application, approaching the value of the dynamic modulus as a limit. Lower values of the static modulus were observed for ramp ice. Deformation studies in a tunnel room (100 x 30 ft) indicated that the room is closing primarily by a block action. (Author)

STRAIN GAGE TECHNIQUE FOR DYNAMIC MEASUREMENT OF ICE, by Don B. Clark. Interim rept. 18 Feb 60, 21p. Technical rept. 060; AD-235 057.
Order from LC mi$2.70, ph$4.80 PB 146 971

The Laboratory is undertaking a study of the properties of sea ice. A technique for applying resistance wire strain gages to ice samples for dynamic measurement of strain has been developed to facilitate this study. A coating was found which would maintain the high electrical impedance necessary between the strain gage and sea ice samples. Strain gages were applied to various samples of fresh water and sea water ice. These were compression-loaded dynamically to failure while the strain was recorded with an oscillograph and bridge amplifier. Sufficient strain data was recorded to indicate the validity of the new technique. Under rapid compression loading to a point near failure of the ice, a strain gaged ice sample can be cycled without permanent deformation or flow of the ice, and without slippage of the gage. Gages properly coated are shown to hold their high electric impedance against sea water ice for a period of time exceeding three weeks. Resistance wire strain gages, with proper preparation and application, can be used advantageously to measure the dynamic strains in fresh water ice or sea ice, and thus determine their structural characteristics. TRANSPORTATION AND PHYSICAL GEOGRAPHY IN WEST AFRICA, by Benjamin E. Thomas. Technical rept. no. 2 on Human Environments in Central Africa Projec., Contract DA 19-129-qm-1309. 1960, 58p. 23 refs.
Order from LC mi$3.60, ph$9.30 PB 147 939

This report includes a set of 12 original maps showing the monthly changes in usable roads and waterways in French West Africa. Because data have already been collected on roads and inland waterways, these routes receive special attention, and items for which material is not at hand, such as ports, seaways, and airways, are omitted. French West Africa was selected as the focus of the study because it reaches from the heart of the Sahara to the Guinea Coast and extends over all the major types of physical areas that are found in West Africa.

A DATA REPORT OF FLORIDA GULF COAST CRUISES, by Frank Chew, S. J. Bein and J. H. G. Stimson. Rept. on Contract Nonr-840(01). June 59, 121p. Rept. 59-1; AD-220 751.
Order from LC mi$6.30, ph$19.80 PB 146 704

This DATA REPORT contains hydrographic and chemical data collected during the 8 major cruises sponsored by the Florida State Board of Conservation during the two-year period beginning July 1955. The data for each station are reported in two parts. The first part, entitled BATHYTHERMOGRAPH OBSERVATIONS, give the date, hour, location and depth of station, sea surface temperature, wind, and air temperature; the bathythermograph instrument number is given for some cruises, in others, the surface salinity (or the sample number for surface salinity) is given. The second part contains the salinity, phosphorus, nitrate and nitrite at the indicated depths. Where pertinent, surface water movements as determined by the GEOMAGNETIC ELECTROKINETOGRAPH (GEK Current), von Arx, W. S. 1950, (An electromagnetic method for measuring the velocities of ocean currents from a ship under way, Pap. Phys. Oceanogr. Meteor. 11(3); 1-62), are also included. Serial numbers of drift tubes are included for one cruise to show the method of recording.

Marine Lab., U. of Miami, Coral Gables, Fla.
RECONNAISSANCE SURVEY OF THE BATHYMETRY OF THE STRAITS OF FLORIDA, by Violet B. Siegler. Technical rept. on Contract Nonr-840(01). June 59, 18p. 15 refs. Rept. 59-3; AD-227 264.
Order from LC mi$2.40, ph$3.30 PB 146 702

The area of the Straits of Florida surveyed in this report extends from approximately 27°15' N (St. Lucie Inlet) along the Florida coast to 24°30' N (the area of Key West) and from 81°50' W to the Grand Bahama Bank. This swath of water extends roughly 250 miles from the above-mentioned north and south points and varies from 40 to 90 miles in width.

A STUDY OF WAVE FORECASTING METHODS AND OF THE HEIGHT OF A FULLY DEVELOPED SEA ON THE BASIS OF SOME WAVE RECORDS OBTAINED BY THE O. W. S. WEATHER EXPLORER DURING A STORM AT SEA, by Willard J. Pierson, Jr. Technical rept. on Contract Nonr-285(03). June 59, 34p. 18 refs. AD-220 419.
Order from LC mi$3.00, ph$6.30 PB 146 694

The growth of the waves in a storm in which the wind speed increased from 25 kn to 62 kn and in which the significant waves grew 6 ft to 42 ft as recorded by the O. W. S. Weather Explorer is studied. Spectra computed from the records are compared with results of Darbyshire and Neumann. The spectral forms given by Neumann for partially developed seas do not agree with the observed spectra, although the height forecasts are good. The results indicate that the height of a fully developed sea as a function of wind speed as given by Neumann is an overestimate. They also suggest that the data studied by Darbyshire do not correspond to fully developed seas for the higher wind speeds and that the height of a fully developed sea as given by Darbyshire is an underestimate. IMPULSIVELY GENERATED WAVES, by William G. Van Dorn. Rept. no. 2 on Contract Nonr-233(35). 12 Aug 59, 80p. 28 refs. AD-225 953.
Order from LC mi$4.50, ph$12.30 PB 148 181

The prediction of the local effects from long period water waves incident upon an arbitrary coastline is approached on a dimensional basis for lack of an adequate hydrodynamic theory. A model for wave runup and shoreline height on a sloping beach is constructed by extrapolating the results of laboratory experiments. The model leads to predictions in satisfactory agreement with field observations of local effects from two large tsunamis. Curves are provided for predicting local offshore wave height and length from an arbitrary source of known energy, as well as local effects in terms of the offshore height. The predictions are considered to be accurate within a factor of 1.8 (70% probability). An attempt is made to construct prediction curves for tsunamis based on wholly seismic evidence by analogy to waves from explosions, but the results are indeterminate, since they depend upon a knowledge of the focal depth of earthquakes. It is concluded that a chain of long-wave stations on selected small islands could give ocean-wide advance warning of dangerous tsunamis, and quantitative predictions of local effects in critical areas. DESIGN WIND PROFILES FROM JAPANESE RELAY SOUNDING DATA, by Norman Sissenwine, Matthew T. Mulkern (Wolf Research and Development Corp.) and Henry A. Salmela. Dec 59, 37p. 14 refs. Air Force Surveys in Geophysics no. 117; AFCRC-TR-59-292; AD-234 551.
Order from LC mi$3.00, ph$6.30 PB 147 444

The best balloon-measured upper winds over Japan are the Tateno relay soundings, a special series of observations especially developed to provide an accurate sounding capability for this area. From these soundings (which are corrected for the curvature of the earth), only those in which a wind speed at either 3, 6, 9, 12, or 15 km exceeds the values achieved 99 and 95% of the time were selected. Profiles, both synthetic and typical, exhibiting general characteristics common to these high-speed cases, are presented. Directional changes accompanying the wind shears are found to be small in the majority of the soundings. (Author)

ATMOSPHERIC NET-RADIATION FLUX DURING WINTER IN THE THULE AREA, GREENLAND, by Robert W. Fenn and Helmut K. Weickmann, 4 Jan 60, 13p. 4 refs. USASRDL technical rept. 2090; AD-230 757.
Order from LC mi$2.40, ph$3.30 PB 148 001

A brief description of an airborne IR net-radiation receiver (developed in Germany) is given. The results of 2 radiosonde flights made with this element at Thule Greenland, on 14 and 15 Feb 1959 are shown. The outgoing net-radiation flux increases with altitude from 0.05 cal cm^{-2} min^{-1} at the surface to about 0.2 cal cm cm^{-2} min^{-1} between 10,000 and 20,000 m. Above 25,000 m the outgoing net-radiation flux again decreases considerably. (Author)

SCATTERING PROPERTIES OF ATMOSPHERIC AEROSOLS, by Robert S. Fraser. Scientific rept. no. 2 on Light in the Atmosphere, Contract AF 19(604)2429. Oct 59, 189p. 57 refs. AFCRC-TN-60-256; AD-233 288.
Order from LC mi$8.40, ph$28.80 PB 146 645

The purpose of the presented study was to determine the intensity and polarization of light scattered by a unit volume of an atmospheric aerosol, for different models of size distribution of aerosol particles. The four polarization parameters were expressed in terms of the four Stokes parameters. Each of the four polarization parameters showed an appreciable dependence on each of the three size distributions of atmospheric aerosol models and on the wave length of the incident light. The total intensity is the only polarization parameter for atmospheric aerosols which has been measured. Measured values of the total intensity of light scattered by atmospheric aerosols were found to be similar to those computed for different models. A normalized scattering matrix was computed for each of the three aerosol models. By introduction of one of these matices into the equation of radiative transfer for a turbid atmosphere, a numerical solution can be obtained in principle. However, numerical computations of the solution become practical only if the number of terms in the series of the matrix elements is reduced. To reduce the number of these terms, it is necessary to introduce restrictive assumptions either into the law of scattering or into the model of size distributions of aerosol particles, or into both.

Electrical Engineering Research Lab., U. of Texas, Austin.
AN EXPENDABLE ATMOSPHERIC RADIO REFRACTOMETER, by A. P. Deam. Rept. on Contract Nonr-375(08). 15 May 59, 36p. 3 refs. Rept. no. 108; AD-217 261.
Order from LC mi$3.00, ph$6.30 PB 146 586

This report describes a device which has been designed to measure atmospheric index of refraction profiles at a frequency of 403 mc. It is a prototype instrument and should be capable of ejection from an aircraft as well as elevation with a balloon. Transmitted frequency is received at a receiver whose recorded output is relative radio index of refraction. This instrument has been successfully tested in a balloon flight to elevations of the order of 60,000 feet. (Author)

ELECTRON DENSITIES IN THE UPPER IONOSPHERE FROM ROCKET MEASUREMENTS, by John S. Nisbet. Scientific rept. no. 126 on Ionospheric Research, Contract DA 36-061-ORD-577, 10 Dec 59, 176p. 77 refs. AD-234 128.
Order from LC mi$8.10, ph$27.30 PB 147 249

An investigation of electron densities in the upper F region of the ionosphere by new techniques employing long range rockets is described. Investigations were confined to propagation measurements between the missiles and ground stations, and to methods not requiring radio links with the missile in addition to those already incorporated for telemetry and tracking purposes. The vehicles were limited to those with satellite launch missions, and to IRBM's. Since such vehicles have considerable horizontal velocity components, suitable methods of analysis were developed. A matrix method is described for analyzing oblique dispersion measurements to provide vertical electron density height profiles. In this method account is taken of horizontal gradients, refraction, and the varying ray path zenith angles in the ionosphere. Two methods of measuring ionospheric dispersion were compared: Faraday rotation, and a method using the difference between the apparent positions of the missile obtained by 2 tracking systems operating on different frequencies. (Author)

ON THE HEAT BALANCE OF THE TROPOSPHERE, by Fritz Kasten, Gunther Korb and others. Final rept. on Contract AF 61(052)18. Jan 59, 123p. 19 refs. AFCRC TR-59-234; AD-232 639.
Order from LC mi$6.30, ph$19.80 PB 146 300

A study is summarized on the radiation balance of the troposphere that was begun in 1955 and is led now to a provisional conclusion. Theoretical foundations are given to calculate the synoptic distribution of the tropospheric radiation balance for single days. The resulting values are averaged with respect to large scale weather situations. The results of the months investigated are represented in maps. Charts of cloudiness and total water vapor content of the troposphere are enclosed for direct comparison. The maps of absorption, emission and tropospheric radiation balance show regions of high and low values of the respective quantities. High values of the tropospheric radiation balance mean considerable energy loss of the troposphere caused by radiative processes, vice versa. For all regions investigated maximum values of the tropospheric radiation balance are found during November and amount to 250 - 300 cal $cm^{-2}d^{-1}$. Minimum energy loss, expressed by small values of the radiation balance, results for the period from May until July with values of 140 - 190 cal $cm^{-2}d^{-1}$. (Author)

FLIGHT TEST RESULTS FOR ML-419 RADIOSONDE TEMPERATURE ELEMENTS MODIFIED TO REDUCE RADIATION ERRORS, by John H. Snow. Technical rept. no. 4A on Contract DA 36-039-sc-78153. Dec 59, 67p.
Order from LC mi$3.90, ph$10.80 PB 148 549

Fourteen balloon flights were made to compare the indicated temperatures of regular ML-419 elements and modified elements. The results and conclusions from these flights are summarized: (a) Nighttime flights: unshielded metal-coated elements have smaller radiation errors than the ML-419 element now in use; aluminum- or gold-coated elements are about equally effective at night; properly shielded metal-coated elements may have less error than unshielded elements. (b) Daytime flights: the modified elements, in all cases surrounded by radiation shields, were cooler than the ML-419 elements at low altitudes (up to 60,000 ft.) and became progressively warmer at higher altitudes; the arrangement which gave the best results was a white-painted 10-inch shield with an aluminum-coated element.

Ohio State U. Research Foundation, Columbus.
METHODS FOR REDUCING THE RADIATION ERROR OF THE ML-419 RADIOSONDE TEMPERATURE ELEMENT AT ALTITUDES UP TO 150,000 FEET, by John H. Shaw. Technical rept. no. 4 on Contract DA 36-039-sc-78153. June 59, 63p. 10 refs. AD-228 264.
Order from LC mi$3.90, ph$10.80 PB 148 548

The factors which influence the radiation error of the ML-419 Temperature Element have been evaluated. It is concluded that a significant reduction in the daytime and nighttime radiation errors of such elements is most likely to be achieved by coating the element with a highly reflecting metallic surface such as polished aluminum. This element should be placed inside a thin-walled radiation shield, black to all radiation on the inside, and a good scatterer of solar radiation and a good emitter of thermal radiation on the outside. The shield should be open at the top, and the element should be placed at such a depth that it rarely receives direct sunlight and is not in the path of air which has had thermal contact with the sides of the shield. Calculations indicate such a system should have a radiation error of less than ±0.5°K at all altitudes to 130,000 ft. (Author)

UPPER ATMOSPHERE CLUTTER RESEARCH. PART I. VHF AND UHF AURORAL INVESTIGATIONS AT COLLEGE, ALASKA, by R. I. Presnell, R. L. Leadabrand, and others. Final rept. pt. 1, on Contract AF 30(602)1762. Apr 59, 88p. 8 refs. SRI Proj. 2225; RADC-TR-59-34; AD-211 937.
Order from LC mi$4.80, ph$13.80 PB 147 131

The results of radar investigations of the aurora at frequencies of 216, 398, and 780 mc are presented. The characteristics of the echoes that have been recorded are range, depth in range, bearing, elevation angle, height, strength, times of occurrence, duration of echoes, and polarization effects. Two distinct types of echoes have been shown to exist, discrete and diffuse. They differ mainly in that the discrete echoes occur at night and the diffuse echoes occur during the day, and the diffuse echoes arise from a much larger reflecting region than the discrete echoes. The echoes have been compared with visual aurora, magnetic activity, earth potentials, 41-mc auroral radar data, and auroral absorption. An indication of the aspect sensitivity of the auroral reflections has been obtained. Crude estimates of the wavelength dependence of reflected echo power have been obtained for the reflections using nonsimultaneous data at 3 frequencies. (Author)

UPPER ATMOSPHERE CLUTTER RESEARCH. PART III: RUSSIAN EARTH SATELLITES 1957 ALPHA AND BEAT RADIO AND RADAR DATA AND A SIMPLE SATELLITE POSITION PREDICTION TECHNIQUE, by W. E. Jaye and L. H. Rorden. Final rept. part 3 on Contract AF 30(602)1762. May 59, 66p. 6 refs. RADC-TN-59-45; AD-212 618.
Order from LC mi$3.90, ph$10.80 PB 147 025

The technique is based on equations derived for circular orbits; it is assumed that the earth is a spherically symmetrical body, that the satellite has a negligible mass, and that there are no drag forces. These equations were used to successfully predict the position of the satellite on a day-to-day basis, and to point the radar beam at the path of the satellite. Included is a description of the Doppler-frequency measuring technique and estimates of the accuracy of the measurements. The accuracy was considered to be quite good, in view of the simple equipment used. Generally, errors in the maximum slope of the Doppler-frequency-time curve were less than 5% and in the time of closest approach less than ±15 seconds. The equations used to relate satellite position to Doppler data are developed and discussed. Analysis of the accuracy of the equations shows that the calculated results are of about the same order of accuracy as the experimental data. (Author)

UPPER ATMOSPHERE CLUTTER RESEARCH. PART VII. DOPPLER INVESTIGATIONS OF THE RADAR AURORA AT 400 MC, by R. L. Leadabrand, R. L. Presnell and others. Final rept. pt. 7, on Contract AF 30(602)1762. Mar 59, 47p. 11 refs. SRI Proj 2225; RADC-TR-59-50; AD-213 581.
Order from LC mi$3.30, ph$7.80 PB 147 150

Using a relatively sensitive 400-mc radar located at College, Alaska, the variation of Doppler shift of auroral echoes has been determined as a function of the following parameters: (1) Azimuth angle of the radar ray, (2) Off-perpendicular intersection angle of the radar ray and the earth's magnetic field, (3) Elevation angle of the radar ray, (4) Range of the echoes, (5) Altitude of the reflection centers, (6) Time of day, (7) Number of occurrences, and (8) Amplitude of the echoes. These data have been further delineated in terms of the type of echo seen (discrete or diffuse) and whether or not the data were taken before or after magnetic midnight. An estimate of the spectrum spread of auroral echoes has been determined by pulse and CW techniques. A consistent trend in these data has been found which indicate an East-West motion of the ionospheric irregularities. There is no appreciable variation in the direction of motion with time of day or with respect to magnetic midnight. The mean velocity of the East-West motion appears to be about 500m per sec. THE EFFECTS OF CABIN ATMOSPHERES ON COMBUSTION OF SOME FLAMMABLE AIRCRAFT MATERIALS, by Howard A. Klein. Rept. on Aircraft Environmental Control. Apr 60, 32p. WADC Technical rept. 59-456.
Order from OTS $1.00 PB 161 841

The effects of varying atmospheric conditions on the combustion of certain flammable materials creating fire hazards in aircraft were measured in a test chamber. Atmospheric compositions used were pure oxygen and oxygen-nitrogen and oxygen-helium mixtures in various proportions. Pressures varied from sea level to 25,000 ft altitude. Flammable materials tested included cotton cloth, 8 samples of aircraft wire, and aircraft fluids including JP-4 fuel, hydraulic fluids, and lubricating oils. Test data indicates the burning rate or ignition temperatures for each type of material under specific atmospheric conditions. Plots of the data illustrate the trends shown by the test results. EVALUATION OF THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY (MIT) MULTI-SHAKER VIBRATION EQUIPMENT FOR CONDUCTING GROUND VIBRATION SURVEYS OF NAVAL AIRCRAFT (PHASE A) by Warren W. Yenney, Jr. and G. Borod. 15 Nov 50, 45p. Rept. no. ASL NAM DE-244, pt. 1.
Order from LC mi$3.30, ph$7.80 PB 146 464

The Massachusetts Inst. of Tech. (M. I. T.) multi-shaker equipment has been evaluated for conducting ground vibration surveys of naval aircraft by employing it to obtain the vibration characteristics of a standard service type F7F-3N airplane. The report describes the methods used in supporting the shakers and attaching them to the various aircraft components as well as the general testing procedures. Since it is intended that this report serve as an example of the types of information that may be obtained with the equipment, sufficient photographs, plates, and records have been included to aid in explaining the methods employed in these tests to prospective users of this equipment.

SEALED CABIN ATMOSPHERE PROBLEMS, by Erwin R. Archibald and David G. Simons. Dec 59, 19p. 6 refs. AFMDC-TR-59-42.
Order from LC mi$2.40, ph$3.30 PB 146 356

Certain physiologic problems encountered in the design and operation of hermetically sealed cabins have been discussed. Known parameters which limit human performance were presented, along with a discussion of atmospheric environmental factors as to upper and lower limits for a flight of 24 hours duration, where conditions of "no performance decrement" are desired. Parameters discussed included: inspired carbon dioxide partial pressure, alveolar oxygen partial pressure, and total cabin pressure. (Author)

Airborne Instruments Lab. [Deer Park] N. Y.
ALTIMETERS FOR LOW ALTITUDE AND FLARE-OUT: AN INVESTIGATION OF THE STATE OF THE ART AND EQUIPMENT AVAILABILITY, by E. N. Hooton and T. C. Wellington. Rept. on Task 17, Contract FAA/BRD-16. June 59, 44p. 27 refs. Rept. no. 5791-17.
Order from OTS $1.25 PB 161 854

Increasing demands for all-weather landing capability require a study of the state of the art in the field of altimetry, with emphasis on these altimeters suitable for low-altitude and flareout. The three primary techniques used in the design of absolute altimeters are CW (radio), pulse (radar), and sonic (operating in the AF range). Subject to certain reservations--due to lack of established flareout criteria--it is concluded that quantized FM/CW techniques can meet the present low-altitude and flareout requirements. By mid 1960 there will be a choice of equipments. With the likelihood of higher accuracy requirements in the future, it is probable that non-quantized CW altimeters will be used more extensively. Currently under development, this equipment will be phased into service by the end of 1960. If extensive development of radio altimeters exhausts the possibility of further substantial improvement in performance, the capabilities of pulse radar altimeters may prove attractive. Present development shows that a high degree of accuracy is possible with light-weight equipment. Sonic altimeters have not found favor in the past because of poor signal-to-noise characteristics. Although the sonic CW altimeter shows promise, this equipment is not likely to be universally applicable. (Author)

Airborne Instruments Lab. [Mineola] N. Y.
RUNWAY CHARACTERISTICS AND PERFORMANCE OF JET TRANSPORTS IN ROUTINE OPERATION, VOLUME I. Rept. for 20 June-11 Nov 59 on Task 15, Contract FAA/BRD-16. Mar 60, 104p. Rept. no. 5791-15.
Order from OTS $2.50 PB 161 856-1

A measurement program has been completed to determine the characteristics and performance of jet aircraft during landings and takeoffs. Data were obtained by photographing the displays of the Airport Surface Detection Equipment (ASDE) radar at New York International Airport (Idlewild), with proper time and identification references. Techniques of data reduction and statistical analysis were developed to determine jet aircraft characteristics and performance. The results of this analysis as well as the data will be useful in various airport research programs, for they comprise a comprehensive record of routine airline operations during various wind and temperature conditions. In addition, the data can be used in the analysis of aircraft performance to determine runway length criteria, and acceleration and deceleration during landings and takeoffs. This technique of obtaining large samples of routine aircraft characteristics and performance data--some-

thing not heretofore available in a practical manner--should be encouraged to obtain similar information on other aircraft types.

Airborne Instruments Lab., Deer Park, N. Y.
RUNWAY CHARACTERISTICS AND PERFORMANCE OF JET TRANSPORTS IN ROUTINE OPERATION, VOLUME II. APPENDIX E. TABULATION OF BASIC DATA. Rept. on Task 15, Contract FAA/BRD-16. Mar 60, 281p. Rept. no. 5791-15.

RUNWAY CHARACTERISTICS AND PERFORMANCE OF SELECTED PROPELLER-DRIVEN AIRCRAFT IN ROUTINE OPERATION. Rept. on Task 15, Contract FAA/BRD-16. Apr 60, 185p. 2 refs.
Order from OTS $3.00 PB 161 857

The average times for an aircraft to decelerate to 60 miles per hour from crossing the runway threshold are 28, 25, 31, and 14 seconds, respectively, for the four categories studied. The ground speeds, 900 feet past the runway threshold, are 114, 109, 98, and 61 knots. The rate of deceleration increases to a maximum at a velocity between 75 to 85 knots for four-engine aircraft and 50 knots for the twin engine aircraft. (Author)

Armour Research Foundation, Chicago, Ill.
DETERMINATION OF EMISSIVITY AND REFLECTIVITY DATA ON AIRCRAFT STRUCTURAL MATERIALS. PART III. TECHNIQUES FOR MEASUREMENT, by O. Harry Olson and James C. Morris. Rept. for 1 May 57-1 May 58 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)3002. Apr 60, 104p. 5 refs. WADC Technical rept. 56-222, Pt. III.
Order from OTS $2.50 PB 161 839

Total normal emissivity is the ratio of total normal radiance emitted by a material to that emitted by an ideal blackbody at the same temperature. Parts I and II describe equipment and techniques employed for obtaining total normal emissivities of conducting materials, such as metals, at elevated temperatures. Part III describes equipment and techniques developed to make similar measurements on non-conducting materials such as refractories and glasses. Several samples are heated simultaneously in a tubular, wire wound furnace and presented successively in the field of view of a thermistor detector through a port in the furnace wall. The equipment and methods are described and data are presented for a list of materials. Low temperature measurements were made with equipment described in Part I and II. An integrating sphere reflectometer was used to measure spectral reflectivity and transmission in the spectral range, 0.3 to 3.0 microns. This employs a Perkin-Elmer monochromator, a comparison integrating sphere, and a lead sulfide detector. (Author) (See also PB 151 603)

A DISCUSSION OF RESTRAINT AND PROTECTION OF THE HUMAN EXPERIENCING THE SMOOTH AND OSCILLATING ACCELERATIONS OF PROPOSED SPACE VEHICLES, by Carl C. Clark and R. Flanagan Gray. Rept. on Proj. TED ADC AE-1412. 29 Dec 59, 56p. 8 refs. Rept. no. 5 on Task MR 005.12-0005.6; NADC MA-5914; AD-234 597.
Order from LC mi$3.60, ph$9.30 PB 146 961

It is not the forces generated by acceleration or deceleration (at least to somewhat beyond 30 G) which damage man, but rather the body distortions which can result from an unbalanced action of these forces. By proper packaging of the human, tolerance will depend on the consequences of local tissue compression or extension rather than on the consequences of gross tissue and organ displacements and distortions. Techniques of centrifuge simulation are presented. A moulded body form contour couch provides a broadened support and reduces body distortion. Tight bandaging of the body and training in techniques of complete body straining are important aspects of these experiments. Water immersion can further reduce body distortions while under acceleration. particularly if in addition the lungs are pressurized. Work on the consequences of long duration acceleration is underway; a man has tolerated 2 G for 24 hr.

ON STRESS INTERACTION IN FATIGUE AND A CUMULATIVE DAMAGE RULE. PART II. 7075 ALUMINUM ALLOY, by Alfred M. Freudenthal and Robert A. Heller. Rept. for 1 Feb-31 Dec 58 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)3982. Jan 60, 23p. 4 refs. WADC Technical rept. 58-69. Pt. II; AD-234 448.
Order from OTS $0.75 PB 161 837

The object of this investigation was the determination of the effects of stress interaction, under randomized stress distributions representing gust and maneuver loads on aircraft wings, on the fatigue life of 7075 aluminum alloy specimens. On the basis of numerous rotating bending fatigue tests it has been demonstrated that the linear cumulative damage rule does not provide a safe fatigue life estimate of unnotched specimens. A non-linear rule representing the test results fairly well has been proposed. (Author) (See also PB 140 816)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
SPECIFICATION FOR A PROXIMITY WARNING INDICATOR: PILOT RESPONSE EVALUATION TEST, by C. Wightman. Rept. on Contract AMB-15. Aug 58, 31p. 11 refs. Rept. no. JA-1266-S-5.
Order from OTS $1.00 PB 161 855

By fixing a number of possible input variables near their optimum values, it has been possible to design an experiment which will provide the desired information at much lower cost and complexity than would be required for a full treatment of all variables. The result will be an evaluation of proximity warning indicator utility under good conditions. The path to follow in future developments of such devices as well as the utility of present models should be indicated by the experimental results. (Author)

SIMULATION OF THE NAVY AIRCRAFT OVERHAUL OPERATION, by Kenneth W. Webb. Technical rept. on Contract Nonr-2755(00). 4 May 59, 24p. Rept. no. 169-2R.
Order from LC mi$2.70, ph$4.80 PB 146 535

This report describes the formulation and use of a mathematical model for simulating the Navy airframe and engine overhaul for a calender quarter.

David Taylor Model Basin, Washington, D. C.
PRELIMINARY INVESTIGATION OF PLAN FORM EFFECT ON AUGMENTATION PARAMETER FOR PERIPHERAL-JET GROUND-EFFECT MACHINES, by Anibal Alfredo Tinajero. Feb 60, 44p. 3 refs. Aero rept. 972. AD-237 673.
Order from LC mi$3.30, ph$7.80 PB 147 727

Results of static tests of four peripheral-jet ground-effect machine plan forms, with jet angle of divergence of -45° and with various tangential deflection angles. Test divided into two parts: hovering tests (zero propulsive thrust) and propulsive thrust tests. For hovering condition most desirable plan form is circular; for configurations with propulsive thrust other than zero the % drop in augmentation decreases as plan form length-to-width ratio increases. (Author)

Daystrom Systems, La Jolla, Calif.
HIGH SPEED COMMUNICATIONS EQUIPMENT, by Bill L. Waddell, Ronald H. Jones, and Gregory Johnson. Final rept. on Contract FAA/BRD-118, formerly Contract C-13ca-693. 226p. 280 refs. Rept. no. 6005-6.
Order from OTS $3.50 PB 161 858

The scope of this report is limited to those systems which use primarily wire or cable for data transmission. All lines are considered to be one-half duplex or more. The data rates handled by the lines, terminals, and terminal equipment are in excess of 600 WPM, or 455 bits/second. The minimum message length is considered as 120 characters of seven bits per character. Point-to-point or multipoint networks are considered. The report describes the requirements of the FAA for the system, a theoretical background for understanding the new field of High Speed Data Communication, the equipment available now and in the future for such a system, and evaluations of the relative capabilities of the equipment to perform to the system requirements and theoretical parameters. Techniques of utilizing the equipment in a system are described and evaluated. Recommendations are presented for further investigation which would allow the data presented here to be utilized for specific applications.

Forest Products Lab., Madison, Wis.
SUMMARY OF RESEARCH BY FOREST PRODUCTS LABORATORY ON COMPOSITE CONSTRUCTION FOR FLIGHT VEHICLES, by Donald G. Coleman. Rept. for July 57-July 58 on Rubber, Plastics and Composite Materials, Contract AF 33(616)58-1. Feb 60, 9p. WADC Technical rept. 52-184, Sup. 6.
Order from LC mi$1.80, ph$1.80 PB 149 183

Developments in the program of research in composite construction for flight vehicles conducted by the U.S. Forest Products Laboratory during 1958 are summarized. In general the approach has been to derive design criteria mathematically, and then to check by test. Four technical reports issued during the fiscal year are abstracted. (Author)

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
THE APPLICABILITY OF SIMULATION TO THE INVESTIGATION OF AIR TRAFFIC CONTROL PROBLEMS, by S. M. Berkowitz, W. W. Felton and others. Final rept. for 8 Aug 49-10 Feb 50 on Contract Cca-27722. 17 Mar 50, 118p. 7 refs. Rept. no. F-2130-1.
Order from LC mi$6.00, ph$18.30 PB 147 957

This report presents methods and devices for simulating the flight of aircraft in the general area and in the final approach areas of an airport under various conditions of wind and under various traffic control systems. Tow devices are highly recommended as capable of being pressed into immediate service for solving the problems currently demanding attention. In the final approach area each of these simulators can represent various numbers and speeds of aircraft, aircraft separation times, glide path lengths. locations of exit strips, control procedures, and wind effects. In the general approach area, the transparency simulator can study and evaluate the relative merits of different methods of air traffic control. Both simulators allow study of delays, flow rates, acceptance rates, dead runway time, distance separations at any time, time separations at any point and such other time-space concepts as may be useful in establishing measures of effectiveness of various control procedures and geographic configurations.

Motorola, Inc., Scottsdale, Ariz.
HYPERBOLIC COORDINATE CONVERTER, by E. H. Lange. Final engineering rept. 15 Sep 59-15 Jan 60, on Contract FAA/BRD-130. 15 Jan 60, 154p.
Order from OTS $3.00 PB 161 853

A study has been conducted to establish the optimum design for a practical, airborne computer that would accept the hyperbolic information available from present low-frequency navigational aids and convert it to a form better suited for air traffic control and general navigation. The outputs chosen for display are distance-to-go and cross-track distance, since these coordinates correspond to displacement from, and distance along, a pre-assigned corridor. The design philosopy employed resolves the conflicting requirements of computer simplicity, long-range operation, and high accuracy report of present-position. The associated computation time is shown to be compatible with the dynamic constraints imposed by atmospheric noise and aircraft velocity considerations. The recommended coordinate converter can be readily combined with other navigational aids to form a complete and integrated control system. Full derivations of the appropriate mathematical results are included along with substantial documentation of the major conclusions reached.

National Research Labs., Ottawa (Canada).
GENERALIZED TABLES FOR THE CALCULATION OF TRAJECTORY CURVES FOR BODIES MOVING IN AIR, by M. M. Currie. 1 Apr 60, 57p. 1 ref. Aeronautical rept. LR-277.
Order from LC mi$3.60, ph$9.30 PB 148 427

Tables are presented from which the cartesian coordinates of a trajectory can be readily derived for any initial conditions if the terminal velocity of the body is known. (Author)

Naval Ordnance Test Station, China Lake, Calif.
ALIGNMENT OF MOVING INERTIAL NAVIGATION SYSTEMS, by Richard B. Seeley and Roy Dale Cole. 17 Dec 59, 48p. 6 refs. NOTS TP-2279; NAVORD rept. 6561; AD-234 263.
Order from LC mi$3.30, ph$7.80 PB 146 340

This report describes and discusses some of the techniques by which a moving inertial platform may be aligned by using external velocity measurements, and also presents some of the major problems and error sources affecting such alignment. (Author)

DEVELOPMENT AND EVALUATION TESTING OF KDH-1 TARGET P/A, by George M. Miller. 1 Apr 49, declassified 12 June 56, 32p. 7 refs. Proj. TED MTC PA-(602, 603); Technical rept. no. 45.
Order from LC mi$3.00, ph$6.30 PB 148 627

This report treats of the results and conclusions derived from 87 flight tests of the KDH-1 target P/A conducted at NAMTC. These tests revealed many difficulties in launching, propulsion, and control that were not apparent in tests of previous low-performance target P/A. After a study of these problems, remedies were devised and tested, with resultant improvements. The test results discussed in this report provided valuable information for the construction and operation of other target P/A of this type, but did not develop the KDH-1 target P/A to a state where it could be used satisfactorily for Fleet operation. (Author)

[Pacific] Missile [Range] Port Mugu, Calif.
EVALUATION OF ELECTRONIC COMPONENTS IN CTV-N-4 AND CTV-N-6 (GORGON) AIRFRAMES, by L. E. Day. Rept. on Proj. TED MTC EL-303. 20 Oct 49, declassified 12 June 56, 77p. 5 refs. Technical rept. no. 61.
Order from LC mi$4.50, ph$12.30 PB 148 632

This report describes the work accomplished in preparing for the flight tests. It includes the development of an instrumentation recovery system and modification of JB-2 pneumatic servos for use in GORGON airframes. The results achieved are of value because of their applicability to other missile test projects.

P[acific] Missile [Range] Port Mugu, Calif.
EVALUATION OF THE KD2G-1 TARGET P/A, by Homer W. Parker. Rept. on Proj. TED MTC PA-614. 28 Oct 49, declassified 12 June 56, 80p. 4 refs. Technical rept. no. 62.
Order from LC mi$4.50, ph$12.30 PB 148 633

The evaluation program was organized to study each flight in three parts. The first part consisted of the preflight preparations required to prepare the P/A for flight. The second part covered the P/A from the time of launching until the P/A was recovered by the retrieving crew. The third part covered the postflight analysis of damage, repair requirements, servicing difficulties and routine maintenance.

[Pacific] Missile [Range] Port Mugu, Calif.
EVALUATION OF THE KD2R-3 TARGET P/A, by D. E. Humbert and J. H. Hooper. Rept. on TED MTC GM-618. 20 May 52, declassified 12 June 56, 51p. 2 refs. Technical rept. no. 88.
Order from LC mi$3.60, ph$9.30 PB 148 640

The KD2R-3 meets the majority of the performance requirements, but that certain changes must be made for its improvement. The P/A was found to be acceptable from a maintenance and serviceability standpoint provided minor changes are made.

[Pacific] Missile [Range] Port Mugu, Calif.
FLIGHT AND GROUND TESTS OF THE KDH-1 TARGET P/A, by George M. Miller. Rept. on TED MTC PA-612. 19 Apr 50, declassified 12 June 56, 36p. Technical rept. no. 72.
Order from LC mi$3.00, ph$6.00 PB 148 637

[Pacific] Missile [Range] Port Mugu, Calif.
FLIGHT TESTING OF THE KDG-2 TARGET P/A, by J. B. Stevens and Norman Rohn. Rept. on Proj. TED MTC PA-610. 12 Apr 50, declassified 12 June 56, 68p. 13 refs. Technical rept. no. 71.
Order from LC mi$3.90, ph$10.80 PB 148 636

In the flight test phase of the project, air speed, rate of climb, receiver range, maneuverability and controllability, endurance, and launching characteristics

were examined. The changes considered most essential as a result of these tests include: elimination of the propeller spinner, strengthening the tank section to withstand parachute landings, modification of the servomotors, adoption of the 32-foot standard parachute, and improvement of the flotation characteristics. Certain other changes discussed in this report are considered desirable but not necessary.

[Pacific] Missile [Range] Port Mugu, Calif.
THE GENERAL PERFORMANCE AND SPECIFICATION CONFORMITY OF THE KD2R-2 TARGET P/A, by George M. Miller. Final rept. on Proj. TED MTC PA-609. 1 Sep 59, declassified 12 June 56, 43p. 5 refs. Technical rept. no. 59.
Order from LC mi$3.30, ph$7.80 PB 148 630

The tests described herein were conducted for determination of the general performance of the KD2R-2 and its conformance with specifications. The results obtained from these tests indicate that the KD2R-2 conforms generally to the Detail Specifications, but does not have adequate flotation or watertight integrity characteristics. With the recommended modifications incorporated, the P/A should be suitable for Fleet use. It is considered to have very satisfactory stability and structural integrity characteristics. (Author)

TEST AND EVALUATION OF THE KD3G-2 (SNIPE) TARGET P/A, by W. C. Slowey. Final rept. on Proj. TED MTC PA-604.2. 19 June 50, declassified 12 June 56, 76p. 8 refs. Technical rept. no. 74.
Order from LC mi$4.50, ph$12.30 PB 148 638

In the over-all performance phase of the project, air speed, maneuverability and controllability, endurance, launching characteristics, parachute recovery, and flotation times were examined. Component performance evaluation was based on behavior during flight and upon laboratory-type ground tests of those components to which failures were attributed or in which failures were anticipated. As a result of these tests, the changes to the target P/A recommended as most essential include: attachment to the fuselage of a protective longitudinal keel, use of a stronger and more easily repairable tank section, modification of the servomotors, shielding of ignition leads, improvement in design and construction of engine cowl, strengthening of parachute suspension cables, and improvement of flotation characteristics.

[Pacific] Missile [Range] Port Mugu, Calif.
TEST AND EVALUATION OF THE XKD2R-1 TARGET P A, by George M. Miller. 27 Sep 48, declassified 12 Jun 56, 46p. 6 refs. Proj. TED MTC PA-607; Technical rept. no. 32.
Order from LC mi$3.30, ph$7.80 PB 148 625

This report discusses the numerous static and flight tests of the XKD2R-1 target P/A, and its evolution to a remotely-controlled target pilotless aircraft suitable for Fleet use. A total of 89 flight tests were made during the test and evaluation program. Many modifications were made to the aircraft with the result that the XKD2R-1 became a reliable and efficient target P/A suitable for production and service use. The modified XKD2R-1 proved to be superior to all previous service target P/A. (Author)

A NEW THEORY OF SANDWICH PLATES. GENERAL CASE, by Yi-Yuan Yu. Technical note no. 6 on Contract AF 49(638)453. Nov 59, 28p. 8 refs. AFOSR-TN-59-1163; AD-234 222.
Order from LC mi$2.70, ph$4.80 PB 146 741

The general 2-dimensional case is given of a new theory of elastic sandwich plates. Extension as well as flexure is considered, and the core of the sandwich may be either isotropic or orthotropic. The general theory is valid for any symmetrically arranged 3-layered plate and for vibration analysis involving wide frequency ranges. For sandwiches with very thin faces simplified equations good for limited frequency ranges are deduced. A brief discussion is given on sandwiches with cores composed of Kelvin-Voigt material. (Author)

Princeton U., N. J.
MANEUVERING CAPABILITY OF AN ANNULAR JET GROUND EFFECT MACHINE, by W. B. Nixon. Rept. on Contract DA 44-177-TC-524. May 60, 71p. 9 refs. Dept. of Aeronautical Engineering rept. no. 515.
Order from LC mi$4.50, ph$12.30 PB 148 776

An elementary analysis, employing non-mixing theory, is made of three general methods of control. The possible advantages of redistributing the annular jet strength are investigated. The slanted jet "integrated" system is the most effective within certain restrictions. Separate thrusting and tilting are seen to have some attributes, particularly in practical application. Side force fins are suggested. The pitching moments introduced with the application of control forces are discussed. Yaw control is found to be more effective with the slanted jet. A comparison with other surface vehicles accentuates the maneuvering limitations of a GEM. Operation over land may require much higher hovering capability than is generally conceded on the basis of performance. (Author)

Princeton U., N. J.
SOME QUALITATIVE CHARACTERISTICS OF A TWO-DIMENSIONAL PERIPHERAL JET, by W. B. Nixon and T. E. Sweeney. Rept. on Contract DA 44-177-tc-524. Sep 59, 19p. Aeronautical Engineering rept. no. 484; AD-233 215.
Order from LC mi$2.40, ph$3.30 PB 146 607

Base pressure distributions of a 2-dimensional peripheral jet model in simulated hovering flight is discussed. Flow patterns were deduced from these distributions and were verified with smoke studies. The standing vortex associated with this type of device is plotted as a function of altitude and angle of inclination, and the relationship between the vortex and static instability is shown for 3 initial jet angles. Also included is a brief discussion of the unsteady flow pattern generated at certain altitudes and initial jet angles. This flow is plotted and is shown to deteriorate, apparently, into a Karman street - possibly explaining the critical altitude reported by other investigators. (Author)

Southern Research Inst., Birmingham, Ala.
DETERMINATION OF THE MECHANICAL PROPERTIES OF AIRCRAFT-STRUCTURAL MATERIALS AT VERY HIGH TEMPERATURES AFTER RAPID HEATING, by James B. Preston and J. Robert Kattus. Rept. for May 57-June 59 on Development and Evaluation of Materials for ICBM and IRBM Applications, Contract AF 33(616)3494. Apr 60, 81p. 18 refs. WADC Technical rept. 57-649, Pt. II.
Order from OTS $2.25 PB 161 893

The short-time, elevated-temperature tensile properties were determined and are reported (1) for unalloyed beryllium at temperatures from ambient through 1500°F (2) for ten combinations of base materials (ETP copper, A-nickel, unalloyed molybdenum, and molded graphite) with protective coatings (chromium and nickel by electroplating; aluminum oxide, zirconium oxide, and zirconium silicate by flame spraying; silicon carbide and silicon carbide-nitride by a diffusion reaction on the surface of graphite), and (3) for a typical high-temperature alloy with linear temperature gradients normal to the axis of loading. HIGH TEMPERATURE STRUCTURES, by N. J. Hoff. Rept. on Contract AF 49(638)223. June 58, 46p. 30 refs. SUDAER no. 79; AFOSR-TN-60-383.
Order from LC mi$3.30, ph$7.80 PB 148 750

A survey is given of the new problems confronting the airplane and missile structural designer and analyst in consequence of aerodynamic heating. The need to expand the knowledge of the structures man into such fields as gas dynamics, thermodynamics and the physics of the solid state is pointed out. (Author)

United Research, Inc., Cambridge, Mass.
A METHOD FOR DETERMINING THE ECONOMIC VALUE OF AIR TRAFFIC CONTROL IMPROVEMENTS AND APPLICATION TO ALL-WEATHER LANDING SYSTEMS. VOLUME I. Rept. on Contract FAA/BRD-17. [1960] 28p.
Order from OTS $0.75 PB 161 852

The method developed for the determination of economic benefits associated with Air Traffic Control improvements is based on the measure of the effects of these improvements (1) in dollar terms on the demand for and the cost of airline passenger transportation, (2) on the costs of general aviation transport, including value of passenger time, and (3) on the annual value of the accidents (loss of property and life) prevented. To determine the annual net return from any selected improvement, the dollar values determined for each of the above measures are summed and the annual operating costs of the improvement are then subtracted. A present value formula which takes into consideration the applicable interest rate and the number of years the improvement can be expected to be in operation is then applied to determine the investment in an improvement which can be justified. In applying the method to a selected improvement the two necessary preliminary steps are determination of the physical effect of the improvement and calculation of the annual reduction in the physical units of disruption, delay, cancellation and diversion. Economic benefits associated with an improvement can then be computed. The method is applied to the effects of an all-weather landing system.

Vehicle Research Corp., Pasadena, Calif.
LIFT CHARACTERISTICS OF WINGS EXTENDED THROUGH PROPELLER SLIPSTREAMS, by Scott Rethorst, Winston Royce and T. Yao-tsu Wu. Rept. no. 1 on Contract Nonr-2388(00). Sep 58, 178p. 16 refs.
Order from LC mi$8.10, ph$27.30 PB 146 592

The study has shown that the lift generating capabilities of wings extending through a jet varies greatly with the wing plan form. The study has shown the existence of and located the finite optimum plan forms for such wings for an extensive range of wing areas and jet velocity ratios. The results obtained have been shown in the limit to approach well known uniform flow results. The results suggest that programmed sectional wing twist, provided for example by flaps, would permit the attainment of an exceptionally high stalling lift coefficient with a gradual stall pattern progressing inboard to the root.

Vehicle Research Corp., Pasadena, Calif.
LIFTING SYSTEMS FOR VTOL VEHICLES, by Scott Rethorst and W. W. Royce. Rept. no. 2 on Contract Nonr-2388(00). 2 May 59, 76p. 4 refs.
Order from LC mi$4.50, ph$12.30 PB 146 523

The various lift generating systems currently of interest for VTOL vehicles are analyzed and compared. Among the lift systems discussed are fixed wing, actuator disc, both ducted and unducted, annular jet, and pressure leakage devices. The force generation of each of these devices is derived from fundamentals. A simple theory for the annular jet is formulated and developed far enough to demonstrate its primary features so as to permit comparison with the other arrangements. Efficiency and force effectiveness, at both zero and forward velocities, are then calculated to provide a uniform basis for the comparative evaluation of these several lifting systems.

HIGH TEMPERATURE STUDIES, by H. Tracy Hall. Final rept. for 19 June 56-31 Mar 60 on Contract DA 04-495-ORD-792. [1960] 41p. 6 refs. OOR rept. 1692.2-Met.
Order from LC mi$3.30, ph$7.80 PB 148 443

An apparatus for subjecting up to 10 cubic centimeters of material to pressures of 15,000 atmospheres at temperatures as high as 10,000°C has been developed and described. The apparatus is relatively simple in its design and could readily be scaled-up by a factor of 25 in volume, if desired. Temperatures of 10,000°C can usually be maintained for periods of 5 to 15 seconds, but in some instances have been maintained for as long as one minute. With this new apparatus, a survey of the effects of very high temperature

has been made on several carbide, boride, nitride, phosphide, oxide, sulfide, and some miscellaneous systems. One material produced under these high-temperature, moderate pressure conditions may have immediate practical use. This material is fused silicon carbide. The compressive strength of this material is 30 times as great as that of ordinary hot-pressed SiC. This high strength silicon carbide may be useful as a cutting tool material. Some of the oxide systems of chromium and manganese exhibited rather high compressive strengths following high temperature treatment. This was true also for ZrB_2 and TiB_2. Some of the metallic oxides produced under high temperature conditions formed semi-conducting materials and might be of further interest with respect to their electrical properties.

Office of Technical Services, Dept. of Commerce, Washington, D. C.
DESALINATION OF WATER. [July 60] 4p. 78 refs. OTS Selective Bibliography SB-419.

A bibliography of reports listed in the two OTS monthly abstract journals: U.S. Government Research Reports and Technical Translations.

Solar Aircraft Co., San Diego, Calif.
PORTABLE GAS TURBINE FOR GENERATOR DESIGN STUDY, by Leland F. Blinman. Final rept. on Contract DA 18-108-405-cml-195. 13 Mar 59, 63p. Solar ER-815; AD-212 298.
Order from LC mi$3.90, ph$10.80 PB 148 446

Gas turbine attributes for use as portable fog generators include: low weight, reliable starting and operation, controlled gas stream temperature, large volume and high velocity exhaust gas stream, low maintenance. The object of this study was the delineation of a fog generator design, based upon the gas turbine cycle, that provides the following characteristics: exhaust gas output of 2 lb/sec at 1000 deg F, variable from 800 to 1000 deg F.; fog oil rate of 150 gal/hr.; started by hand cranking (or high pressure air impingement); total weight of 102 lb, an envelope of 23 in. x 23 in. x 28. in. high; overhaul interval 50 to 200 hours.

Southern Research Inst., Birmingham, Ala.
DEVELOPMENT, CONSTRUCTION, AND TESTING OF OSMIONIC DEMINERALIZERS, by R. E. Lacey, E. W. Lang, and C. E. Feazel. Rept. on Contract no. 14-01-001-88. June 60, 95p. 7 refs. Saline Water Research and Development Progress rept. no. 38.
Order from OTS $2.25 PB 161 862

An operable over-all design for osmionic demineralization has been demonstrated on a small scale, although the size, shape, or materials of particular components may still be changed to obtain better or lower-cost operation. The estimated costs of demineralization, based on the above design, appear to be competitive with those of other processes. However, certain problems that may alter the cost picture remain to be studied in more detail.

Army Engineer Waterways Experiment Station, Vicksburg, Miss.
DUSTPROOFING AND WATERPROOFING OF SOILS. FIELD AND LABORATORY INVESTIGATIONS OF SELECTED MATERIALS, by G. R. Kozan and J. D. Stouffer. Dec 59, 90p. 7 refs. Technical rept. no. 3-530, rept. 1; AD-231 925L.
Order from LC mi$4.80, ph$13.80 PB 146 565

Based on an extensive review of soil-treatment agents, 13 materials were selected for evaluation of their dustproofing and waterproofing capabilities. Of the materials investigated, aniline-furfural, MC-O asphalt, sodium methyl-ethyl propyl siliconate, the quaternary ammonium chloride, the commercial road oil, and the chemically modified MC-O asphalt were sufficiently effective both as dustproofers and waterproofers to warrant further investigation.

Army Engineer Waterways Experiment Station, Vicksburg, Miss.
PREFABRICATED AIRFIELD AND ROAD SURFACING MEMBRANES: TORRID ZONE STORAGEABILITY TESTS, 1954-1957, by S. G. Tucker. May 60, 32p. 2 refs. Technical rept. no. 3-515, rept. 2.
Order from OTS $1.00 PB 161 869

Laboratory and field tests were conducted on coated cotton duck, cotton knit, and cotton tire-cord fabrics to determine their suitability for three years storage in the Torrid Zone. The performance under exposure of dry-back adhesive, which is used to fasten strips of membrane together, was also observed. In the laboratory, the tensile strength of each membrane was determined before, during, and after the storage period; the effects of weathering were also determined by measuring thicknesses and weighing samples of the membranes before and after the three-year storage period. In the field, membrane rolls on wooden and cardboard cores were placed in a rack and exposed to prevailing weather conditions with no protection from rain or sun. The membranes were inspected periodically, and photographs taken to record important developments. Temperature, rainfall, and relative humidity data were recorded throughout the storage period. INSPECTION FOR MAINTENANCE OF PUBLIC WORKS AND PUBLIC UTILITIES, VOLUME 1. 22 Dec 59, 283p. Technical pub. NAVDOCKS P-322; BUDOCKSINST 11014.13B.
Order from LC mi$11.10, ph$44.10 PB 147 655

Efficient and economical management requires that undermaintenance and overmaintenance be avoided, that corrective action be taken on deficiencies before deterioration necessitates major repairs, and that the various items of public works and public utilities meet their functional requirements. This publication has been prepared to gather together the numerous and interrelated responsibilities pertaining to maintenance inspection of public works, public utilities, and civil works facilities. Application of inspection, as outlined herein, will assist in protecting the Government's very large property investment.

ON THE INDEPENDENCE OF YEARLY WATER INPUTS IN DAMS, by J. Gani and B. R. Bhat, (U. of California). Rept. on Contract Nonr-266(59). [1959] 17p. 11 refs. CU-8-59-Nonr-266(59)MS.
Order from LC mi$2.40, ph$3.30 PB 148 573

The paper considers an assumption in Moran's theory of dams [Australian J. Appl. Sci. 5:116-124, 1954], this is that the yearly water inputs into a reservoir are independently distributed. To test the hypothesis, two models are constructed for the annual discharges of 17 Australian rivers. The first, a Markov process with normal residuals, leads to the tentative conclusion that discharges from most of the rivers (some only after transformation) are serially independent. From the second model, a simple Markov chain, it is shown that no reliable conclusion can be drawn. Moran's assumption is accepted as a useful first approximation for all but two of these rivers. (Author)

Naval Civil Engineering Lab., Port Hueneme, Calif.
DESIGN CHARTS FOR R/C BEAMS SUBJECTED TO BLAST LOADS, by J. R. Allgood and G. R. Swihart. Final rept. 11 May 60, 141p. 16 refs. Technical rept. 069. AD-237 958.
Order from LC mi$7.20, ph$22.80 PB 148 241

An ultimate load theory is combined with an idealized dynamic theory to form a computational program for the development of a set of design charts for reinforced concrete beams. The behavior of beams under blast loading is reviewed to aid in the explanation of the computational program and the charts. A procedure for the treatment of shear and bond is presented; the design curves are given and exemplified; and their limitations are discussed.

Electrical and Electronic Engineering

Admiral Corp., Chicago, Ill.
EVALUATION-DEVELOPMENT OF MIL-C-14157 CAPACITORS FOR NUCLEAR RADIATION ENVIRONMENT, by E. R. Pfaff. Scientific rept. no. 3 on Contract NObsr-77612. May 60, 77p.
Order from LC mi$4.50, ph$12.30 PB 148 237

In environmental tests forty-nine of the fifty irradiated samples failed within 154 hours. Of the fifty control samples, eighteen are remaining on test after 400 hours. The irradiated group with the pulsed voltage applied failed rapidly after 65 hours indicating a possible structural change in the units. After 300 hours of irradiation Mylar and Kraft paper were extremely brittle and the units had high internal gas pressure. Preliminary studies of FS-5 and FC-43 dielectric fluid indicate they evolve Fluorine gas during irradiation. Capacitors impregnated with C_{16-18} alkyl bi-phenyl dielectric fluid and solid impregnants are being investigated. (Author)

Aeronautical Electronic and Electrical Lab., Naval Air Development Center, Johnsville, Pa.
SIMULTANEOUS HEAT AND MASS TRANSFER AND ITS APPLICATION TO AIRBORNE ELECTRONIC COOLING, by A. Saltzman. Technical note. 4 May 56, 29p. 3 refs. Rept. no. NADC-EL-N5626.
Order from LC mi$2.70, ph$4.80 PB 148 422

Emphasis is placed on the role of momentum and mass transfer as the "cause" of the cooling problem, and on the limitations of using air alone as a coolant. The main facets of the cooling problem include important design features of the electronic cooling tower system such as means of relegating air to carrier of vapor heat, enthalpy concept, techniques of diffusing vapor heat through stagnant air, high heat capacity characteristics of a two component (vapor-air) system, the high latent heat of vaporization at low dry bulb temperatures, application of fin technology to evaporative cooling, and the application of conventional techniques of calculations of number and height of transfer units.

Applied Physics Lab., Johns Hopkins U., Silver Spring, Md.
BIBLIOGRAPHY ON THERMOELECTRICITY, by S. Goldman. Rept. on Contract NOrd-7386. Nov 58, 25p. 130 refs. TG-326.
Order from LC mi$2.70, ph$4.80 PB 149 555

The bibliography lists the literature cited in Physics Abstracts, Electrical Engineering Abstracts, and Chemical Abstracts from January 1939 through mid 1958. While only a handful of the papers listed deal with engineering applications of thermoelectricity, this should not be taken as a measure of the relative engineering importance of these effects. Rather this is simply an indication of the severe proprietary restrictions on the publication of the results of the applied work.

Armour Research Foundation, Chicago, Ill.
CONTINUOUS FEED BATTERY, by H. F. Bauman and Howard T. Francis. Final rept. 15 Apr 56-15 July 57, on Contract NObs-72131. 30 Sep 57, 15p. AD-158 048.
Order from LC mi$2.40, ph$3.30 PB 148 385

The proposed system was based on a magnesium or aluminum anode with hydrogen peroxide as the cathode reactant. The magnesium-hydrogen system was investigated including determinations of anode evolutions of hydrogen and conditions for platinum black formation resulting in highest cell potential. The maximum load potential of the magnesium-hydrogen peroxide cell was 1.00 v at a cathode current density of 10 amp/sq ft, and changes in cell composition caused little change in potential. Magnesium anodes were used at current densities to 75 amp/sq ft with little polarization in 3.5% NaCl solution. Evolution of hydrogen from such an anode decreased as current density was increased and was approximately half that of the cathode gas in a magnesium-hydrogen cell. Conditions of platinum black formation were reflected in large changes in the cathode reaction potential. Magnesium-hydrogen cells were discharged for long periods by replacing the anode as consumed, but with no electrolyte changes. (Author)

INVESTIGATION OF COLD-TEMPERATURE CHARACTERISTICS OF SONOTONE, 100-AMPERE-HOUR, NICKEL-CADMIUM BATTERIES, by James E. Griffin. 30 Nov 59, 33p. Technical rept. 1607-TR; AD-232 337.
Order from LC mi$3.00, ph$6.30 PB 146 661

This report describes the engineering tests and summarizes the results of the tests conducted at an ambient temperature of -65°F. on two 12-volt. nickel-cadmium batteries. Tests included discharge characteristics of the batteries after they were cold-soaked at -65°F, both prior to and after application of a short circuit at the battery terminals; charging characteristics of the batteries at -65°F.; and discharge characteristics of the batteries into a low impedance.

Army Signal [Research and Development Lab.] Fort Monmouth, N. J.
FIELD SPLICE AND CONNECTORS FOR COAXIAL CABLE TYPE RG-85A/U, by Morton Pomerantz. 3 Dec 57, 29p. 4 refs. Technical memo. no. M-1930; AD-156 262.
Order from LC mi$2.70, ph$4.80 PB 146 590

Series LC connector Type UG-1179( )/U has been newly designed for use with RG-85A/U cable in fixed station radio receiving installations. This one connector, used in conjunction with other standard connectors eliminates the need for the special fittings and splices which have been used in such installations in the past. The simplicity of the design of the UG-1179( )/U permits greater ease of assembly and maintenance, and alleviates to a great extent the possibility of damage in normal handling. The high cost of the standard Navy splice kit has been eliminated. These features have overcome the inherent shortcomings of the special fittings which have been used in the past. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
MICROWAVE CIRCUITRY FOR A FREQUENCY TRANSLATOR, by Robert D. Standley, Charles P. Heinzman, and Nathan Lipetz. 6 Oct 58, 22p. 10 refs. USASRDL Technical rept. 1994; AD-211 334.
Order from LC mi$2.70, ph$4.80 PB 148 112

The microwave circuitry covered by this report was developed for a frequency translator which used a highly stable ammonia beam Maser output of 23,870 mc to stabilize a 300 mc signal. This was achieved through the use of harmonic conversion and dual mixing techniques. Detailed design information of a harmonic generator, TE_{011} mode filters, and polarization convertors is included. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
PIEZOELECTRIC QUARTZ VIBRATORS: PROPERTIES OF CUTS AND MODES OF VIBRATION, by R. Bechmann. 31 Dec 58, 59p. 52 refs. USASRDL Technical rept. 2003; AD-220 106.
Order from LC mi$3.60, ph$9.30 PB 146 653

The parameters of the various modes of quartz bars and plates practically used for frequency control were calculated and are compared with experimental data. The results are given in the form of tables for the various cuts and the figures given are of practical importance as design data for the production of resonator and filter crystals. The temperature behavior of the so-called zero temperature cuts and the dimensions of the quartz vibrator are discussed. The filter crystal design is also considered. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
THE USE OF AN X-BAND SOLID-STATE RUBY MASER WITH A CONVENTIONAL DUPLEXING SYSTEM, by John L. Carter, Morris Katzman, and Irving Reingold. 15 Jan 60, 19p. USASRDL technical rept. 2095; AD-234 085.
Order from LC mi$2.40, ph$3.30 PB 148 002

A series of experiments were performed with an X-band solid-state ruby maser and several conventional types of X-band duplexer tubes under conditions which simulated actual radar system application. Leakage levels for the onset of deterioration of maser performance and for saturation of the maser were determined. Measurements were also made of the recovery time of the maser after it had been fully saturated. The results indicate the degree of improvement required of the duplexer, or the degree of protection that must be provided in addition to the duplexer, if optimum use is to be made of the maser gain characteristics. (Author)

RESEARCH AND INVESTIGATION OF CATHODE EMISSIVE MATERIALS, by W. E. Danforth and D. L. Goldwater. Scientific rept. no. 7 on Contract AF 19(604)3904. 15 Jan 60, 14p. AFCRC-TN-60-143; AD-234 040.
Order from LC mi$2.40, ph$3.30 PB 146 322

Life studies with thorium impregnated matrix cathodes have been carried to 10,000 hours at the 1.0 amp./sq. cm. level ($1550^{o}C_{B}$); 8,000 hours at 2.4 amp./sq. cm. ($1620^{o}C_{B}$) and 3,400 hours at 3.0 amp./sq. cm. ($1720^{o}C_{B}$). The determination of the surface density of thorium on tungsten corresponding to maximum emission has yielded a value of 4.1×10^{14} atoms/sq. cm. with estimated P. E. of 6%. Bombardment of a thorium-on-tungsten monolayer with electrons of energy of 370 volts has been carried to a total integrated bombardment of 81 amp. hr./sq. cm.

INTEGRATED AIRBORNE CNI CONTROL AND DISPLAY EQUIPMENT PROGRAM, by D. G. Erskine and W. D. Philips. Final rept. for 19 Apr 57-4 June 59 on Contract AF 33(600)35175. 4 June 59, 86p. 12 refs. WADC Technical rept. 59-271; AD-235 134.
Order from LC mi$4.80, ph$13.80 PB 149 786

The operational feasibility of an integrated communication-navigation-identification (CNI) control subsystem is discussed. The purpose of this subsystem was to reduce the total amount of critical cockpit area required for the controls of CNI equipments and to simplify their operation, thus relieving the pilot of some of his tasks. The developed subsystem allows the pilot to select and tune most of the CNI equipments with his left hand without visual reference to the primary control panel, which is in the form of a standard adding machine 10-key keyboard. An equipment indicator, located on the instrument panel, is provided for verification of control settings, and appropriate electromechanical devices were incorporated to prevent wrong operation. Tests comparing the operation of the integrated subsystem with the present CNI controls were made, and the results indicate that the subsystem offers an appreciable reduction of the pilot's task with surprisingly little training. Less than half the cockpit area now used for CNI controls is needed for the integrated subsystem. Possibilities of controlling the subsystem from the ground by data link were studied and found feasible and highly desirable for reducing the pilot's work load. (Author)

EXTENDED SYNTHESIS TECHNIQUES FOR MULTIPOLE SAMPLED-DATA CONTROL SYSTEMS, by E. B. Stear and C. T. Leondes. Rept. on Contract AF 49(638)438. Oct 59, 16p. 4 refs. AFOSR-TN-59-1223; AD-233 276.
Order from LC mi$2.40, ph$3.30 PB 146 735

The presentation is made of a logical and efficient procedure for the synthesis of multipole sampled-data control systems. It is assumed that the specifications on the system are stated in the time domain, a common situation. It is not assumed in the synthesis procedure presented that the specifications are stated only at the sampling instants of the system, but rather at arbitrary and necessary instants of time. In addition to this, a lower bound is established for the sampling rate based on system requirements. (Author)

EVALUATION OF DYNAMIC INTERACTION FIELDS IN A TWO DIMENSIONAL LATTICE, by R. E. Collin and W. H. Eggimann. Scientific rept. no. 12 on Contract AF 19(604)3887. 19 Mar 60, 37p. 2 refs. AFCRC-TN-60-381. AD-237 886.
Order from LC mi$3.00, ph$6.30 PB 148 195

The dynamic interaction fields due to a two dimensional lattice of electric and magnetic dipoles are evaluated. The series involved are summed by means of the Poisson summation formula and other means in order to yield results in closed form. The application of the theory to a disc type artificial dielectric medium is considered. (Author)

AN INDUCTIVE RELIABILITY CRITERION FOR RECEIVING SYSTEMS, by Leonard S. Schwartz. Rept. on Contract AF 30(602)2018. Mar 60, 21p. 18 refs. RADC TN-60-3; AD-234 475.
Order from LC mi$2.70, ph$4.80 PB 147 180

Bayes' and Likelihood Tests, used in the detection of signals in noise are reviewed. Their dependence on knowledge of the a priori probabilities and channel statistics is pointed out. An attendant inability to assist in setting decision thresholds when channel statistics are unknown is noted. The nature of a priori information is discussed since prevailing misconceptions concerning this are at the root of much of the weakness of present theories of detection. It is pointed out that the primary aspects of knowledge are a priori and empirical. Only the latter contains probabilistic elements. Possible methods for instrumenting detection systems for both radar and communications operating on principle of inductive probability are discussed. These systems are shown to be potentially capable of achieving any desired degree of reliability, even when operating in a state of almost total initial ignorance regarding channel statistics. (Author)

SUPERGAIN AND VOLUMETRIC ANTENNAS, by E. Spitz. Technical (Final) rept. on Contract AF 61(052)102. 15 June 59, 74p. 9 refs. AFCRC-TR-59-194; AD-228 779.
Order from LC mi$4.50, ph$12.30 PB 146 389

Research was conducted on the problem of radiating structures placed in a certain limited space. Efforts are based on theoretical work on superdirectional antennas. Two problems are considered: the case of a classical antenna, but developed into volume with all supergain effects excluded and the case of a supergain antenna. The performance is given of a practical form of a built volumetric antenna. Supergain antennas consisting of 5 and 11 sources were calculated, and a method of evaluation is indicated. Five and 11 source supergain structures were built with the individual sources isolated by ferrite unilines. Performances are shown.

AIR FORCE HANDBOOK: METHODS OF COOLING SEMICONDUCTOR DEVICES, by Steven K. Morrison and James P. Welsh. Rept. on Contract AF 30(602)1842. May 60, 74p. 17 refs. Rept. no. HM-1247-D-5; RADC-TR-60-22, supplement to RADC-TR-58-126.
Order from LC mi$4.50, ph$12.30 PB 148 783

This Handbook was prepared to aid electronic engineers in the thermal design of reliable military electronic equipment. Enumerated herein are recommended principles and techniques for the thermal design of electronic equipment using semiconductor devices. (See also PB 146 874)

Cornell U. School of Electrical Engineering, Ithaca, N. Y.
INTERPRETATION OF SOME BACKSCATTER ECHOES IN TERMS OF FIELD-ALIGNED IRREGULARITIES IN THE F REGION, by P. F. Weaver, Jr. Technical rept. no. 49 on Studies on Propagation in the Ionosphere, Contract DA 36-039-sc-78258. 15 Dec 58, 93p. 26 refs. Research rept. EE-389; AD-229 659.
Order from LC mi$5.40, ph$15.30 PB 147 246

Long-range radar echoes at 14 mc were studied which seem to be explicable in terms of direct backscatter from field-aligned irregularities in the F region of the ionosphere. These echoes were regularly observable during the evening hours with a high power pulsed transmitter and a rhombic antenna beamed toward the north. A typical echo was spread in range from about 1000 km to about 2000 km and had a fading rate comparable to that of auroral echoes observed at the same frequency. Because of the observed aspect sensitivity of the echoes, contours of the angle between a plane perpendicular to the earth's magnetic field and ray paths from Ithaca were calculated for F-region heights. These contours of off-perpendicular angle indicated that the observed echoes were coming from an area of near-perpendicularity where angles as low as 9^{o} were found. Because of refraction in the F region, all northward ray paths from Ithaca which would be "reflected" back to earth are bent into perpendicularity at some point along their trajectory. The assumption is therefore made that the observed echoes arise from backscattering by irregularities in the F region elongated along the earth's magnetic field. Calculations on the basis, allowing for refraction and delay time in the F region, lead to echoes at about the observed range. (Author)

David Sarnoff Research Center, Princeton, N. J.
STORAGE LIGHT INTENSIFIER DISPLAY PANEL, by H. O. Hook and W. F. Davidson, Jr. Final rept. 1 Apr 56-30 Sep 58, on Contract DA 36-039-sc-71194. 30 Sep 58, 122p. 5 refs. AD-215 163.
Order from LC mi$6.30, ph$19.80 PB 149 103

Layer type storage light intensifiers with 40 elements per inch were made and performed well. Bi-stable storage for 30 minutes is reported. Less satisfactory results were obtained with more complicated structures. Some characteristics of powdered CdS photoconductors are reported and related to the operation of storage light intensifiers. Spectral match of the 4 RCA electroluminors and CdS photoconductor is almost the same. Optical geometry and absorption in feedback paths are evaluated experimentally and theoretically. (Author) (See also PB 149 366)

CONSTRUCTION OF TUBES EMPLOYING PLANAR PERIODIC ELECTROSTATIC FOCUSING, by Burton J. Udelson and McKay R. Bradley. 16 May 60, 31p. 8 refs. Technical rept. TR-828.
Order from LC mi$3.00, ph$6.30 PB 148 464

A new technique has been developed for constructing tubes employing the planar periodic electrostatic focusing of an electron sheet beam. Use of this technique permits the achievement of both mechanical ruggedness and excellent alignment of the electrodes. The technique, in brief, consists in assembling the entire tube structure in separate halves, grinding their surfaces simultaneously with an abrasive wheel, and then bolting the two halves together at each end. Two entirely different methods of assembling the tube halves were developed. Experimental tubes embodying each of these methods were constructed, and each gave excellent beam transmission through the electrostatically focused structure, in one case as high as 99.8 percent. A method of measuring the beam shape and width, and of determining the relative quality of the sheet beam emerging from an electron gun, is described. (Author)

Electric Storage Battery Co., Yardley, Pa.
INVESTIGATION OF AgO PRIMARY BATTERIES, by P. Ruetschi and R. F. Amlie. Quarterly rept. no. 2, 1 Sep-30 Nov 59, on Contract DA 36-039-sc-78319. [1959] 21p. AD-233 532.
Order from LC mi$2.70, ph$4.80 PB 147 974

Electroformed and pasted AgO plates were compared by discharging at the 10-hr rate (300 ma, for the particular size plates used). Various techniques of fabricating and electroforming AgO plates made by the ESB "DP-Process" were studied to obtain improved discharge efficiencies. Theoretical discharge efficiencies of about 91% were realized with the best electroformed plates; this efficiency value is the same as that realized from plates of commercial silver (II) oxides, made with chemically prepared AgO. The influence of sintering temperature was studied on DP-Process electrodes made of discrete Ag particles of about 1μ. This parameter was relatively critical since the discharge efficiency was optimized by keeping the sintering temperature low, at 450° to 500°C. The effect of total charge input was also investigated by charging at several current densities ranging from approximately 4 to 1 ma/cm^2. About 90% of the theoretical capacity was realized with a 75% overcharge and capacity increase was very small with additional charging. The voltage cut-off meter-relay unit was completed and put into operation. Efforts were greatly facilitated by this instrument which automatically interrupts the current at the end of charge or discharge at a present voltage level. Two or more electrodes can be discharged per day on the laboratory bench with a minimum of attendance to give an accurate record of voltage and elapsed time.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
THE DEVELOPMENT AND EVALUATION OF A PANORAMIC RADIO DIRECTION FINDING RECEIVER, by Edward E. Kellum. Technical rept. no. 14 on Contract Nonr-1834(02). 25 Sep 59, 61p. 31 refs. AD-228 194.
Order from LC mi$3.90, ph$10.80 PB 148 599

A panoramic radio direction finding receiver is a device that enables an operator to determine the direction of arrival and frequency of any received signal over a specified bearing sector and frequency band. The purpose of this investigation is to determine the performance of the receiver when used for direction finding. Test results indicated that panoramic radio direction finding is not useful if only a Watson-Watt type of display is used. It is essential that a bearing converter be used; however, the bearing converter used in this test is not satisfactory because of the bearing spread. Methods to lessen the bearing spread are (1) decreasing the IF amplifier bandwidth in the receiver, (2) increasing the intermediate frequency in the bearing converter, and (3) triggering the timing pulse circuit only when the frequency in the bearing converter is the correct frequency. These methods are discussed in the experimental results. A block diagram and description of method (3) above is given.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
EVALUATION OF A LABORATORY MODEL INJECTION TYPE RDF RECEIVER, by Harry A. Shubert. Technical rept. no. 12 on Contracts Nonr-1834(02) and DA [36] 039-sc-74898. 31 Mar 59, 47p. 2 refs. AD-225 274.
Order from LC mi$3.30, ph$7.80 PB 146 357

Descriptions and data are presented on the construction and operation under laboratory conditions of a 2-channel radio direction finding (RDF) receiver matched in phase and gain automatically. The channels are matched by means of a signal injection system. Schematic diagrams, explanations of operation, and photographs and analysis of results are presented. A review of the general principles of operation of a direct reading RDF system with emphasis on the details pertinent to this project is given. An attempt was made to show why the requirements on the receiver are very rigid. The principles of operation of the injection system for channel matching, and an explanation of the construction of the system used are outlined. An analysis is presented of results obtained, in which the results are compared to theoretical calculations and curves. (Author)

Electrical Engineering Research Lab., U. of Illinois, Urbana.
NEW TECHNIQUES IN SWITCHING CIRCUIT SYNTHESIS, by Donald Lee Epley. Doctoral thesis. Technical note no. 13 on Contract AF 49(638)63. 1 May 60, 103p. 42 refs. AFOSR-TN-60-614.
Order from LC mi$5.70, ph$16.80 PB 148 765

Three new switching theory concepts and methods analogous to electrical network theory methods are defined and applied to problems in switching circuit synthesis. The first, the removal synthesis technique, is used to synthesize transmission contact networks with p input terminals and q output terminals. Transmission contact networks are synthesized to realize a transmission matrix containing switching functions between each input-output terminal pair. The second new concept introduced is the 0, 1-configuration of a switching function. Using this representation of switching functions and a mapping procedure, a new method of finding the minimum sums of a given function is developed. The third concept, sensitivity of a contact circuit to contact errors, is used to design circuits with error protection. Two different sensitivities, contact and condition, are defined. Contact sensitivity is used to develop a design procedure for the single contact error and equally likely input combinations case. Condition sensitivity is used in a similar design procedure applicable to multiple contact error case and which includes differences in likelihoods of occurrence of input combinations.

Electron Tube Research Lab., U. of Minnesota, Minneapolis.
STUDIES ON BASE NICKELS FOR OXIDE-COATED CATHODES, by D. E. Anderson. Scientific rept. nos. 5 and 6, 15 Apr-15 Oct 59, on Contract AF 19(604)3890. [1959] 97p. 3 refs. AFCRC TN-60-112.
Order from LC mi$5.40, ph$15.30 PB 146 327

An investigation was made of the applied voltage and diode current (I-V characteristics) of thermionic diodes under μsec pulse conditions. Studies were made of the influence of diode spacing and of deviations from parallel-plane geometry on the observed emission and coating resistance. A new system was developed for the controlled reduction of oxide coatings using a C-Ni diffusion couple. Oxide cathodes based on 0.22% and 0.08% Al-Ni alloys exhibited stable emission levels of over 11 amp/sq cm for operating times of over 5000 hr at 1093°K. The activation of passive-based cathodes exposed to a constant Ba pressure produced appreciable enhancement of emission. Studies of the influence of a heated Ti anode on the emission from an oxide cathode revealed no interaction except when the anode was heated directly over the cathode. (See also PB 143 974)

Electronic Communications, Inc., Timonium, Md.
FERRITE PHASE SHIFTER FOR THE UHF REGION. PART II, by C. M. Johnson and G. V. Buehler. Scientific rept. no. 2, 2 May 58-30 Sep 59, on Contract AF 19(604)2407. 31 Oct 59, 77p. 6 refs. AFCRC TN-60-138; AD-234 145.
Order from LC mi$4.50, ph$12.50 PB 146 324

Ferrite properties which influence phase shifter performance were investigated, and improved versions of the ferrite-loaded, folded-stripline, UHF phase shifter were constructed. Some theoretical relations were derived from conventional ferromagnetic theory to explain the performance of this type of phase shifter, but good quantitative agreement with the experimental results was not attained. This disagreement is attributed to demagnetizing effects. A preliminary investigation was made to determine the nature of these effects and some of the results are included. (Author) (See also PB 137 478)

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
A CIRCUIT FOR BROAD-BAND IMPEDANCE MATCHING OF A PAIR OF LOADS, by James J. Epis. Rept. on Contract DA 36-039-sc-71053. 26 Feb 58, 34p. 2 refs. Technical memo. no. EDL-M129; AD-158 648.
Order from LC mi$3.00, ph$6.30 PB 147 438

A circuit is described in which two loads are coupled to a common transmission line. The circuit, in itself incorporates often-used circuit elements; as a result of the manner in which these elements are inter-connected the transmission line to the generator does not have reflected waves, or standing waves, regardless of the impedance mismatches of the two loads. Thus, the signal generator operates into a perfectly matched system, and undesirable interactions between the loads and the generator do not occur. In many cases, this operation can be maintained over a broad frequency band. The theoretical analysis developed for the circuit is verified by experiment, and several useful and practical applications of the circuit are considered. (Author)

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
HEATER INDUCED FREQUENCY MODULATION IN THE QK-518 BACKWARD WAVE OSCILLATOR, by J. F. Lipman. Rept. on Contract DA 36-039-sc-73170. 18 Oct 57, 16p. Technical memo. no. EDL-M119; AD-161 274.
Order from LC mi$2.40, ph$3.30 PB 147 437

An experimental study has been made on several QK-518 backward wave oscillator tubes to determine frequency modulation characteristics with ac heater power. One source of frequency modulation is resistance in the common heater-cathode lead within the tube. A second source appears to be attraction of electrons by the heater on the positive half cycle, thereby causing frequency pushing. These two effects are opposite. A typical tube has about a 1.5-megacycle deviation at the low-frequency end of the band. As the frequency is increased toward the high frequency end of the band, the deviation decreases to zero, reverses in phase and increases to about one megacycle. (Author)

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
INVESTIGATION OF THE FEASIBILITY OF A BROADBAND WAVEGUIDE ROTARY JOINT USING CIRCULAR POLARIZATION, by P. D. Cogshall.

Rept. on Contract DA 36-039-sc-75012. 23 Mar 59, 32p. 10 refs. Technical memo. no. EDL-M171; AD-215 073.
Order from LC mi$3.00, ph$6.30 PB 147 440

Circular polarization techniques in round and square waveguide are studied for application in a broadband rotary joint. Broadband quarter-wave plates are constructed and assembled in an experimental rotary joint in S-band. Characteristics of resonant conditions and methods of eliminating them are investigated. Resonant slots are used to suppress resonances by absorbing the orthogonal mode in a round waveguide rotary joint. The peak power capability is determined in an X-band model by measuring the breakdown power in a waveguide resonant loop. The measurement techniques are discussed. (Author)

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
AN INVESTIGATION OF UHF SPECTRA OF SINGLE CRYSTALS OF $BaTiO_3$, by Howard Diamond. Rept. on Contract DA 36-039-sc-73170. 15 Apr 58, 11p. 7 refs. Technical memo. no. EDL-M135; AD-161 275.
Order from LC mi$2.40, ph$3.30 PB 147 439

The need for spectral information on good, single crystals of $BaTiO_3$ is emphasized. The frequency range from 65 to 300 mc is investigated using a method which continuously displays dielectric constant versus frequency; the particular range was chosen to check a previously reported resonance at 120 mc. Using spectrographic techniques, no such resonance was found. In the frequency and temperature range considered, the crystal showed a gradual reduction of dielectric constant at the higher frequencies. (Author)

Electronics Research Lab., U. of California, Berkeley.
AN ITERATIVE APPROXIMATION TO FLAT DELAY IN AN EQUAL RIPPLE MANNER, by Charles A. Kulmann. Rept. on Contract N7onr-295(29). 15 June 59, 31p. 5 refs. Rept. no. 89; Series no. 60, issue no. 242; AD-233 099.
Order from LC mi$3.00, ph$6.30 PB 146 582

To date, there has been no analytic solution to the equal ripple delay function; the data presented here is the result of iterative solutions using a high-speed digital computer. In addition to the obvious use for precision delay line design, the results of this paper may also be used in the design of pulse amplifier interstage networks. Since phase distortion in an amplifier will result in dispersion of the transmitted pulse and the resultant difficulty in the resolution of closely spaced pulses, it is desirable to concentrate on the phase (or delay) characteristic. In this paper, the desired constant delay time is approximated in an equal ripple manner over the useful band of frequencies. Results are given in graphic form for orders of approximation up to N = 12 and for values of delay ripple from 0.01% to 10% for a normalized bandwidth of $0 \leq \omega \leq 1$. Denormalization techniques for both low-pass and band-pass cases are outlined in examples. (Author)

Electronics Research Lab., U. of California, Berkeley.
A MICROWAVE ANECHOIC CHAMBER, by F. D. Clapp and D. J. Angelakos. Rept. on Contract N7onr-29529. 21 Sep 59, 13p. 3 refs. Rept. no. 90; Series no. 60, Issue no. 251; AD-235 449.
Order from LC mi$2.40, ph$3.30 PB 148 622

Study of the data leads to the conclusion that the room is about equally effective with the walls either straight or corrugated, with the provision that if the walls are straight, the antenna must be placed in an asymmetrical position in the room. If the walls are corrugated, it is essential that angular joints in the corrugations be suitably covered to prevent additional reflections. If these stipulations are followed, spurious reflections should be at least 20 db down from the main lobe at any angle, and will be considerably better for most cases. This is obviously not good enough for investigation of small side-lobe arrays but is adequate for many purposes.

Emerson and Cuming, Inc., Canton, Mass.
DIELECTRIC EMBEDDING MATERIAL FOR 500°C SERVICE. Final rept. for 1 July 57-31 Mar 58 on Contract NObs-72339. 1 Apr 58, 27p. AD-218 998.
Order from LC mi$2.70, ph$4.80 PB 148 852

A survey of possibly useful commercially available materials and a literature search revealed that the major part of the problem was bonding material suitable for this temperature service. A number of promising types were experimentally evaluated in various modifications. A silica gel bond and a low melting lead glass bond were found most useful. With further development, these materials can be used for the contemplated tasks. A program for further work is included. (Author)

General Electric Microwave Lab., Palo Alto, Calif.
MEASUREMENT AND CONTROL OF HARMONIC AND SPURIOUS MICROWAVE ENERGY, by Vernon G. Price, John P. Rooney, and Richard H. Stone. Final rept., Change A, for July 59-Jan 60 on Contract AF 30(602)1670. 18 Mar 60, 75p. 8 refs. Technical Information Series rept. R60ELM112-4; RADC-TR-60-77.
Order from LC mi$4.50, ph$12.30 PB 148 534

Leaky wall filters were fabricated and are reported herein. A design for a coaxial probe section (to be used in the rotating joint of a radar system) is reported. This probe section is designed to measure the harmonic energy to the fift'. harmonic whether the signals are propagating in either the forward or reverse direction. It is to be noted that all of the harmonic energy in a radar system must pass through the rotary joint (if the radar has one), and hence this is a unique place to make measurements. Measurements were made of the harmonic output of the VA-125 traveling-wave tubes and are reported herein. Thus, limited data are now available on magnetrons, klystrons, and traveling-wave tubes. (See also PB 145 604)

General Electronic Labs., Inc., Cambridge, Mass.
1000 TO 3000 MC RECEIVER FRONT END, by Martin W. Levine. Final technical rept. for 1 May 56-30 June 59 on Contract DA 36-039-sc-72326. [1959] 69p. 1 ref. E-136-F; AD 226 296.
Order from LC mi$3.90, ph$10.80 PB 146 546

The development is presented of a 1000-to 3000-mc front end for providing the tuning function for a radio interference and field strength measuring set (AN/URM-85) and which incorporates the latest design features. A survey into the current state of the art revealed design features which could lead to the development of a receiver front end with superior performance characteristics. A system concept was developed which exploited these design features and a design approach for an experimental model of a 1000-to 4000-mc front end was prepared. After fabrication of the experimental model, and evaluation indicated that the performance of this design with minor modifications would comply with all the required performance criteria. After modifying this design, 2 service test models of the 1000 - to 4000-mc front end were fabricated, evaluated and found to meet the objectives of the technical requirement. (Author)

Studies of aggregation and physical properties of sputtered films of platinum metals, molybdenum, chromium, aluminum and gold.

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
INVESTIGATION ON THE AGING EFFECTS RESULTING FROM PLATING METHODS AND MATERIALS, by Richard B. Belser and Walter H. Hicklin. Quarterly rept. no. 3, 1 Oct 54-1 Jan 55, on Contract DA 36-039-sc-56753. [1955] 51p. 1 ref.
Order from LC mi$3.60, ph$9.30 PB 138 212

Positive-ion bombardment of glass and quartz substrates and its effects on the adherence and the aging of gold, silver and aluminum films deposited thereon by sputtering and evaporation. Films deposited on substrates, which were subjected to bombardment before deposit and aged by heating thereafter, were remarkably free of bubbles and pin holes common to films deposited on substrates which were not subjected to bombardment. Behavior of bimetal films indicate that these films hold much interest for studies of diffusion and the behavior of metals but that only selected metal pairs, of proven stable performances, should be given serious consideration as coatings for quartz resonators. (See also PB 138 211)

ANTENNA CONTROL GROUP ANDB TYPE 2. 3NS6. Technical manual. Rept. on Contract NObsr-64741. 11 Dec 56, 133p. NAVSHIPS 92913.
Order from LC mi$6.90, ph$21.30 PB 147 953

The Antenna Control Group Type 2. 3NS6 consists of an antenna pedestal with servo control suitable for use with the Antenna Assembly 2. 3NS3 and a 30 foot antenna similar to the 2. 3NS3. The control group has been primarily designed to automatically slave a master antenna unidirectionally up to a maximum velocity of 26 rpm.

ITT Labs., Nutley, N. J.
INVESTIGATION OF ELECTRICALLY VARIABLE DELAY LINES, by S. R. Hoh and G. R. Leef. Final rept. on Contract AF 30(602)1859. Jan 60, 52p. 9 refs. RADC-TR-59-214; AD-231 095.
Order from LC mi$3.60, ph$9.30 PB 146 597

Electrically variable delay lines based on ferroelectrics were investigated analytically and experimentally. This work was supported by evaluations of available materials as well as by a material development program. A material Q of 100 was obtained with a barium-strontium titanate which is the highest ever reported in this frequency range. A new multisection delay line was developed incorporating ferroelectrics. This line has an attenuation comparable to standard delay cables and, in addition, miniaturization and controllability. (Author)

DOPPLER PHASE-DIFFERENCE INTEGRATOR, by G. M. Hyde and K. E. Perry. Rept. on Contract AF 19(122)458. 12 Nov 58, 34p. 2 refs. Technical rept. no. 189; AD-206 258.
Order from LC mi$3.00, ph$6.30 PB 148 369

The Doppler phase-difference integrator is a type of constant false-alarm rate (CFAR) detector that operates by integrating unit vectors formed on the phase difference between successive target return pulses from the receiver of a phase-coherent radar. The detection process is accomplished mainly by means of digital circuitry. Since it has been found that for successful detection a fairly large number of hits on target (50 or more) are necessary, the device is not adaptable to all radars. However, this detector does show some interesting features in the ability to map out ground clutter and in the possibility of plotting wind velocities in storm clutter. (Author)

Little, Arthur D., Inc., Cambridge, Mass.
RESEARCH INVESTIGATION OF REFLECTIVE WALL COATINGS FOR MICROWAVE RESONATORS. Quarterly rept. no. 5, 15 Mar-15 June 58, on Contract DA 36-039-sc-73143. 15 July 58, 28p.
Order from LC mi$2.70, ph$4.80 PB 147 178

This report discusses our experimental investigation of the relaxation of optically oriented sodium atoms. Experimental data are presented on the relaxation time at various buffer gas pressures in an unlined glass cell and a polyethylene-lined cell. Analysis of the experimental results indicates that polyethylene definitely inhibits the wall relaxation of the aligned atoms. (See also PB 145 405)

SIMPLE METHOD OF RECORDING FREQUENCY IN NUCLEAR MAGNETIC RESONANCE STUDIES, by J. A. Hofmann and P. L. Sagalyn. June 60, 7p. MRL rept. no. 77.
Order from LC mi$1.80, ph$1.80 PB 148 409

In studies of broad nuclear magnetic resonance lines where the line is scanned by varying the spectrometer frequency, deviations from frequency sweep linearity can produce significant errors in the measured areas, second moments, etc., unless frequency markers are recorded along side the resonance curve at sufficiently small frequency intervals. This note describes a convenient, relatively automatic system for recording such frequency markers, using commercially available equipment.

Melabs., Palo Alto, Calif.
RESEARCH AND DEVELOPMENT OF A SOLID STATE PARAMAGNETIC MASER, by Roy W. Roberts and Harold D. Tenney. Quarterly progress (scientific) rept. no. 7, 10 Dec 59-9 Mar 60, on Contract AF 19(604)4071. 9 Apr 60, 37p. 12 refs. AFCRC-TN-60-552.
Order from LC mi$3.00, ph$6.30 PB 148 403

Theoretical calculations showing the effects of various types of cross relaxation mechanisms on maser inversion ratio are given. Examples of three spin, four spin, and five spin processes are given and the results compared to experiments which have been described in the recent literature. Transient solutions of the rate equations are obtained and methods of measuring the cross relaxation probability described. The design of a superconducting iron-cored electromagnetic is described. It is anticipated that this magnet will allow the use of longer slow-wave structures than are possible with the conventional laboratory electromagnet. (Author) (See also PB 146 323)

Michigan U. Research Inst., Ann Arbor.
AN INTRODUCTION TO THE PRACTICAL APPLICATION OF FERROELECTRICS, by T. W. Butler, Jr. Technical Memo. no. 61 on Contract DA 36-039-sc-63203. Oct 58, 26p. 7 refs. 2262-191-T; AD-208 107.
Order from LC mi$2.70, ph$4.80 PB 147 225

Properties of ferroelectric materials and to physical principles involved in their applications. Three groups of applications which make use of (1) the high permittivity, (2) the nonlinear properties and (3) electro-mechanical properties are discussed. Applications utilizing the nonlinear properties are of much greater interest to the electrical engineer.

Michigan U. Research Inst., Ann Arbor.
LARGE-SIGNAL ANALYSIS OF CROSSED-FIELD DEVICES, by O. Gandhi and J. E. Rowe. Semiannual progress rept. no. 1, 1 Sep 58-1 Mar 59, on Contract DA 36-039-sc-78223. Aug 59, 46p. 14 refs. 2820-1-P; AD-228 064.
Order from LC mi$3.30, ph$7.80 PB 147 992

A large-signal theory for planar crossed-field amplifiers and oscillators is developed in which the effects of space charge, circuit loss and finite values of the gain parameter D are accounted for. The working equations are formulated from the Lorentz force equation, the continuity equation and a transmission-line equation developed from the equivalent circuit for the RF structure. The space-charge force between electrons is calculated using a Green's function method for essentially point charges in the interaction region. The equations are valid for thick streams. The working equations will subsequently be solved as an initial boundary-value problem. The dependent variables and their derivatives will be given at the input boundary. The initial conditions are specified. (Author)

Michigan U. Research Inst., Ann Arbor.
LARGE-SIGNAL ANALYSIS OF CROSSED-FIELD DEVICES, by O. Gandhi and J. E. Rowe. Semiannual progress rept. no. 2, 1 Mar-1 Sep 59, on Contract DA 36-039-sc-78223. [1959] 47p. 2 refs. 2820-2-P; AD-232 554.
Order from LC mi$3.30, ph$7.80 PB 147 993

A numerical procedure for the solution of the large-signal crossed-field equations is developed and the differential equations are transformed into difference equations. A flow diagram is developed to illustrate the iterative method of solving the equations. The large-signal results are compared with results from a small-signal theory and it is determined that the agreement is good within the limitations of the small-signal theory assumptions. A study of truncation error is presented. The effect of cyclotron waves is considered and the accuracy of replacing the slow-wave structure with an infinitely conducting sheet for space-charge field calculations is evaluated. (Author) (See also PB 147 992)

Michigan U. [Research Inst.] Ann Arbor.
REDUCTION OF SIGNAL-TO-NOISE RATIO WITH RANGE FOR PbTe AND THERMISTOR DETECTORS, by A. LaRocca and G. Zissis. Rept. on Proj. Michigan [Contract DA 36-039-sc-52654]. July 56, 23p. 1 ref. 2144-246-T; AD-201 131.
Order from LC mi$2.70, ph$4.80 PB 146 563

When contrast signal was used to obtain signal-to-noise values, the S/N of a PbTe cell decreased with range at a much faster rate than did the S/N of a thermistor. Contrast signal is the signal resulting from the experimental idealization of target and background produced by using two sources of known emissivity to furnish the radiation used for measurement of S/N. RESEARCH ON CROSSED-FIELD ELECTRON DEVICES, by R. W. Larson, R. J. Martin and others. Quarterly progress rept. no. 4, 1 Sep-1 Dec 59, on Contract DA 36-039-sc-78260. [1959] 48p. 6 refs. 2854-5-P; AD-233 439.
Order from LC mi$3.30, ph$7.80 PB 147 968

A discussion of the initial experimental tests on the crossed-field stream analyzer with the potential trap

in the sole is presented and some analog computer calculations of electron trajectories through the trap are given. A general verification of previous results has been obtained. Extensive calculations of heating-wave amplification in the presence of beam space-charge and circuit loss are given and the significance of the results is discussed. Starting conditions for the M-type BWO are obtained when d=0 and some interesting aspects with regard to their dependence on H and r are commented on. A generalized analysis of the two-beam crossed-field amplifier is developed in which the slip between the two beams is accounted for. A physical interpretation of the growth mechanism in such a device is offered. (Author)

Microwave Associates, Inc., Burlington, Mass.
VARIABLE CAPACITANCE MICROWAVE DIODE. Quarterly progress rept. no. 3, 1 May-31 July 59, on Contract DA 36-039-sc-78236. [1959] 49p. 10 refs. AD-229 343.
Order from LC mi$3.30, ph$7.80 PB 146 456

The negative-resistance varactor amplifier is analyzed. Amplification is possible for any ratio of signal frequency to cutoff frequency. As this ratio increases, the admissible range of pump frequency narrows and the noise figure increases; also, the "gainwidth" (the range of possible signal frequencies for a given pump frequency) narrows. The first samples of hermetically sealed varactors have passed all required environmental tests. (Author) (See also PB 145 960)

HIGH POWER MICROWAVE SWITCH, by S. J. Tetenbaum. Quarterly progress rept. no. 4, 16 Mar-15 June 59, on Contract DA 36-039-sc-78044. 30 July 59, 16p. AD-228 198.
Order from LC mi$2.40, ph$3.30 PB 146 533

Satisfactory construction techniques have been developed for both the forsterite and synthetic mica switch tubes. The major problem associated with the latter tube is that the raw material is non-uniform, both from block to block and within a block, and most of the raw material was slightly porous, making it unusable as a vacuum envelope. High power measurements performed on forsterite switches with and without metal gaskets and with Helium, Argon and Neon gas fillings, have shown that except for life, the switches meet the acceptable requirements. The switches exhibited short life due to excessive gas cleanup and a rapid variation of the breakdown power with time. Possible reasons for these effects are discussed and changes in tube construction are suggested for improving the switch life. The electromagnetic and switching power supply have been constructed and tested. They meet all requirements. (Author) (See also PB 145 809)

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
HIGH POWER MICROWAVE SWITCH, by S. J. Tetenbaum. Final rept. for 15 June 58-31 Aug 59 on Contract DA 36-039-sc-78044. 1 Nov 59, 51p. 4 refs. AD-230 934.
Order from LC mi$3.60, ph$9.30 PB 148 335

A high power cyclotron resonant gas switch covering the 2.7 to 3.7 kmc band was designed and tested. Three different discharge tubes were investigated. An encapsulated window tube was unsatisfactory because the available windows tended to crack at high average powers. A synthetic mica tube was unsatisfactory because the raw material was non-uniform and tended to be porous. A forsterite tube was readily fabricated and exhibited satisfactory electrical properties. The major obstacle to the practical use of the forsterite switch is its short life, being only about 40 hours even with a 500 cc gas reservoir. This is due to excessive gas cleanup, probably caused by ion trapping in the tube walls. Changes in design and construction are suggested which offer promise of increasing switch life. (Author) (See also PB 146 533)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
THE SCANNING PROCESS IN PICTURE TRANSMISSION, by A. E. Laemmel. Rept. on Contract AF 30(602)1471. 29 Mar 57, 51p. 23 refs. Rept. R-563-57, PIB-491; RADC TN-57-215; AD-131 112.
Order from LC mi$3.60, ph$9.30 PB 146 371

This report examines several fundamental aspects of the picture scanning process used in electrical facsimile or telephoto systems. In particular, scanning processes are analyzed with respect to the relation between the required time-bandwidth product and the unavoidable degradation of resolution which usually results. Upper bounds on the performance of such systems are given, together with several improved methods of scanning which hold promise of getting closer to ideal conditions than those presently in use. All of the results obtained are completely independent of the picture statistics and number of gray levels used, so that they may be used alone with any sort of copy, or together with a coding or mapping process with more restricted types of copy. (Author)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
SOME STATISTICS CONCERNING TYPEWRITTEN OR PRINTED MATERIAL, by Sid Deutsch. Rept. on Contract AF 30(602)1471. 31 Oct 56, 29p. Rept. R-526-56; PIB-456; RADC TN-57-22; AD-114 236.
Order from LC mi$2.70, ph$4.80 PB 146 372

The first set of statistics assumes that the original sample is composed of discrete resolution elements that are binary quantized and .01 inch square. The second set of statistics assumes that the original sample is binary quantized and continuously scanned in a vertical direction along lines that are .01 inch apart. The third set of statistics assumes that the original sample is composed of discrete resolution elements that are binary quantized and .01 inch square. The fourth set of statistics again assumes discrete quantized square elements.

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
CRYSTAL DETERIORATION STUDIES, by P. P. Lombardini, R. J. Doviak, and H. Kritikos. Final rept. Task 2 on Contract AF 30(602)1615.

15 Apr 58, 172p. 185 refs. Rept. no. ES-28-030-05; RADC TR-58-95; AD-148 811.
Order from LC mi$8.10, ph$27.30 PB 146 367

A study of deterioration of microwave crystal rectifiers was conducted in two phases. In Phase A an experimental investigation was undertaken to determine the threshold power levels needed for partial and total burnout under conditions of different pulse-widths and exposure time. A new indicator of crystal burnout was developed. Phase B was concerned with a critical review of the available literature on crystal burnout.

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
INTERFERENCE STUDIES, by O. M. Salati, R. A. Rosien and others. Final rept. Task 1, vol. 1, 15 Aug 56-15 Apr 58, on Contract AF 30(602)1615. 15 Apr 58, 210p. 38 refs. Rept. no. ES-27-030-05; RADC-TR-58-96; AD-148 812.
Order from LC mi$9.30, ph$31.80 PB 146 366

This report presents the results of research on the theory of interference prediction and interference measurement techniques. Eight separate sections are devoted to permissible interference levels or susceptibilities, data presentation, methods and devices for measuring spurious and harmonic radiation, out of band pulsed and CW interference in a microwave receiver, loss of radar information due to blanking, bandwidth conservation in pulsed radars, graphical techniques for great circle calculations, comments on military interference specifications, and prevention of moding in magnetrons.

National Research Labs., Ottawa (Canada).
ANALYSIS AND COMPUTER STUDY OF AN ADAPTIVE CONTROL SYSTEM, by D. A. Dawson. Sep 59, 95p. 8 refs. Mechanical Engineering rept. MK-4.
Order from LC mi$5.40, ph$15.30 PB 148 080

The concept of total cost or economic penalty is formulated for adaptive control of regulators. The cost is assumed to be a function of the error and the manipulated variable, although the function need not be known a priori. A circuit is then described which will optimize the system, that is, will vary the gain of the controller so as to bring it towards the value associated with the minimum total cost. The results of an experimental study are included which describe the effect of variations of the parameters of the adaptive circuit on the over-all behaviour. It is found that with such a circuit the gain oscillates about the optimum value while the cost oscillates around some value above the minimum possible value. An attempt is made to define quantities which describe the effectiveness of such adaptation. The adaptive system is also modified so as to optimize with respect to two controller variables. (Author)

Naval Ordnance Lab., White Oak, Md.
A CONTINUOUS OSCILLOGRAPHIC METHOD FOR THE DETERMINATION OF DETONATION VELOCITIES IN SOLID CAST EXPLOSIVES, by Adolph B. Amster, Paul A. Kendall and others. 16 Mar 59, 15p. 10 refs. NAVORD rept. 6280; AD-225 615.
Order from LC mi$2.40, ph$3.30 PB 148 454

The continuous electronic measurement of detonation velocities in solid cast explosives is made possible by using a new technique. A fine nichrome wire is cast within and parallel to the long axis of a confined explosive. A record of its resistance during detonation serves to locate the ionization front associated with detonation. The measurement is recorded on an oscillograph. From the photograph of this record, instantaneous detonation velocities are measured to within ±2%. This new method makes possible study of the development, stability, and decay of detonations by non-optical means. (Author)

Naval Ordnance Lab., White Oak, Md.
A FREQUENCY-MODULATION MAGNETIC-TAPE PLAYBACK SYSTEM, by D. J. Torpy. 1 Aug 58, 22p. NAVORD rept. 6156; AD-206 317.
Order from LC mi$2.70, ph$4.80 PB 147 226

Data recording systems which make use of frequency-modulation of a carrier signal recorded on magnetic tape are subject to noise resulting from speed variations in the recording or playback mechanisms. This report describes a playback system which reduces this noise by utilizing a constant-frequency reference signal recorded simultaneously with the data signal, but on a different channel of the tape, to obtain a measure of the speed variations. By using this information, the system reduces the noise to a fixed level which is independent of the magnitude of the speed variations. (Author)

Naval Research Lab., Washington, D. C.
THERMOELECTRICITY, by J. W. Davisson and Joseph Pasternak. Status rept. no. 4. Mar 60, 182p. 2 refs. NRL Memo. rept. 1037.
Order from LC mi$8.40, ph$28.80 PB 147 307

A thorough review of the status of thermoelectricity was provided by a conference held at the Bureau of Ships in December. Each activity described its contracts and evaluated the progress that had been made on them. All of these contracts are described in the final section of this report. Another meeting was a symposium presenting new materials prospects to complement the array of engineering studies. Most of the attention was devoted to refrigeration, but feasibility of a variety of other applications including such things as distillation and pumping were also discussed. (See also PB 145 603)

Navy Electronics Lab., San Diego, Calif.
ANTARCTIC PHOTOMETRY FOR THE DEVELOPMENT OF AN ICE RECONNAISSANCE TELEVISION, by J. M. Hood, Jr. 6 Apr 59, 20p. 2 refs. Research and Development rept. 904; AD-220 475.
Order from LC mi$2.40, ph$3.30 PB 148 644

A series of photometric measurements were made in the Antarctic to assist in the development of a helicopter-borne ice-reconnaissance television. A detailed photometric description of the environment is presented along with broad recommendations for the functional design of a suitable television system. A detail brightness range of 20 to 1 and meteorological

ranges as high as 75 naut mi were measured. Recommendations are made for a system having a 600-to-800 line scan with a minimum video bandwidth of 10 Mc. A single fixed lens of 1-in focal length in combination with the standard 1-in vidicon should give good area coverage and stable observer orientation. (Author)

New York U. Coll. of Engineering, N. Y.
THE CORRELATION PROCESS, by B. Harris and L. S. Schwartz. Technical note on Contract AF 30(602)1655. 15 Apr 59, 65p. 19 refs. RADC-TN-59-145; AD-214 598.
Order from LC mi$3.90, ph$10.80 PB 147 301

Three aspects of the process are considered: (1) The application of inductive probability to the correlator to improve the performance as a sequential detector, as well as to permit the automatic assimilation of a priori knowledge into the decision. (2) The expansion of the correlation function in a series of orthognal functions whose coefficients are determined by linear passive elements. This permits the cross-correlation function to be determined by a smaller bank of coefficient detectors instead of a large bank of parallel correlators. In this method the correlation function can be displayed by impulse triggering the corresponding circuit. (3) Pattern recognition as a means of determining whether or not the cross correlation function indicates the inputs are correlated. Further development of this idea is required before its usefulness can be determined.

New York U. Coll. of Engineering, N. Y.
ENERGY RELATIONS IN FEEDBACK CONTROL SYSTEMS CONTAINING A NON-LINEAR ELEMENT, by Richard Wolfson. Rept. on Contract AF 49(638)586. Jan 60, 52p. 4 refs. Technical rept. 400-7; AFOSR-TN-60-17; AD-232 433.
Order from LC mi$3.60, ph$9.30 PB 147 337

Equations among the average output powers in a single-loop, non-linear feedback control system are developed. These "energy distribution equations" have a form that relates summations of the output power at all frequencies in the non-linear network, to circuit responses calculated at the source frequencies.

New York U. Coll. of Engineering, N. Y.
INFORMATION FLOW CRITERIA FOR FEEDBACK CONTROL SYSTEMS, by S. S. L. Chang. Rept. on Contract AF 49(638)586. Jan 60, 33p. 5 refs. Technical rept. 400-8; AFOSR-TN-59-1328; AD-231 893.
Order from LC mi$3.00, ph$6.30 PB 146 715

Information capacity in Shannon's sense is suggested as an additional criterion for control systems and components. This criterion applies equally well to linear as well as nonlinear systems, and enables a designer to determine the tolerable amounts of small signal nonlinearities in components. Equations are derived for calculating required system capacity from given signal properties and allowed error, loss of information rate in system components, required capacities of system components, and calculation of information capacities from the characteristics of system components with either direct or indirect limiting. PROCEEDINGS OF THE OSU-WADC RADOME SYMPOSIUM, by Robert Fouty and W. A. Greene. Rept. on Radome Techniques and Components, Contract AF 33(616)5410. June 58, 764p. 141 refs. WADC Technical rept. 58-272, vol. I; AD-155 831.
Order from LC mi$11.10, ph$102.90 PB 149 186

This report is one of three containing the papers submitted for the 1958 Radome Symposium. The papers contain technical information pertaining to the design, fabrication, and testing of radomes for ground and airborne use. (Author)

Ohio State U. Research Foundation, Columbus.
THE ANALYSIS AND PRODUCTION OF DENSE ELECTRON BEAMS FOR USE IN MICROWAVE TUBES, by R. M. Campbell. Final rept. on Contract AF 18(600)980. Mar 60, 104p. 9 refs. AFOSR-TR-60-50.
Order from LC mi$5.70, ph$16.80 PB 147 771

Several mathematical methods of analysis were studied and a pinhole-camera gun tester was built. Of the mathematical methods studied, a relaxation method in conjunction with a resistance analog network appeared to be the most useful. A paraboloidal-spheroidal gun, a nonconfocal spheroidal gun, and a modified Heil gun were analyzed mathematically using the relaxation method. This method was also used to study the space-charge-limited potential distribution in spheroidal and paraboloidal diodes. A toroidal gun capable of high perveance but with resulting low convergence was studied using a gun tester. The pinhole-camera gun tester was utilized to study the paraboloidal-spheroidal gun, the nonconfocal spheroidal gun, the modified Heil gun, and a spherical cathode gun. Current density distributions in the beams, and in some instances transverse velocity distributions, were measured. In all cases, the measurements were made for a range of cold cathode-to anode spacings. These data are presented in detail and are intended as a guide in the design and utilization of these and similar electron guns. (Author)

Ohio State U. Research Foundation [Columbus].
LARGE-SIGNAL BEHAVIOR OF A DEGENERATE PARAMETRIC AMPLIFIER, by Y. P. Vaddiparty. Scientific rept. no. 3 on Contract AF 19(604)4060. Nov 59, 13p. 4 refs. AFCRC TN-60-161; AD-233 983.
Order from LC mi$2.40, ph$3.30 PB 146 606

Degenerate parametric amplifiers with the signal frequency at about half the pump frequency have been studied under strong saturating signals. Certain peculiarities of behavior including a shift in the frequency of maximum gain and sudden jumps in gain at certain frequencies in the pass band were observed. A semi-quantitative explanation in terms of the strong nonlinearity of the diode under saturating signals is provided. The results may be useful in providing information on the signal-handling capacity of an amplifier, particularly for modulated signals. (Author)

[Pacific] Missile [Range] Port Mugu, Calif.
KD2C-1 ZERO DRAG TELEMETERING ANTENNA DEVELOPMENT, by James C. Coe. 26 Nov 47, declassified 12 June 56, 22p. Technical rept. no. 23.
Order from LC mi$2.70, ph$4.80 PB 148 624

A Zero Drag telemetering antenna has been developed for the KD2C-1 in which the metal structure of the target drone is excited by a radio transmitter and feed line entirely contained inside the fuselage. This antenna was found to be decidedly superior to a quarter wave vertical antenna which used the metal structure of the target drone for a counterpoise as is common practice. The superiority was particularly marked with horizontally-polarized waves. In the course of the investigation, many antennas and feed lines in various combinations were installed and tested, and were found to be inferior to the internally-fed antennas as the representative patterns show. The Zero Drag antenna showed no effect upon the pattern of the control receiver. (Author)

Philco Corp., Lansdale, Pa.
NUCLEAR RADIATION RESISTANT POWER TRANSISTOR, RESEARCH AND DEVELOPMENT, by G. F. Watson. Quarterly progress rept. no. 2, 15 Aug-15 Nov 59, on Contract DA 36-039-sc-78307. [1959] 32p. R109-B; AD-231 899.
Order from LC mi$3.00, ph$6.30 PB 148 341

The calibration of the MIT nuclear reactor was verified. It was demonstrated that exposure of surface barrier transistors in core tube 3GV6 at a power level of 1 megawatt, for periods of 1.8 min and 18 min will provide accumulated dosages of 10^{13} and 10^{14} NVT, respectively. The haziness apparent at the bottom of etched pits was eliminated by the use of larger diameter jets. A cabinet-model precision plater was constructed and put into operation. Emitter electrodes 80 mils diam and collector electrodes 100 mils diam were plated with this system. Considerable progress was made in device assembly techniques. A brush plating technique was developed for gold plating only the top of the stem. Consistently good blank-to-tab soldering was obtained through the use of nickel tabs and a modified soldering fixture. Some difficulty has been experienced in soldering the collector electrode to the stem pedestal. A new stem mounting fixture is presently being evaluated. Un-mounted electrical samples were constructed. (Author)

Porter, H. K., Co., Inc., Prospect Park, Pa.
INDUSTRIAL PREPAREDNESS STUDY ON NON-NICKEL BEARING ALLOY BRAID WIRE, by F. J. Ferrari and W. J. Donnelly. Final engineering rept. for 23 June 57-31 Dec 58 on Contract DA 36-039-sc-72778. [1959] 15p. AD-218 990.
Order from LC mi$2.40, ph$3.30 PB 148 642

The study was conducted to obtain background in the drawing techniques of a substitute non-nickel-bearing 0.015-in.-diam. braid wire for 18-8 stainless steel used in the production of CX-1065/G (Spiral 4) cable and delivery of a pilot run production of this substitute wire. A trial lot of 100 lb of 1/4-in.-diam. rod was used to produce 0.015-in.-diam. braid wire according to the following practice: (1) pickling in HNO_3-HR (10-2 wt-%); (2) coating with Cowles and Lime; (3) cold reduction with HR Vaughn to 0.115-in. diameter in 5 holes; (4) cleaning with alkaline degrease; (5) annealing the strand in dissociated NH_3 atmosphere at 2000°F and 6 fpm; (6) pickling in HNO_3-HF; (7) coating with Cowles and Lime; (8) cold reduction with HR Vaughn to 0.051-in. diameter in 4 holes; (9) cleaning with alkaline degrease; (10) annealing the strand in dissociated NH_3 atmosphere at 2000°F and 10 fpm; (11) pickling in HNO_3-HF; (12) coating with Cowles and Lime; (13) cold reduction with HFV Vaughn to 0.031-in. diameter in 3 holes; and (14) cold reduction with 12 HF Vaughn to 0.015-in. diameter in 7 holes. Because of the lower corrosion resistance of the non-nickel bearing alloy substitute, the conversion practice employed in the production of 18-8 stainless steel braid wire must be modified. Bright annealing must be used in place of batch annealing and nonmetallic coating should be used to avoid exposure to severe acid clean cleaning.

Raytheon Co., Newton, Mass.
INVESTIGATION OF THE CORRELATION OF STANDARD DIODE EMISSION STUDY CONTRACT FINDINGS WITH PRODUCTION TYPE TUBES USING STANDARD PRODUCTION EQUIPMENT, by F. Hill, C. Bardsley and others. Scientific rept. no. 3, 16 June-15 Sep 59, on Contract AF 19(604)4095. 11 Nov 59, 43p. AFCRC TN-59-965; AD-233 494.
Order from LC mi$3.30, ph$7.80 PB 146 329

The Raytheon Company is conducting an investigation of the effect of the variable parameters of commercial exhaust procedure upon the reliability of emission capabilities of a commercial vacuum tube (6AH6). This is an attempt to correlate previous findings from exhaust studies with commercial methods of exhausting vacuum tubes. A total of 123 tests were conducted during this period on an improved exhaust machine. The improvement in pumping speed was attained on this exhaust urit by increasing the plumbing size between the exhaust stem of the vacuum tube and the vacuum pump. A comparison of initial electrical characteristics (0 hour readings) with the methods of exhaust processing show that the machine is capable of producing good tubes up to a speed of 1050 tubes/hour. A 25% reduction in current at exhaust lighting will only produce satisfactory tubes at 530 tubes/hour. A 25% increase in current at exhaust lighting produced heater burn-outs showing the limitations in heater design. Tests conducted at 900 tubes/hour without the use of oil diffusion pumps produced satisfactory tubes. (Author) (See also PB 143 399)

Raytheon Co., Newton, Mass.
INDUSTRIAL PREPAREDNESS STUDY ON TRANSISTORS AND AUTOMATIC MACHINERY FOR THEIR MANUFACTURE, by Frank M. Dukat and George Freeman. Step 1 Final rept. for 23 June 52-15 Oct 56 on Contract DA 36-039-sc-30237. [1956] 197p.
Order from LC mi$8.70, ph$30.30 PB 147 538

Machinery was developed for automatic and semiautomatic transistor manufacture. The transistor types for which this automation was accomplished were the low power germanium audio family, the 2N64 and 2N65. New surface treatments and packaging techniques were developed to accomplish and improve the product parameters and reliability. The automation program sponsored by this contract resulted in an overall increase in operator productivity of 4.6 to 1.

Raytheon Co., Waltham, Mass.
INVESTIGATION OF THE CORRELATION OF STANDARD DIODE EMISSION STUDY CONTRACT FINDINGS WITH PRODUCTION TYPE TUBES USING STANDARD PRODUCTION EQUIPMENT, by F. Hill, C. Bardsley and others. Scientific rept. no. 4, 16 Sep 59-15 Jan 60, on Contract AF 19(604)4095. 11 Mar 60, 36p. AFCRC-TN-60-184.
Order from LC mi$3.00, ph$6.30 PB 148 123

The effect is investigated of the variation in exhaust parameters upon the quality of emission on a 6AH6 type commercial vacuum tube. All tests conducted on the improved Sealex exhaust machine were burned on life for 500 hours and were evaluated for emission characteristics. Speed tests conducted from 530 to 1300 tubes per hour under standard exhaust conditions and with lighting variations show no difference in emission levels during life burning. All tests show the initial 24-hour slump. Extreme variations in exhaust lighting conditions (50% less lighting positions or a 25% reduction in lighting current) show gassy tubes at initial test. Tests conducted at 1200 tubes per hour show high initial gas scrap. A re-evaluation of tests conducted on an exhaust unit having poor pumping efficiency shows these tubes to have lower emission levels. An exploratory aging study points to the fact that this may be the reason for the previously-noted 24-hour slump. (Author) (See also PB 143 399)

Raytheon Co., Waltham, Mass.
STUDY OF PLATINOTRON DEVICES, by Gerry Perloff and W. C. Brown. Quarterly rept. no. 1, 1 Nov 58-1 Feb 59, on QKS-779, Contract DA 36-039-sc-78229. [1959] 56p. 3 refs. AD-227 039.
Order from LC mi$3.60, ph$9.30 PB 148 550

A study of platinotron devices was initiated. The research program is aimed at developing a microwave tube capable of producing a minimum of 100 w CW power and operating in the vicinity of 35 kmc with a minimum bandwidth of 10%. A design was laid out, major parts were ordered, and assembly of parts begun. Copper brazing of stainless steel parts was accomplished successfully. Some additional experiments on the adequacy of the liquid cooling system were made and it was determined that with stainless steel tubing with an inside diameter of .004", heat fluxes of 5 - 10 kw per sq cm could be successfully handled. It was determined that a flow of .25 gal per min of water could be obtained in an experimental header-vane assembly consisting of 21 stainless steel tubular vanes, each having 004" I. D. and each .261" long. If a bulk temperature rise of 50°C is assumed, a flow of .25 gal per min. represents more than 3 kw of anode dissipation. Results obtained to data indicate that this general approach to obtaining appreciable CW power in the millimeter region is quite feasible.

Rome Air Development Center, Griffiss AFB, N. Y.
IMPACT OF TRANSPORTATION ON ELECTRONIC EQUIPMENT, by John F. Carroll. Apr 60, 20p. 1 ref. RADC-TN-60-48.
Order from LC mi$2.40, ph$3.30 PB 147 641

The general impact of various modes of transportation on electronic equipment is considered in terms of amplitude, frequency, source impedance, and time. An analysis is made of a single degree of freedom, fixed end beam, using linear and non-linear response. It is concluded that no available measurements of environment are adequate to describe a source in quantitative terms, however, from observation of tests and field experiences, unrealistic failures in tests or deficiencies in test procedures can be determined. Proper design criteria can be derived only when test procedures become more realistic. (Author)

Schwinger, Julian, Cambridge, Mass.
INVESTIGATION OF HIGH FREQUENCY LIMITATIONS IN MILLIMETER WAVE GENERATORS, by Julian Schwinger. Semiannual rept. no. 1, Feb-Aug 59, on Contract DA 36-039-sc-78282. [1959] 35p. 5 refs. AD-231 593.
Order from LC mi$3.00, ph$6.30 PB 147 934

The theory developed dealing with the interaction between the electromagnetic field in a cavity resonator and a number of two-level molecules is generalized to include a gaussian spread in the molecular frequency. Using the formalism previously developed for a quantum-mechanical field in a lossy cavity, expressions are obtained by means of second-order perturbation theory for the expectation values of the field strength and field energy in the cavity and of the power loss by the molecules. It is shown that the parts of the field energy resulting from induced and spontaneous emission, respectively, initially increase as the square of the time and approach steady-state values after (different, in general) transient periods, each of which is determined by two time constants: cavity relaxation time and inverse molecular frequency spread. It is also shown that both the induced and spontaneous emission power radiated by the molecules increase initially linearly with the time and approach steady-state values after transient periods. Shallcross Mfg. Co., Selma, N. C.
VIBRATOR TEST SET TS 747 ( )/U, by John L. McCotter, Jr. and John S. Shallcross. Final rept. for 8 Apr 57-18 Mar 59, on Contract DA 36-039-sc-73239. [1959] 83p. AD-228 801.
Order from LC mi$4.80, ph$13.80 PB 146 339

A vibrator test set was developed which is capable of testing vibrators in accordance with test procedures

recommended by vibrator manufactures. The instrument evaluates vibrators with the following tests: (1) the output voltage is checked from the power supply to determine if it is normal at a normal input voltage, (2) the operation of the vibrator is checked at high and low input voltages to determine that it will operate under both conditions, (3) provisions are made for testing the characteristics of a vibrator under load, (4) the operating frequency of the vibrator is measured at any instant by a built-in frequency measuring circuit, (5) buffering may be changed from primary to secondary or changed in value with switches on the panel, (6) a circuit breaker protects the vibrator power supply and it may also be used to determine the exact starting voltage of a vibrator, (7) a resistive load is provided for the secondary contacts of a self-rectifying type vibrator in order to observe the condition of these contacts, (8) a built-in electronic switch makes it possible to observe primary and secondary wave forms at the same time, and (9) the input voltage is provided in 3 continuously variable ranges, to provide a means for testing a vibrator above and below its normal operating voltage.

Smyth Research Associates, San Diego, Calif.
TROPOSPHERIC AND IONOSPHERIC RADAR REFRACTION EFFECTS, by L. J. Anderson, S. Weisbrod and others. Final rept. on Contract AF 30(602)1624. [1959] 114p. 4 refs. SRA-91; RADC-TR-59-84; AD-217 406.
Order from LC mi$6.00, ph$18.30 PB 147 149

This report describes simple methods for computing refraction effects, such as radar elevation angle and range errors, total ray bending and Faraday rotation, caused by the troposphere and the ionosphere. These methods are applied to radiosonde and ionogram data for Fairbanks, Thule and Leuchars, Scotland, to obtain the statistical distribution of refraction effects at these locations. The application of the methods to the computation of refraction effects at a given time and location is described in detail, and numerical examples are given. The statistical analysis shows that tropospheric refraction is greatest and most variable at Fairbanks. There is a seasonal trend at all stations, with maximum refraction at Thule and Fairbanks in winter, and in Scotland in summer. Ducting is weak at all stations; the lowest trapped radar frequency being 800 megacycles. (Author)

Sperry Piedmont Co., Charlottesville, Va.
SOUND WAVE RAY TRACER (MOD I). Final engineering rept. on Contract Nonr-790(00). Sep 58, 175p. Rept. no. 240-104.
Order from LC mi$8.10, ph$27.30 PB 146 104

The Sound Wave Ray Tracer MOD I, is a device which computes and plots a family of sound rays from the measurement of the velocity of sound through a medium as a function of depth. The equipment handles both surface and bottom reflections. The family of rays provides a complete picture of the sound field, and the density of the rays is an indication of the sound intensity. The equipment is built in and around a desk type cabinet. All operating controls are on the front of the unit. Electrical inputs are 115-volt, 60-cycle, single-phase, and 115-volt, 400-cycle, two-phase; the latter being supplied by a separate motor generator. These connections are made by means of connectors at the rear of the desk. All electronic units are housed in the pedestals of the desk assembly and all mechanical units are mounted on a base plate on the top of the desk.

Stanford Electronics Labs., Stanford U., Calif.
AN EXPERIMENTAL INVESTIGATION OF CROSSED FIELD INTERACTION, by T. Sato. Rept. on Contract AF 33(616)6207. 8 Feb 60, 85p. 32 refs. Technical rept. no. 385-5; AD-234 277.
Order from LC mi$4.80, ph$13.80 PB 147 245

An experimental study of the diocotron effect in a thin electron beam is presented. The diocotron effect is the amplification of microwave signals in an electron beam moving between parallel conducting plates, under crossed-field conditions. The diocotron effect was measured by means of an experimental tube. This tube has a variable-length drift section located between two magnetron-type beam coupling sections. The diocotron effect was directly measured by changing the drift section length and observing the change in the total gain of the tube. The diocotron effect was detected and measured as functions of the beam parameters and degree of modulation. Agreement with the small-signal theory of Heffner and Unotoro is good.

Stanford Research Inst., Menlo Park, Calif.
TECHNIQUES FOR PREVENTION AND REMOVAL OF ICE ON RADOMES, by I. G. Poppoff and R. C. Goettelman. Final rept. on Contract AF 30(602)1442]. 30 Apr 57, 70p. 17 refs. SRI Project SU-1614; RADC TR-57-123; AD-131 180.
Order from LC mi$3.90, ph$10.80 PB 146 374

Investigation of coatings that might reduce accretion and adhesion of ice showed that fabrics and other materials presently used for radomes already have the desired property of low ice adhesion. However, ice adhesion can be lessened further by the use of some silastics, silicones, and Teflon. Of the many "ice-phobic" coatings investigated, none was capable of reducing ice accretion more than 30% compared with radalon-neoprene. Several hypothetical systems were designed to illustrate the practicality and, in some instances, the cost of utilizing the techniques investigated in this study.

Syracuse U. Research Inst., N. Y.
STUDY OF SYSTEM RELIABILITY: ENTROPY OF A CONTINUOUS CHANNEL, by F. M. Reza. Final rept. on Contract AF 19(604)2452. Jan 60, 37p. 14 refs. Rept. no. EE-507-6001-F; AFCRC-TR-60-F.
Order from LC mi$3.00, ph$6.30 PB 148 093

The main object of this report is to outline some results for continuous channels similar to those discussed for discrete systems, principally, the entropy associated with a random variable assuming a continuum of values.

Tung-Sol Electric, Inc., Bloomfield, N. J.
UTILIZATION OF SELF-SUSTAINED ELECTRON EMISSION INVESTIGATION, by B. G. Firth and Warren C. Johnson. Quarterly rept. no. 3, 1 Apr-30 June 59, on Contract DA 36-039-sc-78081. [1959] 24p. AD-225 838.
Order from LC mi$2.70, ph$4.80 PB 147 989

The spot size obtainable in an MgO cathode-ray tube gun is better than originally thought possible. Evidence shows the high velocity electrons may be adequately focused, and the emission sustaining current reduced to the same order of magnitude as the beam current. Cathode improvement is required to achieve beam currents of 1 to 1.5 ma for picture tube applications. From tests made thus far, secondary emission preamplifier tubes appear to be within the realm of possibility. They can be used also to provide dynatron oscillations up to 15 mc and higher. Larger and somewhat better cooled cathodes are expected to make better audio amplifier tubes. Correction of cathode defects was achieved primarily by ultrasonic cleaning of cathode sleeves, cleaner hydrogen firing, better spray coating conditions, and the use of purer materials. (Author) (See also PB 147 988)

Vitro Labs., West Orange, N. J.
GENERAL USAGE ASSEMBLIES FOR NAVY ELECTRONIC EQUIPMENT. Quarterly progress rept. no. 9, 1 Feb-30 Apr 58, on Contract NObsr-72538. 22 May 58, 38p. KLX-10114.
Order from LC mi$3.00, ph$6.30 PB 149 288

The objectives of this work include the development of specifications for General Usage Assemblies, the purchase of representative types of sample assemblies from various manufacturers, construction of prototypes for evaluation of additional types, and the performance of similar work for transistorized General Usage Assemblies. Life tests of eleven types of General Usage Assemblies purchased from outside manufacturers are being conducted. Those units having the longest time on test have now passed 7000 hours. Additional failures occurring during the period of this report have been considered in arriving at revised estimates for mean time to failure for each of the types of assembly under test. Intensive investigation of the behavior of transistors under various conditions has led to the formulation of preliminary designs for three types of assemblies.

Westinghouse Research Labs., Pittsburgh, Pa.
ADVANCES IN SCREEN STRUCTURE AND DATA DISTRIBUTION FOR THE ELF DISPLAY SYSTEM, by E. A. Sack. Rept. on Contract NObsr-72782. 1 Mar 60, 34p. 5 refs. Scientific paper 410FF298-P1.
Order from LC mi$3.00, ph$6.30 PB 149 289

Each element of a typical ELF screen is a configuration of four capacitors, two diodes and a resistor. Microcircuit structures have been developed which achieve a display resolution of 256 elements per square inch. The switching matrix which distributes brightness control signals to the ELF elements is an integral part of the screen array. At present, multi-junction silicon diode strips perform the switching function. Several one-inch-square model screens have been assembled. Larger arrays, eight inches wide by four inches high, are under construction. Screens with edge dimensions measured in feet appear to be feasible. The highlight brightness of experimental screens with 400 cps excitation is 10 foot-lamberts. Contrast ratios of between 50 and 100 to 1 are obtained with 200-volt control signals. Halftone uniformity is satisfactory. In one display system, brightness information is distributed at approximately one element per microsecond with a frame storage time of 5 seconds. Much longer image storage is possible with new switching techniques. (Author)

Air Force Missile Development Center, Holloman AFB, N. Mex.
WEAR, SOLID LUBRICATION, AND BEARING MATERIAL INVESTIGATION FOR HIGH-SPEED TRACK APPLICATIONS, by Milton R. Wolfson. Mar 60, 59p. 2 refs. AFMDC-TR-60-7.
Order from LC mi$3.60, ph$9.30 PB 148 204

High-speed wear and lubrication were investigated on 60 track tests made with the Stanford Research Institute test slipper. The variables were velocity, bearing material, nominal bearing pressure, and track condition. Wear rate of stainless steel increased with velocity (825 to 2,500 fps) while there was little or no apparent effect on molybdenum. Wear rate was reduced by several solid track coatings, most notably by metallic zinc and slaked lime. (Author)

Air Force Missile Test Center, Patrick AFB, Fla.
THE ACCURACY OF AMR INSTRUMENTATION. 5 May 60, 81p. 63 refs. RCA Quality Analysis TR no. 11; AFMTC-TR-60-13.
Order from LC mi$4.80, ph$13.80 PB 148 217

This report gives the best available estimates of the accuracy of RCA/MTP tracking instrumentation in use on the AMR range. These estimates are made on the basis of studies conducted over a considerable period of time. The report provides a definitive discussion of the character of the errors encountered and discusses methods used to determine estimates of errors. Comprehensive statements are made concerning the errors of measurement for the various instrumentation systems. Included also is a section on the determination of the accuracies of reduced data in position, velocity, and acceleration.

Air Force Missile Test Center, Patrick AFB, Fla.
A LEAST SQUARES PITCH AND YAW REDUCTION FOR NARROW ANGLE TRACKING CAMERAS, by George H. Rosenfield. Rept. on Missile Test Project Contract AF 08(606)3413. Jan 60, 57p. 7 refs. RCA Data Processing Technical rept. no. 57; AFMTC-TR-60-8.
Order from LC mi$3.60, ph$9.30 PB 148 314

A rigorous least squares adjustment is presented for computing the pitch and yaw elements of missile attitude, utilizing the measured V-angle of the missile body image vector with reference to the film co-

ordinate system. The solution directly computes absolute pitch and yaw using the missile images exposed on the photographic records from two or more photogrammetric tracking cameras. Camera orientations and measured V-angles only are required in the reduction together with an approximation of the missile attitude. An outline of the computational program and a numerical example is presented to facilitate programming for electronic computation. The procedure is applicable only to pitch and yaw reduction from long focal length, narrow-angle tracking cameras. It is based upon the assumptions that the line of sight from the camera to the missile coincides with the optical axis of the lens, and that the photographic plane is perpendicular to the line of sight. (Author)

American Inst. for Research [Pittsburgh, Pa.]
TECHNIQUES FOR HUMAN FACTORS EVALUATION OF PROTOTYPE SPECIAL WEAPONS AND ASSOCIATED EQUIPMENT, by James W. Shearer, Dan A. Peterson, and Edward B. Slebodnick. Rept. on Contract AF 29(601)513. Apr 59, 134p. AIR-259-59-FR-198; AFSWC-TR-59-14; AD-217 701.
Order from LC mi$6.90, ph$21.30 PB 146 599

The purpose of this study was to develop a method for systematic evaluation of human factors aspects of prototype special weapons equipment. Human factors inputs to system design have customarily been made in early planning stages and later on in operational testing stages. But until the present time there has been no set of techniques for coordinating human factors analyses of prototype equipment with engineering tests of prototype equipment. The techniques developed in this study are intended to fill this gap. Techniques developed include a guide to evaluation of preliminary manuals or instructions pamphlets, a guide to static evaluation of equipment, and an observational record form for use in functional try-outs of equipment. The guides assist the analyst in making recommendations for design of equipment and for content and format of instruction manuals. The observational record form is used in noting operational requirements for personnel, time, and training. It also is used for identifying personnel errors and error-likely situations. (Author)

Applied Psychological Services, Wayne, Pa.
TECHNIQUES FOR EVALUATING OPERATOR LOADING IN MAN-MACHINE SYSTEMS. APPLICATION OF A PREVIOUSLY DERIVED MODEL TO THE LAUNCHING OF AN AIR-TO-AIR MISSILE, by Arthur I. Siegel and J. Jay Wolf. Rept. on Contract Nonr-2492(00). June 59, 45p. 4 refs. AD-225 525.
Order from LC mi$3.30, ph$7.80 PB 146 684

Further evaluations were made of a previously derived model of the human operator in a man-machine system. The model was applied to the pilot's task of launching an air-to-air missile. Thirty-five computer runs, each representing 88 launchings by a given pilot type, were completed. For the average pilot (F = 1.00) a failure probability between 0.40 and 0.435 was indicated in the stress threshold range coincident with that previously derived for landing aboard a carrier. This range of failure probabilities does not coincide with the 0.186 value for failure probability given by outside criterion data for this launching task. Agreement with the 0.186 value was achieved by interpolation when F = 0.91, i.e., pilots who are 9% faster than average. The 9% discrepancy was believed to be a result, at least in part, of a fallible criterion. Over the two tasks the model (1) gave results which agreed in the main with information received from pilots; (2) was generally consistent; and (3) predicted reality reasonably well. It appears that the goal of prediction of the effectiveness of the human operator in man-machine systems has been achieved to some extent for single operator situations.

Army Ordnance Corps, Washington, D. C.
ACCEPTANCE INSPECTION EQUIPMENT DESIGN MANUAL FOR ORDNANCE MATERIEL. 1 Mar 56, 196p. ORD-M608-12.
Order from LC mi$8.70, ph$30.30 PB 146 182

The purpose of this manual is to prescribe the policies and procedures used in the preparation, interpretation and maintenance of all inspection equipment drawings. This manual also establishes and prescribes definite design data and practices applicable to inspection equipment.

SATELLITE FREQUENCY MEASUREMENTS, by O. P. Layden and H. D. Tanzman. 1 Oct 59, 48p. USASRDL Technical rept. 2067; AD-229 155.
Order from LC mi$3.30, ph$7.80 PB 149 384

The investigation being carried out on the frequency observations of radio signals from the Russian and American satellites is discussed. Various plots of frequency versus time are given for the Russian and American satellites in orbit as well as take-off curves for all American satellites. The equipment used to obtain Doppler measurements is described and the frequency and time accuracy associated with the system is discussed. (Author)

Army Signal [Research and Development Lab.] Fort Monmouth, N. J.
VARIABILITY OF BALLISTIC METEOROLOGICAL PARAMETERS, by A. Arnold and R. Bellucci. 30 Aug 57, 114p. 16 refs. Technical memo. no. M-1913; AD-144 154.
Order from LC mi$6.00, ph$18.30 PB 148 119

Variability data from various sources have been examined. This examination led to equations describing variability of wind and of density. The magnitude of variability depends on geographic location, season of the year, and possibly other parameters. The data on wind velocity are more extensive, permitting a more thorough examination. For mid-latitudes and to moderate altitudes, for all seasons, and with an attempt made to remove instrumental error, the following equations were obtained: Time variation: r.m.s. velocity $= 4t^{0.5}$ where t is the time interval in hours (between the values of 1/2 and 12) and the velocity in miles per hour. Distance variation: r.m.s. velocity $= \frac{3}{2}s^{0.5}$ where s is the distance interval in miles (between the values of 4 and 80). The above equations cover conventional winds. For ballistic winds the r.m.s. value should be reduced by 20 per cent.

Avco-Everett Research Lab., Mass.
AIR SCOOPING VEHICLE, by Felix Berner and Morton Camac. Rept. on Contract AF 04(647)278. Aug 59, 121p. 17 refs. Research rept. 76; AFBMD-TR-59-17.
Order from LC mi$6.30, ph$19.80 PB 147 213

A satellite vehicle is described which collects gases from the upper atmosphere and stores them in liquid form. Such a vehicle could serve as a filling station in space, furnishing liquid oxygen or air to other spacecraft. The vehicle represents an alternative to launching these liquids into orbit from the surface of the earth. The two methods are compared on an economic basis, and it is shown that the proposed vehicle permits substantial savings when operated beyond about one year. The feasibility of developing such a system for long-time operation is investigated. Several practical designs are discussed. (Author)

Avco-Everett Research Lab., Mass.
CONTROLLED RECOVERY OF NON-LIFTING SATELLITES, by R. W. Detra, F R. Riddell, and P. H. Rose. May 59, 20p. 9 refs. Research rept. 54.
Order from LC mi$2.40, ph$3.30 PB 147 202

This paper considers the problem of recovering, at a pre-selected site, satellites that are orbiting close to the earth (i.e., within a few hundred miles of the earth's surface). Considerations are limited to vehicles which accomplish re-entry into the atmosphere with drag devices. The discussion centers on two possible means of effecting controlled recovery of satellites.

Avco-Everett Research Lab., Mass.
THE DRAG BRAKE MANNED SATELLITE SYSTEM, by R. W. Detra, A. R. Kantrowitz and others. Aug 59, 26p. 19 refs. Research rept. 64; AD-227 524.
Order from LC mi$2.70, ph$4.80 PB 147 206

The manned satellite designs which have been most frequently proposed are extrapolations either of airplanes or of missile nose cones. A new approach is presented to the design of a manned satellite system. The central feature of this design is a variable area drag brake. For a given capsule and payload, the elements associated with attitude stabilization, recovery from orbit, re-entry, landing accuracy control and final landing of the system described comprise less than half the weight required for the same functions in presently envisioned retro-rocket systems. (Author)

Avco-Everett Research Lab., Mass.
A ROUGH ESTIMATE OF THE ATTENUATION OF TELEMETERING SIGNALS THROUGH THE IONIZED GAS ENVELOPE AROUND A TYPICAL RE-ENTRY MISSILE, by S. C. Lin. Rept. on Contract AF 04(645)18. Feb 56, 51p. 20 refs. Research rept. 74; AD-221 395.
Order from LC mi$3.60, ph$9.30 PB 147 212

A rough estimate was made on the attenuation of telemetering signals to be expected through the ionized gas layer surrounding a typical long range missile reentering the earth's atmosphere at hypersonic speeds. The results indicate that in the frequency range used by the standard telemetering system, (e.g., the RDB system, $f \approx 200$ mc) it would be difficult to send any signal through the ionized gas throughout the critical part of the trajectory. If the electron-ion recombination rate turns out to be sufficiently rapid, microwave frequencies ($f \approx 3 \times 10^{10}$ cps.) will probably be satisfactory. Even if the electron-ion recombination rate is very slow, microwaves still seem to work at sufficiently high altitudes (above 150,000 ft or so) according to the present estimate. The low frequency end of the spectrum ($f \lesssim 1$ mc) can probably be utilized for transmission below the ionosphere. (Author)

Avco-[Everett] Research Lab., Mass.
A THEORY FOR THE ABLATION OF GLASSY MATERIALS, by Hans A. Bethe and Mac C. Adams. Rept. on Contract AF 04(645)18. Nov 58, 32p. 10 refs. Research rept. 38.
Order from LC mi$3.00, ph$6.30 PB 147 198

The ablation of glassy materials, when subjected to aerodynamic heating, is treated theoretically. The approximate equations are shown to be extremely accurate for determining the energy absorbed per unit mass of ablated material. For simplicity the analysis is restricted to the stagnation region of a blunted body and only steady state ablation is considered.

Aviation Medical Acceleration Lab., Naval Air Development Center, Johnsville, Pa.
BIOSATELLITE, DEVELOPMENT AND STUDY WITH; LETTER REPORT CONCERNING LIFE SUPPORT SYSTEM, by George H. Kydd and Peter Craig. Rept. MA-4 on BuMed Proj. MR 005.15-0002.16. 6 Jan 60, 14p. 1 ref. TED ADC AE 1412.2; NADC MA L6001; AD-231 598.
Order from LC mi$2.40, ph$3.30 PB 146 346

A closed system environmental chamber was designed and constructed for the purpose of studying animals under simulated capsule conditions for long periods of time. The chamber was considered to have worked well. Preliminary observations were made on the CO_2 scrubber, the circulating pump, temperature regulation, relative humidity, and the O supply system.

Ballistic Research Lab., Aberdeen Proving Ground, Md.
FREE FLIGHT RANGE TESTS OF A 10-CALIBER CONE CYLINDER, by Eugene D. Boyer, Apr 60, 33p. 15 refs. Memo. rept. no. 1258.
Order from LC mi$3.00, ph$6.30 PB 148 513

The aerodynamic properties of a ten-caliber cone cylinder are presented and analyzed. The Magnus data are definitely non-linear. It is shown that at

subsonic Mach number the non-linear Magnus moment should cause a limit motion. Finally the data are combined with results of a finned model program to yield the properties of the fins. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
MICROFLASH PHOTOGRAPHIC INSTRUMENTATION OF THE INTERIOR BALLISTICS LABORATORY, by E. L. Bonhage and H. G. McGuire. July 59, 24p. 4 refs. Memo. rept. no. 1216; AD-225 582.
Order from LC mi$2.70, ph$4.80 PB 148 459

Various high speed photographic instrumentation systems used to obtain well defined photographs of fast moving objects are described. Several experimental applications are explained briefly to illustrate the manner in which plate cameras or high speed continuous film cameras were used to record ballistic events illuminated with either one-shot flash sources or a single flash tube pulsed at a high rate. Experimental conditions dictating the choice of equipment, camera settings, film and developing procedures are discussed. Photographic results of each experiment, to show the quality of pictures obtained by these techniques are included. (Author)

PROCEDURE FOR DETERMINATION OF GAS EVOLVED BY THERMITE MIXTURES, by Robert E. McIntyre. 4 Feb 60, 24p. 3 refs. Technical rept. TR-702; AD-233 048.
Order from LC mi$2.70, ph$4.80 PB 146 752

A manometric procedure for the rapid determination of gases in pyrotechnic mixtures has been developed. The pressure readings are made using a strain gage pressure transducer, and readings taken at 135°C and at room temperature allow the determination of condensable and noncondensable gas as well as total gas. The sensitivity of the method is 0.01 ml of gas for the usual sample weighing 2 g, or 0.05 ml/g. About 30 min is required for a determination. (Author)

PROPOSED VEHICLE FOR TEST AND RECOVERY OF GUIDED MISSILE FUZES, by D. A. Worcester and R. J. Gath. 5 Feb 60, 9p. Technical rept. TR-808; AD-233 018.
Order from LC mi$1.80, ph$1.80 PB 146 751

Determination of burst-height accuracy of guided missile fuzes is difficult because of the limited number of flights and, in some circumstances, the limitations of down-range field instrumentation which must cover a large impact area. A system has been designed to permit testing of complete fuzes by dropping in modified bombs with parachute recovery of the fuzes subsequent to function. This system permits simulation of approach conditions over an instrumented area, provides for accurate determination of burst height, and allows reuse of fuzes. Thus burst-height accuracy can be determined at low cost with a small number of fuzes. (Author)

T320-TYPE (FIREFLY) FUZES, by Warren V. Moore. Summary 16 May 60, 22p. TR-822.
Order from LC mi$2.70, ph$4.80 PB 146 913

Mechanically operated 20- and 30-mm pyrotechnic-delay fuzes, capable of providing timed burst 1 sec and 2 sec after firing, have been designed and subjected to limited field testing. The 20-mm fuzes were designed specifically to check external ballistics of the M56 round when fired crosswind from an aircraft. The 30-mm fuzes are patterned after the 20-mm designs; the 1- and 2-sec delays in these fuzes differ only in burning rate and amount of delay powder. The basic design employs a spring-loaded firing pi.. that is held in place by two arming rods; a pyrotechnic delay and explosive train. The arming rods move out under centrifugal force, freeing the firing pin to start the delay. (Author)

DEVELOPMENT OF A PYROTECHNIC PHOTO RELAY FOR USE WITH A PHOTOCELL CONTACT FUZING SYSTEM, by Erling Bertrand. Mar 60, 21p. 8 refs. Technical rept. 2645; AD-235 187.
Order from LC mi$2.70, ph$4.80 PB 146 520

A pyrotechnic photo relay was designed to be used as part of a self-destructive device in a missile. As part of a photocell contact fuzing system, the relay will be initiated by the stab action of a firing pin in the fuze upon contact of a missile with the ground. Within less than 200 microseconds, the relay will emit sufficient light to activate a photocell located up to 7 feet from the relay. The configurations of the relay and the type of pyrotechnic compositions were established (NOL-130 primer mixture; 65/35 zirconium powder/potassium perchlorate flash composition) and the light output was brought under control; the firing time was investigated. When tested by dropping a weight on the firing pin, it was found that the functioning times were erratic and would occur as much as 700 microseconds after the weight struck the pin. An explosive ram was constructed to replace the drop weight. With this testing arrangement consistent firing times were obtained and the desired amount of light was produced within the required time interval. (Author)

Feltman Research and Engineering Labs., Picatinny Arsenal, Dover, N. J.
WORK IN CONNECTION WITH IMPROVING PACKING FOR AERIAL DELIVERY OF FUZE, VT, (T178) M517, by J. M. Spilman. Final engineering rept. June 59, 15p. 3 refs. FR: 5-60; AD-230 645.
Order from LC mi$2.40, ph$3.30 PB 146 984

Three new designs and the standard design of packing supports were evaluated. During laboratory rough handling and simulated aerial delivery tests results showed that the design of polystyrene base and nose supports offered a greater degree of physical protection to the fuze. This was compared by observing battery failure which was found from previous tests to be the most sensitive part of the fuze to damage. In addition since the former design utilized two steel supports (basic design) and two cushions, savings in material and labor costs also resulted as did use of nonstrategic material by using the new design of polystyrene supports. For this reason it was recommended that the new design of packing supports be utilized. (Author)

Hermes Electronics Co., Cambridge, Mass.
PRECISION OF COMPENSATED TRACKING SYSTEMS, by Richard J. Davisson. Rept. on Contract AF 19(604)5905. 5 Nov 59, 147p. 136 refs. Rept. no. M-810; AFCRC-TR-59-356; AD-230 096.
Order from LC mi$7.20, ph$22.80 PB 147 343

Factors affecting the precision which can be achieved with various types of missile and satellite tracking systems are described. The "ranges" which are measured in pulse and doppler system are expressed as power series expansions in the reciprocal of the radio frequency employed. The terms of these series are discussed in relation to the tropospheric and ionospheric effects from which they arise, and methods for eliminating the principal refraction errors are described. It is shown that overall ranging errors can be reduced to the order of 30 ft or less by these techniques. Precision angle measurements are shown to be much more difficult to achieve. (Author)

FILTERING SAMPLED FUNCTIONS, by E. D. Fullenwider and B. I. McNamee. 12 July 56, rev. Apr 59, 44p. 12 refs. Technical memo. no. 64-104.
Order from LC mi$3.30, ph$7.80 PB 148 851

A method suitable for use with a digital computer in filtering any function of time sampled at a constant rate is described. Each point of the output is found by replacing the corresponding point of the input with a suitable linear combination of itself with adjacent values. The constants in the linear combination are those which minimize the rms magnitude of the difference between the desired and the actual frequency-response functions. This dependence of the output on both past and future values of input makes the filter more versatile than network filters. The spectral density of the input need not be known. Examples include a square filter, equivalents of network filters, and filters similar to network filters but without phase shift.

Naval Ordnance Lab., White Oak, Md.
A PIEZOELECTRIC FORCE GAGE FOR MEASURING DRAG ON TWO-DIMENSIONAL MODELS IN THE SHOCK TUBE, by William G. Luke and Luther W. Slifer. 1 Apr 59, 61p. 4 refs. NAVORD rept. 6211; DASA-1170.
Order from OTS $1.75 PB 161 872

The design, development, testing, and final evaluation of a piezoelectric force gage for measuring drag forces in a shock tube are described. The gage is a one-inch cylinder of square cross section which, when mounted, extends across the entire width of the shock tube. It has a central test section which is free to respond to applied forces while the end sections are rigidly mounted to the shock tube walls. In this way, registry of end and wall effects is minimized so that the gage configuration may be considered two-dimensional. The sensing element of the gage is a one-half-inch-diameter, four-pile, plastic-bonded, tourmaline crystal stack which is readily adaptable to other gage configurations. The plastic-bonded element is superior in ruggedness to conventional, solder-bonded elements and has a comparable sensitivity of 24 micro-microcoulombs per pound. It is capable of withstanding forces up to 30 pounds. This is adequate for shock pressures up to 10 psi but breakage of the crystals is expected to occur frequently when larger forces are applied. Inaccuracies of the gage are estimated to be less than 15 per cent under any of the test conditions for which it is intended. The errors result primarily from the sensitivity of the gage to temperature and from record-reading inaccuracies due to noise level. (Author)

Naval Ordnance Lab., White Oak, Md.
PISTON TYPE STRAIN GAGES, by V. C. D. Dawson. 13 Jan 59, 15p. 5 refs. Ballistics research rept. 11; NAVORD rept. 6251; AD-220 458.
Order from LC mi$2.40, ph$3.30 PB 148 452

For the past several years piston type strain gages have been used at the Naval Ordnance Laboratory's ballistic range facilities to record pressures. The theory used to predict the frequency response, sensitivity and pressure limit of such gages is presented. (Author)

Naval Ordnance Test Station, China Lake, Calif.
THE DEVELOPMENT OF THE SQUIB MK 1 FOR USE IN NAVY ROCKET IGNITERS, by R. L. Smith. 6 Apr 56, 30p. 6 refs. NOTS 1384; NAVORD rept. 5039.
Order from LC mi$2.70, ph$4.80 PB 149 270

The Squib Mk 1 was developed in response to the need in Naval ordnance for a high-quality squib to initiate small metal-cased igniters. The first fully specified, non-proprietary Navy squib, the Squib Mk 1 overcomes the deficiencies of earlier squibs in reliability, safety, and quality control. The results of proof testing in 2.75-in. folding-fin aircraft rocket igniters and motors were entirely satisfactory. Of more than 12,000,000 squibs produced, none have been rejected. (Author)

Naval Ordnance Test Station, China Lake, Calif.
HANDBOOK ON THE EFFECTIVENESS OF CLUSTER WEAPONS AGAINST UNITARY TARGETS, by Eldon L. Dunn. 12 Jan 60, 177p. 3 refs. NOTS TP-2382; NAVORD rept. 7019; AD-234 857.
Order from LC mi$8.10, ph$27.30 PB 146 990

This report contains the results of a parametric study on the effectiveness of cluster weapons against unitary targets, where a unitary target is a target such as a tank or ship which may be regarded as a unit for purposes of tactical warfare. The effects of number of bomblets, delivery error, ammunition dispersion, target length and width, warhead effectiveness and inclination of trajectory are considered. The results of the study are presented in handbook form so that one may quickly determine the effectiveness of any proposed cluster weapon, once specific values have been assigned to the above parameters. (Author)

Naval Ordnance Test Station, China Lake, Calif.
LOCKSEAL JOINT FOR ROCKET COMPONENTS, by Sydney R. Crockett. 11 Oct 57, 56p. 2 refs. NOTS-1492; NAVORD rept. 5275; AD-150 474.
Order from LC mi$3.60, ph$9.30 PB 146 529

In response to the need for an improved means of uniting the components of a rocket, the Lockseal Joint has been conceived and developed. It locks and seals one component to another by forcing metal from the wall of one into a rubber-lined, circumferential groove in the surface of the other. In work to date it has been applied to 1- to 3-in., soft-steel and hardened-steel motor tubes, and to 1- to 5-in., soft-aluminum and hardened-aluminum tubes--the walls of both steel and aluminum tubes being of varying thicknesses. Numerous tests have demonstrated its superiority in many respects, including strength, axial alignment, and producibility, to joints now commonly used in rocket design. (Author)

Naval Ordnance Test Station, China Lake, Calif.
A METHOD OF IGNITING SMALL PROPELLANT GRAINS IN A LARGE COMBUSTION CHAMBER, by Carl D. Runge. 28 Oct 59, 18p. NOTS TP-2355; NAVORD rept. 6612; AD-234 839.
Order from LC mi$2.40, ph$3.30 PB 146 985

Several methods of igniting a short ammonium nitrate grain housed in a long grain chamber were explored. The requirement for this use occurs in short-duration torpedo tests in which grains of considerably less than full length are needed. The result of the experimental investigation was an effective pyrotechnic ignition system for this situation. The ignition method which proved most successful used an assembly of ammonium perchlorate propellant and boron potassium nitrate pellets on the ammonium nitrate grain base.

Naval Ordnance Test Station, China Lake, Calif.
A PHOTOMETRIC SYSTEM FOR MEASURING INTENSITY AND DURATION OF PYROTECHNIC SIGNALS: DESCRIPTION AND USE, by R. E. Lawrence. 17 Sep 58, 31p. NOTS 2105; NAVORD rept. 6408; AD-207 684.
Order from LC mi$3.00, ph$6.30 PB 146 991

A description is given of the photometric instrumentation developed for the measurement of the intensity, duration, and inherent delay of flash signals used for inflight evaluation of missile fuzes. The delay time and the duration are typically measured to the nearest 0.1 millisec. The light intensity is normally read to an accuracy of about 5%. This report serves as an operational manual for the technicians who use the equipment and as a source of information for others who may wish to duplicate the equipment and methods. (Author)

Naval Ordnance Test Station, China Lake, Calif.
PINHOLE CAMERA DETERMINES SPATIAL POSITION, ORIENTATION, OR DYNAMIC SURFACE PRESSURE OF MISSILE, by D. B. Clark and W. H. Allan. 14 Apr 59, 22p. NOTS TP 2217; NAVORD rept. 6526.
Order from LC mi$2.70, ph$4.80 PB 146 525

A new technique was devised for measuring the roll, yaw, and pitch orientation of a missile. These measurements may be made while the missile is accelerating in the launching tube or while the missile is in free flight. The technique uses a pinhole camera located in the nose of the missile and electronic flash lamps for reference lights. The camera photographs the pulsating reference lights that are located downrange--one on each side of the trajectory line.

THE WATER EXIT OF A MISSILE RELEASED BELOW THE SURFACE OF THE OCEAN, by Warner Goldsmith. Rept. for June-Aug 57. 3 Aug 57, 27p. NOTS 1838; NAVORD rept. 5622; AD-160 387.
Order from LC mi$2.70, ph$4.80 PB 146 095

Equations of motion are developed describing the behavior of a missile at the water-air interface of an ocean after release of the missile from a submerged position. The missile is modeled as a rigid right-circular cylinder and is assumed to execute plane motion under the action of gravity, forces produced by surface waves, and a current of constant velocity. The initial conditions for the present problem must be derived numerically as the terminal values for the subsurface motion of the missile which has been described in a previous report. A complete analysis of the surface emergence of the missile requires the numerical solution of the differential equations on an automatic computer. (Author)

Naval Supersonic Lab., Mass. Inst. of Tech., Cambridge.
A METHOD FOR PREDICTING THE LIFETIME OF A NEAR SATELLITE, by R. Earl Good. Master's thesis. Rept. on Contract AF 19(604)5894. Jan 60, 63p. 21 refs. Technical rept. 418; AFCRC-TN-60-287.
Order from LC mi$3.90, ph$10.80 PB 148 530

The behavior of satellite orbits under the perturbing effect of atmospheric drag is studied in order to determine the lifetime of a satellite. The wide extremes in drag coefficient, velocity, and density that a satellite experiences during one revolution is studied for possible methods of removing uncertainties in the lifetime predictions. By dividing the satellite lifetime into three phases - circularization, spiral decay, and terminal - approximate methods can be developed to estimate the satellite lifetime in each phase. The method developed is based on the law of conservation of energy. It considers a differential loss in energy per revolution through the drag; and then by integrating for N number of revolutions, the total change in the ellipse shape is determined per revolution. The lifetime of the satellite is then the sum of the revolutions in each phase. (Author)

RESEARCH DIRECTED TOWARD THE DESIGN, DEVELOPMENT, AND CONSTRUCTION OF METEORITIC MICROPHONE DETECTORS OF VARIOUS SENSITIVITIES FOR USE IN SATELLITES, by H. E. Harrington. Scientific rept. no. 1 on Contract AF 19(604)5715. 15 Jan 60, 34p. AFCRC TN-60-229; AD-233 737.
Order from LC mi$3.00, ph$6.30 PB 146 319

An electronic system designed for the express purpose of exploiting the data-gathering potential of a specific vehicle in obtaining information regarding the influx of micrometeor material was developed. An acoustic sensing technique is employed, whereby the particulate matter to be detected activates a supersonic microphone device. The resultant electrical signal is amplified to a suitable level, graded as to magnitude, and stored internally by electronic means for subsequent recording and/or telemetering to ground receiving stations by the system inherently available within the chosen vehicle. A brief historical background of the development of the technique is presented, together with details of the specific system evolved for this application. Various design features which are peculiar to this application are presented and discussed. The prototype equipment which resulted from the development program was subjected to a testing program to verify its suitability for the anticipated use, and several sets are currently under construction. INVESTIGATION OF SINGLE JATO BOOSTER LAUNCHINGS OF LTV-N-2 TYPE MISSILE, by Willy A. Fiedler and Robert Lusser. Rept. on Proj. TED MTC PA-501.1. 20 Sep 49, declassified. 37p. GSR-11; Technical rept. no. 60.
Order from LC mi$3.00, ph$6.30 PB 148 631

Launching configurations for LTV-N-2 type missiles using one JATO, 2KS-33,000, with either straight or canted nozzle are described. The advantages, possibilities, and special problems of each configuration are discussed, using the LTV-N-2 missile as an example. Two types of launchers for zero- and short-length launching are described. New methods of athwartship firing and jettisoning of the missile in event of emergency are discussed. Storage of two LTV-N-2 missiles in the existing submarine hangar is found practicable. Combined methods of c.g. determination and JATO thrust alignment are described. Studies and calculations indicate that complete reliability can be attained with a single JATO booster in zero- and short-length launchings. (Author)

[Pacific] Missile [Range] Port Mugu, Calif.
PTV-N-2 (GORGON IV). Final rept. on Proj. TED MTC PA-503. 14 Dec 48, declassified 12 June 56, 26p. Technical rept. no. 40.
Order from LC mi$2.70, ph$4.80 PB 148 626

This project was established to evaluate the C-20-.85C ramjet power plant as a propulsion unit, utilizing the PTV-N-2 (GORGON IV) as a vehicle. The first five free-flight tests were conducted for the primary purpose of aerodynamic evaluation of the test vehicle. Sufficient data were accumulated during

these tests to make this evaluation. As a flight-test vehicle, PTV-N-2 possessed a high degree of aerodynamic stability in both powered and unpowered flight, but flight durations were limited by equipment failures. Two vehicles were expended for a later ramjet evaluation phase. The performance of the C-20-. 85C ramjet power plant revealed that difficulties would be encountered in securing reliable operation at the designed Mach number of 0. 85. The next phase of the PTV-N-2 flight test program was devoted to investigating the suitability of five vehicles as target P/A.

Picatinny Arsenal, Dover, N. J.
PYROTECHNIC SPOTTING DEVICE FOR THE HONEST JOHN ROCKET SYSTEM, by Ralph B. Wright. July 60, 31p. Technical rept. 2691.
Order from LC mi$3.00, ph$6.30 PB 146 877

This report describes the development of a pyrotechnic spotting device for the Honest John rocket. To meet stringent requirements as to time of functioning, resistance to surface heating, interchangeability of units used to signify different events, and resistance to both vibration and acceleration stresses, a literature study of initiators and compositions, as well as a series of local laboratory experiments and static tests, was necessary before the first complete design could be attempted. As work progressed, requirements were changed, necessitating modifications of existing designs or complete redesigning of the device. Thus, several spotting device designs, designated Types 1, 2, 3, 10, and 13, were completed specifically for the Honest John rocket. The Type 13 design takes into consideration all mandatory requirements for an Honest John rocket spotting device made up to the date of this report. Types 2, 3, 10, and 13 have all been used successfully in Honest John system flights. This work indicated that development of flash charges of various specific light intensities and durations, capable of matching various light, camera, and film conditions, would be useful during future missile test flights employing spotting devices. (Author)

Picatinny Arsenal, Dover, N. J.
USE OF CLOSED BOMB TEST METHODS FOR ASSESSING 81 mm MORTAR PROPELLANT, by Lester Shulman and Louis Bottet. July 60, 11p. 4 refs. Technical rept. 2693.
Order from LC mi$2.40, ph$3.30 PB 147 852

The results obtained from 320 closed bomb firings and 280 proof firings of test samples representing 14 production lots of M5 increment propellant for the 81 mm mortar indicate a high degree of correlation, as shown by the statistical "H" test. On the basis of these results, equations relating flight velocities and mortar tube pressures to closed bomb parameters are derived. With these equations, velocities and pressures for the 81 mm mortar can be predicted within $\pm$2.3% and $\pm$4.9%, respectively. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
EXPERIMENTAL TEMPERATURE DISTRIBUTION IN A HEMISPHERICAL NOSE CONE IN HYPERSONIC FLOW, by S. V. Nardo, John L. Boccio, and others. Rept. on Contract Nonr-839(23). June 59, 56p. 3 refs. PIBAL rept. no. 494; AD-218 655.
Order from LC mi$3.60, ph$9.30 PB 146 581

Results are presented of tests on a hemispherical nose cone in the hypersonic tunnel. The test conditions with respect to Mach number and Reynold's number correspond to Mach numbers in the range of 15 to 20 at altitudes of 85,000 ft and higher. The stagnation temperature was varied from 850° F to 14000°F. Aerodynamic and thermal load data are given in the form of pressures along a meridian of the model and temperature-time histories at various points on the model. Future research will involve the analysis of these data in order to evaluate heat transfer coefficients and the thermal and mechanical stresses within the body. The hemispherical nose cone is made of Type 304 stainless steel, has an outer diameter of 7-3/4 in. and is one in. thick. Instrumentation consists of 13 pressure taps and 40 thermocouples. (Author)

Rock Island Lab., Ill.
THE EFFECT OF VOLATILE CORROSION INHIBITORS ON MIL-B-131 BARRIER MATERIALS, by E. S. Burke. 2 Feb 60, 21p. 10 refs. Rept. no. 60-294; AD-234 721L.
Order from LC mi$2.70, ph$4.80 PB 147 338

MIL-B-131 barrier materials with polyvinyl chloride, polyethylene and metallized polyethylene-polyester heat sealing films, respectively, and unsupported films of these plastics were placed in contact with paper impregnated with dicyclohexyl ammonium nitrite; a mixture of urea, sodium nitrite and monoethanolamine benzoate; dicyclohexylamine caprylate; and an amine carboxylate and exposed to temperature cycling for various periods of time. The effect of these conditions on the water resistance of the seal, moisture vapor transmission rate, delamination of the plastic film and sealability of the barrier material was measured as well as the effect of this exposure on the tensile and elongation properties of the unsupported plastic films.

Rock Island Arsenal Lab., Ill.
WET STRENGTH IN ORDNANCE PACKAGING, by W. F. Garland. 21 Dec 59, 22p. 20 refs. Rept. no. 59-3219; AD-233 868L.
Order from LC mi$2.70, ph$4.80 PB 147 221

This report covers the evaluation of thirteen commercially available wet strength papers of the kraft type, i.e., as used in several Military packaging specifications. Wet strength treatments of these papers included: synthetic rubber latices, formaldehyde resins, fluorochemicals and two treatments not stated. The wet tensile strength and percent wet strength of all materials was considerably greater than that of the two control materials. As a group, the synthetic rubber treated papers showed a higher percent wet strength than the other papers tested. Only one wet strength treated paper was effectively fungus resistant. (Author)

Rome U. (Italy).
ANISOTROPIC COMPOSITE THERMAL STRUCTURES FOR HYPERSONIC FLIGHT, by Luigi Broglio. Technical note no. 1 on Contract AF 61(052)198. Feb 59, 49p. 7 refs. SIARgraph no. 52; AFOSR-TN-59-1015; AD-230 231.
Order from LC mi$3.30, ph$7.80 PB 146 707

The solution is given for the instantaneous source of heat located at a generic point of an anisotropic heterogeneous composite body of whatever shape. The solution satisfies both the differential equation of the heat conduction and the boundary conditions of the specific body. Thus, by using appropriate space integrals of such solution and by leaving all kinds of nonlinearities (such as variation of thermal properties, radiation and so on) to the final timewise integration, a very general solution is found. The solution is introduced for the thermal shock generated by an instantaneous unit timewise temperature step at a generic point of a body of whatever shape. The solution satisfies the differential equations of the dynamic thermal motion and the boundary conditions of the specific body. Here again the most general solution is immediately written as an appropriate space and time integral of the unit solution. By combining the results, the thermal motion generated by an instantaneous heat source located at a generic point is obtained. (Author)

Springfield Armory, Mass.
NONDESTRUCTIVE INSPECTION OF BRAZED CLEVIS ON 7.62mm M60 MACHINE GUN OPERATING ROD GUIDE ASSEMBLY, by R. D. Korytoski and E. H. Abbe. 28 Dec 59, 17p. 3 refs. SA-TR19-1504. AD-237 235.
Order from LC mi$2.40, ph$3.30 PB 147 914

An investigation was made in order to develop a nondestructive test method for the evaluation of brazed joints on the M60 guide assembly operating rod. The ultrasonic resonance method provided a nondestructive test means to evaluate the soundness of brazed areas. Completely brazed areas produced several resonance indications with thickness approximating 0.130 inch. A poorly brazed joint shows a single resonance indication with thickness approximately 0.050 inch. Ultrasonic pulse echo method could not be be practically applied. The ultrasonic resonance method proved most feasible and was used in the development of inspection procedures. (Author)

Watertown Arsenal Labs., Mass.
HYDROSTATIC TESTING OF COLD EXTRUDED 155mm HE SHELL, M107, by C. A. Riddle and E. J. Lemay. Jan 60, 45p. Technical rept. no. WAL TR-763.71/1; AD-233 958.
Order from LC mi$3.30, ph$7.80 PB 147 234

Cold extruded 155MM HE Shell, M107, from six different lots containing exterior surface defects peculiar to the manufacturing process, were internally loaded to destruction with hydrostatic pressure. Surface defects were detectedy by "Magnafluxing" and examination with a crack depth indicator. Strain measurements were recorded. The test results demonstrate that the type of surface defects encountered do not contribute to an increase in the amount of strain in defective surface areas when compared with nondefective areas. METALLURGICAL EXAMINATION OF 155mm T387 HE SHELL, by C. A. Riddle. Feb 60, 14p. Technical rept. WAL TR 763.6/1; AD-234 564.
Order from LC mi$2.40, ph$3.30 PB 147 278

Mechanical and metallurgical properties of four 155MM Shell, HE, T387 were determined. The variation of properties throughout the shell length are noted. Improperly seated rotating bands are considered to be a serious defect in manufacture. (Author)

Watertown Arsenal Labs., Mass.
THE RIFLING AND ROTATING BAND DESIGN HANDBOOK. SUPPLEMENT. SECTION 3.2. DETERMINATION OF BAND PRESSURE EXPERIMENTALLY, by Francis I. Baratta and John Campo. Mar 60, 64p. 3 refs. Technical rept. no. WAL TR 760/410-2; AD-234 995.
Order from LC mi$3.90, ph$10.80 PB 147 277

This report is to be incorporated in the "Rifling and Rotating Band Design Handbook," WAL No. 760/410(c). Specifically, some of the results of the "Thick Walled Cylinder Handbook," WAL no. 893/172 (PB 119 941), have been extended and presented here in a different manner so that, by their use, both band pressure as a function of travel as well as band pressure at the maximum radial loading may be readily determined experimentally. Illustrative problems are included to better acquaint both band and gun tube designers with techniques involved in experimental determination of band pressure.

Watervliet Arsenal, N. Y.
ANALYTIC DEVELOPMENT OF DESIRABLE STRESS DISTRIBUTION CHARACTERISTICS IN SEALING RINGS LEADING TO RECOMMENDATION OF RING NO. 5 FOR APPLICATION TO CLOSED BREECH LAUNCHERS, by M. A. Sadowsky. Mar 60, 98p. Technical rept. WVT RR-6006.
Order from LC mi$5.40, ph$15.30 PB 146 215

Laboratory testing of closed breech sealing rings Nos. 1 and 4 and the mathematical analysis of those rings showed that they are prone to elliptic buckling and plastic flow due to stress concentration at the lips. Ring No. 5 was then designed on the basis of mathematical shell theory. It is believed that it will be as nearly free from those faults as possible. It is suggested that Ring No. 5 be produced and evaluated experimentally. (Author)

ABC DECONTAMINATION EQUIPMENT FOR PERSONNEL IN THE ARCTIC, by W. R. Nehlsen. Final rept. 8 Mar 60, 17p. 4 refs. NCEL Rept. 072; AD-234 875.
Order from LC mi$2.40, ph$3.30 PB 146 969

A 60 man per hour portable shower unit was designed for decontamination of large numbers of personnel in arctic climates. A shower waste water treatment and recirculation system was included to minimize the effects of critical water shortages expected under arctic conditions. Tests on the shower waste recirculation system showed that satisfactory results could be obtained on atomic and biological agents, but the allowable time interval before starting chemical agent decontamination proved to be so brief that no mass decontamination method could be considered effective. Because of the inherent dangers of the recirculating system, an individual washing kit was devised as an alternative to the shower unit. The individual washing kit is safer and more economical for atomic and biological decontamination, but neither system is suitable for chemical agent decontamination. (Author)

Ship Building

David Taylor Model Basin, Washington, D. C.
COMPARATIVE SEAKEEPING TESTS AT THE DAVID TAYLOR MODEL BASIN, THE NETHERLANDS SHIP MODEL BASIN AND THE ADMIRALTY EXPERIMENT WORKS, by George P. Stefun. May 60, 38p. 13 refs. Rept. 1309.
Order from LC mi$3.00, ph$6.30 PB 148 653

Comparative results are presented of seakeeping tests on a model in waves run at the David Taylor Model Basin (TMB), the Netherlands Ship Model Basin (NSMB), and the Admiralty Experiment Works (AEW). A brief description is given of the test methods used by the three tanks in connection with the test program initiated by the International Towing Tank Conference (ITTC). The results of the wave tests are compared with respect to resistance, shaft rpm, heave amplitude, pitch amplitude, and phase-angle measurement. The comparisons indicate that fair agreement among the three tanks exists for most of the test conditions, but somewhat large discrepancies exist for conditions of low model speeds and for large wave amplitudes. The reasons for discrepancies are discussed together with recommendations for improved correlations for future seakeeping test results. (Author)

Davidson Lab., Stevens Inst. of Tech., Hoboken, N. J.
EFFECT OF APPENDAGE AND HULL FORM ON HYDRODYNAMIC COEFFICIENTS OF SURFACE SHIPS, by Stavros Tsakonas. Rept. on Contract Nonr-263(18). July 59, 66p. 11 refs. Rept. no. 740; AD-220 007.
Order from LC mi$3.90, ph$10.80 PB 147 083

Tests were made to determine the hydrodynamic coefficients in the yaw plane of EET Model 842 (of the Taylor Standard Series) with skegs of varying size, shape and position. Similar experiments were conducted with flat plates having the same profile area and geometry as the various configurations. The static and damping hydrodynamic coefficients were determined for various angles of attack by means of straight-course experiments and by interpolation of rotating-arm data. Comparison of the straight-course results with those derived by linear interpolation of the rotating-arm data show excellent agreement. Investigation of various flat plates reveals a similarity between the hydrodynamic characteristics of a model and those of a corresponding plate. An attempt to study the usefulness of the flatplate coefficients in regard to determining the stability indices for a ship model of the same profile area is included. (Author)

George Washington U., Washington, D. C.
AN APPROACH TO THE PROBLEM OF ALLOWANCE LIST EVALUATION, by Sheldon Haber. Rept. on Contract Nonr-761(05). 20 Aug 59, 32p. 7 refs. Serial T-108/59; AD-226 119.
Order from LC mi$3.00, ph$6.30 PB 148 157

The essential feature of the allowance list problem is the specification, in advance, of the range and quantity of commodities to be stocked on vessels to meet varying demands under conditions of uncertainty, where the supply of commodities is subject to a space restraint as well as other possible restraints. An attempt is made to explore the process of evaluating alternative allowance lists, the commodities of which can be ranked only ordinally. The assumption was that alternative allowance lists are available and the parts with high and low military worth can be distinguished. Criteria of allowance list efficiency used by other investigations are organized into 2 groups: range measures that take into account the number of different parts demanded but not stocked, and depth measures that indicate the extent to which stocked parts are stocked in insufficient quantities. Several measures are proposed to supplement the conventional range and depth measures. These were designed to determine the range of exchange rates between high- and low-worth parts for which one allowance list is preferable to another.

George Washington U., Washington, D. C.
AN EXAMINATION OF CRUISER USAGE DATA, PART 2, by Mina Haskind Gourary. Rept. on Logistics Research Project, Contract Nonr-761(05). 1 Sep 59, 12p. 3 refs. Serial T-110/59; AD-226 364.
Order from LC mi$2.40, ph$3.30 PB 148 586

An examination is made of cruiser electronic parts usage data (Cognizance-N material). Tabulations are presented of the actual demand for electronics materials. These tables provide information on the number of transactions per quarter; on the frequency with which items are demanded during a stated period of time; on the total quantity used during a stated time period of a given item; and on the distribution of usage among the ship itself, shipyards, tenders, and other activities.

George Washington U., Washington, D. C.
SIMULATIONS OF ALTERNATIVE ALLOWANCE LIST POLICIES, by Henry Solomon and Marvin Denicoff. Rept. on Logistics Research Project, Contract Nonr 761(05). 25 May 59, 36p. 4 refs. Serial T-102/59; AD-216 826.
Order from LC mi$3.00, ph$6.30 PB 146 584

A simulation is described to permit an evaluation of alternative policies for constructing allowance lists for naval vessels. The research program, the allowance list test program (ALTP), aims to increase the supply endurance and self-sufficiency of combatant ships through the medium of improved allowance lists. The following factors are considered: endurance loading, the period of support, criteria for selecting the range and depth of insurance items, and the storage limitation of the ships.

Naval Technical Mission in Europe.
GERMAN SUBMARINE DESIGN, 1935-1945, by W. R. Ignatius, H. A. Arnold and others. July 45, declassified 15 Dec 53, 48p. Technical rept. 312-45.
Order from LC mi$3.30, ep$9.30 PB 146 556

This report was released for sale to the public 1 Aug 60.

From strategic considerations the basic offensive weapon of the German Navy in World War II was the submarine, even as it was in World War I. After the long naval holiday between 1918 and about 1935, the German submarine building program started with a clean slate. Numerous types were designed and actual construction ran into almost unbelievable numbers. Many design changes were made during the course of the war. The way ultimately led to the design of an intricate and interesting vessel based upon a new concept of submarine warfare, according to which submarines must remain submerged indefinitely, attain speeds heretofore considered impossible, operate at great depths, and must be highly maneuverable.

Naval Technical Mission in Europe.
LOSS OF THE GERMAN BATTLESHIP TIRPITZ ON 12 NOVEMBER 1944, by T. G. Springer and E. B. Hitchcock. Aug 45, declassified 2 July 59, 31p. 4 refs. Technical rept. 222-45.
Order from LC mi$3.00, ep$7.80 PB 146 552

This report was released for sale to the public 1 Aug 60.

The German Battleship "Tirpitz" while at anchor in Tromsoe Fiord, Norway on the morning of 12 November, 1944 was attacked by two (2) formations of British Lancasters which dropped a total of 29 "Tallboy" bombs. Each of these bombs had a total weight of 12,000 pounds including a 5,200 pound Tropex explosive charge. All bombs evidently landed to port of the ship's centerline. There was one confirmed direct hit and probably two others. At least seven bombs landed in the water within the torpedo net, two or three very close to the ship. There was extensive structural damage on the port side, and a tremendous amount of water swept into and over the ship. Efforts to keep the "Tirpitz" upright were unsuccessful and she capsized about 7 minutes after the first bomb struck. She is now resting on the bottom of Tromsoe Fiord at an angle of about 135 degrees with her superstructure buried in the mud.

Naval Technical Mission in Europe.
PROJECTED BATTLESHIPS OF GERMAN NAVY, CONSISTING OF TWO TYPES KNOWN AS "O" AND "H" AND SOME PROJECTED TYPES KNOWN AS "H" 41, "H" 42, "H" 43, AND "H" 44, by K. S. Brown and C. A. Stuelcken. Oct 45, declassified 2 July 59, 40p. Technical rept. 526-45.
Order from LC mi$3.00, ep$7.80 PB 146 557

This report was released for sale to the public 1 Aug 60.

Data has been assembled on the projected types of battleships to show the overall characteristics and to allow for a brief comment. A virtually complete set of contract plans for type "O" is furnished, as well as an assortment of contract plans and arrangement plans for type "H". Only the principal characteristics of types "H" 41, "H" 42, "H" 43 and "H" 44, are known.

Reed Research, Inc., Washington, D. C.
INVESTIGATION OF HULL-SUPERSTRUCTURE INTERACTIONS. Final rept. on Contract NObs-[72338]. Aug 58, 30p. 14 refs. AD-218 851L
Order from LC mi$2.70, ph$4.80 PB 146 674

Analytical studies and model experiments were made of the stresses induced in a destroyer by longitudinal bending loads, with particular reference to the stresses in the deckhouse and the main deck and the effect on these stresses of providing an expansion joint in the deckhouse. Several theoretical approaches are reviewed and some extensions are developed. Calculations by 4 different methods were made of the longitudinal stresses in the Q-1 deck for the portion of the deckhouse abaft the expansion joint. The loading of the ship, used for the computations, was that proposed for the full-scale test of the DD931 class destroyer. A common assumption in all the calculations was that the deck is infinitely stiff so that there is no vertical movement of the deckhouse relative to the hull.

FOOD, HANDLING, AND PACKAGING EQUIPMENT

Food

Office of Technical Services, Dept. of Commerce, Washington, D. C.
FOOD PRESERVATION (EXCEPT BY IRRADIATION) (1950-1960). May 60, 10p. 125 refs. OTS Selective Bibliography SB-412.
Order from OTS $0.10 OTS SB-412

A bibliography of reports listed in the two OTS monthly abstract journals: U. S. Government Research Reports and Technical Translations. Reports are listed in categories as follows: dehydration, freezing, and food preservation, general.

Purdue U. Agricultural Experiment Station, Lafayette, Ind.
THE FEASIBILITY OF UTILIZING IONIZING RADIATION TO INCREASE THE STORAGE LIFE OF POTATOES, by M. Workman, N. K. Ellis, and M. Patterson. Rept. no. 11 (Final) for 1 Nov 56-30 Apr 59 on Contract DA 19-129-qm-789. [1959] 78p. File no. S-557; AD-233 086.
Order from LC mi$4.50, ph$12.30 PB 147 223

The influence of 5 dosages of gamma irradiation on White Sebago, Katahdin, Russet Burbank and Red Pontiac potatoes is described. The dosages used were 5.0, 7.5, 10.0, 12.5, and 15.0 kilorep. The potatoes were given different curing treatments. Storage was at 41°, 47°, and 55°F. Maximum storage period was two years. The influence of decay, weight loss, sprouting, internal discoloration, specific gravity and other factors is considered. (Author)

MACHINERY, FABRICATION, AND ACCESSORY EQUIPMENT

Technical Operations, Inc., Burlington, Mass.
AN EXPERIMENTAL STUDY OF FRETTING AND GALLING IN DENTAL COUPLINGS, by John F. Batter and F. Everett Reed. Final rept. on Contract NObs-72304. June 58, 60p. Rept. no. TO158-20; AD-212 761.
Order from LC mi$3.60, ph$9.30 PB 148 854

Specimens of materials used in dental couplings were tested in a simplified wear test machine which duplicated as closely as possible the actual wear conditions existing in operating couplings. The wear patterns that were obtained by tests of short duration on this machine duplicated those found in service. The results of tests covering the variables, load, speed, duration, amplitude of motion, surface finish and hardness are presented together with discussions of the effects of these variables. (Author)

Engines and Propulsion Systems

Air Force Special Weapons Center, Kirtland AFB, N. Mex.
AN INTRODUCTION TO NUCLEAR PROPULSION, by Kenneth R. Chapman. Apr 60, 49p. 18 refs. AFSWC-TN-60-9.
Order from LC mi$3.30, ph$7.80 PB 148 344

Propulsion of rocket vehicles by means of energy from the nuclear fission process is discussed in nonscientific terms. A single parameter (specific impulse) is used for comparing propulsion schemes. Nuclear and chemical rocket engines are compared; various means of using nuclear energy for rocket propulsion are described; a brief discussion and propulsion requirements in three selected missions is included. Appendixes clarify derivation of some equations used in the text and to introduce some reactor concepts to those readers not familiar with nuclear reactors. (Author)

Besler Corp., Emeryville, Calif.
DESIGN STUDY OF A STEAM POWER SYSTEM FOR A LANDING CRAFT, by William J. Besler and John L. Boyen. Rept. on Contract Nonr-2159(00). 30 Sep 57, 105p. AD-157 190.
Order from LC mi$5.70, ph$16.80 PB 146 571

Design studies were conducted on 775-hp steam-engine power plants. The units are to be quiet, flexible, light, inexpensive, efficient, and dependable for installation in high-performance landing craft. The specifications for the power system are summarized. The plant would be a compound steam engine with a forced-circulation boiler operating at 7400 lb/hr and 1200 psig at 760°F. The speed of the engine at full output would be 2200 rpm. The boiler efficiency would be about 83%, and the engine efficiency would be 76% (percentage of Rankine).

Lockheed Aircraft Corp., Sunnyvale, Calif.
A PROPULSION DEVICE USING AN EXPLODING-WIRE PLASMA ACCELERATOR, by W. L. Starr. Dec 58, 20p. LMSD-418 236.
Order from LC mi$2.40, ph$3.30 PB 147 640

A device that accelerates a plasma derived from an exploding wire to velocities of 8×10^6 cm/sec has been developed. A description of the experimental apparatus used and the results attained is given in this report. The impulse produced is about 10^3 dyne sec and, for a firing rate of 1 sec^{-1}, a thrust of 50 dynes/cm^2 is presently attainable. A brief analysis of the accelerating forces and their dependence on circuit parameters is also presented. Planned improvements should result in increases in both the impulse and propellant velocities. (Author)

Manufacturing Equipment and Processes

Brush Beryllium Co., Cleveland, Ohio.
FABRICATION OF BERYLLIUM WIRE, by A. G. Cross, Jr., R. G. O'Rourke, and W. W. Beaver. Progress rept. no. 2, 16 Dec 58-15 Feb 59, on Contract NOas-59-6030-C. [1959] 14p. 2 refs. AD-215 613.
Order from LC mi$2.40, ph$3.30 PB 149 617

Extensive true-stress - true-strain tensile testing was performed on hot-pressed QMV beryllium. Using analytical expressions, it is estimated that reductions in area at 850°F by wire drawing of at least 35% may be made between stress-relieving treatments. A process consisting of cold compacting canned powder by swaging, sintering the compacts to make extrusion blanks, and warm extruding the blanks to draw stock has been partially investigated. It was found that a critical compact green density existed. Swaging beyond this point destroyed the compact. Initial drawing experiments at 850°F have been made, and these indicate that large reductions in area per pass are more desirable than light reductions from the standpoints of surface and lubrication. (Author)

Naval Research Lab., Washington, D. C.
THE EFFECT OF NEUTRON IRRADIATION ON THE CHARPY V AND DROP-WEIGHT TEST TRANSITION TEMPERATURES OF VARIOUS STEELS AND WELD METALS, by J. R. Hawthorne and L. E. Steele. Final rept. 27 May 60, 28p. 4 refs. NRL rept. 5479.
Order from OTS $0.75 PB 161 448

Charpy V-notch and drop-weight specimens were used to determine changes in transition temperature for various steels and weld metals irradiated in different nuclear and thermal environments to integrated fast-neutron-flux exposures to 1×10^{19} NVT (>1.0 Mev). The Brookhaven Graphite Reactor, the Oak Ridge Low Intensity Test Reactor, and ARCO Materials Testing Reactor were used for the irradiations at temperatures under 200°F and at 575°F. Irradiations to integrated fast-neutron flux levels of 5×10^{18} NVT effected 40° to 100°F shifts in transition temperatures. Increasing the irradiation temperature from 200°F to 575°F significantly decreased the radiation-induced damage. Transition-temperature shifts in the order of 250°F were developed for materials irradiated at temperatures less than 200°F to an integrated fast-neutron flux dosage of 1×10^{19} NVT. Post-irradiation heat treatment revealed that recovery of properties may be obtained by 650°F annealing. Comparison of Charpy V and drop-weight nil-ductility transition temperature shifts for 17 material irradiations demonstrated excellent correspondence in the evaluation of irradiation effects by these two test methods. (Author)

Rodman Lab., Watertown Arsenal, Mass.
EPOXY RESIN DIES FOR INVESTMENT CASTING PATTERNS, by Francis C. Quigley and Eugene DeLuca. Dec 59, 8p. 6 refs. Rept. no. RPL 13/8; AD-234 073.
Order from LC mi$1.80, ph$1.80 PB 147 231

The resin system is compatible with the materials employed in the conventional die-making processes and can readily replace soft metal alloys as a casting medium in the production of wax pattern dies. The plastic die offers definite advantages over its metal counterpart including simplified construction, reduced handling weight, and reduced costs. The surface finish and dimensional reproducibility of wax patterns produced in a resin die parallel those of wax patterns produced in a machined, metal die. (Author)

Rodman Lab., Watertown Arsenal, Mass.
A MACHINING PRODUCTION FUNCTION, by Roy Mennell. Dec 59, 10p. 9 refs. Rept. no. RPL 23/10: AD-233 855.
Order from LC mi$1.80, ph$1.80 PB 147 232

A general production function is derived based on a generalization of machining data to describe all combinations of the inputs - tools and machines - necessary to give any production rate. A method is developed for solving for the minimum cost combination of inputs with the result that optimum number of machines assigned and cutting speed, as well as the resulting cost, are determined. (Author)

Stanford Research Inst., Menlo Park, Calif.
FEASIBILITY STUDY OF PLASMA WELDING OF REFRACTORY METALS, by Jess W. Wilson. Progress rept. no. 3, 1 Nov 59-1 Mar 60, on [Contract NOas-59-6234C] 22 Mar 60, 4p. SRI Proj. SU-2927.
Order from LC mi$1.80, ph$1.80 PB 148 425

The high power density and high heat transfer rate of a plasma jet make it of interest as a possible welding tool for the refractory metals, such as Ta, Mo, Ti, Zr, and W. The possible advantages of such an instrument are less contamination and a smaller heat-affected zone arising from the shorter heating times and consequently higher welding speeds. In this feasibility study the construction and operating characteristics of a small-diameter plasma torch are being studied. (See also PB 145 814)

Transport, Traction and Hoist Facilities

Arctic Aeromedical Lab., Ladd AFB, Alaska.
MODIFICATION OF WEAPONS CARRIER FOR CROSS COUNTRY USE OVER TUNDRA, SNOW AND SAND, by Jack Castle, Jr. Sep 57, 8p. Technical note AAL-TN-57-41.
Order from LC mi$1.80, ph$1.80 PB 146 631

It is recommended that the AC&W squadrons be furnished 3/4 ton vehicles equipped with U.S. Royal Knobby Implement tires 17:00 x 16 for use in unimproved areas, and that the modified vehicles be locked into the 4-wheel drive gear, thereby causing an even pull on all four wheels.

Detroit Arsenal, Center Line, Mich.
M-56 PNEUMATIC COMBAT BOGIE TIRE TESTS, by James K. Matter and Walter O. Perrott. 18 Nov 58, 50p. Rept. no. 4320 (Final).
Order from LC mi$3.30, ph$7.80 PB 146 532

George Washington U., Washington, D. C.
TIME-PHASING RELATIONSHIPS IN DETERMINING MERCHANT SHIP REQUIREMENTS FOR OVERSEAS CARGO LIFT. PART I. THE EXPORT-NO PIPELINE SYSTEM, by Ralph B. Hunt and Erling F. Rosholdt. Rept. on Logistics Research Project, Contract Nonr-761(05). 15 May 59, 92p. Serial T-101/59; AD-217 232.
Order from LC mi$5.40, ph$15.30 PB 146 585

A methodology is presented for determining the number of merchant ships required to transport known but possibly variable monthly quantities of export cargo between the continental United States and overseas ports. It pertains only to the situation where no pipeline or traffic exists and it is necessary to generate a pipeline from the beginning. The contributions to the necessary data made by the schedule of lift requirements and a ship's turnaround are discussed. The concept of notional ship and notional value is explained and a graphic method of analysis of the behavior of the pipeline as a function of turnaround time, delivery period and lift requirement schedule is developed and translated into complete sets of equations for calculating the pipeline build-up. The behavior of an export

shipping pipeline under the conditions of the study is illustrated for the cases of increasing, decreasing and variable monthly lift requirements for a sample group of turnaround times. (Author)

Land Locomotion Lab., Ordnance Tank-Automotive Command, Center Line, Mich.
DETERMINATION OF VEHICLE SINKAGE PARAMETERS BY MEANS OF RIGID WHEELS. PART I. by T. Czako and M. G. Bekker. May 58, 37p. Rept. no. 33; AD-235 846.
Order from LC mi$3.00, ph$6.30 PB 147 242

The present way of determination of stress-strain parameters in soils by means of rectangular or round loading areas is time consuming and cannot be performed without alternate moving and stopping the measuring device over the terrain under measurement. To provide a quicker and continuous method of operation which would enable one to measure these parameters in a way more susceptible to automation, the use of rigid wheels instead of plates has been proposed. When towing such wheels under varying load, and measuring the corresponding sinkage, this new method of determining the discussed soil parameters was successfully tested in dry and wet sand. (Author)

Naval Civil Engineering Lab., Port Hueneme, Calif.
DEVELOPMENT AND TEST OF SLED TRAIN HOOKUP AND RELEASE DEVICES, by Douglas Taylor Final rept. 26 Jan 60, 41p. 6 refs. Technical rept. 047; AD-233 336.
Order from LC mi$3.00, ph$7.80 PB 146 728

A sled to tractor-or-sled hitch, a sled train safety release, and a drawpole elevating device were developed and tested. The sled to tractor-or-sled hitch could not be used with the tractor winch cable and was unsatisfactory. A torsilastic drawpole support, a modified Otaco drawpole spacer with Neidhart torsional springs at each end, was considered as a substitute for the drawpole elevating device. The tractor hitch with safety release device was mounted on a D2 LGP snow tractor and used by one man to couple and release a sled equipped with the drawpole elevator. These items are recommended for in-service test. (Author)

Minnesota U., Minneapolis.
THE PLASTIC COEFFICIENTS FOR WORK-HARDENING MATERIALS, by W. H. Warner and P. Mahmoodi. Rept. for June-Oct 58, with revisions Mar-June 59 on Contract AF 33(616)5449. Apr 60, 17p. 8 refs. WADC Technical rept. 59-674.
Order from OTS $0.50 PB 161 886

In the establishment of the form of their generalized stress-strain law for work-hardening inelastic materials, Warner and Handelman did not show how the plastic coefficients could be evaluated in terms of material properties. This report first shows how this can be done, giving the general form of the coefficients for various states of stress. The validity of the assumptions behind this representation must be experimentally tested; comparison with existing results is carried out as far as possible. The conclusion suggests what types of experiments are needed to test the validity of the law, and if they are successful, what further experiments are needed to provide the information necessary to solve various combined stress problems analytically. (Author)

PHOTOGRAPHIC CHEMICALS AND EMULSIONS. June 60, 8p. 112 refs. OTS Selective Bibliography SB-417.
Order from OTS $0.10 OTS SB-417

A bibliography of reports listed in the two OTS monthly abstract journals: U.S. Government Research Reports and Technical Translations. Reports listed were added to the OTS collection during the period 1950 to July 1960.

Owens-Corning Fiberglas Corp., Newark, Ohio.
INVESTIGATION OF GLASS-METAL COMPOSITE MATERIALS, by Herbert B. Ailes. Annual progress rept. no. 2, 15 Mar 56-15 Mar 57, on Contract NOrd-15764. 29 Mar 57, 34p. 4 refs. AD-153 297.
Order from LC mi$3.00, ph$6.30 PB 149 620

Several major variables in the vacuum injection technique of compositing Al and Al-coated glass fibers were studied to obtain improved composite strengths. The best tensile strengths were obtained with 14S or 23S Al matrix alloys. It was possible to increase the glass concentration of a glass reinforced Al composite by heating the composite above the melting point of the Al alloy and allowing the Al to run out of the composite under the force of gravity. A glass reinforced Al bar 0.45 in. in diameter was hot rolled. Reductions of 1.5% pass resulted in a total reduction of 20%. A complete set of physical properties is being compiled on a standard composite of Al reinforced with Al-coated fibers. Composites of glass reinforced Al were made by hot pressing longitudinally oriented Al-coated fibers; measured strengths are presented. Orienting the fibers in 2 perpendicular directions decreased the strength by about 60%. Composites made of Al reinforced with bare glass fibers gave maximum strengths of 10,500 psi at 75°F. Glass reinforced Al tubes 1 in. in diameter made by the vacuum injection technique showed that rim stresses comparable to tensile strengths of the standard composites are feasible. (Author)

Adhesives and Sealants

Naval Weapons Plant, Washington, D. C.
COMPARISON OF ADHESIVE SYSTEMS FOR STRUCTURAL BONDING OF ALUMINUM, by Richard L. Nutt and William Lurie. 27 Apr 60, 9p. NWPW-T-8-60; NAVORD rept. 6953, Part 2.
Order from LC mi$1.80, ph$1.80 PB 148 359

Tensile lap-shear tests, using various combinations of primers and adhesives, were conducted at several temperatures to obtain comparative values for the NWP-developed adhesive system and several alternative systems for structural bonding of aluminum. Of all the systems tested, the NWP-developed system was found to have the best combination of satisfactory strength properties, and uniformity of strength level over the temperature range tested. (Author) (See also PB 148 358)

Naval Weapons Plant, Washington, D. C.
DEVELOPMENT AND EVALUATION OF AN ADHESIVE SYSTEM FOR STRUCTURAL BONDING OF ALUMINUM, by Ruth S. Kobler, William Lurie, and Richard L. Nutt. 20 Apr 60, 24p. 13 refs. NWPW-T-4-60; NAVORD rept. 6953, Part 1.
Order from LC mi$2.70, ph$4.80 PB 148 358

On the basis of a preliminary literature survey covering the field of adhesives and adhesion, an adhesive system formulation and associated fabrication techniques were selected and recommended for use in the developmental fabrication of the aluminum tail assembly of the LITTLE LULU weapon. In order to confirm the conclusions and recommendations derived from the literature survey, an evaluation of this adhesive system and its associated procedures was conducted. Effects of several processing variables were determined. The optimum combination of these variables resulted in average tensile lap-shear values (3728 psi at -67°F, 3736 psi at 83°F, and 2784 psi at 160°F) which were in excess of the requirements established for the system, and also in excess of the requirements of MIL-A-5090C. The peel strength test values obtained (approximately 21 in.-lb./in.) were considerably above those quoted in the literature for the individual constituents of the system. (Author)

Ceramics and Refractories

Battelle Memorial Inst., Columbus, Ohio.
INVESTIGATION OF SINTERABLE POWDERS AND PROPERTIES OF BERYLLIA CERAMICS, by James E. Johnson, A. J. Smalley, and Winston H. Duckworth. Rept. for 15 Feb-31 Dec 59 on Electrical and Electronic Materials, Contract AF 33(616)6238. Apr 60, 24p. 5 refs. WADD Technical rept. 60-108.
Order from OTS $0.75 PB 161 891

Information was developed on the effects of processing variables and microstructure on the fracture strength of ceramics made from sinterable oxide powders. The characteristic of high strength being associated with low porosities and small average crystal sizes was observed in ceramics of both MgO and BeO, but no quantitative correlation was found. Highest strengths were obtained when time and temperature of sintering were sufficient for densification above about 96 per cent of theoretical, provided that the sintering time and temperature was insufficient to give crystal sizes larger than the smallest observed, 5-6 microns for BeO ceramics and 10 microns for MgO ceramics. In the case of BeO powder prepared by pyrolysis of high-purity sulfate, calcining to an intermediate temperature (1700-1800°F) gave the powder that densified most readily when compacted and sintered, but one that did not have the greatest tendency toward crystal growth. The lack of quantitative correlations between bulk density, average crystal size, and strength, indicated that strength was affected by some factor or factors other than these two. (Author)

Cornell Aeronautical Lab., Buffalo, N. Y.
AN INVESTIGATION OF THE THEORETICAL AND PRACTICAL ASPECTS OF THE THERMAL EXPANSION IF CERAMIC MATERIALS. VOLUME 2. RESEARCH, by Henry P. Kirchner, Kenneth M. Merz, and Harold T. Smyth. Summary rept. for 1 July 58-31 Aug 59 on Contract NOrd-18419. 31 Aug 59, 49p. 17 refs. Rept. no. PI-1273-M-4; AD-227 766.
Order from LC mi$3.30, ph$7.80 PB 148 739

Attempts were made to predict the thermal expansion coefficient by 2 general methods, one in which an openness-ratio concept is used, the other in which statistical mechanics is applied. The results of these predictions were compared with data from the literature. A crude correlation seemed to exist between the the openness ratio and the thermal expansion coefficient. The thermal expansion coefficient decreased with increasing openness ratio for oxides and silicates. It seems likely that the openness ratio can be used to select low expansion phases from a large group of phases for which the thermal expansion coefficient is not known. This investigation did not result in sufficient experimental data to reach a definite conclusion on this point. The thermal expansion of phases having the sodium chloride structure can be predicted by using a statistical mechanical method. The results of the predictions were good considering the assumptions that were made. It may be possible to eliminate the assumption that the atoms vibrate independently of each other. (See also PB 161 826)

THE HOT PRESSING OF FINE GRAINED CERAMIC OXIDES FOR USE IN THERMAL CONDUCTIVITY STUDIES, by R. K. Francis, J. J. Swica and others. Rept. for 1 Nov 58-31 Oct 59 on Surface and Interface Phenomena of Matter, Contract AF 33(616)3798. Feb 60, 32p. 8 refs. WADC Technical note 59-394.
Order from OTS $1.00 PB 161 851

The relationships between time, temperature, pressure and grain growth in hot pressing were studied using alumina grain to determine the techniques necessary for the production of dense polycrystalline alumina having a grain size in the four to five micron range. It was found that alumina having a density of the order of 95% of theoretical and grain size in the desired range could be produced using a short time at maximum temperature in hot pressing. A METHOD FOR THE OBSERVATION OF THE INFRARED SPECTRUM AT HIGH TEMPERATURE VAPORS BY MATRIX ISOLATION. I. THE INFRARED SPECTRUM OF LITHIUM FLUORIDE, by M. J. Linevsky. Rept. on Contract AF 04(647)269. June 60, 18p. 8 refs. Technical Information Series R60SD387.
Order from LC mi$2.40, ph$3.30 PB 148 763

An apparatus has been developed that is capable of obtaining the infrared spectrum of matrix isolated vapor molecules generated by Knudsen effusion. The fundamental vibrational frequency of lithium fluoride has been observed in argon, krypton, xenon, and nitrogen matrices. Shifts in this frequency due to the interactions with the various matrices have been explained on a basis of a semi-classical model. (Author)

IGNITION CHARACTERISTICS OF SPECIAL JET ENGINE FUELS, by R. R. Ricci. Rept. on TED Proj NAM-PP502. 9 Feb 54, 55p. AEL-1282.
Order from LC mi$3.60, ph$9.30 PB 149 192

It is concluded from the results obtained on the tests conducted under this project that: (a) A correlation exists between fuel flow required for ignition and a definable volatility-viscosity characteristic. (b) Hydrocarbon class or structure, as an independent variable, does not appear to affect the fuel flow required for ignition. (c) At conditions of constant test chamber velocity and constant air and fuel temperature, variation in chamber pressure does not significantly affect the minimum fuel flow required for ignition. (d) At conditions of constant test chamber velocity the ignitable air-fuel ratio range will decrease as air and fuel temperatures decrease. (e) At conditions of constant test chamber pressure and air and fuel temperature the ignitable air-fuel ratio range will decrease with decreasing velocity. (f) The ignition characteristics of fuels must be considered as separate and distinct from the combustion characteristics and must not be interpreted as comparable to engine "starting" performance.

FURTHER STUDIES OF PURE AMMONIUM PERCHLORATE DEFLAGRATION, by Raymond Friedman and Joseph B. Levy. Rept. on Contract AF 18(600)1502. 28 Jan 60, 24p. 14 refs. AFOSR-TN-60-209; AD-233 370.
Order from LC mi$2.70, ph$4.80 PB 146 755

The effects of pressure, catalyst, and radiant energy were investigated on the burning rate of rocket propellants containing NH_4ClO_4. A deflagration rate-vs-pressure curve showed that pressed pellets of NH_4ClO_4, 4 mm square and 38 mm long, burned at essentially constant pressure in a nitrogen atmosphere. The lower pressure limit was extended from 45 to 22 atm. Experiments showed that the lower limit is insensitive to sample size and to the substitution of He for N as the ambient atmosphere. Small additions of copper chromite powder increased the lower pressure limit while the large additions decreased it. A radiant heating apparatus was developed to produce conditions which permit steady deflagration at atmospheric pressure. For pure NH_4ClO_4, there is a critical radiation level (10 cal/sq cm-sec) below which only slow sublimation occurs and above which deflagration occurs. The deflagration rate is essentially linear with radiation flux and extrapolates to a finite rate at zero radiant flux. The addition of Cu-0202 catalyst increased the deflagration rate and reduced the threshold flux required for ignition. The chemical composition of the product gases from deflagrating NH_4ClO_4 were investigated at pressures from atmospheric to 2000 psi, both with and without the copper chromite catalyst. The gaseous products were N, N_2O, and O.

HYDROGEN PEROXIDE LABORATORIES, by W. C. Schumb and C. N. Satterfield. Quarterly periodic status rept. on Contract Nonr-1841(11). 30 Sep. 59, 9p. AD-228 153.
Order from LC mi$1.80, ph$1.80 PB 148 871

Stability studies: Experiments showed that a definite increase in the decomposition rate of H_2O_2 solutions occurs at low concentrations. The rate is practically constant down to about 10 to 12 wt-% H_2O_2, but triples at 3 wt-% Hydrogen peroxide decomposition flame at sub-atmospheric pressures: The superheater area was increased, and the stopcock and stopcock grease were eliminated so that the apparatus consisted of the boiler flask and superheater in one unit. The burner tube was connected to the superheater by a flexible joint and enclosed in an externally heated Cu tube. The top of the burner tube was connected to the sampling condenser. The vapor coming from the burner tube was ignited by a hot wire. Usable photographs of the flames were obtained. Porous-walled reactor studies: Experiments made in the porous reactory by using CO_2, He, and N as carrier gases confirmed the results previously reported and indicated the strong effect of the diffusivity of H_2O_2 in the carrier gas. Similar experiments in a plain Pyrex reactor of the same size which was operated at 215°C produced rate constants 10 to 100 times lower than those recorded in the porous reactor. Decomposition of H_2O_2 vapor on catalytic surfaces: The modified apparatus failed to produce consistent results. (See also PB 146 281)

ANALYTICAL PROCEDURES FOR ROCKET PROPELLANTS. VII. MIXED ACID, by John D. Clark. Sep 52, 20p. 4 refs. Rept. no. 24.
Order from LC mi$2.40, ph$3.30 PB 149 185

The conventional method of analyzing mixed acid (nitric acid, approximately 15% sulfuric acid, plus small quantities of water and NO_2) is discussed, and the inherent inaccuracies in the method are pointed out. A new method of analysis of mixed acid, based upon a conductimetric titration of the sulfuric acid after interfering ions have been substantially eliminated, is described. This method is free of the inherent disadvantages of the conventional method, is faster, and appears to be capable of an appreciably higher degree of precision and accuracy. (Author)

Naval Engineering Experiment Station, Annapolis, Md.
A COMPARISON OF THE RELATIVE EFFECTIVENESS OF n-CETANE AND PARAFFINIC GAS OIL IN DIESEL FUEL COMPATIBILITY TESTS, by R. T. Jones. 16 Dec 57, 17p. 3 refs. Research and development rept. 070129E; AD-205 173.
Order from LC mi$2.40, ph$3.30 PB 147 442

Filter-clogging, screen-clogging, and accelerated stability test procedures were used. Data illustrating the mechanism of the type of incompatibility involved were obtained. The gas oil was not equivalent to cetane in detecting incompatibility in the filter- and screen-clogging tests used. With suitable adjustments, the gas oil gave results comparable to those obtained with cetane in the accelerated stability test. However, n-cetane was found to have certain advantages over the gas oil in this test.

THE STABILIZATION OF SILICONE LUBRICATING LIQUIDS ABOVE 200°C. PART I. CONVENTIONAL OXIDATION INHIBITORS AND SOME HIGH-SURFACE SOLIDS, by H. R. Baker, F. F. Sullivan, and C. R. Singleterry. Interim rept. 2 June 60, 33p. 16 refs. NRL rept. 5457.
Order from OTS $1.00 PB 161 314

A study of the stabilization of silicone oils at temperatures between 250° and 371°C has shown that the useful life of the commercially available types may be extended from three to five times by the use of certain oxidation inhibitors known to be effective in other systems. The relative value of different inhibitors varies with the temperature and the aromatic content of the oil. The deterioration of silicones in this temperature range is primarily an oxidative process. This oxidation is inhibited by high-surface solids such as Shawanigan black, copper phthalocyanine, and ferric oxide, by conventional inhibitors of the arylamine type, and by dilauryl selenide. Dilauryl selenide was ineffective at 300°C and higher; phenylalphanaphthylamine caused a relatively uniform improvement at 250° and 300°C. The gains from any inhibitor were small at 371°C. The chemical diversity of the effective inhibitors and the relatively high temperatures at which they are effective suggest that the mechanism of inhibition differs from that operating in conventional oils at temperatures below 200°C. The improvements shown with lightly phenylated silicones permit formulation of lubricants having acceptable viscosity characteristics and oxidation stability over the range from -55°C or lower to 305°C. This work has led to the discovery of new

types of inhibitors, specifically for use with silicone liquids, which are an order of magnitude more effective than conventional inhibitors. (Author)

North Carolina State Coll., Raleigh.
LUBRICATION BEHAVIOR OF LIQUID METALS, by Patrick H. McDonald. Rept. for July 58-Sep 59 on The Structure and Properties of Interfaces, Contract AF 33(616)5885. Mar 60, 76p. 16 refs. WADC Technical rept. 59-764.
Order from OTS $2.00 PB 161 888

This report describes the investigation of the lubricating behavior of liquid metals in two categories: hydrodynamic and boundary lubrication. The basic theory of the hydrodynamic study is that of the Reynolds equation. This theory has been extended, after the manner of Christopherson, to a new state of development in this report. An experimental device has been designed and constructed for confirming this theory as it relates to liquid metals. The complex and elaborate aspects of this apparatus are described in detail in the report. The study of a variety of liquid metals with this apparatus is anticipated. A macroscopic theory of the boundary lubrication region has been employed. This theory has been applied to a cylinder-flat combination, and the lubricating behavior has been seen to depend upon the state of contact stress for this configuration. An apparatus for these investigations is also described in the report. (Author)

DETONATION INDUCTION DISTANCES IN COMBUSTIBLE GASEOUS MIXTURES AT ATMOSPHERIC AND ELEVATED INITIAL PRESSURES, IV. HYDROGEN-NITRIC OXIDE. V. HYDROGEN-OXYGEN-DILUENT. VI. THEORETICAL ANALYSIS, by Loren E. Bollinger, Michael C. Fong, and Rudolph Edse. Final technical rept. on Contract AF 33(616)5615 continuation on Contract AF 33(616)3913. Aug 59, 86p. 19 refs. WADC Technical rept. 58-591, Pt. IL
Order from OTS $2.25 PB 161 878

Experimental measurements have been made to determine the detonation induction distances in hydrogen-nitric oxide mixtures and in hydrogen-oxygen-diluent mixtures in a 50-mm diameter tube for various diluent concentrations at initial pressures of 1 and 5 atmospheres and an initial temperature of 40°C. Detonation could not be obtained in the 12-foot long tube with any of the hydrogen-nitric oxide mixtures used at initial pressures of 1, 5, or 10 atmospheres. Nitrogen, helium, argon, and carbon dioxide were the individual diluents which were added to a stoichiometric mixture of hydrogen and oxygen. Addition of any of the diluents caused an increase in the detonation induction distance by varying amounts. For a given volume of diluent, carbon dioxide caused the greatest increase in induction distance while the addition of argon resulted in the least increase. A theoretical analysis of the formation of a detonation wave has been made. A correlation function was found which relates the detonation induction distanc to the Reynolds number, the normal burning velocity of the mixture, the sonic velocity of the unburned gas, and the adiabatic combustion temperature of the given mixtures. (See also PB 151 873)

Olin Mathieson Chemical Corp [Baltimore, Md.]
STUDY OF SUPEROXIDIZERS, by F. O. Penzig. Interim rept. for 5 June 58-4 June 59 on Energy Transfer Research, Contract AF 29(600)1667. Feb 60, 21p. 20 refs. AFMDC-TN-60-3; AD-234 301.
Order from LC mi$2.70, ph$4.80 PB 146 633

This report presents the investigation of new methods for the preparation of higher oxides of hydrogen, a study and evaluation of reported techniques for the preparation of higher oxides of hydrogen, and the development and refinement of analytical methods. The methods include the reaction of hydrogen atoms with liquid ozone, irradiation of dilute hydrogen peroxide solutions, reaction of ozone and oxygen with organic and inorganic materials, electrolysis of hydrogen peroxide, and dissociation of water vapor by electric discharge. The reaction of hydrogen atoms with ozone produced a compound containing hydrogen and oxygen in a molar ratio corresponding to H_2O_4 or HO_2. Condensation of dissociated water vapor produced a mixture of H_2O_2, and higher oxides.

Rock Island Arsenal Lab., Ill.
THE EFFECT OF HUMIDITY ON THE CONSISTENCY OF GREASES, by Max T. Fischer. 27 Apr 60, 14p. 2 refs. Rept. no. 60-1309.
Order from OTS $0.50 PB 161 861

When certain nonsoap thickened mineral oil greases exhibited shear breakdown after storage at low humidity, greases of other types were stored at several humidities to determine their effect on storage and shear stability. Worked and unworked quarter scale penetrations in a miniature grease worker cup were obtained on surface and subsurface grease samples stored in four ounce ointment cans at 0, 50 and 100% relative humidities maintained in desiccators for as long as seven months. When storage or use of greases in high or low humidity environments is anticipated, the stability of individual products should be ascertained since moisture stable and unstable greases of some soap and nonsoap thickened types are available. The soap thickened-mineral oil greases are more likely to be stable to the effects of moisture than are the soap thickened synthetic fluid or nonsoap thickened greases.

Leather and Textiles

Bjorksten Research Labs., Inc., Madison, Wis.
DEVELOPMENT OF TEXTILE TYPE VITREOUS SILICA YARNS, by W. Wendall Drummond and Burns A. Cash. Rept. for Feb-Sep 59 on Air Force Textile Materials, Contract AF 33(616)6255. Mar 60, 53p. WADC Technical rept. 59-699.
Order from OTS $1.50 PB 161 845

Experiments were performed leading to development of methods for producing vitreous silica textile yarns from fused quartz canes or rods by means of electrical heating devices. Both induction and resistance furnace devices were used, best performance being obtained from a resistance unit shielded against radiation losses and operating in a protective atmosphere. Power capabilities of available equipment

were insufficient to permit production of a large number of continuous filaments simultaneously, but operation with five filaments was achieved. A limited amount of data on physical properties of filaments and strands was obtained. (Author)

Naval Ordnance Lab., White Oak, Md.
WAFFLE-TYPE CORE MATERIAL FOR SANDWICH CONSTRUCTION, by H. A. Perry, Jr. 7 July 58, 29p. 38 refs. NAVORD rept. 6100; AD-206 315.
Order from LC mi$2.70, ph$4.80 PB 147 222

A fabricated core material is described which consists of a single sheet with symmetrical truncated pyramidal indentations, alike on both sides, resembling the geometry of a waffle. A waffle core of rigid sheet material when bonded between two flat, high strength faces, produces a strong, light-weight structure. Two separate channels exist for the flow of heat-transfer media in the plane of the sheet. The "Waffle" type of sandwich construction appears potentially to be of considerable value in the fabrication of aircraft parts, radomes, a solid blast protective flooring and heat exchangers. It offers a solution to aircraft de-icing and flight cooling problems. (Author)

Quartermaster Research and Engineering Center, Natick, Mass.
APPARENT THERMAL DIFFUSIVITY OF FABRICS, by James J. Powers and Francis W. Botsch. Feb 60, 22p. 7 refs. Technical rept. EP-126; AD-233 365 and AD-234 969.
Order from LC mi$2.70, ph$4.80 PB 148 652

The concept of thermal diffusivity is applied to fabrics and fabric systems in order to provide a parameter for the mathematical analysis of the thermal response of clothing to non-uniform boundary conditions. Particular solutions of the Fourier Conduction Equation for unidimensional heat flow are discussed for a thick slab of cloth and for a semi-infinite solid composed of fabric layers. Four experimental methods are applied in the determination of the apparent thermal diffusivity of cloth, using boundary step changes and periodic variations in temperature. The apparent thermal diffusivity of blanket cloth was found to be .0225 in.^{2}/min. and that of Nylon 66 to be .0030 in.^{2}/min. (Author)

ALKALINE-ORGANIC MISSILE COMPONENT PAINT REMOVERS, by A. Mankowich. Rept. 1, 10 June 59, 27p. 1 ref. Rept. no. CCL-78; AD-220 378.
Order from OTS $0.75 PB 161 859

Stable, single phase, alkaline-organic paint removers have been developed suitable for stripping paint from missile component parts of aluminum and magnesium. Bench tests indicating improvement in stripping efficiency of 50 to 75 percent over that of the best conventional alkaline aluminum strippers were confirmed by field tests at an Ordnance Depot. The addition of specific high boiling-high flash point glycols and/or triols and hydroxyalkylamines to conventional alkaline aluminum strippers produced the stable, single phase paint removers of improved efficiency. Exploratory tests indicated that certain cationic dispersing agents could replace the fatty acid or rosin soaps of the developed formulations. (Author)

RAPID DETERMINATION OF ANTIMONY TRIOXIDE IN FIRE RETARDANT PAINT, by G. G. Esposito. 26 Apr 60, 7p. 1 ref. CCL no. 93.
Order from LC mi$1.80, ph$1.80 PB 146 678

The method presented provides an accurate, rapid volumetric determination of antimony trioxide in the presence of lead chromate by a modification of the iodine process. The method is based upon the reduction of antimony with potassium iodide followed by selective oxidation of the trivalent antimony to the pentavalent form with iodine in the presence of sodium bicarbonate. (Author)

Naval Research Lab., Washington, D. C.
EFFECT OF TEMPERATURE ON THE LUMINANCE OF PHOSPHORESCENT AND FLUORESCENT MATERIAL USED FOR AIDS TO MILITARY ACTIVITY IN THE DARK, by L. J. Boardman. Interim rept. 26 Oct 59, 11p. NRL rept. 5380.
Order from OTS $0.50 PB 161 005

The effect of temperature on the luminance of various types of aids to military activity under covery of darkness has been measured at temperature ranging between -60° and 200°F. The luminance of fluorescent materials appears to have a maximum value near 75°F with very little change between 60° and 80°F and dropping no more than 20 percent at the extreme temperatures. The luminance characteristics of phosphorescent materials were affected markedly by the temperature. For a constant intensity of excitation, phosphorescent materials appear to have a maximum intensity at about 75°F. The luminance-decay rate of both a high initial brightness (HIB) and low initial brightness (LIB) material was increased with increasing temperatures. At higher temperatures, above 75°F, the rate of luminance decay of the HIB material was so rapid that its usefulness was destroyed. Below 75°F the rate of luminance decay was greatly retarded until at -60°F the luminous life for both the HIB and LIB specimens is about equal. Temperature has essentially no effect on the luminance of the radioactive self-luminous materials throughout the range used in this series of measurements (-60° to 150°F). However, at about -60°F the luminance begins to drop appreciably. A comparative measure of the absorbed phosphorescent energy at various temperatures of a constant irradiation was made.

Naval Research Lab., Washington, D. C.
THE PROPERTIES OF PAINTS AS AFFECTED BY ULTRAVIOLET RADIATION IN A VACUUM. PART I, by F. M. Noonan, A. L. Alexander, and J. E. Cowling. Interim rept. 13 July 60, 41p. 10 refs. NRL rept. 5503.
Order from LC mi$3.30, ph$7.80 PB 146 488

The control of temperature is a problem of major concern to the designers of spacecraft. The exchange of energy between a vehicle in space and its surroundings is limited to the radiation process. The idea of using paint on a space vehicle is very attractive, because a properly chosen paint might afford a practical, relatively convenient means of controlling the absorption and emission of radiant energy by the craft, thereby achieving temperature control. This report is concerned with the study of film-forming resins in a high vacuum under the influence of ultraviolet irradiation.

Plastics

Naval Ordnance Lab., White Oak, Md.
AN ADIABATIC CALORIMETER FOR THE DETERMINATION OF THE SPECIFIC HEATS OF CASTING RESINS, by R. W. Warfield, P. Donovan, and M. C. Petree. 8 Mar 58, 31p. 15 refs. NAVORD rept. 6094; AD-162 973.
Order from LC mi$3.00, ph$6.30 PB 148 450

The report describes an adiabatic calorimeter, with temperature controlling and measuring instrumentation, which has been developed for the determination of the specific heat of casting resins as a function of temperature over the range 30°C to 160°C. Results are presented for a number of typical casting resins. In some resins changes in specific heat values are observed which are indicative of second order transitions. (Author)

STEREOSPECIFIC THERMOSETTING RESINS AND HIGH HEAT RESISTANT ADHESIVES, by P. Esemplare, R. Saltzman and others. Interim rept. no. 4, 1 Feb 59-31 Mar 59, on Contract NOas-58-870-c. 7 Apr 59, 10p. Rept. no. 704; AD-229 178.
Order from LC mi$1.80, EP $3.30 PB 148 388

A statistical study was undertaken to determine the effect of Tergitol NP27 on the standard resin which involved the addition of the micelle former in successively greater percentages to the standard resole formulation. Results indicated that the greater the percentage of Tergitol, the lower the flexural strength. The strength retention was greater for a larger percentage of Tergitol of about 10%. Optimum concentration appeared to be about 12.5%. Two opposing forces appeared to exist. Glass cloth reinforced laminates were prepared, tested, and heat aged. A comparison was made between the standard resole (RRL-39-83) and a commercially available high-heat resistant resin. Both resins were laminated, heat aged for 24 hr at 500°F, and tested similarly. Preliminary results indicated that the standard resole had a strength retention upon heat aging approximately twice that of the commercial resin.

STRESS RELAXATION AND STRUCTURE OF HIGH TEMPERATURE ELASTOMERS, by Maurice Morton, V. R. Allen, and R. D. Gates. Technical rept. no. 5, 1 June-31 Aug 59, on Contract Nonr-2573(00). [1959] 28p. 6 refs. AD-228 633.
Order from LC mi$2.70, ph$4.80 PB 148 600

It has been assumed that degradation during press-heating of an extracted vulcanizate is comparable to degradation during vulcanization. Based on this assumption, calculations have been made to correct for the effect of degradation during crosslinking on the sol fraction and the degree of crosslinking. The corrected sol fraction is considerably greater than proposed by theory for natural rubber peroxide vulcanizates. Further, the deviation from theory is dependent on the original molecular weight of the primary chains. The number of chain entanglements per chemical crosslink has then been calculated, assuming that the deviation is attributable to such entanglements. It was proposed that the effectiveness of chain entanglements, i.e., number of apparent physical crosslinks, may be a function of the extent of applied strain on the network. It was found that the number of network chains, as measured by equilibrium swelling, was slightly higher for a good solvent (carbon tetrachloride) than for a poorer solvent (benzene). A sample of Viton A cured with Diak No. 1 exhibited greater resistance to high temperature degradation than did a triethylene tetramine-piperazine cure as evidenced by stress-relaxation studies. With the Diak No. 1 cure, very little change occurred in the stress-relaxation curve when the temperature was raised from 150°C. to 240°C. When raised to 275°C., however, degradation proceeded much more rapidly. (Author) (See also PB 146 230)

Material Lab., New York Naval Shipyard, Brooklyn, N. Y.
INFLUENCE OF MOLECULAR STRUCTURE AND SUBSTITUENTS ON THE ANTIZONANT PROPERTIES OF ARYL DIAMINE CHEMICALS, by A. E. Ruff and A. D. Delman. Research and development rept. 4 Mar 57, 25p. 14 refs. Final rept. on Lab Project 5850-A-2.
Order from LC mi$2.70, ph$4.80 PB 149 549

The influence of molecular structure and substituents on the antiozonant properties of fourteen related aromatic diamine chemicals was investigated in terms of their relative effectiveness as inhibitors of ozone-induced polymer degradation. Results, obtained by viscometric techniques, indicate that symmetrical compounds are superior, as antiozonants, to analogous unsymmetrical compounds. In addition, the protective capacities of the antiozonants vary inversely

with the size, number of N-hydrogen substituents, and the distance between the amine groups. The relative effectiveness of the chemicals investigated is correlated with free radical stability, in accordance with the theory of resonance. (Author)

LOSS OF ANTIOZONANT EFFICACY IN BUTADIENESTYRENE (SBR) RUBBER AFTER SHELF STORAGE, by E. W. Bergstrom. 25 Feb 60, 17p. 2 refs. Rept. no. 60-487; AD-234 723.
Order from LC mi$2.40, ph$3.30 PB 147 339

An investigation was carried out to determine the ozone resistance of (1) antiozonant inhibited SBR vulcanizates which had been stored unstressed indoors and outdoors for various periods of time and (2) vulcanizates prepared from the same inhibited compounds after storage uncured, indoors for various periods of time prior to curing. It was found that vulcanizates inhibited with N-phenyl-N'-cyclohexyl-p-phenylenediamine have excellent ozone resistance in accelerated (25 and 50 pphm) ozone tests when the vulcanizates are stressed and exposed to ozone within three days from the date they are cured. However, the same vulcanizates have no ozone resistance in accelerated ozone tests after being stored (1) unstressed indoors for one week or longer and (2) unstressed outdoors for a period of one month or longer. All antiozonant inhibited SBR vulcanizates which had been stored unstressed for periods up to 24 and 30 months both indoors and out had excellent ozone resistance in outdoor tests.

Rock Island Arsenal Lab., Ill.
OZONE RESISTANCE OF BUTYL VULCANIZATES, by E. W. Bergstrom. 16 May 60, 18p. 11 refs. Rept no. 60-1593.
Order from LC mi$2.40, ph$3.30 PB 148 366

An investigation was carried out to determine the ozone resistance of Butyl (IIR) vulcanizates compounded using formulations recommended by the rubber manufacturer for maximum ozone resistance. These formulations contained high wax loadings. Non-halogenated IIR vulcanizates prepared using these formulations had excellent ozone resistance in accelerated static tests when exposed to 25±3 pphm ozone and in outdoor static tests when exposed at a stress of 20 percent. They had poorer ozone resistance (1) in accelerated static tests when exposed to 50±5 pphm ozone, (2) in dynamic tests and constant load tests when exposed to 25±3 pphm ozone and (3) when exposed outdoors in bent loop fixtures. Chlorinated IIR vulcanizates prepared using the recommended formulations had poor ozone resistance in accelerated static tests when exposed to either 25±3 or 50±5 pphm ozone. The vulcanizates had excellent ozone resistance in outdoor tests, however, when exposed at a stress of 20 percent.

Rock Island Arsenal Lab., Ill.
STYRENE POLYMERIZATION DURING THE MILLING OF DIENE RUBBERS, by H. Wolfgang Jureleit. 28 May 59, 23p. 4 refs. Rept. no. 59-1448; AD-217 043L.
Order from LC mi$2.70, ph$4.80 PB 147 341

A method is described to polymerize styrene during the milling process of an elastomer, such as polybutadiene or a copolymer of butadiene and acrylonitrile. This "mill polymerization" was initiated by finely dispersed sodium and by sodium alcoholate. The developed method does not require any solvents or special apparatus. The experiments were performed on a conventional 2-roll rubber mill. Analysis of the final polymer compositions resulting from the mill polymerization indicates that most probably "graft polymers" are formed by this method. The results also indicate that the milling of uncured elastomers with sodium dispersion might be developed into a new method of vulcanizing without sulfur or sulfur-containing compounds. (Author)

Rock Island Arsenal Lab., Ill.
SYNTHESIS OF STEREOREGULATED HOMOPOLYMERS AND COPOLYMERS OF BUTADIENE AND STYRENE, by Ronald R. Freeman. 5 Jan 60, 28p. 10 refs. Rept. no. 59-3286; AD-233 875L.
Order from LC mi$2.70, ph$4.80 PB 147 230

Results are presented on the homopolymerization of butadiene and styrene and the copolymerization of butadiene with styrene using triethyl aluminum and titanium tetrachloride (Al-Ti) as catalysts.

Aeronautical Research Associates of Princeton, Inc., N. J.
BEHAVIOR OF SOLUTIONS OF THE NAVIER-STOKES EQUATIONS FOR A COMPLETE CLASS OF THREE-DIMENSIONAL VISCOUS VORTICES, by Coleman duP. Donaldson and Roger D. Sullivan. Rept. on Contract AF 49(638)255. May 60, 32p. 11 refs. AFOSR-TN-60-172.
Order from LC mi$3.00, ph$6.30 PB 148 027

A study has been made of the complete class of solutions of the Navier-Stokes equations wherein the radial, tengential, and axial velocities in cylindrical coordinates (r, ϕ, z) are the forms $u = u(r)$, $v = v(r)$, and $w = zw(r)$. These solutions are found to represent a rather large class of three-dimensional viscous vortex motions. The class of solutions contains Burgers' analytic solution for an unconstrained one-celled vortex as a special limiting case. The solutions obtained show that vortex motions are possible which have more than one "cell". That is, the flow may not simply spiral in toward an axis and out along it as in a one-celled configuration but may have nested regions of successively reversed axial flow. The behavior of the solutions in passing from single to multiple-celled configurations is discussed and the solution for the extremely interesting case of a two-celled analogue to Burgers' unconstrained vortex, which probably occurs quite often in nature, is given in closed form.

FIGURES OF MERIT OF TRANSFER FUNCTIONS AS RATIONAL FUNCTIONS OF THEIR COEFFICIENTS, by Herbert Knothe. Jan 60, 25p. AFMDC TR-60-3; AD-233 558.
PB 146 378

General methods and explicit formulas in terms of the coefficients of a linear differential equation are developed to express figures of merit for the response of a linear system to a step input.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
DYNAMIC INVENTORY POLICY WITH VARYING STOCHASTIC DEMANDS, by Samuel Karlin. Technical rept. no. 15 on Contract Nonr-225(28). 24 Sep 59, 58p. 14 refs. AD-227 373.
Order from LC mi$3.60, ph$9.30 PB 148 894

An extended version of the classical Arrow, Harris, Marschak dynamic inventory process is presented. The case for a single commodity is considered. A sequence of ordering decisions is made at the beginning of a number of periods of equal duration, which result in the buildup of inventories. Stock is depleted by consumption (demand), which is assumed to be an observation of a random variable with a known distribution function. All distribution functions are assumed to possess continuous densities and to belong to nonnegative random variables. A general proof is given for the fact that with a linear ordering and arbitrary independent demand distribution through successive periods, the optimal policy in each period is determinec by a single critical number. With the characterization of the optimal policy known, the main theorem is proved pertaining to comparisons of the critical numbers under the hypothesis that the demand densities are suitably stochastically ordered.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
THE SEQUENTIAL DESIGN OF EXPERIMENTS FOR INFINITELY MANY STATES OF NATURE, by Arthur E. Albert. Technical rept. no. 47 on Contract N6onr-25140. 3 Aug 59, 88p. 9 refs. AD-220 544.
Order from LC mi$4.80, ph$13.80 PB 148 158

The results of Chernoff's sequential design (Ann. Math. Stat. 30: 1959) are extended to the case where the possible states of nature are infinite in number. The assumption is made that there are 2 possible actions (terminal decisions) and a class of available experiments. After each observation, the statistician decides whether or not to continue. If he decides to continue, he must select one of the available experiments; if he decides to stop, he must select one of the 2 terminal actions.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
THREE HYPERBOLIC SURFACES WITH UNUSUAL PROPERTIES, by Robert Osserman. Technical rept. no. 14 on Contract DA 04-200-ORD-704. 19 Feb 60, 14p. 8 refs. OOR rept. 1323.18-M.
Order from LC mi$2.40, ph$3.30 PB 148 436

This paper gives examples of simply-connected surfaces which exhibit various types of unusual behavior. The first example is a polyhedral surface of the form $z = f(x, y)$ over the whole x, y-plane, for which an explicit quasiconformal map is given onto the interior of the unit disk. The second is a complete simply-connected minimal surface which is conformally equivalent to the unit disk. The third is the Riemann surface of the inverse to a function analytic in the unit disk.

Battelle Memorial Inst., Geneva (Switzerland).
THEORETICAL STUDY ON HOMOTOPY THEORY AND DUALITY FOR MODULES AND SPACES. Final and annual technical rept. no. 1. 1 Feb 59-31 Jan 60, on Contract DA 91-591-EUC-1060. 29 Feb 60, 14p. 3 refs. AD-234 398.
Order from LC mi$2.40, ph$3.30 PB 147 255

Homotopy groups of two variables and their duality properties are studied both in the algebraic and in the topological context. On the algebraic side, the theory of these groups and their exact sequences is built up in a most general framework. The results are then applied to special cases and interrelated with known algebraic concepts, primarily for modules over a ring. On the topological side, algebraic topology is shown to be obtainable from the groups, their exact sequences, and the related concepts. The new concepts and results suggested by the duality are investigated. (Author)

California U., Berkeley.
ON SINGULAR PARTIAL DIFFERENTIAL BOUNDARY PROBLEMS, by Frantisek Wolf. Technical rept. no. 7 on Contract Nonr-222(62). June 59, 23p. 7 refs. AD-225 635.
Order from LC mi$2.70, ph$4.80 PB 146 415

Second order partial differential boundary problems are considered. The differential operator is required to be elliptic inside the domain G (not necessarily bounded) and its ellipticity $\sigma(s)$ is allowed to go to zero on the boundary (called singular points of G). The situation is generalized concerning non-self-adjoint operators and general boundary conditions. The operators are compared and the difference of their resolvents are studied by having the operators defined in the same space, $L^2(G)$. The operators are to be the same near the singular points as far as their boundary conditions and curves are concerned. Certain additional boundary curves Σ are added to ∂G in order to remain in $L^2(G)$. These curves may be contained entirely in the interior of G, or divide G in several disconnected subregions G_1, G_2 with different boundary conditions on the 2 sides of Σ. The differential operator is completely reduced by the decomposition $L^2(G) = L^2(G_1) \oplus L^2(G_2)$, where the functions of $L^2(G_1)$ are all zero on G_2, and similarly for $L^2(G_2)$. Proof is presented of the theorem which asserts that the difference of the 2 resolvents is a compact operator.

Columbia U., New York.
ON THE GEOMETRICAL SIGNIFICANCE OF THE MOMENTS OF ORDER STATISTICS AND OF DEVIATIONS OF ORDER STATISTICS FROM THE MEAN IN SAMPLES FROM GAUSSIAN POPULATIONS, by Harold Ruben. Rept. on Contract Nonr-266(59). [1959] 16p. 4 refs. CU-9-59-Nonr-266(59)MS.
Order from LC mi$2.40, ph$3.30 PB 148 577

Let $E = E_{r|n}$ denote the rth largest observation in a random sample of n observations from a normal population with zero mean and unit variance. The distribution is investigated of $E_{r|n}$, the rth order statistic, and that of $E_{r|n} - \bar{E}$, the deviation of the rth order statistic from the sample mean ($\bar{E} = \sum_1^n E_{r|n}/n$), from the point of view of the moment of these distributions. The characteristic function of $E_{r|n} - \bar{E}_{r|n}$ and of $E_{r|n}$ are obtained in a form which enables the geometrical significance of the moments of the 2 statistics to be assessed. Also shown is the fact that the sth moment of $E_{r|n} - \bar{E}$ is equal to the expectation of $n^{-1/2} s H_s(E\sqrt{n})$ in the elementary probability law distribution, where $H_s(x)$ is the $(s+1)$th Tchebycheff-Hermite polynomial, normalized so that the coefficient x^s is unity.

RUNGE-KUTTA-GILL SOLUTION OF FIRST-ORDER DIFFERENTIAL EQUATIONS, by Alexander Edwards. Rept. on Contract DA 20-089-ORD-39246. 20 Apr 60, 19p. 3 refs. Rept. no. RR-23.
Order from LC mi$2.40, ph$3.30 PB 148 522

This report presents an extension for use with Purdue University's Compiler IL The extension solves a system of first-order differential equations of the form $dx_i/dt = f_i(x_i, t)$ using the Runge-Kutta Method as developed by Dr. Stanley Gill, (Cambridge Philosophical Society Proc. 1951, v. 47, p. 96-108). The extension as written is used with Burrough's Datatron 205 Digital Computer with the automatic floating-point unit, Model 360. The program is written in machine language. The approximate running time per solution is calculated by the expression: $T_{\Delta t} = (.34 + .6n) + 4t_f$ where $T_{\Delta t}$ = time in seconds for each interval Δt, n = number of equations and t_f is the time required to evaluate the functions $f(x_i)$. The accuracy is of the order $(\Delta t)^5 x_i$. (Author)

Connecticut U. [Storrs]
ON ORTHONORMAL SERIES AND DENSITY OF INTEGERS, by Richard P. Gosselin. Rept. on Contract AF 49(638)608. May 60, 17p. 3 refs. AFOSR-TN-60-555.
Order from LC mi$2.40, ph$3.30 PB 148 402

This note considers the convergence implications of hypotheses on the coefficient sequence of orthonormal series of the type $\sum_{n \geq 1} (\log n)^b |a_n|^2 < \infty$, $0 \leq b < 2$. The results are stated in terms of the almost everywhere convergence of subsequences of the full sequence of partial sums whose indices satisfy specified density conditions. (Author)

A BIBLIOGRAPHY OF PUBLICATIONS IN THE THEORY OF GAMES, by H. Stephen Schloss. Scientific rept. no. 1, 1944-1959, Contract AF 19(604)4573. 23 Oct 59, 96p. 1474 refs. AFCRC-TN-59-797; AD-234 153.
Order from LC mi$5.40, ph$15.30 PB 146 648

This bibliography was compiled primarily by examining the issues of The Mathematical Reviews from 1944 to the present, Operations Research, Annals of Mathematical Statistics, existing bibliographies in works by J. C. C. McKinsey, D. Blackwell and M. A. Girshick, Abraham Wald, R. D. Luce and H. Raiffa, and the comprehensive listing in Contributions to the Theory of Games IV, Annals of Mathematics Studies, no. 40, Princeton University Press. Other entries were found during general reading in this field. While some articles are not readily available they have been included, since the titles will indicate the aspect of game theory in which the particular writer is interested.

Electronics Research Lab., Northeastern U., Boston, Mass.
A BIBLIOGRAPHY OF RECENT PUBLICATIONS IN QUEUING THEORY, by Samuel M. Giveen. Scientific rept. no. 2, 1955-1959, on Contract AF 19(604)4573. 15 Dec 59, 17p. 128 refs. AFCRC-TN-60-103; AD-234 152.
Order from LC mi$2.40, ph$3.30 PB 146 647

This bibliography is designed to cover the literature on queuing theory for the period from 1955 to 1959. The present bibliography is concerned basically with the mathematical theory of the subject, and articles involving applications have been included where they seem to have a direct bearing on the mathematical equations of the theory. Purely descriptive articles have in general been omitted.

AN EXACT SEQUENCE IN DIFFERENTIAL TOPOLOGY, by Morris W. Hirsch. Rept. on Contract AF 49(638)253. May 60, 4p. 4 refs. AFOSR-[TN]-60-544.
Order from LC mi$1.80, ph$1.80 PB 148 326

An exact sequence... $\rightarrow \Gamma^n \rightarrow \theta^n \rightarrow \Lambda^n \rightarrow \Gamma^{n-1} \rightarrow \ldots$ is described, relating certain abelian groups of interest in differential topology. (Author)

Institute for Advanced Study, Princeton, N. J.
AN INITIAL VALUE PROBLEM FOR POSITIVE SYMMETRIC HYPERBOLIC SYSTEMS, by Milton Lees. Rept. on Contract AF 49(638)253. Dec 59, 13p. 3 refs. AFOSR [TN]-60-30; AD-232 920.
Order from LC mi$2.40, ph$3.30 PB 146 316

An initial value problem for a symmetric hyperbolic system of partial differential equations is investigated by the method of finite differences. The assumption is made that the matrices of the system are symmetric and positive-definite. The initial value problem posed is distinct from the Cauchy problem. The existence and uniqueness of a solution is proved for all sufficiently smooth data. An approximate numerical procedure is described.

Institute for Advanced Study, Princeton, N. J.
ON A COLORING PROBLEM, by E. Asplund and B. Grunbaum. Rept. on Contract AF 49(638)253. Dec 59, 12p. 2 refs. AFOSR [TN]-60-29; AD-232 951.
Order from LC mi$2.40, ph$3.30 PB 146 317

A problem, posed by A. Bielecki (Colloq. Math. 1:33, 1948) is solved by the following theorem: Each family of rectangles in the plane, with horizontal and vertical edges, and such that no 3 have a common point, may be decomposed into 6 subfamilies consisting of mutually disjoint recetangles. Some related problems and results are discussed. (Author)

Institute for Advanced Study, Princeton, N. J.
ON EMBEDDING DIFFERENTIABLE MANIFOLDS IN EUCLIDEAN SPACE, by Morris W. Hirsch. Rept. on Contract AF 49(638)253. May 60, 10p. 10 refs. AFOSR-[TN]-60-545.
Order from LC mi$1.80, ph$1.80 PB 148 327

Recent results on combinatorial manifolds are applied to obtain embedding theorems for differentiable manifolds. It is shown that if M is a differentiable n-manifold, M can be embedded in Euclidean q-space R^q, where (a) $q = 2n-1$ if M is non-closed; (b) $q = n+2$ if M is contractible and n is odd; (c) $q = n+1$ if M is contractible and n is even. Various other results are obtained by assuming special conditions, e. g. M is parallelizable, or M is highly connected. (Author)

GREEN'S FUNCTIONS FOR MONATOMIC SIMPLE CUBIC LATTICES, by A. A. Maradudin, E. W. Montroll and others. Rept. on Contracts AF 18(600)1315 and AF 49(638)399. Nov 59, 34p. 28 refs. Technical note BN-188; AFOSR-TN-60-202; AD-234 104.
Order from LC mi$3.00, ph$6.30 PB 146 416

A tabulation to six significant figures of the Green's functions for monatomic simple cubic lattices which are defined by the integral $I(a, b, c; \alpha; \beta) = \frac{1}{\pi^3} \int_0^{\pi}\int_0^{\pi}\int_0^{\pi} \frac{\cos ax \cos by \cos cz}{(2+\alpha)\beta - \cos x - \cos y - \alpha \cos z}\, dx\,dy\,dz$ is presented for the following ranges of the parameters: $\mu = \beta^{-1} = 0.00(0.01)1.00$; $\alpha = 1, 2, 4, 8, 16$; and $0 \leq a^2 + b^2 + c^2 \leq 15$. The recurrence formula satisfied by this integral, closed form expressions for the integral for special values of the parameters, asymptotic expressions valid in different ranges of the parameters, and examples of the applications of these tables are presented. (Author)

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
AN OPTIMAL POINCARE INEQUALITY FOR CONVEX DOMAINS, by L. E. Payne and H. F. Weinberger. Rept. on Contract AF 49(638)228. Feb 60, 15p. 6 refs. Technical note BN-193; AFOSR-TN-60-248; AD-233 371.
Order from LC mi$2.40, ph$3.30 PB 146 754

The second (first non-zero) eigenvalue μ_2 of the free membrane problem $\Delta v + \mu v = 0$ with $\partial v/\partial n = 0$ on the boundary for an n-dimensional convex domain of diameter D is shown to satisfy $\mu_2 \geq \pi^2 D^{-2}$. Equality is approached for a thin parallelepiped. (Author)

TREATMENT ERRORS IN COMPARATIVE EXPERIMENTS, by George Zyskind and Oscar Kempthorne. Rept. on Contract AF 33(616)5599. Apr 60, 83p. 45 refs. WADC Technical note 59-19.
Order from OTS $2.25 PB 161 874

The present report investigates a representative number of alternative experimental schemes in which explicit allowance is made for the fact that application of intended amounts of treatments may be subject to error. It is shown how the question of treatments subject to error may structurally be incorporated into a broader overall approach to experimental designs. When certain sets of structural conditions are satisfied the expected values of mean squares in the analyses of variance tables have simple and easily specifiable forms. These conditions have been verified to hold in all of the examples discussed. If treatment errors are operative then repeated independent attempts at realizing the preassigned amounts of treatments are to be desired since without them partial or total confounding of treatment amounts and treatment errors will result. The presence of treatment errors tends to decrease the sensitivity of tests of significance for treatment effects. The presence of interactions involving treatment errors tends not only to further decrease the sensitivity of tests but also to introduce negative bias both into tests of significance for treatments and into the estimation of the treatment component of variation; but the presence of these interactions tends to overestimate the average variance of estimates of treatment differences. (Author)

ON THE FACTORIZATION OF TRINOMIALS OVER GF(2) by Solomon W. Golomb, Lloyd R. Welch, and Alfred Hales. Rept. on Contract DA 04-495-ORD-18. 14 July 59, 21p. 7 refs. Memo. no. 20-189; AD-225 598.
Order from LC mi$2.70, ph$4.80 PB 148 648

The factorization of trinomials over GF(2) is investigated, and tables of factors of trinomials through degree 45 are included. Up to degree 36, the trinomials are factored completely. Detailed information on the periods of the trinomials and their factors is presented. (Author)

Kansas U., Lawrence.
CHARACTERISTICS AND CAUCHY PROBLEM FOR NONLINEAR PARTIAL DIFFERENTIAL EQUATIONS OF FIRST ORDER, by Jacek Szarski. Technical rept. no. 21 on Studies in Eigenvalue Problems, Contract Nonr-58304. 1959, 102p. 17 refs. AD-225 054.
Order from LC mi$5.70, ph$16.80 PB 148 173

The theory of Cauchy characteristics is investigated for the equation of the form: $z_x = f(x, y_1, \ldots, y_n, z, z_{y_1}, \ldots, z_{y_n})$. The Cauchy problem is also studied for z_x and for systems of equations of the form: $z^i_x = f^i(x, y_1, \ldots, y_n, z^1, \ldots, z^m, z^i_{y_1}, \ldots, z^i_{y_n})$, $z^i_{x_v} = p^{iv}(x_1, \ldots, x_p, z^1, \ldots, z^m)$, and $z^i_{x_v} = f^{iv}(x_1, \ldots, x_p, y_1, \ldots, y_n, z^1, \ldots, z^m, z^i_{y_1}, \ldots, z^i_{y_n})$, where $i = 1, 2, \ldots, m$ and $v = 1, 2, \ldots, p$. Partial differential inequalities of the first order are considered, and also the uniqueness of the solution of the Cauchy problem for z_x and for z^i_x. The classical theory of characteristic strips of first order is treated for z_x together with recent results obtained by A. Plis. Characteristic strips of second order are considered for z_x, and existence theorem are studied for z_x and z^i_x. Also considered are the uniqueness and existence theorems for p^{iv} and f^{iv}.

THEORY OF BESSEL POTENTIALS. PART I, by N. Aronszajn and K. T. Smith. Technical rept. no. 22 on Studies in Eigenvalue Problems, Contract Nonr-58304. 1959, 120p. 27 refs. AD-226 343.
Order from LC mi$6.00, ph$18.30 PB 148 585

A basis is presented for a treatment of differential eigenvalue and boundary value problems. The general theory of functional spaces and functional completion previously developed is applied to special spaces which are of importance in the study of differential problems, especially of the elliptic type. Potentials are considered which are based on the kernels: $G_\alpha(x) = \frac{1}{2^{(n+\alpha-2)/2}\pi^{n/2}\Gamma(\frac{\alpha}{2})} K_{\frac{n-\alpha}{2}}$ times $(|x|)|x|^{(\alpha-n)/2}$, where $K_{(n-\alpha)/2}$ is the modified Besel function of the third kind. All corresponding potentials are called Bessel potentials of order α. The theory of potentials of order α in the whole space R^n is given. The classes of potentials P^α are considered in the subdomains of R^n (especially in bounded domains), and also on differentiable and Riemannian manifolds.

ASYMPTOTIC REPRESENTATION OF THE SPECTRAL FUNCTION OF SELF-ADJOINT ELLIPTIC OPERATORS OF THE SECOND ORDER WITH VARIABLE COEFFICIENTS, by F. J. Bureau. Technical (scientific) note no. 2 on Contract AF 61(052)86. Nov 59, 80p. 21 refs. AFOSR-TN-59-1182; AD-232 050.
Order from LC mi$4.50, ph$12.30 PB 146 716

Let $L_x \equiv a^{ij}(x)\frac{\partial 2}{\partial x^i \partial x j} + b^i(x)\frac{\partial}{\partial x} + c(x)$, $(i, j = 1, \ldots, n)$ be a self-adjoint elliptic operator with analytic coefficients and $u_{tt} - L_x u = 0$ the totally hyperbolic equation associated with L_x. The connection between the elementary solutions of L_x and the hyperbolic equation is described. The solution of the Cauchy problem for the hyperbolic equation is written with classical symbols only. Then the asymptotic behavior is considered of the spectral function $\Theta(x, y; \lambda)$ of $L_x v + \lambda v = 0$, $x \in D$, and $v = 0$ on D, where λ a parameter, D a bounded simply connected domain of R^n with boundary D.

WATSON TRANSFORMS ON GROUPS, by Richard R. Goldberg. Rept. on Contract AF 49(638)383. Mar 60, 7p. 1 ref. AFOSR TN-60-198; AD-233 957.
Order from LC mi$1.80, ph$1.80 PB 146 417

The theory of general transforms of $L^2(0, \infty)$ is extended to groups. If G is any locally compact abelian group then, on $L^2(G)$, a set of integral transforms is constructed each of which gives rise to a unitary transformation on $L^2(G)$. With appropriate specialization these integral transforms become the classical Watson transforms. (Author) (See also PB 146 418)

ON THE METHOD OF KRYLOV-BOGOLIUBOV-MITROPOLSKI FOR THE EXISTENCE OF INTEGRAL MANIFOLDS OF PERTURBED DIFFERENTIAL SYSTEMS, by J. K. Hale. Rept. on Contract AF 49(638)382. Jan 60, 19p. 15 refs. Technical rept. 60-1; AFOSR-TN-59-1293; AD-233 806.
Order from LC mi$2.40, ph$3.30 PB 146 365

Some important results of N. Bogoliubov and Y. Mitropolski [Asymptotic methods in the theory of nonlinear oscillations, (Russian) Moscow (1955) Rev. 1958] on the existence of integral manifolds of differential systems are discussed. The results are stated in terms of a particular problem, but the proofs of these results apply to a much larger variety of questions. Only those generalizations are mentioned which are essential to make an association with some recent results of various authors in this country, and postpone a more complete discussion of the generalizations to a later paper. (Author)

PERIODIC ORBITS ON TWO MANIFOLDS, by Bruce L. Reinhart. Rept. on Contract AF 49(638)382. Jan 60, 13p. 3 refs. Technical rept. 60-2; AFOSR-TN-59-1282; AD-233 043.
Order from LC mi$2.40, ph$3.30 PB 146 722

Given any vector field V on an oriented 2 manifold, an integer I(V, C), defined by an integral, is assigned to any curve C. On the other hand, to any C with everywhere nonzero tangent vector, an integer called the winding number of C can be assigned. By comparing these 2 integers, necessary conditions for C to be a periodic orbit may be obtained. These ideas are discussed and applied to a problem on the solid torus. A certain class of vector field is shown to always admit a periodic orbit.

SOME EXTENSIONS OF LIAPUNOV'S SECOND METHOD, by J. P. LaSalle. Rept. on Contract AF 49(638)382. [1960] 38p. 8 refs. Technical rept. 60-5; AFOSR-TN-60-22; AD-233 805.
Order from LC mi$3.00, ph$6.30 PB 146 363

In studying the stability of a system it is never completely satisfactory to know only that an equilibrium state is asymptotically stable. As a practical matter, it is necessary to have some idea of the size of the perturbations the system can undergo and still return to the equilibrium state. It is never possible to do this by examining only the linear approximation. The effect of the nonlinearities must be taken into account. Liapunov's second method provides a means of doing this. Mathematical theorems underlying methods for determining the region of asymptotic stability are given, and the methods are illustrated by a number of examples. (Author)

ORDER STATISTICS AND ESTIMATORS FOR THE WEIBULL DISTRIBUTION, by F. C. Leone, Y. H. Rutenberg, and C. W. Topp. Rept. on Contract AF 49(638)361. Mar 60, 25p. 14 refs. AFOSR-TN-60-489.
Order from LC mi$2.70, ph$4.80 PB 147 747

The first part of this paper is devoted to an expository discussion of the properties of the generalized Weibull Distribution $F(x) = 1 - \exp[-((x-a)/b)^c]$. This is followed by a discussion of the order statistics from the distribution. In the second part, properties of the distributions of the smallest and largest order statistics are studied. The third part deals with problems of estimation of parameters.

INTRA- AND INTER-BLOCK ANALYSIS FOR FACTORIALS IN INCOMPLETE BLOCK DESIGNS, by R. A. Bradley, R. E. Walpole, and C. Y. Kramer. Technical rept. no. 7 (Final) on The Development of Statistical Methods for Experimental Designs in Quality Control and Surveillance Testing, Contract Nonr-2352(01). June 59, 42p. 22 refs. AD-219 182.
Order from LC mi$3.30, ph$7.80 PB 146 406

An extension was made on the recent work of Kramer and Bradley [Ann. Math. Stat. 28:349-361, 1957] to the use of factorials in the several suitable classes of two-associate class, partially balanced incomplete block (p. b. i. b.) designs not previously considered. A second objective is to complete the earlier work through utilization of inter-block information in combined intra- and inter-block estimators. Considered specifically are the recovery of inter-block information in group divisible designs, both intra- and inter-block analyses for Latin-square, sub-type L_2 designs and Latin-square, sub-type L_3 designs, and discuss other p. b. i. b. designs with two associate classes. In each situation tests of significance and estimators of factorial effects are obtained along with efficiencies of contrasts. (Author)

Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C4). July 59, 21p. 6 refs. AD-229 937.
Order from LC mi$2.40, ph$4.80 PB 147 273

A program was constructed to provide certain basic statistical parameters associated with the classical multivariate linear regression model. Treating standard regression weights derived by any of several methods, the program supplies 2 measures of comparison and effectiveness: (1) the multiple correlation coefficient and (2) the average squared error of prediction. In addition, raw score regression weights, or b weights, are provided which may be utilized in predicting the dependent (criterion) variable of the model. The additive constant of the raw score model is also calculated. (Author)

A STOCHASTIC METHOD OF SOLVING PARTIAL DIFFERENTIAL EQUATIONS USING AN ELECTRONIC ANALOG COMPUTER, by Kuei Chuang, Louis F. Kazda, and Thomas Windeknecht. Rept. on Project Michigan, Contract DA 36-039-sc-78801. June 60, 53p. 8 refs. 2900-91-T.
Order from LC mi$3.60, ph$9.30 PB 148 524

This report presents an analog-computer method for solving a general class of two-dimensional boundary-value problems in which only a small number of operational amplifiers is required. The method simulates the boundary-value problem under consideration as a stochastic model by a technique commonly designated the "Monte Carlo method." In this case, the stochastic method becomes a tool for the numerical analysis of the partial differential equation. Although the Monte Carlo method of digital-computer solution of partial differential equations has been extensively studied, its application to the analog computer is believed to be new.

INTERPRETIVE ROUTINE FOR QUADRUPLE-PRECISION NUMBERS, by Murray E. Sherry. Mar 59 9p. Cambridge Computer Series no. 3; AFCRC-TN-59-155; AD-233 828.
Order from LC mi$1.80, ph$1.80 PB 146 331

For programming purposes, the Cambridge computer contains 2000 registers numbered 0000 to 1999, each of which will accomodate a 10 decimal digit number with sign. Registers 0000 to 0099 and 0900 to 1999 are used for the quadruple-precision routine. Registers 0100 to 0899 are for general programming use. The quadruple-precision routine enables the programmer to deal with numbers containing 37 decimal digits. The exponent of the number is the written exponent (mod 500). Numbers are stored in memory in 4 successive registers. A number is referred to by the location of the first register. The correct sign of the number must be carried in all 4 memory locations. THE DECISION AND SYNTHESIS PROBLEMS IN SEMI-MODULAR SWITCHING THEORY, by James H. Shelly. Doctoral thesis. Rept. on Contract Nonr-1834(27). 20 May 59, 98p. 41 refs. Rept. no. 88; AD-219 323.
Order from LC mi$5.40, ph$15.30 PB 146 603

The decision and synthesis procedures are investigated for semi-modular circuits, a sub-class of asynchronous switching circuits. This includes a characterization of such circuits by means of properties of a set of numerical vectors and an application of these results to the synthesis problem. The synthesis procedure studied assumes that the description of the circuit to be synthesized is in the form of a set L of n-dimensional vectors of non-negative integers. The object of the synthesis is to produce a semi-modular circuits C whose C-state lattice coincides with L. Another aspect of the synthesis problem is that the description of the circuit is often in a flow chart form, rather than as a lattice of vectors. (Author)

Electronics Research Lab., U. of California, Berkeley.
AN OPTIMAL STRATEGY FOR A SATURATING SAMPLE-DATA SYSTEM, by Charles A. Desoer and Jack Wing. Rept. on Contract AF 18(600)1521. 15 Dec 59, 42p. 6 refs. Series no. 60, issue no. 262; AFOSR-TN-60-67; AD-233 739.
Order from LC mi$3.30, ph$7.80 PB 146 361

The problem of finding, proving, and implementing the optimal strategy for the sampled-data servo is discussed. A second-order linear servomechanism is considered. The optimal control signal for this system may be obtained by a simple method using standard analog computer techniques. A formulation is presented of the problem that requires the minimum number of parameters. The set of all possible initial states is partitioned into sets, R_N, in terms of the minimum number of sampling periods required to reach equilibrium. Theorems are presented which establish the exact shape of these sets. The optimal strategy is shown to be unique for special initial states. The optimality of the proposed strategy is established and implemented. The relationship between the optimal strategy for the sampled system and the optimal relay solution for the corresponding continuous system is discussed.

Institut d'Optique, Paris (France).
DESIGN OF A COMPUTER ESPECIALLY ADAPTED TO THE STUDY OF THE PROPERTIES OF THIN FILMS. Final technical rept. no. 1, 1 Mar 59-1 Mar 60, on Contract DA 91-591-euc-1080. [1960] 33p. AD-235 138.
Order from LC mi$3.00, ph$6.30 PB 147 252

A study is summarized of the design of the logical scheme of a digital computer especially adapted to the study of the properties of thin films. The study of thin films leads to operations which, from the computer point of view, were classified under 2 categories: (1) elementary operations such as algebraic sums and multiplications; and (2) interpretive operations as division, square root, sine, cosine, and exponential functions. The following special features for optical calculations were developed: (1) a double address system which rules the connections between the memory and the arithmetic unit; (2) a novel complement-type of performing algebraic sums within the arithmetic unit; (3) a novel conversion from fixed, point to floating-point notation, to operate automatically when required within a running program; and (4) jump and return transfers to and from subroutines.

International Telemeter Corp., Los Angeles, Calif.
CONVENTIONS REGARDING LOGICAL ARRANGEMENT OF INFORMATION ON DISC. Technical rept. no. 13 [on Contract AF 30(602)1566] 20 Oct 57, 13p. RADC-TN-57-384; AD-131 380.
Order from LC mi$2.40, ph$3.30 PB 146 723

Consideration was given to the following: (1) the representation and ordering of information, (2) punched paper tape, (3) flexowriter punching, (4) the tape-to-tape unit, (5) the tape-to-film unit, (6) the film-to disk unit, and (7) the desk reader unit.

Michigan U. Research Inst., Ann Arbor.
APPLICATION OF LOGIC TO THE DESIGN OF COMPUTING MACHINES, by A. W. Burks, H. Wang, and J. Holland. Final rept. on Contract AF 18(603)72. Aug 59, 13p. 2512-4-F; AFOSR-TR-59-106; AD-226 604.
Order from LC mi$2.40, ph$3.30 PB 146 390

The results previously obtained on fixed automata are summarized. Results obtained on growing automata are reviewed. A universal computer is described which is capable of simultaneously executing an arbitrary number of sub-programs. The number of such sub-programs vary as a function of time under program control or as directed by input to the computer. Three features of the computer are: (1) the structure of the computer is a 2-dimensional modular (or iterative) network; (2) each sub-program is spatially organized, thus facilitating the simulation of highly parallel systems having many points or parts; and (3) the computer's structure and behavior can, with simple generalizations, be formulated so as to make it a useful abstract tool for investigating problems in automata theory. SAMPLED-DATA CONTROL SYSTEMS WITH TWO DIGITAL PROCESSING UNITS, by James C. Hung. Rept. on Contract AF 49(638)586. Jan 60, 29p. 8 refs. Technical rept. 400-2; AFOSR-TN-60-18; AD-232 461.
Order from LC mi$2.70, ph$4.80 PB 146 714

The theory and the procedure are presented for designing the sampled-data control system having a digital processing unit in the forward line and another digital processing unit in the feedback loop to response to inputs as well as to neutralize the disturbance of a deadbeat system. The examples using the proposed design procedure are given, and their root-loci are plotted and discussed. (Author)

A THEORY OF SMALL DEFORMATIONS OF SOLID BODIES, by J. F. Besseling. Rept. on Contract AF 49(638)223. Feb 59, 112p. 42 refs. SUDAER no. 84; AFOSR-TN-59-605; AD-217 172.
Order from LC mi$6.00, ph$18.30 PB 148 754

An attempt is made to present a theory that is capable of giving a mathematical description of the following phenomena observed in the deformation and heating of solid bodies: thermal stresses, thermoelastic damping of vibrations, dynamic and static moduli, Bauschinger effect and other anisotropic hardening phenomena in plastic deformation, primary creep preceding the secondary stage of steady creep under constant stress, creep recovery and stress relaxation. The variational principles of thermoelasticity, creep and of the theories of plasticity are all derived from one thermodynamic variational principle which is formulated with the aid of the entropy displacement field introduced by Biot. Thermoelastic damping of bending vibrations of beams and creep damping of pure shear vibrations are considered in some detail. (Author)

THE EFFECT OF AXIAL CONSTRAINT ON THE INSTABILITY OF THIN CIRCULAR CYLINDRICAL SHELLS UNDER EXTERNAL PRESSURE, by Josef Singer. Technical note no. 1 on Contract AF 61(052)123. Sep 59, 21p. 9 refs. AFOSR-TN-60-165; AD-232 083.
Order from LC mi$2.70, ph$4.80 PB 146 711

The effect of axial elastic restraint on the instability of a circular cylindrical shell under hydrostatic pressure or under uniform lateral pressure, is analysed by a Rayleigh Ritz approach. For the case of hydrostatic pressure the effect is calculated for a wide range of parameters and design curves are presented for the percentage increase in critical pressure. The analysis is carried out for restraints which are active from the beginning of loading and for such which come into action only at the onset of buckling, and the difference between these 2 types of restraint is shown to be very small. POINTED VERTICES IN THE YIELD SURFACE, by Aris Phillips. Technical rept. no. 7 on Contract Nonr-609(12). Sep 59, 26p. 9 refs. AD-228 393.
Order from LC mi$2.70, ph$4.80 PB 148 568

Tests were described in which thin-walled tubes of annealed commercially pure aluminum (2S-0) were loaded under combined tension and torsion. The paths of loading in those tests had, at regular intervals, very abrupt changes in the direction of the stress increment vector. These abrupt changes in the direction of the stress increment vector were found to produce small abrupt changes in the direction of the plastic strain increment vector. Such results imply the existence of pointed vertices in the yield surface and specifically imply that the loading path carries a pointed vertex with it. The evaluation of these tests is continued. The loading path is shown conclusively to carry a pointed vertex with it. (Author)

SIMPLIFIED VIBRATION ANALYSIS OF ELASTIC SANDWICH PLATES, by Yi-Yuan Yu. Technical note no. 5 on Contract AF 49(638)453. Aug 59, 25p. 6 refs. AFOSR-TN-59-1082; AD-234 221.
Order from LC mi$2.40, ph$4.80 PB 146 639

In a sequence of 3 recent papers by the author, a new flexural theory of elastic sandwich plates was developed, and, on the basis of the theory, the flexural vibration of sandwich plates was analyzed. The theory is good for a very wide frequency range that is of practical interest, but vibration analysis on the basis of the theory will in general be complicated due to the high order of the equations. For low frequency ranges simplified treatment of the vibration problem becomes possible and is discussed. Simpler equations of motion of sandwich plates are introduced, and their accuracy is determined by comparing with the previous more complete equations. (Author)

BUCKLING OF A THIN CIRCULAR CYLINDRICAL SHELL HEATED ALONG AN AXIAL STRIP, by D. W. Hill. Rept. on Contract AF 49(638)223. Dec 59, 99p. 19 refs. SUDAER no. 88; AFOSR-TN-59-1250.
Order from LC mi$5.40, ph$15.30 PB 148 504

The problem considered is that of a thin circular cylindrical shell heated along a narrow strip in the axial direction. The restraint of the cooler portion causes compressive axial stresses in the heated strip, and if these stresses are sufficient in magnitude the cylinder can buckle into waves along the heated strip. The problem is solved using the Ritz method, assuming for the displacements Fourier series modified by a shape factor chosen to magnify the solution in the vicinity of the heated strip. The convergence rate of the solution is greatly increased by the shape factor. In the analysis of the stress distribution, the cylinder is assumed to be simply supported on its ends so that the radial and circumferential displacements there are the range $0 \leqslant E\alpha V/\sigma_y \leqslant 5$ and the particular case $E\alpha V/\sigma_y \to \infty$. Detailed solutions are given for $E\alpha V/\sigma_y = 1, 2, 3, 4, 5$ and ∞. (Author)

Stanford U., Calif.
IDEALIZED COLUMNS, by N. J. Hoff. Rept. on Contract AF 49(638)223. Aug 58, 27p. 18 refs. SUDAER no. 82; AFOSR-TN-60-381.
Order from LC mi$2.70, ph$4.80 PB 148 752

Graphic methods and simple analytic formulas are presented for the determination of the quantities of greatest interest in the elastic, plastic and creep buckling of columns. The results are rigorously valid only for columns of idealized I section but they represent good approximations in the case of extruded and built up sections. (Author)

Stanford U., Calif.
MECHANICS APPLIED TO CREEP TESTING, by N. J. Hoff. Rept. on Contract AF 49(638)223. Dec 58, 88p. 49 refs. SUDAER no. 83; AFOSR-TN-59-39.
Order from LC mi$4.80, ph$13.80 PB 148 753

The non-linearity of the creep laws governing the inelastic deformations of structural materials at high temperatures makes it difficult for the engineer to interpret correctly the results of creep tests and to predict the effect of small changes in the parameters upon the strain rates. It is the purpose of this paper to present information on the basis of which these tasks can be performed a little more easily. The causes of the large scatter in the results of creep tests, the effect of creep on the stress distribution, the interaction between linear elasticity and non-linear creep, and the difficulties encountered in the determination of the primary phase of creep are discussed with the aid of the principles of applied mechanics. The paper closes with a brief survey of instability phenomena. (Author)

Stanford U., Calif.
THE STRESSES IN AN ELASTO-PLASTIC BAR SUBJECTED TO A SUDDEN CHANGE OF SURFACE TEMPERATURE, by E. W. Parkes. Rept. on Contract AF 49(638)223. Jan 60, 21p. 8 refs. SUDAER no. 89p AFOSR-TN-60-321
Order from LC mi$2.70, ph$4.80 PB 148 505

An analysis is given for the stress history in an elasto-plastic bar subjected to a sudden change of surface temperature. The type of behavior is found

to depend on the ratio of thermal strain (αV) to yield strain (σ_y/E). For $E\alpha V/\sigma_y < 1$, the stresses are entirely elastic. For $1 < E\alpha V/\sigma_y < 2.04$ there are two transient zones of compressive yielding. For $2.04 < E\alpha V/\sigma_y < 4.4$ there are two transient zones of compressive yielding and two enduring zones of tensile yielding. For $E\alpha V/\sigma_y > 4.4$ there are two transient zones of compressive yielding, one transient zone of tensile yielding, and two enduring zones fo tensile yielding. The investigation is restricted to zero, but the axial displacements and end rotations are not restricted. In the calculation of the stability, a simplified thermal stress distribution is assumed which is the one prevailing in the middle of the cylinder. The stresses are assumed to vary around the circumference but to be constant in the axial direction. Expressions are given relating the physical parameters of the cylinder, the temperature distribution, and the magnitude of the temperature causing buckling.

A SURVEY OF THE THEORIES OF CREEP BUCKLING, by N. J. Hoff. Rept. on Contract AF 49(638)223. June 58, 66p. 50 refs. SUDAER no. 80; AFOSR-TN-60-382.
Order from LC mi$3.90, ph$10.80 PB 148 751

A survey is presented of the theories of buckling of structural elements whose materials is subject to creep deformations. Two fundamentally different approaches to the solution of the buckling problem are discussed. In one, the structural element is assumed to be perfect and perfectly centered under the loads and buckling is initiated by a disturbance in the configuration. In the second, the creep deformations begin in consequence of the deviation of the unloaded centerline or median plane of the structural element from the line of load application. In both cases the element has a finite lifetime. A critical time of creep buckling is defined beyond which the element cannot be used to carry the prescribed loads. (Author)

Stanford U., Calif.
A THEORY OF ELASTIC, PLASTIC, AND CREEP DEFORMATIONS OF AN INITIALLY ISOTROPIC MATERIAL SHOWING ANISOTROPIC STRAIN-HARDENING, CREEP RECOVERY, AND SECONDARY CREEP, by J. F. Besseling. Rept. on Contract AF 49(638)223. Apr 58, 41p. 10 refs. SUDAER no. 78; AFOSR-TN-60-384.
Order from LC mi$3.30, ph$7.80 PB 148 749

Stress-strain relations are given for an initially isotropic material, which is macroscopically homogeneous, but inhomogeneous on a microscopic scale. An element of volume is considered to be composed of various portions, which can be represented by subelements showing secondary creep and isotropic work hardening in plastic deformation. If the condition is imposed that all subelements of an element of volume are subjected to the same total strain, it is demonstrated that the inelastic stress-strain relations of the material show anisotropic strain-hardening, creep recovery, and primary and secondary creep due to the non-uniform energy dissipation in deformation of the subelements. Only quasi-static deformations under isothermal conditions are considered. The theory is restricted to small total strains. (Author)

THE STABILITY OF A CIRCULAR CYLINDER UNDER FINITE EXTENSION AND TORSION, by A. E. Green and A. J. M. Spencer. Technical rept. no. 12 for Sep 55-Jan 57 on Application of Invariance Principles in Continuum Mechanics, Contract DA 19-020-ORD-3487. Mar 57, 39p. 10 refs. Rept. DA-3487/12; OOR rept. 1271.16M.
Order from LC mi$3.00, ph$6.30 PB 138 003

A circular cylinder of isotropic, homogeneous elastic material is deformed by finite extension and torsion. The stability of the resulting equilibrium position is investigated by using the equations of the theory of small elastic deformations superposed on finite elastic deformations as the equations of neutral equilibrium of the body. These equations are formulated in terms of a general strain-energy function for the body, but in order to solve them the strain-energy function is specialized to the Neo-Hookean form.

Florida U. Engineering and Industrial Experiment Station, Gainesville, Fla.
LINE LOADINGS ON FINITE LENGTH CYLINDRICAL SHELLS: SOLUTION BY THE FINITE FOURIER TRANSFORM, by William A. Nash and T. F. Bridgland, Jr. Interim technical rept. no. 3 on Application of Shallow Shell Theory to Equilibrium and Buckling Phenomena, Contract DA 01-009-ORD-671. Mar 60, 10 refs. OOR rept. 2028.3-E.
Order from LC mi$2.70, ph$4.80 PB 148 438

The linear equations due to Flügge for the thin elastic circular cylindrical shell are solved by the use of the finite Fourier transform for two general cases of radial line loadings on a finite length shell. The loadings considered are: (a) an arbitrary line load acting along a generator and (b) an arbitrary line load applied around the circumference. The solution presents the orthogonal displacement components of the middle surface in the form of rapidly converging series. (Author)

COMPARISON OF YIELD CONDITIONS FOR CIRCULAR CYLINDRICAL SHELLS, by Antonio Sawczuk and Philip G. Hodge, Jr., Rept. on Contract Nonr-1406(04). May 59, 16p. 6 refs. DOMIIT rept. no. 1-7.
Order from LC mi$2.40, ph$3.30 PB 146 589

The yield condition for a rigid-plastic circular cylindrical shell subjected to axially symmetric loading is described in terms of the circumferential hoop stress n and the axial bending moment m. Different yield conditions are obtained depending on whether the shell is of homogeneous of ideal-sandwich construction and on whether the shell material satisfies Tresca's or Mises' yield condition. Previous work has been limited to Tresca's yield condition.

Institute of Engineering Research, U. of California, Berkeley.
ON THE GENERAL PROBLEM OF ELASTOKINETICS IN THE THEORY OF SHALLOW SHELLS, by P. M. Naghdi. Technical rept. no. 5 on Contract Nonr-222(69). Aug 59, 37p. 9 refs. Series no. 131, issue no. 5; AD-227 106.
Order from LC mi$3.00, ph$6.30 PB 148 192

Nonlinear, as well as linear, elastokinetic problems of thin shallow shells are investigated. The case of cylindrical shells is also included and treated separately. It is shown that the elastokinetic problems of shallow shells may be characterized by a system of simultaneous nonlinear partial differential equations involving the axial displacement and a stress function. These equations are exact withing the scope of the theory of shallow shells. Through a suitable order of magnitude analysis and upon certain approximations, two other systems of equations are deduced; the latter, which neglects the effects of longitudinal inertia terms, reduces to the previously know results for transverse vibrations. Three systems of equations are also deduced for dynamical problems of circular cylindrical shells in terms of radial displacement and a stress function. The first of these is such that upon linearization it becomes equivalent to Donnell's equations. Wave propagation is discussed in an infinite cylindrical shell according to the linearized differential equations. (Author)

AER, Inc. [Pasadena, Calif.]
RESPONSE OF MECHANICAL SYSTEMS TO RANDOM EXCITING FORCES, by Henry J. Stumpf. Rept. on Contract N123(60530)18702A. 1 Dec 59, 255p. 15 refs. Technical rept. 116; NOTS TP-2365; NAVORD rept. 7010; AD-234 535.
Order from LC mi$11.10, ph$39.60 PB 146 989

A brief discussion of linear vibrating systems is given, with special emphasis on multidegree-of-freedom systems. The reason that real normal modes do not exist unless the damping is of a special form is presented. A method for obtaining complex normal modes is reviewed. The problem of random exciting forces is considered, and the general techniques of the Fourier Series and Fokker-Planck methods are developed. Several detailed examples are given for both stationary and nonstationary inputs.

Avco-Everett Research Lab., Mass.
THEORY OF RADIATION FROM LUMINOUS SHOCK WAVES IN NITROGEN, by Peter Hammerling, J. Derek Teare, and Bennett Kivel. Rept. on Contracts AF 04(647)278 and DA 19-020-ORD-4862. June 59, 31p. 14 refs. Research rept. 49; AFBMD-TR-59-3; AD-220 509.
Order from LC mi$3.00, ph$6.30 PB 146 651

The physical properties behind a normal shock in nitrogen are calculated as a function of time. These include the variation of temperature, composition, ionization, and the intensity of radiation from the N_2^+ first negative band system. A particular case is considered for which experimental data are available, and regions sensitive to particular rates are indicated. A discussion of a method of determining the dissociation rate constants from measurements of the tails of radiation intensity profiles is appended. (Author)

BOUNDARY LAYER SEPARATION EFFECTS ON THE STATIC STABILITY OF A FLARED-TAIL MISSILE CONFIGURATION AT M = 2 TO 5, by J. Don Gray. Rept. on ARO, Inc., Contract AF 40(600)800. June 60, 24p. 4 refs. AEDC-TN-60-103.
Order from LC mi$2.70, ph$4.80 PB 148 100

Force and pressure measurements with a blunt-cone, cylinder-frustum configuration at M = 2 to M = 5 were made over a wide Reynolds number range to investigate the effects of boundary layer separation on the static stability parameters, C_{N_α} and x/l. Laminar boundary layer separations upstream of the flared tail produced stability parameters which were equal to or greater than those obtained when transition occurred far upstream of the flare (essentially no flow separation). Distributed roughness on the model nose essentially eliminated the variation of C_{N_α} and x/l with Reynolds number when $Re \geq 0.2 \times 10^6$, based on centerbody diameter. At Mach numbers of 4 and 5, an effect of model scale was present in the initial, normal-force curve-slope results for smooth models, whereas the center-of-pressure data were closely correlated by the free-stream Reynolds number. The test Reynolds number range was 0.06×10^6 to 3.3×10^6, based on centerbody diameter. (Author)

Arnold Engineering Development Center [Tullahoma, Tenn.]
AN INVESTIGATION OF SUPPORT INTERFERENCE ON AGARD CALIBRATION MODEL B, by C. J. Schueler. Rept. on ARO, Inc. Contract AF 40(600)800. Feb 60, 25p. 9 refs. AEDC-TN-60-35; AD-233 041.
Order from LC mi$2.70, ph$4.80 PB 146 569

Tests were conducted in the 12-in supersonic wind tunnel to determine the critical sting length for AGARD Calibration Model B with a sting-to-body diam ratio of 0.3. The tests were made at Mach numbers 2, 3, and 4 and covered a Reynolds number range of 3.5×10^6 to 13.5×10^6 based on the body length. The results indicate that the sting had no significant influence on the model surface pressure even when interference on base pressure was maximum. Over the Mach number and Reynolds number range of the tests, negligible interference was introduced by the windshield for sting length to model diameter ratios greater than 2.5. (Author)

Avco-[Everett] Research Lab., Mass.
AERODYNAMIC DISSIPATION, by H. E. Petschek. June 57, 22p. 8 refs. Research rept. 23; AD-201 438.
Order from LC mi$2.70, ph$4.80 PB 147 193

An attempt is made to re-examine the derivation of the basic aerodynamic flow equations in order (1) to discuss dissipation in a completely ionized gas in the presence of a magnetic field, and (2) to demonstrate that the basic microscopic dissipation mechanism is appreciably different.

Avco-Everett Research Lab., Mass.
AN EXPERIMENTAL AND THEORETICAL STUDY OF QUARTZ ABLATION AT THE STAGNATION POINT, by Mac C. Adams, William E. Powers, and Steven Georgiev. Rept. on Contract AF 04(647)278. June 59, 41p. 10 refs. Research rept. 57.
Order from LC mi$3.30, ph$7.80 PB 147 203

The ablation characteristics of fused quartz are determined experimentally utilizing an air arc wind tunnel. It is shown that opaque quartz will effectively absorb about 4000 Btu/lb and will radiate the aerodynamic heating, with negligible ablation, for a satellite trajectory.

Avco-Everett Research Lab., Mass.
EXPERIMENTAL STUDIES OF SHOCK WAVES IN NITROGEN, by John C. Camm and James C. Keck. Rept. on Contracts AF 04(647)278 and DA 19-020-ORD-4862. June 59, 23p. 4 refs. Research rept. 67, supersedes Research note 140; AFBMD-TN-59-9; AD-227 525.
Order from LC mi$2.70, ph$4.80 PB 147 209

Radiative relaxation behind shock waves in pure N is being studied to determine rate constants for recombination of N atoms. The radiation was measured as a function of wavelength for conditions corresponding to $T = 6000^oK$ with $\rho = 0.018\,\rho_o$ and $T = 6300^oK$ with $\rho = 0.12\,\rho_o$. The most prominent radiation in the wavelength interval studied is associated with the $N_2^+(1-)$ and $N_2(1+)$ bands. The intensity histories exhibit strong overshoot in the shock front for both bands and the peak to equilibrium intensity ratio was measured. Preliminary analysis of the final approach to equilibrium indicates that at 6400^oK the recombination rate constant for N atoms is $< 0.3 \times 10^{-32}$ cm^6/sec when N_2 is the catalyst and 2.4×10^{-32} cm^6/sec when the N is the catalyst. (Author)

HEAT TRANSFER TO SATELLITE VEHICLES RE-ENTERING THE ATMOSPHERE, by N. H. Kemp and F. R. Riddell. Rept. on Contract AF 04(645)18. Oct 56, 32p. 8 refs. Research rept. 2 (formerly Research note 21).
Order from LC mi$3.00, ph$6.30 PB 146 655

A recently developed theory of heat transfer at high velocities and high altitudes is applied to the problem of a satellite vehicle entering the atmosphere. Circular re-entry orbits are considered for bodies under the influence of gravity and drag forces. Numerical results are presented which can be used to determine the conditions under which the survival of such a satellite may be expected. In addition, an analysis is made of the value of exerting a lift force on the re-entering vehicle as a means of preventing its destruction. (Author)

Avco-[Everett] Research Lab., Mass.
HYPERSONIC CONICAL SHOCKS FOR DISSOCIATED AIR IN THERMODYNAMIC EQUILIBRIUM, by Saul Feldman. May 57, 13p. 3 refs. Research rept. 12; AD-150 841.
Order from LC mi$2.40, ph$3.30 PB 147 190

Effort is made to solve the cone problem. The Taylor-Maccoll equation is set up for a dissociating gas in thermodynamic equilibrium. Solution of the conical shock equation is analyzed for an incompressible fluid downstream of the shock. A comparison of the pressure coefficients calculated from the exact solution and the approximate incompressible one shows very good agreement.

Avco-[Everett] Research Lab., Mass.
AN INVESTIGATION OF STAGNATION POINT HEAT TRANSFER IN DISSOCIATED AIR, by Peter H. Rose and F. R. Riddell. Rept. on Contract AF 04(645)18. Apr 57, 18p. 12 refs. Research rept. 7 [formerly Research note 32] AD-150 550.
Order from LC mi$2.40, ph$3.30 PB 147 189

Theoretical and experimental results are presented for laminar heat transfer at the stagnation point of a blunt body in hypersonic flow. Results are presented for air at temperatures up to 8000^oK with up to 50% dissociation. In all cases the wall is relatively near room temperature. The experiments were performed in a shock tube and new experimental techniques are described. The data are compared with theoretical calculations including the effects of new physical phenomena, particularly dissociation, associated with high temperature air. (Author)

Avco-Everett Research Lab., Mass.
THE LARGE HIGH PRESSURE ARC PLASMA GENERATOR: A FACILITY FOR SIMULATING MISSILE AND SATELLITE RE-ENTRY, by P. Rose, W. Powers, and D. Hritzay. Rept. on Contracts AF 04(645)18 and AF 04(647)278. June 59, 35p. 12 refs. Research rept. 56; AFBMD-TR-59-6.
Order from LC mi$3.00, ph$6.30 PB 146 649

The development of an arc wind tunnel capable of stagnation pressures in the excess of twenty atmospheres and using as much as fifteen megawatts of electrical power is described. It is capable of reproducing the aerodynamic environment encountered by vehicles flying at velocities as great as satellite velocity. By the addition of a high capacity vacuum system, this facility can be used to produce the low density, high Mach number environment needed for simulating satellite re-entry, as well as hypersonic flight at extreme altitudes.

Avco-Everett Research Lab., Mass.
A NUMERICAL COMPARISON BETWEEN EXACT AND APPROXIMATE THEORIES OF HYPERSONIC INVISCID FLOW PAST SLENDER BLUNT-NOSED BODIES, by Saul Feldman. Rept. on Contract DA 19-020-ORD-4765. June 59, 21p. 13 refs. Research rept. 71; AD-226 728.
Order from LC mi$2.70, ph$4.80 PB 147 210

Calculations have been made of the flow field past a blunt body moving at hypersonic speeds through the atmosphere to include large distances downstream from the nose. Detailed profiles of the equilibrium thermodynamic functions and flow streamlines are presented for a hemisphere-cylinder moving through air at 60,000 ft. altitude at 17,500 ft/sec. A comparison is made between exact and approximate theories of the flow past slender blunt-nosed bodies, and it is shown that the second order blast wave theory could be used for the purpose of finding shock shape and the body pressure distribution. The present calculations could be used as an estimate of the inviscid wake left by a short blunt body in hypersonic flight. (Author)

ON ABLATING HEAT SHIELDS FOR SATELLITE RECOVERY, by Steven Georgiev, Henry Hidalgo, and Mac C. Adams. Rept. on Contract AF 04(647)278. July 59, 33p. 16 refs. Research rept. 65; AFBMD TR-59-7; AD-226 327.
Order from LC mi$3.00, ph$6.30 PB 147 207

Ablation is considered as a means of heat protection for recoverable satellites and a simple theory is presented for the energy absorbed per unit mass of ablated material. Experimental results, obtained in an air arc wind tunnel under simulated re-entry conditions, are presented for Teflon and Fiberglas. The results are shown to be in good agreement with the theory. Finally the insulation requirements for various types of heat shields are discussed and it is shown that a low temperature ablating heat shield is superior to both the heat sink and radiating heat shields. ON THE INSTABILITY THEORY OF THE SOFT OR MELTED SURFACE OF AN ABLATING BODY WHEN ENTERING THE ATMOSPHERE, by Saul Feldman. Rept. on Contract AF 04(645)18, Aug 58, 41p. 11 refs. Research rept. 34; AD-205 515.
Order from LC mi$3.30, ph$7.80 PB 147 398

Some ablating bodies entering the atmosphere will melt or soften. Under deceleration, the soft or melted surface will tend to develop instabilities of the Lamb-

Taylor type. Two situations involving viscous incompressible fluids are investigated here: one where the liquid layer has constant viscosity and finite thickness, and the other, where the viscosity increases exponentially with distance away from the interface, and the layer is semi-infinite in extent.

PHYSICAL GAS DYNAMICS RESEARCH AT THE AVCO RESEARCH LABORATORY, by P. H. Rose. Rept. on Contract AF 04(645)18. July 57, 55p. 32 refs. Research rept. 9, formerly Research note 37; AD-150 790.
Order from LC mi$3.60, ph$9.30 PB 146 658

Physical gas dynamic problems associated with the high temperatures involved in flight at hypersonic Mach numbers are being studied. The central concept of this study is that the important elements of the environment anticipated can be duplicated in shock tubes. Several investigations, conducted in shock tubes, into critical gas dynamic problems associated with the high temperature are described. Heat-transfer measurements in the laminar, dissociated, boundary layer at the stagnation point are discussed. Measurements of the radiative emissivity and electrical conductivity of high-temperature air are described. Preliminary studies of magnetohydrodynamics are summarized.

RADIATION FROM HOT AIR AND STAGNATION HEATING, by Bennett Kivel. Rept. on Contracts AF 04(647)278 and DA 19-020-ORD-4862. Oct 59, 29p. 16 refs. Research rept. 79; AFBMD-TR-59-20; AD-232 836.
Order from LC mi$2.70, ph$4.80 PB 147 214

The radiation heating of the stagnation region for flight speeds up to 50,000 ft/sec is investigated using experimental shock tube data supplemented by theoretical estimates. Non-equilibrium effects which modify the radiation predictions at high altitudes (≥30 mi) are pointed out. The radiation is compared with aerodynamic heating and is found to be important at high velocities (≥30,000 ft/sec) and low altitudes (≤25 mi). For this flight regime the dominant radiation results from the capture of electrons by nitrogen. (Author)

RADIATIVE TRANSPORT WITHIN AN ABLATING BODY, by Leo P. Kadanoff. Rept. on Contract AF 04(647)278. July 59, 39p. 7 refs. Research rept. 61; AFBMD TN-59-12; AD-220 505.
Order from LC mi$3.00, ph$6.30 PB 147 204

A method was developed for the calculation of net radiative flux and temperature distribution within a semi-infinite body which emits, absorbs, and scatters radiation and which allows some radiation to escape from its surface. This method was applied to the problem of calculating temperature distributions within bodies in steady state ablation.

Avco-[Everett] Research Lab., [Mass.]
STAGNATION POINT HEAT TRANSFER MEASUREMENTS IN DISSOCIATED AIR, by P. H. Rose and W. I. Stark. Rept. on Contract AF 04(645)18. Apr 57, 47p. 21 refs. Research rept. no. 3; AD-150 547.
Order from LC mi$3.30, ph$7.80 PB 146 656

The results of an experimental investigation of the laminar heat transfer at the stagnation point of a blunt body in partially dissociated air are presented and are compared to the theoretical treatment of Fay and Riddell. Heat transfer results are presented for air temperatures as high as 8000°K where more than 50% of the molecules are in the dissociated state. The experiments were performed in a shock tube and the new experimental techniques and principles are discussed briefly. Simulation of flight stagnation conditions at velocities up to satellite velocity 26,000 ft/sec. is shown to be possible in shock tubes and data has been obtained over a large altitude range at these velocities. A THEORY OF ABLATION OF GLASSY MATERIALS FOR LAMINAR AND TURBULENT HEATING, by Henry Hidalgo. Rept. on Contract AF 04(647)278. June 59, 33p. 16 refs. Research rept. 62; AFBMD TN-59-13; AD-227 993.
Order from LC mi$3.00, ph$6.30 PB 147 205

The steady state equations of motion for a thin layer of an incompressible, glassy material on the surface of an ablating and radiating blunt body are reduced to a first order ordinary differential equation which is integrated numerically. This solution is coupled with the solution of the air boundary layer for both laminar and turbulent heat transfer with or without mass vaporization of the ablating material. The distribution of the effective energy of ablation around the body is thus obtained for a cone cylinder with a hemispherical cap that re-enters the atmosphere at hypersonic flight speeds, and has quartz as the ablating material. This solution of the equations of motion at the stagnation point was verified by arc wind tunnel experiments. The present state of development of the arc wind tunnel does not permit its use for experimental investigations of ablation around blunt bodies under turbulent heating. However, the complete understanding of the ablation process at the stagnation point coupled with the current knowledge of the turbulent heating rates provides solid grounds for the validity of this ablation theory around blunt bodies. TRAILS OF AXI-SYMMETRIC HYPERSONIC BLUNT BODIES FLYING THROUGH THE ATMOSPHERE, by Saul Feldman. Rept. on Contract DA 19-020-ORD-4765. Dec 59, 94p. 12 refs. Research rept. 82; AD-233 703.
Order from LC mi$5.40, ph$15.30 PB 147 215

The trail left in the atmosphere by a body moving at hypersonic speeds is the subject of a theoretical treatment, in which the trail is divided into 2 regions: (1) the expansion-controlled trail, which treats the behavior of the wake behind the body up to a point,

along the direction of flight, where the pressure decays to the free stream value and cooling is principally controlled by the expansion of the flow; and (2) the conduction-controlled trail, where the trail cools mainly by diffusion of heat away from the high temperature core. Results of calculations that assume thermodynamic equilibrium of the flow field give the values of the thermodynamic variables in the trail of a sphere, axial distributions of emitted thermal radiation and maps of electron density distribution. Viscous effects in blunt body trails are of small importance and the cooling of the conduction-controlled trail is essentially due to conduction of heat. This portion of the trail does not widen as one proceeds downstream. Flight velocities considered vary between 15,000 and 35,000 ft/sec and altitudes range between 100,000 and 250,000 ft. (Author)

TURBULENT HEAT TRANSFER THROUGH A HIGHLY COOLED PARTIALLY DISSOCIATED BOUNDARY LAYER, by Peter H. Rose, Ronald F. Probstein, and Mac C. Adams. Rept. on Contract AF 04(645)18. Jan 58, 58p. 15 refs. Research rept. 14; AD-159 548.
Order from LC mi$3.60, ph$9.30 PB 147 191

The problem of heat transfer from high temperature air through a turbulent boundary layer to a cold surface is considered both analytically and experimentally. Heat transfer data obtained in shock tubes are presented and correlated by a semi-empirical theory which includes the effect of atomic diffusion. The distinguishing characteristics of turbulent boundary layers with dissociation and large cooling are considered. It is shown that the equations governing such flow, after certain approximations, can be represented in a form similar to the classical equations for a turbulent boundary layer.

VISCOUS AERODYNAMIC CHARACTERISTICS IN HYPERSONIC RAREFIED GAS FLOW, by Ronald F. Probstein and Nelson H. Kemp. Rept. on Contract AF 04(647)278. Dec 59, 71p. 26 refs. Research rept. 48 (Rev.); AFBMD-TR-59-2.
Order from LC mi$4.50, ph$12.30 PB 146 652

This paper considers the problem of calculating viscous aerodynamic characteristics of blunt bodies at hypersonic speeds and at sufficiently high altitudes where the appropriate mean free path becomes too large for the use of familiar boundary layer theory but not so large that free molecule concepts apply.

Ballistic Research Labs., Aberdeen Proving Ground, Md.
INTERFEROMETRIC STUDY OF THE BLUNT BODY PROBLEM, by R. Sedney and G. D. Kahl. Apr 60, 37p. 15 refs. Rept. no. 1100.
Order from LC mi$3.00, ph$6.30 PB 148 744

An experimental investigation of the flow fields around spheres in free flight was made using the optical interferometer. Data were taken for Mach numbers approximately 5 in argon, nitrogen, and air. For the temperatures existing behind the shock in nitrogen, vibrational excitation should occur but is not found. This is explained by the long relaxation path length compared to the scale of the experiment. If relaxation occurs at all it will be confined to a thin layer contiguous to the body. Evidence of molecular vibrations is found for the air test but slightly more than would be expected assuming that the oxygen is excited and the nitrogen frozen. A method of obtaining all flow variables, given the density is explained; it uses only the principles of conservation of mass and energy. (Author)

Combustion [Aerodynamics] Lab., Harvard U., Cambridge, Mass.
THE PROPAGATION OF TURBULENCE INTO A LAMINAR BOUNDARY LAYER, by Morton Mitchner. Interim technical rept. no. 3 on Contract DA 19-020-ORD-1029. June 52, 175p. 30 refs. AD-11 945.
Order from LC mi$8.10, ph$27.30 PB 149 269

The following topics are discussed: propagation of turbulence in open channel flow, experimental procedure, propagation of turbulence in a boundary layer, mechanism for the propagation of turbulence, and some considerations on the growth and decay of vorticity. A calculation for the minimum value of the jump height ratio, and the induced velocity for bounded regions are discussed in appendixes.

PRESSURE FLUCTUATIONS ON THE WALL ADJACENT TO A TURBULENT BOUNDARY LAYER, by Mark Harrison. Dec 58, 14p. 7 refs. Rept. 1260; AD-209 434.
Order from LC mi$2.40, ph$3.30 PB 148 033

A fully developed turbulent boundary layer with a zero pressure gradient has been studied in a subsonic wind tunnel. The pressure fluctuations on the wall of the wind tunnel were measured by small flush-mounted microphones. Data for the dimensionless spectral density of the pressure fluctuations, $P(f)/\rho^2 U_o^3 \delta^*$, as a function of the frequency parameter $f\delta^*/U_o$ are presented; $P(f)$, ρ, U_o, δ^*, and f are respectively the spectral density, fluid density, free stream velocity, boundary layer displacement thickness, and frequency. Data for the coefficient $(\overline{p^2})^{1/2}/\frac{1}{2}\rho U_o^2$ are also presented. The transverse cross correlation for the pressure fluctuations was studied by using two flush mounted microphones.

Rather than the longitudinal cross correlation, the longitudinal cross spectral density was studied, yielding a measure of the coherence of the pressure fluctuations at two points as a function of fx/U_C, where x is the longitudinal spacing of the two points and U_C is the effective convection velocity of the spatial pattern. A KINETIC THEORY DESCRIPTION OF RAREFIED GAS FLOWS, by Lester Lees. Rept. on Hypersonic Research Proj., Contract DA 04-495-ORD-19. 15 Dec 59, 89p. 44 refs. Memo no. 51; AD-233 618.
Order from LC mi$4.80, ph$13.80 PB 147 240

An approach to the kinetic theory of gas flows is developed which starts with Maxwell's original integral equations of transfer, rather than with the Maxwell-Boltzmann equation for the velocity distribution function itself. The advantage of this method is that relatively simple distribution functions are utilized which contain a small number of unknown functions to be determined by applying the conservation laws, plus several additional higher moments. For simplicity a 2-stream Maxwellian is employed, which is a natural extension and generalization of Mott-Smith's function for a normal shock, but differs from it in certain essential respects. This technique is now being applied to some typical non-linear rarefied gas flows. (Author)

STABILITY OF THE COMPRESSIBLE LAMINAR BOUNDARY LAYER, by Eli Reshotko. Rept. on Hypersonic Research Proj., Contract DA 04-495-ORD-19. 15 Jan 60, 168p. 21 refs. Memo. no. 52; AD-233 619.
Order from LC mi$7.80, ph$25.80 PB 147 239

As a result of a study of the stability of the compressible laminar boundary layer, it was concluded that neutral stability is achieved when the net energy transferred from the mean flow to the disturbance flow by the action of Reynolds stress is exactly dissipated. However, the relative importance of the various mechanisms changes with Mach number, so that the neutral stability diagram for a hypersonic flow might not be recognized in terms of its incompressible counterpart. Among the changes are the following: (1) The rate of conversion of energy from the mean flow to the disturbance flow through the action of the viscosity in the vicinity of the wall increases with Mach number; (2) Instead of being nearly constant across the boundary layer, the amplitude of inviscid pressure fluctuations for Mach numbers greater than 3 decreases markedly with distance outward from the plate surface, and (3) At Mach numbers less than about 2, dissipation effects are minor, but they become extremely important at higher Mach numbers, since for neutral disturbances, they must compensate for the generally destabilizing effects of items 1 and 2 above. DESIGN, FABRICATION, AND EVALUATION OF AXISYMMETRIC NOZZLES, by Larry L. Lynes. Master's thesis. Rept. on Contract Nonr-222(45). 10 Sep 59, 50p. 9 refs. Technical rept. HE-150-174; Series no. 20, issue no. 132; AD-226 224.
Order from LC mi$3.30, ph$7.80 PB 148 616

The pumping capacity of the no. 3 wind tunnel was increased in 1954 in order to accommodate a Mach 6 nozzle of a usable test section size. This increased capacity left the previous nozzles still usable in their own range, but with a smaller test section size than would have been available with the increased capacity. Since it is most desirable to have as large a test section as possible, it is necessary to have the nozzles designed at maximum capacity. Scaling procedures are given for increasing the size of the existing nozzles to meet the increased capacity. This was accomplished by application of scaling laws to a Mach 4 nozzle, followed by fabrication and experimental evaluation of the resulting nozzle. (Author)

ON THE EXISTENCE OF INFINITE ACCELERATION POINTS IN TRANSONIC FLOWS AROUND AIRFOILS WITH FINITE CURVATURE, by Silvio Nocilla. Technical note 11 on Contract AF 61(514)1124. Dec 58, 20p. 6 refs. AFOSR-TN-59-197; AD-211 474.
Order from LC mi$2.40, ph$3.30 PB 147 445

The problem is investigated of the formation of shock waves around airfoils with finite curvature in transonic flow. As a suitable criterion for the theoretical interpretation of the appearance of such a shock wave it is assumed the appearing of a point with infinite acceleration on the physical plane. The conditions which must be fulfilled on the hodograph plane in order that such a point exists, and the properties which must possess the corresponding stream function are studied. The theory is then applied to airfoils with constant curvature. (Author)

ESTIMATION OF UNSTEADY AIRLOADS ON BLUNT BODIES IN A HYPERSONIC STREAM. PART I. THEORY, by Haim Kennet. Rept. on Contract AF 49(638)160. Oct 59, 55p. 19 refs. Fluid Dynamics Research Group rept. no. 59-6; OSR Technical note no. 59-1273; AD-232 606.
Order from LC mi$3.60, ph$9.30 PB 146 335

A theoretical method is developed for estimating aerodynamic loads on symmetric blunt-nosed bodies, at zero angle of attack, performing small-amplitude harmonic oscillations in a main hypersonic stream. Time dependent effects are introduced as small perturbations superimposed on an approximate steady field. A power series solution yields the perturbation pressure distribution on the body. Shock amplitude and phase angle are also obtained. The results are applied to a spherical cap, in which the case the leading terms of the series solution are evaluated. (Author)

FLIGHT RESEARCH INVESTIGATION OF LAMINAR SEPARATION OF A HIGH LIFT BOUNDARY LAYER CONTROL AIRPLANE, by Dezso Gyorgyfalvy. Research rept. no. 25 on Contract Nonr-978(01). 26 June 59, 74p. 8 refs. AD-225 178.
Order from LC mi$4.50, ph$12.30 PB 147 450

A study was made of a technique for calculating and measuring laminar separation in connection with a flight research investigation of the droop nose as an aid in delaying the leading edge stall. The calculation of laminar separation by means of the Holstein-Thwaites method proved to be unsatisfactory; but the simple relation $U_{sep}/U_{max} = 0.94$, was found to be a good approximation. The droop nose proved to be advantageous. However the attainable gain in maximum lift was not more than about 20%. (Author)

STRUCTURAL ANALYSIS OF MULTI-HINGED CONTROL SURFACES, by E. Kosko. Mar 60, 174p. Aeronautical rept. LR-276.
Order from LC mi$8.10, ph$27.30 PB 148 519

An elastic small-deflection analysis is presented of a control surface supported on a structure by means of three or more hinges. Effects of sympathetic flexure, of local bracket flexibility and of angular deflection are taken into account. The existence is shown of an elastic hinge moment, quadratically dependent on the external loading. Application of the method is illustrated by numerical examples, which show that some secondary effects may become more critical than those of direct loading. (Author)

Naval Ordnance Lab., White Oak, Md.
MAGNUS MOMENT ON PURE CONES IN SUPERSONIC FLIGHT, by John D. Nicolaides and John J. Brady. 20 Jan 59, 42p. 15 refs. NAVORD rept. 6183; AD-219 843.
Order from LC mi$3.30, ph$7.80 PB 148 451

By aeroballistic range techniques, the Magnus moment is measured on 20° pure cones at M = 2. The results indicate that the Magnus moment may be critically dependent, in both size and sign, on the nature of the boundary layer (i.e., laminar, turbulent, or mixed). The normal force and damping moment are also found to be significantly dependent on the nature of the boundary layer. The characteristics of the boundary layers are revealed in the spark shadowgraphs of the aeroballistic range technique and its transient and sometimes chaotic character noted. Criteria for specifying the general nature of the boundary layer are evolved and used to correlate the coefficient data. The experimental force and moment coefficients are compared with theoretical values obtained from various suggested physical models of the flow. (Author)

THE EFFECTS OF ELEVATED TEMPERATURES ON AIRCRAFT STRUCTURES: AN OUTLINE OF SOME PROBLEMS AND RESULTS, by Frederick V. Pohle. Rept. on Contract Nonr-839(23). Aug 59, 24p. 67 refs. PIBAL rept. no. 495.
Order from LC mi$2.70, ph$4.80 PB 148 176

This report outlines some problems and results in heat transmission in the structure, in thermal stresses due to external heating, and in thermal buckling.

Polytechnic Inst. of Brooklyn, N. Y.
ON A NEW APPROACH FOR THE SOLUTION OF NON-SIMILAR BOUNDARY LAYER PROBLEMS, by Luigi G. Napolitano and Antonio Ferri. Rept. on Contract AF 49(638)217. Mar 60, 39p. 3 refs. PIBAL rept. no. 507; AFOSR-TN-59-356.
Order from LC mi$3.00, ph$6.30 PB 148 557

A new method of solution for non-similar dissipative flow fields is proposed which is essentially based on the description of such flow fields by means of "inner" and "outer" profiles jointed along a continuous "matching" line lying within the field itself. The inner and outer profiles are single-parameter profiles derived from the solution of a total differential equation upon which not all the pertinent physical conditions are necessarily imposed. The "inner" profiles are in fact the inner part of solutions for which the conditions of boundness at infinity have not been imposed. The "outer" profiles are the outer part of solutions which do not satisfy the true physical similarity requirements at the wall.

Polytechnic Inst. of Brooklyn, N. Y.
RECENT DEVELOPMENTS CONNECTED WITH THE HYPERSONIC FACILITY OF THE POLYTECHNIC INSTITUTE OF BROOKLYN. PART I. TESTS OF THE COMPRESSION HEATER. PART II. ASPECTS OF THE DESIGN, CONSTRUCTION, AND INSTALLATION ON A MULTIPLE-OUTLET COLLECTION FOR THE CONVECTION HEATER, by Sergio R. Panunzio. Rept. on Research on Utilization of the Hypersonic Wind Tunnel, Contract AF 33(161)3978. Oct 59, 29p. 11 refs. WADD Technical rept. 60-94.
Order from OTS $0.75 PB 161 882

Two recent developments are described in this report. The first pertains to tests of the compression heater; these were carried out in order to evaluate the utility of the compression heater for hypersonic testing. The results of the tests indicate that there is a substantial air leakage past the piston of the heater, causing unsatisfactory heater performance. This leakage occurs in both directions during various phases of the compression cycle. Alterations in the design of the diaphragm are clearly required before improved performance can be anticipated. The second development discussed in this report pertains to the design and installation of a collector which permits the operation of several wind tunnels as well as of the compression heater from the convection heater. This collector increases to a considerable degree the capabilities of the hypersonic facility. In this report the design considerations and analysis of the collector are outlined and the pertinent construction details discussed. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
TRANSIENT TEMPERATURE DISTRIBUTIONS IN A SPHERE DUE TO AERODYNAMIC HEATING, by Frederick V. Pohle and John L. Boccio. Rept. on Contract Nonr-839(23). Sep 59, 32p. 10 refs. PIBAL rept. no. 553; AD-225 844.
Order from LC mi$3.00, ph$6.30 PB 148 891

The 2-dimensional transient heat condition problem for a solid sphere with constant properties was solved for the case of rotational symmetry and a surface temperature that varied with time and latitude. For given surface conditions this solution can be used to determine the heat input at the surface; these results were compared with similar values computed from a one-dimensional insulated plug experiment. In addition the experimentally determined internal temperatures were compared with those predicted by the 2-dimensional theory. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
TURBULENT HEAT TRANSFER ON BLUNT-NOSED BODIES IN TWO-DIMENSIONAL AND GENERAL THREE-DIMENSIONAL HYPERSONIC FLOW, by Roberto Vaglio-Laurin. Rept. on Aerodynamic Research, Contract AF 33(616)3265. Sep 58, 49p. 22 refs. WADC Technical note 58-301; AD-206 050.
Order from LC mi$3.30, ph$7.80 PB 149 283

Recent results obtained for three-dimensional laminar boundary layers are extended to the turbulent case. It is shown that in the presence of highly cooled surfaces and of moderate Mach numbers of the outer stream, the crossflow and the pertaining Reynolds stresses in a general three-dimensional turbulent boundary layer are negligible even for large transversal pressure gradients. The demonstration assumes that Reynolds analogy is satisfied by the flow in the streamline direction; subsequently, the validity of this assumption is established by extending a correlation due to Mager between two-dimensional compressible and incompressible turbulent boundary layers. From a study of the transformation and of its implications, a rapid method for the analysis of the boundary layer flow under the subject conditions is established. In the absence of general three-dimensional data, a comparison with experiments and with

the predictions of other known analyses is presented for several axisymmetric configurations; the results of the method proposed here exhibit good agreement with the data. The equations governing the mean motion in a general compressible three-dimensional turbulent boundary layer are derived in an appendix. (Author)

HYPERSONIC VISCOUS FLOW PAST A BLUNT BODY WITH AN APPLIED MAGNETIC FIELD. PART II, by Ching-Sheng Wu. Rept. on Contract AF 49(638)465. Aug 59, 28p. 10 refs. Rept. no. 443; AFOSR-TN-60-210. AD-235 786.
Order from LC mi$2.70, ph$4.80 PB 148 347

The main purpose of the present investigation is to study how much the skin friction and heat transfer rate will be reduced by the presence of hydromagnetic interaction. In fact, the present analysis has simplified the physical model considerably.

Research Labs. for the Engineering Sciences, U. of Virginia, Charlottesville.
FREE MOLECULE COUETTE FLOW BETWEEN ROTATING CYLINDERS, by J. H. Bodine and A. R. Kuhlthau. Rept. on Contract NOrd 18211. Mar 60, 19p. 2 refs. Rept. no. AST-2849-102-60U.
Order from LC mi$2.40, ph$3.30 PB 148 389

It is the purpose of this paper to present a detailed theoretical analysis of the free-molecule flow which is amenable to experimental check and thus may provide a means for a more careful estimate of the numerical value of the reflection parameter.

APPROXIMATE THEORY OF GROUND INTERFERENCE ON SLENDER ROCKET SLEDS OF ARBITRARY CROSS SECTION WITH APPLICATION TO THE CONFIGURATION ROCKETDYNE RS-2 SLED, by Rudolf Hermann and Walter L. Melnik. Rept. on Contract AF 29(600)2102. Jan 60, 34p. 7 refs. AFMDC-TR-60-1; AD-234 280.
Order from LC mi$3.00, ph$6.30 PB 146 379

The pressure distribution on slender rocket-propelled sled bodies moving along the ground is computed for subsonic and moderate supersonic Mach numbers. The flow about a slender body of arbitrary cross section is approximated by superposition of locally tangent conical fields along the axis of the body and its image. This method is used to calculate the pressure distribution on configuration Rocketdyne RS-2 sled for M= 0.7, 0.8, 1.5, 2.0, and 2.4. The normal force loading and lift coefficient are obtained from an integration of the pressure distribution. Comparison with the lift coefficient measured by AEDC at M = 2 on a model of this sled configuration having zero nose droop indicates very good agreement with theory. (Author)

Rosemount Aeronautical Labs., U. of Minnesota Minneapolis.
EXPERIMENTAL AERODYNAMIC INVESTIGATION OF BASIC ROCKET SLED CONFIGURATIONS M = 1.5 TO M = 3.0, by Rudolf Hermann, Frederick Moynihan, and Howard Peterson. Rept. on Contract AF 29(600)2003. Oct 59, 63p. 3 refs. RAL-RR-167; AFMDC-TR-59-41; AD-233 789.
Order from LC mi$3.90, ph$10.80 PB 146 380

Wind tunnel measurements of the drag, lift, center of pressure location and pitching moment for some basic sled shapes and orientation parameters under the influence of ground effects are presented and discussed. Sled models were mounted on a simulated Holloman track cross section. Mach number range is from 1.5 to 3.0. Sled geometric variables include nose shape and angle on a circular cross-section sled, and body width on a rectangular cross-section sled. Sled orientation variables include height above the trough and angle of attack. Presence of the ground has little effect on the sled drag if it is mounted above the level of the rails. However, the ground effect caused positive lift loads which for many configurations were in the order of, or larger than the drag.

RESEARCH ON EVAPORATIVE FILM COOLING OF A MACH NUMBER 7 CONTOURED WIND TUNNEL NOZZLE IN THE ROSEMOUNT AERONAUTICAL LABORATORIES' HYPERSONIC FACILITY, by Rudolph Hermann, Walter L. Melnik, and Janis O. A. Stankevics. Rept. for 1 Oct 58-30 Sep 59 on Contract AF 33(616)6077. May 60, 63p. 38 refs. WADD Technical rept. 60-251.
Order from OTS $1.75 PB 161 885

An experimental research program on evaporative film cooling of a Mach Number 7 Laval nozzle was conducted in the 12 x 12-inch test section of the hypersonic blow-down wind tunnel. Cooland (water) was injected through a thin strip of porous stainless steel plate located upstream of the nozzle throat where the average Mach number was 0.10. The object of this investigation was to analyze the influence of evaporative film cooling on the potential flow area available for model testing. For this purpose, a transverse pitot pressure and total temperature survey was performed in the uniform flow region of the test section. Impact pressure and total temperature measurements were made in the turbulent boundary layer on the wall at the nozzle exit where M 7 with stagnation temperatures up to 2040°R. The results are compared to a former investigation of evaporative film cooling in a throat section of a hypersonic nozzle. Results of a simplified theoretical analysis of evaporative film cooling showed good agreement with wall temperatures measured at the throat of the nozzle. Concentration and total enthalpy profiles across the boundary layer were obtained from a simi-

larity analysis of the binary turbulent boundary layer with evaporative film cooling using some experimental data. (Author)

AN ALTERNATIVE FORMULATION OF THE PROBLEM OF FLUTTER IN REAL FLUIDS, by Wen-Hwa Chu and H. Norman Abramson. Technical rept. no. 2 on Contract Nonr-2470(00). 29 Aug 58, 20p. 10 refs. AD-204 388.
Order from LC mi$2.40, ph$3.30 PB 147 160

The potential theory of a harmonically oscillating thin airfoil is generalized by discarding the conventional Kutta-Joukowski condition at the trailing edge and introducing a generalized equivalent condition. The bound vorticity distribution is expressed in a form of the Birnbaum-Glauert formula and the resulting equation is solved by application of Glauert's series method. The lift and moment, which depend upon the trailing edge singularity, are found to contain two complex semi-empirical parameters which may be evaluated from experimental data. The implications of these results in various applications are discussed.

Technische Hochschule, Vienna (Austria).
CONDUCT THEORETICAL RESEARCH ON THE STRENGTH OF VORTICES PRODUCED BEHIND A SHOCK WAVE IN THE BOUNDARY LAYER FOR SUPERSONIC FLOW, by Rudolf Bruniak. Technical final rept. on Contract AF 61(052)78. [1960] 15p. AFOSR-TR-60-18; AD-232 069.
Order from LC mi$2.40, ph$3.30 PB 146 710

The present paper undertakes to investigate vortices appearing behind a shock wave in the boundary layer as to their strength and their influence on the thickness of the boundary layer.

Technische Hochschule, Munich (West Germany).
LINEAR SUPERSONIC FLOW PAST COMBINATIONS OF A CYLINDRICAL BODY AND TRIANGULAR WINGS, by Ferdinand Peischl and Hans J. Stetter. Technical note. no. 11 on Contract AF 61(514)1080. 24 Nov 59, 28p. 13 refs. AFOSR-TN-59-1160; AD-233 274.
Order from LC mi$2.70, ph$4.80 PB 146 737

The normalized pressure-distribution was computed for wing-body combinations consisting of an infinite (rotational) cylindrical body and plane delta-wings with supersonic leading edges. Linear supersonic theory was used without further approximations. After an introduction of quasi-cylindrical wing-body interference theory and the statement of the problem, the non-trivial second step of the procedure is solved analytically. This solution is Fourier-analyzed numerically to yield the boundary data for the third step the computations of which were described previously. The pressure distribution is shown in several graphical representations and a discussion of the results is given. All computations were made on the PERM electronic computer. (Author)

WIND TUNNEL STUDIES OF PRESSURE AND VELOCITY DISTRIBUTION, by Edwin S. Holdredge and Bob H. Reed. Summary rept. no. 2 for 1 Sep 56-21 Aug 57. [1957] 52p. AD-148 336.
Order from LC mi$3.60, ph$9.30 PB 148 229

The scope of this report is limited to the investigation and results of studies on single obstacles having rectangular shapes. Most of the previous work on the velocity around objects has dealt with problems related to windbreaks. Since the windbreak is long compared to its height the air flows in a vertical plane. The present studies are of three dimensional objects and the flow is three dimensional.

University of Southern California, Engineering Center, Los Angeles.
REDUCTION OF THE BOUNDARY LAYER THICKNESS IN A HYPERSONIC NOZZLE, by Serge A. Waiter. Rept. on Contract AF 18(603)95. 20 May 60, 28p. 3 refs. USCEC rept. 56-213; AFOSR-TN-60-514.
Order from LC mi$2.70, ph$4.80 PB 148 355

The reduction of the boundary layer thickness in a hypersonic nozzle can be realized by cooling the walls: in this way, an important heat transfer from the flow is created, increasing the density in the boundary layer. The integration of the mass flow equation will show the influence of the wall temperature on the boundary layer thickness. Applications to specific cases are proposed for a given nozzle. The following results are observed: (1) the power needed for cooling the nozzle is low, (2) this power varies slowly with the wall temperature (if $T_w < 200^oK$) but decreases with the Reynolds number and the stagnation temperature for a given Mach number. Charts are given for $8 \leq M \leq 18$ and for stagnation temperature $T_s \leq 2000^oK$. For higher temperatures, dissociation and ionization appear so the problem must be solved for each special case: the general heat transfer equation is given and its application is easy if the stagnation conditions and the local Mach number are known. Hydrodynamics, Hydraulics, and Hydrostatics

St. Anthony Falls Hydraulic Lab., U. of Minnesota, Minneapolis.
THE ST. ANTHONY FALLS HYDRAULIC LABORATORY GRAVITY-FLOW FREE-JET WATER TUNNEL, by Edward Silberman and John F. Ripkin. Rept. on [Contract Nonr-710(24)]. Aug 59, 49p. 5 refs. Technical Paper no. 24, Series B.
Order from LC mi$3.30, ph$7.80, PB 148 166

A unique facility for studying cavitation phenomena has been developed at the St. Anthony Falls Hydraulic Laboratory of the University of Minnesota in the form of a gravity-flow free-jet water tunnel which makes use of the 50-ft drop in the Mississippi River at the Falls where the Laboratory is situated. The tunnel is an outgrowth of projects sponsored by the Office of Naval Research and is used for experimental

studies of cavities under an exceptionally wide range of conditions, especially at small cavitation numbers Both axially symmetric and two-dimensional test sections have been provided. The facility differs from customary water tunnels in that the test jet is surrounded by a gas-filled chamber in which the pressure can be lowered to nearly vapor pressure of the liquid stream. Operation is entirely by gravity flow; no pumps are required either for actuating the stream or producing vacuum in the test chamber. The test jet is vertical, 40 in. long, and flows at speeds up to 50 fps. The axially symmetric jet is 10 inches in diameter, while the alternate two-dimensional jet is 5 in. thick between rigid walls and of adjustable width from 6 to 15 in. between free boundaries.

St. Anthony Falls Hydraulic Lab., U. of Minnesota, Minneapolis.
EXPERIMENTAL STUDIES OF PNEUMATIC AND HYDRAULIC BREAK-WATERS, by Lorenz G. Straub, C. E. Bowers, and Zal S. Tarapore. Rept. on Contract Nonr-710(10). Aug 59, 58p. 28 refs. Technical Paper no. 25, Series B.
Order from LC mi$3.60, ph$9.30 PB 148 167

Experimental studies were conducted on two similar models of both pneumatic and hydraulic breakwaters, having a length ratio of 4.5:1. Tests of the pneumatic system indicated that the horsepower requirements for a given percentage of attenuation depended only on the wave length, the submergence of the manifold, and the depth of water. Multiple-manifold breakwaters with different spacing between manifolds were tried and found to be of no particular advantage over the one-manifold system. An intermittent bubbler device was also tested very briefly, showing very little difference from the one-manifold data. Test of the hydraulic system indicated that power requirements varied with wave steepness as well as wave length. Orifice area was a very important parameter as this affected the discharge requirements and the required size of supply piping. The power requirements of the pneumatic system are somewhat less than the hydraulic for average values of wave steepness, but the maximum attenuation achieved was less than the hydraulic. (Author)

Princeton U., N. J.
OBSERVATIONS ON LIQUID SHEETS FORMED BY COLLIDING VERTICAL JETS, by R. M. Koros, J. M. Deckers, and M. Boudart. Rept. on Contract AF 49(638)[32]. [1960] 61p. 14 refs. AFOSR-TN-60-234.
Order from LC mi$3.90, ph$10.80 PB 147 918

When two opposed vertical jets collide, a stable liquid sheet is formed. By measurements of conductivity, it was found that the thickness of the sheet at a distance from the jet axis is inversely proportio. to L. Thus, the cross-sectional area to liquid flow and also the momentum of the liquid stay constant as the sheet spreads outward. There is, however, a loss of momentum of the fluid in the region of formation of the sheet. This loss is reflected by some mixing of the jets taking place in this region. Such liquid sheets have been used previously to study surface tension of freshly formed surfaces. The present work confirms the validity of the technique in the case of liquids with low viscosity.

Naval Ordnance Test Station, China Lake, Calif.
THEORETICAL LIFT AND DRAG ON VENTED HYDROFOILS FOR ZERO CAVITY NUMBER AND STEADY TWO-DIMENSIONAL FLOW, by Andrew G. Fabula. 4 Nov 59, 47p. 7 refs. NOTS TP-2360; NAVORD rept. 7005; AD-235 285.
Order from LC mi$3.30, ph$7.80 PB 146 988

Linearized, plane cavity-flow theory for steady, two-dimensional flow is used to predict lift and drag on hydrofoils with forced ventilation by gas exhaust on one side. Conditions assumed include cavity pressure equal to free-stream pressure, smooth separation of the free stream-lines, and infinite cavity length. Lift and drag coefficients are calculated versus exhaust point for several basic profile shapes, and formulas for lift, drag and moment coefficients are given for arbitrary profile.

Naval Ordnance Test Station, China Lake, Calif.
A METHOD FOR THE PRODUCTION OF UNIFORM BEADS OF CONTROLLED DENSITY IN THE DENSITY REGION CLOSE TO UNITY, by Arnold Adicoff. 8 Aug 59, 15p. NOTS TP 2308; NAVORD rept. 6580; AD-226 899.
Order from LC mi$2.40, ph$3.30 PB 148 448

A technique for the production of small spheres has been developed which consists primarily of forming the spheres in liquid nitrogen from a rubber latex, then coagulating these spheres in an ice-salt-acetic acid bath. The density of the spheres can be carefully controlled by the addition of a solid, more dense component to the latex prior to its coagulation. (Author)

Naval Ordnance Test Station, China Lake, Calif.
BASE-VENTED HYDROFOILS, by T. G. Lang. 19 Oct 59, 35p. 6 refs. NOTS TP-2346; NAVORD rept. 6606; AD-234 838.
Order from LC mi$3.00, ph$6.30 PB 146 987

Lift-producing hydrofoils that operate with a portion of the surface vented with gas were analyzed. The gas-covered surface is defined as the base. Results of the analysis show that a large number of different types of base-vented hydrofoils exist, some of which may have greater cavitation resistance and higher efficiency than the best of the fully wetted hydrofoils, provided, of course, that sufficient gas is available for venting. Other results show that a cambered base-vented hydrofoil having a parabolic cross section can operate near the surface without vapor cavitation, at speeds as much as 50% greater than those of fully wetted hydrofoils, and with little sacrifice in efficiency. Experimental tests on base-vented hydrofoils are needed to verify the results of this analysis (Author).

David Taylor Model Basin, Washington, D. C.
TESTS OF A PLANING BOAT MODEL WITH PARTIAL HYDROFOIL SUPPORT, by Peter Sherman. Aug 58, 25p. 7 refs. Rept. 1254; AD-205 320.
Order from LC mi$2.70, ph$4.80 PB 147 257

A model of a planing boat was equipped with two horizontal submerged hydrofoils which were designed to carry part of the weight of the craft. The foils were located forward of the center of gravity. Smooth-water resistance tests were made with foils at various fore-and-aft positions and various angles of attack to determine the optimum arrangement. Tests were also made of the foils alone. It was found that an appreciable scale effect on foil performance existed at Reynolds numbers below about 5×10^5. The data from the tests of the hull with foils, when corrected for scale effect on foil performance, indicated that the resistance of a planing boat can be decreased when such foils are added by as much as 27 1/2 percent. The best result was attained with the foils located at 28 percent of the hull length aft of the bow, and with the foil chord line at an angle of -3.5 deg with respect to the hull baseline. (Author)

METALLURGY

North American Aviation, Inc., Downey, Calif.
ELECTRODEPOSITION OF ALUMINUM ON MAGNESIUM, by E. W. Cooke and S. Kritzer. Rept. for 1 June 58-31 Mar 59 on Materials Applications, Contract AF 33(616)5854. Nov 59, 30p. 5 refs. WADC Technical rept. 59-465; AD-232 138.
Order from OTS $0.75 PB 161 892

This report describes detailed tests made to electrodeposit aluminum directly onto magnesium, using a modification of the non-aqueous bath developed by the National Bureau of Standards. The report shows that good adhesion is not obtained and a reaction occurs between the electroplating solution and magnesium. However, the report indicates that by using a zinc immersion intermediate coating, satisfactory adhesion is obtained. The purity of the aluminum deposited in this manner is greater than 99.8%, with low porosity. Good adhesion is also obtained on copper and steel. These coatings can be satisfactorily anodized. (Author)

Northwestern Technological Inst., Evanston, Ill.
SUBLIMATION OF SMALL SODIUM CHLORIDE SPHERES INTO ARGON, by D. H. Whitmore and J. B. Moser. Rept. on Contract AF 49(638)436. 15 Apr 60, 21p. 24 refs. AFOSR-TN-60-526.
Order from LC mi$2.70, ph$4.80 PB 148 210

The rate of vaporization of sodium chloride into an argon atmosphere was investigated over the temperature range 726° to 770°C using a hot-stage method to follow the change of radius of a small, subliming sodium chloride sphere. An integrated rate expression was derived for the present experimental conditions which showed the square of the radius of the volatile particle to be directly proportional to the time, the proportionality constant being both pressure and temperature dependent. In general, the pressure and temperature behavior of the empirical rate data is consistent with the proposed model which assumes that the vaporization rate is controlled by molecular diffusion of sodium chloride vapor away from the outer edge of a thin boundary layer adjacent to the surface of the sphere undergoing sublimation. Reports are arranged in sections as follows: metal coatings, general; electroplating; electropolishing; vapor deposition and vacuum deposition; phosphate coatings; plating.

Pitman-Dunn Labs. Group, Frankford Arsenal, Philadelphia, Pa.
SINTERING ATMOSPHERES FOR BRASS COMPACTS, by R. A. Powell and F. I. Zaleski. Dec 59, 27p. Rept. R-1526; AD-233 880.
Order from LC mi$2.70, ph$4.80 PB 147 238

The highest tensile properties (26,000 psi tensile strength; 4 to 5 percent elongation) were obtained with 70-30 brass compacts sintered in covered boats with atmospheres that contained 80 to 100 percent hydrogen. The best tensile properties (18,000 psi tensile strength; 2 percent elongation) for the uncovered boat condition were obtained with the brass compacts sintered in atmospheres that contained 40 to 100 percent hydrogen. The zinc losses of the brass compacts decreased. Sintering in air or carbon monoxide resulted in high zinc losses and very low tensile properties.

Ferrous Metals

Battelle Memorial Inst., Columbus, Ohio.
THE MECHANISM OF HARDENING IN 17-7PH STAINLESS STEEL, by E. E. Underwood, A. E. Austin and others. Rept. for 15 May 59-14 May 60 on Kinetics of Internal Structural Changes, Contract AF 33(616)6521. June 60, 54p. 19 refs. WADD Technical rept. 60-236.
Order from OTS $1.50 PB 161 850

The unique hardening found in precipitation-hardening stainless steels was investigated both in commercial sheet alloys of 17-7PH and high-purity ferrite single crystals of Fe-17Cr-7Ni-2Al. Profuse precipitation of needle-shaped particles was responsible for maintaining the high hardness level in the aged crystals. Ordering was not detected by X-ray diffraction in severely quenched single crystals in which precipitation was suppressed. However, aged crystals displayed superlattice reflections from chromium and nickel on the bcc lattice, suggesting that the particles are ordered. Neutron-diffraction data indicate that the precipitate has an ordered bcc structure with iron on one sublattice and chromium, nickel, and aluminum distributed on the other sublattice. (Author)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
EVALUATION OF CAST ALLOYS FOR USE AT HIGH TEMPERATURES, by John Salvaggi. Final rept for 11 Dec 56-15 Dec 57 on Contract NObs-72224. [1958] 13p. 2 refs. Rept. no. KB-1137-M-4; AD-207 503.
Order from LC mi$2.40, ph$3.30 PB 148 242

Austenitic stainless steel compositions containing 17-20% chromium, 12-20% nickel, 2.5-5% molybdenum and 0.27-0.48% carbon were modified by additions of minor quantities of titanium, boron, columbium and tungsten and cast into test bars using the shell mold process. Several of these compositions displayed excellent high temperature strength properties, with 100-hour rupture stress values in the 24,000 psi range at 1500°F and 14,500 psi range at 1600°F being recorded. These high strengths were accompanied by adequate ductility values. Several ferritic heats were also prepared in the same manner and tested at 1200°F. The 100-hour rupture strength values obtained were comparable to those reported in the literature for several commercial stainless steels. However, extremely low ductility would make these alloys virtually unusable in their present condition. (Author)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
IMPROVEMENT OF Cr-Ni-Mo IRON BASE ALLOYS BY VACUUM MELTING AND CASTING, by Franklin J. Gillig. Final rept. on Contract NObs-77019. 30 Sep 59, 16p. 6 refs. Rept. no. KA-1289-M-6.
Order from LC mi$2.40, ph$3.30 PB 148 243

The objective of this program was to investigate the effects of minor changes in composition and vacuum melting on the high temperature mechanical properties of iron base alloys containing 20 Cr- 20 Ni-5 Mo and various minor additions of Cb, W, Ti, B and Al. Twenty-one heats were cast with varying compositions. The 100-hour rupture strength at 1500°F was used as the basis for rating the elevated temperature strength. The strength of the base line heat was not surpassed by any appreciable amount but equivalent strengths were obtained with several compositions that are leaner in alloying elements. (Author)

Illinois U., Urbana.
ON THE CRYSTALLOGRAPHY OF MARTENSITE: THE "{225}" TRANSFORMATION IN ALLOYS OF IRON, by C. M. Wayman, J. E. Hanafee, and T. A. Read. Rept. on Contract AF 49(638)420. [1960] 33p. 25 refs. AFOSR-TN-60-525.
Order from LC mi$3.00, ph$6.30 PB 148 874

For an accurate study of the transformation it is necessary that the martensite habit plane and orientation relationship for a single plate be determined. These observations are especially needed for the "{225}$_A$" transformation for which this determination had not previously been made. The presence of martensite sideplates was observed. The nature of these plates is uncertain at present. The findings point to the need for a microscopic examination of the austenite-martensite inferface.

Light Metals

Alloyd Corp., Cambridge, Mass.
RESEARCH ON TECHNIQUES FOR THE PRODUCTION OF ULTRA-PURE BERYLLIUM, by Malcolm Basche and Laurence M. Schetky. Rept. for 1 July 58-30 June 59 on Metallic Materials, Contract AF 33(616)5300. Mar 60, 55p. 18 refs. WADC Technical rept. 58-457, Pt. II.
Order from OTS $1.50 PB 161 877

Three techniques for making high purity Be were investigated: zone purification in moderate vacuum, distillation under high vacuum, purification through halide reduction of $BeCl_2$. Zone purification in vacuum proved to be impractical as a result of high Be vapor pressure. Distillation under high vacuum showed promise. Purification through halide reduction produced Be 99.6% and showed promise for improvement. (Author) (See also PB 151 878)

DEVELOPMENT OF A SINTERED TITANIUM POWDER BY VAPOR PHASE REACTION, by F. Ermanis, H. Margolin, and P. Herasymenko. Final rept. on Contract NOa(s) 58-101-d. 1 Dec 59, 15p. 8 refs.
Order from LC mi$2.40, ph$3.30 PB 147 256

A method for the production of sintered titanium composed of ductile titanium metal or its alloys and of a fine dispersion of insoluble titanium compounds. At present only a limited number of compounds are known which are insoluble in solid titanium at elevated temperatures. The most promising compounds appeared to be titanium phosphide with a solubility in α-titanium of less than .07% at 790°C, and titanium sulphide whose solubility in α-Ti is about .015% at 888°C.

New York U. Coll. of Engineering, N. Y.
THE TITANIUM ALUMINUM PHASE DIAGRAM, by E. Ence and H. Margolin. Final rept. on Contract DA 30-069-ORD-2164. July 59, 34p. 21 refs. OOR rept. 1939. 2-ORD-Met.
Order from LC mi$2.40, ph$3.30 PB 148 428

Rodman Lab., Watertown Arsenal, Mass.
SOME PROPERTIES OF TITANIUM PROCESSED BY POWDER METALLURGY METHODS, by Francis S. DeLacey. Dec 59, 14p. 7 refs. Technical rept. no. RPL 41/10; AD-233 979.
Order from LC mi$2.40, ph$3.30 PB 147 233

The effect of compacting pressure and firing temperature variations on the tensile and shrinkage properties of titanium powder metal compacts was investigated. The effects of increasing the magnitude of compacting pressure were as follows: the tensile yield strength increased from 32,600 psi to 57,800 psi; the reduction of area increased from 3.2 to 18.6% and the volume shrinkage decreased from 4.86 to 1.99%.

Watertown Arsenal Labs., Mass.
AN ENGINEERING EVALUATION OF NOTCH SENSITIVITY IN HIGH STRENGTH SHEET MATERIALS. PHASE I. NOTCH TESTING. PHASE II. HYDRAULIC-BULGE TESTING, by George M. Orner and Carl E. Hartbower. Mar 60, 98p. 20 refs. Technical rept. no. WAL TR 405.1/1; AMC TR-60-7-662; AD-233966L
Order from LC mi$5.40, ph$15.30 PB 147 235

The most economical test for notch sensitivity in high-strength sheet, in tough and moderately tough materials in thicknesses greater than about 0.040 inch, is the standard Charpy impact test. Commercially available annealed titanium sheet has good notch toughness properties at strength levels in the range 118 to 147 ksi. The feasibility of using an underwater spark discharge technique for bulge testing high-strength sheet materials at impact strain rates was investigated. Small bulges were produced in thin sheet materials; however, the electrical-mechanical efficiency of the system was too low to test sheet in heavier gages.

Watertown Arsenal Labs., Mass.
THE TRUE-STRESS TRUE-STRAIN PROPERTIES OF TITANIUM AND TITANIUM ALLOYS AS A FUNCTION OF TEMPERATURE AND STRAIN RATE, by Thomas S. DeSisto. Mar 60, 44p. 7 refs. Technical rept. no. WAL TR 405.2/4; AD-234 827.
Order from LC mi$3.30, ph$7.80 PB 147 276

True-stress true-strain properties of commercially pure titanium, Ti-7%Mn, Ti-5%Al - 2.5%Sn, and Ti-6%Al-4%V were obtained at temperatures of 800°F to -319°F at strain rates of 0.001, 0.01, and 0.1 inch per minute. For all materials tested, the flow stress increases with decreasing temperature and increasing strain rate, and the strain at fracture decreases with decreasing temperatures. The strain at maximum load decreases with increasing strain rate and decreasing temperature. An exception is shown by the commercially pure titanium where the strain at maximum load and fracture strain increase sharply with decreasing temperature. (Author)

RATE OF DIFFUSION OF CARBON IN ALPHA AND IN BETA TITANIUM AS A FUNCTION OF THE TEMPERATURE AND CONCENTRATION, by Eugene Bucur and F. C. Wagner. Final technical rept., 12 Dec 52-1 July 54, on Contract DA 36-034-ORD-1157(RD). 24 Sep 54, 70p. 13 refs. WAL rept. no. 401/169-16.
Order from LC mi$3.90, ph$10.80 PB 148 039

The diffusion rates of carbon in titanium were determined over a range of temperature from 736°C to 1150°C. The activation energies were obtained by application of the Arrhenius type equation, $D = D_o e^{\frac{-Q}{RT}}$ and from a logarithmic plot of the diffusion coefficients versus the reciprocal of the absolute temperature; the values obtained for the alpha and beta temperature range are 43,500 cal/mole and 48,400 cal/mole respectively. By substituting the respective D_o value and Q value for the alpha or beta temperature range in the Arrhenius type equation the diffusion coefficient for a specific temperature can be calculated directly. The rate of diffusion of carbon in titanium is independent of concentration, or at most, very slightly dependent on concentration.

Naval Research Lab., Washington, D. C.
LOW TEMPERATURE DEPENDENCE OF THE ELECTRICAL RESISTIVITY AND THERMOELECTRIC POWER OF PALLADIUM AND PALLADIUM NICKEL ALLOYS CONTAINING ABSORBED HYDROGEN, by A. I. Schindler and R. J. Smith. Final rept. 3 June 60, 7p. 4 refs. NRL rept. 5481.
Order from LC mi$1.80, ph$1.80 PB 146 217

Electrical resistivity and thermoelectric power measurements have been made on a series of hydrogen-containing palladium and nickel-palladium alloys. It is known that a two-phase region exists at a hydrogen to palladium atom ratio of less than 0.6 while above this hydrogen concentration only a single-phase region exists. A resistivity maximum and, relative to pure palladium, a thermoelectric power minimum has been found at T = 50°K for the palladium-hydrogen samples containing $H/Pd \geq 0.58$. In addition a resistivity minimum has been found for these samples at approximately 90°K. At temperatures less than 80°K, the absolute thermoelectric power for Pd-H falls off rapidly as a function of composition in the vicinity of H/Pd = 0.6. However, at temperatures greater than 90°K a maximum is found in the absolute thermoelectric power at H/Pd = 0.6. (Author)

THE CHROMIUM-COLUMBIUM BINARY SYSTEM, by John A. Misencik (Massachusetts Inst. of Tech.). Master's thesis. Mar 60, 45p. 5 refs. Technical rept. no. WAL TR 805.5/1; AD-234 510.
Order from LC mi$3.30, ph$7.80 PB 147 279

The complete binary system chromium-columbium has been developed, using metallographic, X-ray diffraction and thermal analysis techniques. The existence of beta-chromium has been confirmed and a eutectoid reaction, in the high chromium portion of the diagram, has been found at 1550°C, in addition to the eutectic reaction at 1660°C. The maximum solubility of columbium in chromium at 1500°C is 5 weight percent. The maximum solubility of chromium in columbium is 12 weight percent at 1500°C. The intermetallic compound at the stoichiometric ratio ($CbCr_2$) has been confirmed. (Author)

POLARIZATION CAPACITANCE DETERMINATIONS OF SURFACE ROUGHNESS, by M. K. Testerman. Rept. on Surface and Interface Phenomena of Matter, Contract AF 33(616)5541. Apr 60, 39p. 24 refs. WADD Technical rept. 60-97.
Order from OTS $1.00 PB 161 847

Polarization capacitances of metallic surfaces are investigated in aqueous (0.5N KCl) and non-aqueous (0.18M KI-CH_3OH, 0.38M KI-$C_3H_5(OH)_3$, and 0.25M KI-$HCONH_2$) electrolytic systems. These systems are evaluated according to their general applicability for the determination of surface roughnesses. A pretreatment procedure is described for preparing an apparently deoxidized aluminum surface. Polarization capacitances obtained for copper, stainless steel, titanium, amalgamated copper, and pretreated aluminum surfaces are compared in the non-aqueous 0.25M KI-$HCONH_2$ system. Curves of capacitance versus applied polarizing potentials are depicted which indicate a high degree of dependency of double-layer capacitance on polarization potentials. Description of experimental procedure and apparatus is accompanied by explanatory figures and tables. (Author) (See also PB 151 268)

USE OF RADIOACTIVE IODINE VAPOR FOR DETERMINING SURFACE ROUGHNESS, by M. K. Testerman. Rept. on Surface and Interface Phenomena of Matter, Contract AF 33(616)5541. Dec 59, 48p. 25 refs. WADC Technical rept. 59-659.
Order from OTS $1.25 PB 161 844

Several relative roughness factors of gold, brass, and aluminum surfaces, exhibiting varying degrees of surface roughness, have been determined by utilizing I^{131} vapor as an adsorbate. Polished gold foil, possessing a high degree of purity, was used as a reference surface. A roughness factor of one was chosen arbitrarily for this reference surface, and all roughness factors contained herein are relative to this value. The roughness factors obtained for brass were decidedly higher than those obtained for other metals. Hence, it was concluded that a chemical combination resulted from the adsorbed layer of I^{131} on the brass surface accounting for the higher specific activity obtained. Figures and illustration describing the experimental equipment are given, as well as data tables and other information pertinent to the previously-mentioned roughness factors. (Author)

OBSERVATIONS OF THE DEFORMATION OF ALUMINUM SUBJECTED TO IMPULSIVE LOADS OF CONSTANT MAXIMUM AMPLITUDE AND VARIABLE IMPULSE, by G. Moss and C. Glass. Apr 60, 11p. 3 refs. Technical note no. 1310.
Order from LC mi$2.40, ph$3.30 PB 148 514

A study was made of the strain of four crystallographically identical aluminum samples, each of which had been subjected to an impulsive load applications were cylindrically symmetrical so that strictly hydrodynamic behavior of the aluminum during plastic deformation would have resulted in craters with round cross sections. Actually, the craters developed were as nearly square as they were round. Hence, it was concluded that aluminum deforms by the usual mechanisms even when subjected to the extreme stress levels used in this work, i. e. 270 kilobars. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
STUDIES OF THE DEFORMATION MECHANICS OF AN IMPULSIVELY LOADED COPPER SINGLE CRYSTAL, by G. Moss and C. Glass. Apr 60, 15p. 4 refs. Memo. rept. no. 1257. AD-237 578.
Order from LC mi$2.40, ph$3.30 PB 148 512

A copper single crystal which had been internally loaded with an explosion was recovered, and the mechanism by which it deformed at the metal-explosion interface was established as slip on {111} planes, probably in <110> directions. This is the mechanism by which copper commonly deforms when stressed with nonimpulsive loads. Hence, it is concluded that the final deformation of copper due to explosively applied loads with initial pressures of approximately 400 kilobars is influenced by the metal strength and structure. This is in contrast with the usual treatments of explosively induced strain, which are based on the assumptions that metal strength is negligible relative to the explosive load and that deformation can be treated as an entirely hydrodynamic process. EFFECTS OF CONCENTRATED HYDROGEN PEROXIDE ON MECHANICAL AND CORROSION PROPERTIES OF STRUCTURAL ALUMINUM ALLOYS, by Franklin J. Gillig. Final rept. on Contract NObs-72258. 16 Feb 59, 64p. Rept. no. KC-1164-M-11; AD-214 856.
Order from LC mi$3.90, ph$10.80 PB 148 376

Nine wrought and three cast aluminum alloys were exposed to commercial 90% H_2O_2 as manufactured and 90% H_2O_2 with 3 grams per liter chloride ion and 4 grams per liter nitrate ion added. The majority of the exposures were of 6 months duration. Some of the specimens had to be removed prematurely due to

severe corrosion or rapid deterioration of the peroxide. Evaluation tests included mechanical properties, stress corrosion, metallographic examination and chemical analyses of the peroxide in order to determine its deterioration. The presence of chloride ion was found to accelerate corrosion greatly in all of the alloys. Wrought alloys 5254 and 3003 were found to be the most compatible and B-214 was the best cast alloy. CORROSION OF SUPERALLOYS BY SELECTED FUSED SALTS, by A. Moskowitz and L. Redmerski. Rept. for 15 Mar 59-15 Feb 60 on Finishes and Materials Preservation, Contract AF 33(616)6196. Mar 60, 84p. 30 refs. WADD Technical rept. 60-115.
Order from OTS $2.25 PB 161 848

The corrosion of Inconel X, Inconel 702, Rene 41, M-252, and Haynes 25 by potassium chloride and lithium fluoride at 1600 to 1900 F was studied. Thin coatings of the salts (1.5 mg/cm^2) caused severe corrosion of the alloys in air, which resulted in accelerated failures of thin sheet specimens in creep-rupture testing. Rankings for the alloys based on creep-rupture tests were similar for uncoated and salt-coated materials: Haynes 25, Rene 41, and M-252 best, Inconel 702 poorer, and Inconel X poorest. The corrosion products consist of oxides and spinels and only very little corrosion, if any, occurs without oxygen. The presence of the salt prevents the normal formation of a protective oxide film. X-ray diffraction studies showed differences between the normal oxidation products and the oxide corrosion products produced with salt present. The corrosion occurs as severe surface attack with consequent eroding away of metal, as intergranular penetration, and as internal voids formed in the alloy. All of the alloys were susceptible to each of these types of corrosion. Grain boundary separation effects due to stress (2,500 to 10,000 psi) were also found. (Author

DEVELOPMENT OF A DUCTILE, OXIDATION-RESISTANT AND HIGH STRENGTH SINGLE-PHASE (AUSTENITIC) ALLOY BASED ON Fe-Al-Mn-C SYSTEM, by R. C. Gibson. Bimonthly progress rept. no. 2, 15 Dec 59-15 Feb 60, on Contract NOas-60-6025-c. 21 Mar 60, 14p.
Order from LC mi$2.40, ph$3.30 PB 148 003

Work was initiated to develop a ductile, oxidation-resistant and high strength alloy based on the Fe-Al-Mn-C system for use at intermediate temperatures (1100 to 1400 F). Results of heat treating studies performed on an Fe-Al-Mn-C-Mo-W-V base alloy containing additions of copper and nickel have revealed that copper has little or no effect on the hardness of the alloys when aged in the temperature range 1100 to 1400 F. Nickel, however, was observed to significantly increase the hardness of the alloys during aging at these same temperatures (1100 to 1400 F). Based on hardness data, there is no apparent interaction between copper and nickel which affects the aging characteristics of the alloy. (Author)

THE EFFECTS OF INELASTIC ACTION ON THE RESISTANCE TO VARIOUS TYPES OF LOADS OF DUCTILE MEMBERS MADE FROM VARIOUS CLASSES OF METALS. PART XII. ECCENTRICALLY-LOADED TENSION MEMBERS AND COLUMNS MADE OF 17-7PH STAINLESS STEEL AND Ti 155A TITANIUM ALLOY AND TESTED AT VARIOUS TEMPERATURES, by Q. M. Sidebottom, S. Dharmarajan and others. Rept. on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5658. Feb 60, 84p. 11 refs. WADC Technical rept. 56-330, Pt. XII.
Order from OTS $2.25 PB 161 836

Experimental data were obtained from eccentrically-loaded columns made of 17-7PH stainless steel and Ti 155A titanium alloy and tested at room temperature, from eccentrically-loaded columns made of 17-7PH stainless steel and tested at 1000°F, and from eccentrically-loaded tension members and columns made of Ti 155A titanium alloy and tested at 800°F. In most cases the creep tests were limited to 30 min. At the elevated temperatures the inelastic deformation was time dependent for the 17-7PH stainless steel and was mostly time independent for the Ti 155A titanium alloy. The theoretical analysis of room temperature tests data obtained from Ti 155A titanium alloy members tested at 800°F was based on the interaction curve-moment-load curve theory. The arc hyperbolic sine theory was used in the analysis of data obtained from 17-7PH stainless steel members tested at 1000°F. In all cases good agreement was found between theory and experiment. AN INVESTIGATION OF THE RELATIVE DEFORMATION OF VARIOUS METALS BY CONCUSSION FORMING METHODS, by Don May. Rept. on Contract NOrd-15719. 6 July 59, 94p. 1 ref. Project rept. # SPDIR 20; AD-218 491.
Order from LC mi$5.40, ph$15.30 PB 148 461

The most extensive investigation centered around AISI 4130. Lesser amounts of work were done with AISI 1020, Vascojet 1000, MBMC #1, aluminums 2024-0, 2024-T and 6061-T. Tetryl, the properties of which are included in the main body of the report, was used as the explosive throughout the investigation. The effect of concussion forming on the hardness, thickness and grain structure of typical specimens is reported. The relationship between explosive charge size and the amount of specimen deformation is presented for several materials and conditions. The relationship between material thickness and the amount of specimen deformation is presented for several materials at various conditions. The relationships between the proximity of the explosive charge to the work piece and the amount of deformation are presented for several materials and conditions. The relationship between yield strength and specimen deformation is given for different materials and conditions. A minimum investigation into the feasibility of forming hemispheres at a single detonation was conducted. (Author)

THE EFFECTS OF STORED ENERGY AND RECRYSTALLIZATION ON THE CREEP RUPTURE PROPERTIES OF INTERNALLY OXIDIZED COPPER-ALUMINA AND COPPER-SILICA ALLOYS, by Masao Adachi and Nicholas J. Grant. Rept. for 1 Sep 58-1 Sep 59 on Solid State Research, Contract AF 33(616)5424. Dec 59, 27p. 9 refs. WADC Technical rept. 59-777.
Order from OTS $0.75 PB 161 846

Copper-silica and copper-alumina alloys of low oxide content were produced by the internal oxidation and extrusion of copper-silicon and copper-aluminum alloy powders. These alloys show normal behavior after recrystallization. With increasing amounts of recrystallization at temperatures up to 1050°C, the creep rupture strength at 450°C decreases and the ductility increases. Cold work of the partially or completely recrystallized alloys results in an increase in creep rupture strength and a decrease in ductility. The strength of dispersed oxide hardened alloys of this kind is due to a combination of micron or sub-micron dispersion of an insoluble oxide and a high value of stored energy through cold work. In the as-extruded condition, both the dispersion and the cold work impede the dislocation movements. After recrystallization the only impediment to dislocation movement is the oxide dispersion. Improved ductility and higher creep rates are a result. (Author)

STABILIZATION OF THE MARTENSITIC TRANSFORMATION IN IRON-NICKEL ALLOYS, by John Woodilla, P. G. Winchell (Purdue U.) and Morris Cohen. Technical rept. no. 2 on Contract Nonr-1841(35). 15 Sep 59, 8p. 7 refs. AD-226 382.
Order from LC mi$1.80, ph$1.80 PB 148 565

An isothermal mode of the martensitic reaction was employed to derive the activation energy for stabilization. An Fe-Ni alloy with 30.8 wt-% Ni and 0.007 wt-% C, and in the form of rods 0.074 in. in diameter and 2 1/2 in. long were used. The specimens were sealed in evacuated Vycor tubes and austenitized at 1100°C for one-half hour prior to quenching in water. One series of specimens was decarburized (and denitrogenized) prior to the austenitizing treatment by annealing in moist H for 182 hr at 1215°C. All the specimens were transformed to martensite by cooling to -195°C before final austenitizing. Both the 0.007% C and the decarburized series then had an M_s temperature of about -30°C. The isothermal martensitic transformation was conducted at a reference temperature of -88°C, and was traced by means of electrical resistance measurements. The rate of decrease of the resistance ratio ($-dR/_{dt}$) provided a measure of the transformation rate. The stabilization treatment was introduced by up-quenching from the reference temperature to a stabilizing temperature between 0° and 22°C. In the hydrogen-annealed series, the extent of transformation during the stabilizing cycle was usually larger than in the 0.007% C series; some martensite actually formed at the stabilizing temperature as well as during the quench back to the reference temperature. The decarburized specimens displayed no sign of stabilization; this established C and/or N as the controlling agent for the stabilization phenomena.

Materials Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
ELECTRON MICROSCOPY OF ETCH PITS, by Richard E. Pawel. Rept. for Mar 58-Dec 58 on Materials Analysis and Evaluation Techniques. Oct 59, 29p. 9 refs. WADC Technical rept. 59-68; AD-231 280.
Order from OTS $0.75 PB 161 838

An advanced electron microscopic technique has been developed which uses etch pits to delineate the crystalline structure and orientation of single grains of polycrystalline copper, brass and aluminum. In addition this method has been extended to permit the study of the deformation of these materials using the direction and the extent of slippage of the slip lines to indicate the local deformation on a microscale. Suitable chemical etching and replication techniques were developed for these materials in the course of this study. (Author)

STUDIES OF ALLOY THERMODYNAMICS BY LIQUID TIN SOLUTION CALORIMETRY, by Raymond L. Orr and Ralph Hultgren. Final rept. for 1 Nov 53-31 Oct 58 on Study of Atomic Bonding Forces in Alloys, Contract DA 04-200-ORD-171, T. O. 8. 1 Apr 60, 16p. 26 refs. Series no. 76, issue no. 13; OOR rept. 906. 14-Met.
Order from LC mi$2. 40, ph$3. 30 PB 148 433

A liquid tin solution calorimeter capable of accurate measurements of alloy heats of formation as well as other types of thermodynamic measurements has been developed and applied to the thermodynamic study of a number of alloy systems. The accomplishments of this study have been reviewed mainly by reference to previous technical reports and published papers which have been submitted. The technical reports, published papers, and graduate theses resulting from this research are listed, and an evaluation is made of the progress made.

Rock Island Arsenal Lab., Ill.
STORAGE STABILITY OF PETROLATUM TYPE CORROSION PREVENTIVE COMPOUNDS, by Linden H. Wagner. 28 Apr 60, 36p. 10 refs. Rept. no. 60-1366.
Order from LC mi$3. 00, ph$6. 30 PB 148 365

Commercially formulated petrolatum base corrosion preventive compounds consisting of six Class 1A, three Class 2, and five Class 3, qualified under Military Specification MIL-C-11796A, "Corrosion Preventive, Petrolatum, Hot Application", were stored indoors in bulk containers. They were evaluated for storage stability throughout a five year period in accordance with the test requirements of Specification MIL-C-11796A. Infrared absorption spectra were determined simultaneously during the storage period for comparative purposes. Additional coated test panels were exposed in outdoor and shed storage exposure to determine the effect of prolonged weathering after 12, 15, 18, 21 and 24 months. The stability of the compounds varied so that no assurance can be given that products qualified against the specification will continue to be satisfactory beyond approximately three years when placed in storage. (Author)

A MECHANICAL PROPERTY FORECASTER FOR TITANIUM ALLOYS, by C. F. Hickey, Jr. and L. S. Croan. Sept 59, 16p. 2 refs. Technical rept. no. WAL TR-405. 21/2; AD-227 130.
Order from OTS $0. 50 PB 161 018

An investigation was conducted to determine if the mechanical properties of heat-treated titanium alloy forgings in various upset thicknesses can be forecasted by using thin test coupons. All upset discs were the product of the same bar and each was reduced by an equal percentage during upsetting. Ti-6%Al-4%V was selected for test material because of its widespread use as a commercial alloy. Results of the study indicate that mechanical properties of the heavier sections can be forecasted by duplicating their cooling rates in the thin upset test coupon. (Author)

NUCLEAR PHYSICS AND NUCLEAR CHEMISTRY

Ecole Normale Supérieure (France).
THE AXIAL VECTOR CURRENT IN BETA DECAY, by R. P. Feynman (California Inst. of Tech.) M. Gell-Mann, and M. Lévy. Technical note no. 17 on Contract AF 61(052)173. [1960] 30p. 20 refs. AFOSR-TN-60-294; AD-234 428.
Order from LC mi$2.70, ph$4.80 PB 146 551

In order to derive in a convincing manner the formula of Goldberger and Treiman (Phys. Rev. 110:1478, 1958) for the rate of charged pion decay, the possibility is considered that the divergence of the axial vector current in β decay may be proportional to the pion field. Three models of the pion-nucleon interaction (and the weak current) are presented that have the required property. The first, using gradient coupling, has the advantage that it is easily generalized to strange particles, but the disadvantages of being unrenormalizable and of bringing in the vector and axial vector currents in an unsymmetrical way. The second model, using a strong interaction proposed by Schwinger and a weak current proposed by Polkinghorne, is renormalizable and symmetrical between V and A, but it involves postulating a new particle and is hard to extend to strange particles. The third model resembles the second one except that it is not necessary to introduce a new particle. (Renormalizability in the usual sense is then lost, however). (Author)

COUPLED INTEGRAL EQUATIONS FOR THE NUCLEON AND PION ELECTROMAGNETIC FORM FACTORS, by M. Baker and F. Zachariasen. Technical note no. 10 on Contract AF 49(638)388. Feb 60, 47p. 5 refs. AFOSR-TN-60-184; AD-233 730.
Order from LC mi$3.30, ph$7.80 PB 147 334

The dispersion relations for the nucleon isotopic vector form factors and the pion form factor which take into account contributions from both the 2π and NN intermediate states become a set of coupled integral equations for the form factors if the four amplitudes $(\pi\pi|NN)$ $(\pi\pi|\bar{\pi}\bar{\pi})$ $(NN|\pi\pi)$ $(NN|\bar{\pi}\bar{\pi})$ are assumed known. If these 4 amplitudes are replaced by their Born approximation values and spin and certain kinematic factors are neglected, the resulting set of coupled singular integral equations can be solved exactly. Comparison of these exact solutions with the form factors obtained from the usual approximation of retaining only

the lowest mass state (i.e. the 2π state) confirms the hope that high mass states do not contribute much to dispersion integrals. It is also of interest that these solutions are obtained from dispersion relations without subtractions and satisfy the necessary conditions that they vanish at infinite momentum transfer and take on the value at the origin for all values of the coupling parameters appearing in the equations. (Author)

X-RAY YIELDS FROM u-MESONIC ATOMS, by M. A. Ruderman. Rept. on Contract AF 49(638)327. Dec 59, 38p. 23 refs. AFOSR-TN-60-118; AD-233 715.
Order from LC mi$3. 00, ph$6. 30 PB 146 745

The interesting suggestion was made that the rapid drop in the yield of K X-rays in the light elements may be associated with the capture of μ-mesons into the metastable 2s-state. The mechanisms for making transitions from the 2s to the 1s state and from various ρ-states into the 2s state were investigated in detail for Li, Be and B. It is found that the paradoxical reduction of K X-rays remains unexplained.

LOW ENERGY PION PHENOMENA, by J. Hamilton and W. S. Woolcock. Scientific note no. 2 on Contract AF 61(052)233. Oct 59, 33p. 43 refs. AFOSR-TN-59-1314. AD-234 215.
Order from LC mi$3.00, ph$6.30 PB 146 739

The relation between low energy pion-nucleon scattering and pion photo-production is examined. Correct extrapolation to threshold of both the π^+ and π^- photoproduction data gives agreement with theory. A recent new method for analysing the scattering data is applied, giving $a_1 = 0.178$, $a_3 = -0.87$, and reasonable agreement with the Panofsky ratio $P = 1.5$ is obtained. An inner Coulomb correction to the scattering data helps to improve this agreement. The possibility of detecting a π-π interaction by low energy pion scattering is examined. A new dispersion relation connects the s- and p-wave phase shifts at low energies; this relation excludes some well known sets of phase shift curves. (Author)

UPPER BOUNDS ON SCATTERING LENGTHS FOR STATIC POTENTIALS, by Larry Spruch and Leonard Rosenberg. Rept. on Contract AF 19(604)4555. Oct 59, 34p. 25 refs. Research rept. no. CX-43, AFCRC-TN-59-669; AD-233 305.
Order from LC mi$3.00, ph$6.30 PB 146 566

It is shown that in the zero energy scattering of a particle by a center of force, where no bound state exists, the Kohn variational principle provides an upper bound on the scattering length. A bound may also be obtained from Hulthén's method, although with the same form of trial function the Kohn result will be lower (and therefore better) than the one obtained from the Hulthén principle. The Rubinow formulation need not provide a bound; for those calculations which have been performed in this form, the results may be converted without any further calculations so that they correspond to the Kohn form, and therefore, under the circumstances considered, do give a bound. Analogous results hold for states of non-zero orbital angular momentum. (Author)

HIGH ENERGY ELECTRON-ELECTRON SCATTERING, by Yung-Su Tsai. Technical note no. 16 on Contract AF 49(638)388. May 60, 69p. 26 refs. AFOSR-TN-60-546.
Order from LC mi$3.90, ph$10.80 PB 148 163

The radiative corrections to the electron-electron scattering to order α^3 are calculated for (1) the colliding beam experiment and (2) the experiment in which the target electron is at rest initially. The contributions from high energy real photons are included. The two photon exchange diagrams are found to give only negligible contributions to the cross sections after infrared cancellation. The effect due to the possible breakdown of quantum electrodynamics is discussed. A preliminary study on the electron-positron colliding beam experiment involving various interactions is made. The vacuum polarizations involving heavier particles than an electron pair in the closed loop are investigated. (Author)

ON THE DECAY INTERACTION OF STRANGE PARTICLES, by B. Sakita (U. of Wisconsin) and S. Oneda. Rept. on Contract AF 49(638)24. Feb 60, 16p. 20 refs. Physics Dept. Technical rept. no. 165; AFOSR-TN-60-304; AD-234 727.
Order from LC mi$2.40, ph$3.30 PB 147 443

It is proposed that the strength of the coupling constants is different for the strangeness non-conserving and strangeness conserving currents in the scheme of Fermi interactions of an ordinary charged current-current type. First, the consistency with experimental results is analyzed by introducing phenomenologically the direct Λn interaction which satisfies the $|\Delta I| = 1/2$ rule in addition to the usually assumed primary Fermi interaction. Then, the possibility of the derivation of this interaction as the effective interaction of the primary Fermi interactions is discussed. (Author)

A THOMAS-FERMI TECHNIQUE FOR DETERMINING CHARACTERISTICS OF ALKALI ATOMS WITH EXCITED VALENCE ELECTRONS, by Harvey J. Brudner. Technical rept. no. 4 on Contract Nonr-285(15). 1 July 59, 147p. 78 refs. AD-228 163.
Order from LC mi$7.20, ph$22.80 PB 146 968

A technique is developed for the calculation of excited state, one-electron wave functions which is based on the Thomas-Fermi statistical theory of the atom. The case most immediately applicable to calculation via a Thomas-Fermi technique is that of an alkali atom with an excited valence electron since the remaining electrons form a full, symmetric core, all of whose electrons are in the ground state. The technique developed allows for correction for the penetration of the excited electron's wave function, and for semi-empirical correction of polarization and exchange effects. A special, very accurate, numerical technique for solving the Thomas-Fermi differential system for an arbitrary positive ion is described. The Thomas-Fermi potential is then used as a central field in the Schrödinger equation together with the Heisenberg type of polarization energy correction. Angular dependence is assumed to be capable of separation (an approximation also made in Hartree theory), and 2 basic techniques for solving the radial Schrödinger equation are discussed. (Author)

RESEARCH ON SCINTILLATION CRYSTALS AND THEIR ACTIVATORS. I. ZONE MELTING AND ZONE LEVELING OF LiI(Tl). II. COMPACTION AND ACTIVATION OF SCINTILLATORS. III. EFFECT OF COLOR CENTERS ON THE SCINTILLATION OF KI(Tl), by Harold V. Watts, Robert H. Bragg and others. Rept. for 1 June 56-14 May 58 on Contract AF 33(616)3748. July 58, 67p. 17 refs. WADC Technical rept. 58-380; AD-155 861.
Order from OTS $1.75 PB 161 870

In the preparation and growth of impurity activated inorganic scintillators one faces the problems of undesirable impurities in the starting material and of difficulties in many host-activator systems in maintaining uniform activator concentration over reasonable distances. The techniques of zone melting and zone leveling were applied to the preparation of thallium activated lithium iodide. Lithium iodide was successfully purified by zone melting; and a thallium doped ingot prepared by zone leveling the pure lithium iodide was found to be a scintillator of optimum pulse height with a uniform thallium concentration, maintained for about half of the total ingot length of eight inches. Many of the problems of production of scintillators by crystal growth methods may be by-passed by the successful application of the high pressure compaction technique to the production of scintillators. The compaction technique allows the usage of diverse activation methods in the preparation of scintillators. Some of these methods have been investigated. Since the creation and ionization of color centers are processes which compete with scintillation for the energy absorbed from the impinging nuclear radiation, a correlation of luminescence characteristics versus color center concentrations was studied to gain insight into the details of the influence of defects in scintillators.

Army Chemical Warfare Labs., Army Chemical Center, Md.
A PORTABLE LOW-LEVEL ALPHA COUNTER FOR FIELD USE, by Arthur Lind and John C. Goshorn, Jr. Mar 60, 13p. CWLR-2378.
Order from LC mi$2.40, ph$3.30 PB 148 228

A proportional-probe alpha-survey meter (Nuclear Chicago model 2111) has been modified into an enclosed-chamber-type alpha counter, using a multiplier-phototube, alpha scintillator, and a housing designed to accept swipes. The modified instrument is both reliable and sensitive enough to detect very low levels of alpha contamination. The major improvement in reliability is the elimination of the air probe which was subject to high-voltage leakage and microphonics. (Author)

ATTEMPT TO EVALUATE CHLORINATED HYDROCARBON DOSIMETERS BY CROSS CALIBRATING ELEVEN GAMMA RAY SOURCES, by Robert L. Hickmott, Maurice J. Cote, and Philip B. Hemmig. Rept. for Mar 58-Nov 59 on Materials Analysis and Evaluation Techniques. Nov 59, 18p. WADC Technical note 59-401.
Order from OTS $0.50 PB 161 875

An evaluation of the chlorinated hydrocarbon dosimetry system of Convair, Fort Worth was attempted. The evaluation consisted of two phases. The first phase tested the precision of the dosimetry system. It involved the irradiation of thiry five single dosimeters at WADC. The second phase was intended to field test the dosimetry system. It was also hoped that data from this phase would permit the cross calibration of the participating facilities. Data obtained in this program is presented with an analysis of the results. (Author)

OPTICALLY ACTIVE ORGANIC COMPOUNDS AS HIGH LEVEL GAMMA DOSIMETERS, by Stanley M. Dec. Rept. for Aug 58-June 59 on Materials Analysis and Evaluation Techniques. Feb 60, 39p. 9 refs. WADC Technical rept. 59-711.
Order from OTS $1.00 PB 161 881

This project was initiated in order to develop a dosimeter system which could extend the range of current dosimeter methods. A new technique was used, wherein the effects on the rotation of optically active organic compounds were determined with gamma radiation. Data was presented for fourteen optically active compounds. Several potential dosimeter systems were uncovered indicating linear, or near linear response in the degradation of optical activity as a function of total gamma dose up to 4×10^{10} ergs $gram^{-1}$ carbon. Further investigation is recommended to develop the systems. Calibration, reproducibility, sensitivity to impurities, dose rate dependence, and irradiation to higher dose levels are factors which should be considered. (Author)

RECYCLING DOSERATE METER RGI-20, by E. J. Wesley and T. L. Sheridan. 18 May 59, 29p. 2 refs. Research and development technical rept. USNRDL-TR-323; AD-220 474.
Order from LC mi$2.70, ph$4.80 PB 148 372

A hybrid tube plus transistor blocking oscillator system was adapted to a high range gamma doserate meter for disaster survey applications. The instrument features single battery operation, a hermetically sealed input consisting of the ion chamber detector and electrometer tube, and low impedance range switching at the meter. Included is a summary of the design criteria and formulas for both the ion chamber detector and the recycling circuit, with particular reference to the mechanism of compensation for battery voltage and ambient temperature changes. The calibration setting for the instrument is maintained within 5% for battery voltage drift from 1.5 to 1.1 v and temperature changes from 55°C to -40°C. (Author)

OPERATION AND MAINTENANCE MANUAL. 8-COUNTER LOW BACKGROUND NUCLEAR RADIATION MEASUREMENT SYSTEM. Final rept. on Contract AF 19(604)3874. 18 Jan 60, 54p. AFCRC TR-60-112; AD-233 727.
Order from LC mi$3.60, ph$9.30 PB 146 382

The 8-counter low-background nuclear radiation measurement system is a device designed to measure minute quantities of radioactivity. Each counter is independent of the other counters, both electronically and mechanically, so that the individual sample changes may be made in any counter without disturbing operation of the other counters. Thus, in addition to providing a means of measuring levels of radioactivity that are not easily measured by conventional detection devices, the system provides for efficient use of the equipment by allowing eight samples to be counted at one time for the relatively long counting periods required to obtain a statistically sufficient number of counts. OXYGEN REMOVAL FROM REACTOR WATER BY A COPPER AMMINE COMPLEX EXCHANGE RESIN, by A. S. Powell and E. V. Falcone. Rept. on Contract DA 44-192-eng-11.18 Dec 59, 13p. 5 refs. CEND/2407/RS/68.
Order from LC mi$2.40, ph$3.30 PB 147 042

Tests of a copper ammine complex exchange resin were made by flowing either air or oxygen-saturated water through a 30 in. long glass column containing 0.00018 ft.^{3} (50 ml) of the resin at the start of each test. Water flows of 6, 8 and 12 gpm/ft.^{3} (41.6, 55.5 and 83.3 ml/min) at 120, 150, 175 and 200°F and pH's 6, 7 and 8 were used. Oxygen in inflowing water was determined by the Winkler method; that in water leaving the bed by the Indigo-Carmine method. Flow was continued until effluent reached 0.1 ppm oxygen. The amount of oxygen removed did not vary with change in flow rate, pH or temperature. Some resin broke down during runs, particularly at the highest temperature, causing high pressure drops and low oxygen removals. Total solids in effluents ranged from 8 ppm at the start of a run to 111 ppm at the end. Analyses of effluent water showed a maximum of 1.2 ppm copper content. Regeneration of the resin columns was complex and caused leaching of copper oxides. Successive regenerations caused the resin to break down into fines which blocked flow through the column.

Institute of Engineering Research, U. of California, Berkeley.
THE ELASTIC-PLASTIC CYLINDER SUBJECTED TO RADIALLY DISTRIBUTED HEAT SOURCE, LATERAL PRESSURE AND AXIAL FORCE WITH APPLICATION TO NUCLEAR REACTOR FUEL ELEMENTS, by T. B. Kammash, S. A. Murch, and P. M. Naghdi. Technical rept. no. 1 on Contract DA 04-200-ORD-171, continuation of U. of Michigan Contract DA 20-018-ORD-14447. July 59, 40p. 14 refs. Series 130, issue 1; OOR rept. 2275.1-E; AD-226 197.
Order from LC mi$3.00, ph$6.30 PB 148 437

The elastic-plastic deformation of a solid cylinder in the presence of a distributed heat source and subjected to a lateral pressure p and an axial force F is considered in detail using Tresca's yield function, its associated flow law, and a linear work-hardening law Particular attention is given to the class of problems in which the radial stress, and not the axial stress, is the intermediate principal stress. The general results are applied to the cylindrical nuclear reactor fuel element in the state of plane strain with a radially distributed Gaussian heat source, acting in its fissionable interior. The solution is expressed in closed form in terms of the exponential integral and the incomplete gamma function and is found to exhibit 3 stages of plastic deformation. In stage I the plastic domain consists of 2 concentric and adjacent zones with different stress fields and different rates of propagation which expand outward from the center of the cylinder; in stage II the elastic domain vanishes, while the inner plastic zone continues to propagate; and in stage III a third plastic zone is formed at the outer radius which propagates inward. Throughout the deformation the states of stress are found to exhibit regular progression. A numerical example is included. (Author)

LOW ENERGY ELASTIC SCATTERING ON ELECTRONS BY OXYGEN AND NITROGEN, by P. Hammerlind, W. W. Shine, and B. Kivel. Rept. on Contract AF 04(645)18. Mar 57, 19p. 9 refs. Research rept. 6 (formerly Research note 31) AD-150 621.
Order from LC mi$2.40, ph$3.30 PB 147 395

The elastic scattering of slow electrons by O and N is calculated by the method of phase shifts. The Hartree potential gives a cross section (2×10^{-15} cm^2) for O on the order of magnitude needed to agree with the experiments of Lamb and Lin in air. Since the Hartree potential is known to be too weak as it neglects exchange and polarization, this agreement is considered fortuitous. Exchange forces are introduced by a new approximation based on a suggestion of Slater for bound atomic states. The exchange approximation is adjusted to fit the more elaborate calculation of Bates and Massey for zero energy and zero polarization. The addition of a reasonable polarization force results in an acceptable potential and closer agreement with experiment. A similar calculation is made for nitrogen. In this case the Hartree potential alone gives a cross section which is too large. The inclusion of exchange and polarization leads to better agreement with the measurements in air. (Author)

TOTAL GAMMA ABSORPTION IN C^{12}, N^{14}, O^{16}, AND Al^{27} AT 20 MEV, by Edward E. Carroll, Jr. Technical rept. no. 5 [6] on Contract Nonr-551(17). Sep 59, 130p. 107 refs. AD-235 189.
Order from LC mi$6.30, ph$19.80 PB 148 591

Total gamma absorption cross-sections of C^{12} from 20.0 to 21.15 Mev, and of N^{14}, O^{16}, and Al^{27} from 20.0 to 20.5 Mev, were measured using monochromatic gamma rays. A direct absorption technique was used in which samples were placed between the target of an electrostatic generator, and large sodium-iodide scintillation detectors. Monochromatic photons from the $T^3(p,\gamma)He^4$ reaction were varied in energy by changing the energy of the incident protons. The C^{12} cross-section showed pronounced structure with resonances resolved at 20.15 Mev, 20.46 Mev, and 20.92 Mev, with integrated cross-sections of 1.1, 1.0, and 6.6 Mev-millibarns respectively. Oxygen showed a sharply rising cross-section suggesting a strong resonance peaked above about 20.5 Mev. The cross-sections of N^{14} and Al^{27} were smooth over the energy interval investigated. Vienna U. (Austria).
ON THE RENORMALIZATION OF BETA COUPLING, by K. Baumann and A. Hõld. Scientific note no. 1 on Contract AF 61(052)265. 17 Nov 59, 5p. 5 refs. AFOSR-TN-60-26; AD-232 391.
Order from LC mi$1.80, ph$1.80 PB 146 712

The renormalization of the vector and axial vector current is calculated for a single Dirac field which is coupled to itself. A nonlocal Fermi-type interaction is introduced which has been treated by Abrikosov et al (Phys. Rev. 111:321, 1958). In the limit of small nonlocality the renormalization can be performed nonperturbationally. The vector nonrenormalization and an axial vector renormalization factor are found to be greater than one. THE OSCILLOSCOPE METHOD OF MEASURING NUCLEAR HALF-LIVES, by I. Bergström, E. Bonacalza and others. Technical note no. 2 on Contract AF 61(052)118. 1 Feb 60, 39p. 23 refs. AFOSR-TN-60-295; AD-234 429.
Order from LC mi$3.00, ph$6.30 PB 146 643

It is shown that the modern fast oscilloscopes now available commercially are very simple and powerful tools for measuring nuclear half-lives. The advantages and the limitations of the method are discussed. In order to illustrate the problems which are associated with measurements in different half-life regions, seven half-lives associated with metastable states in nuclei were measured. The oscilloscope method can be used in the whole region where conventional delayed coincidence technique is applicable. A very great advantage of the oscilloscope method is that above about 1 μs, it can be very easily used as a multi-channel time analyzer, by continuously photographing the events on the oscilloscope screen.

Naval Radiological Defense Lab., San Francisco, Calif.
ACTIVITY-SIZE RELATIONSHIP OF FALLOUT PARTICLES FROM TWO SHOTS, OPERATION REDWING, by H. K. Chan. 19 Feb 59, 71p. 10 refs. Research and Development Technical rept. USNRDL-TR-314; AD-233 607.
Order from LC mi$4.50, ph$12.30 PB 146 474

The activity of coral fallout particles was studied as a function of individual size. Single particles from 2 shots at Operation Redwing were sized and identified as being of a spheroidal, irregular or dendrite-like type and then measured for gamma activity. Two particle size parameters were employed, equivalent projected area diameter (D_a) and maximum diameter (D_m). The study shows that an extensive range of activities is associated with each size and size-type group. Field data taken at one station indicate that the activities of a size-type group follow a normal distribution. According to the same data the activity varies as $D_a^{2.2}$ and $D_m^{1.7}$ for irregular particles, $D_a^{3.7}$ for spheriodal particles, and $D_m^{2.1}$ for dendrite-like particles. (Author)

THE EXCHANGE OF RADIANT ENERGY BETWEEN CLOTHED MEN AND A DESERT ENVIRONMENT, by A. A. Woodward, W. V. Blevins, and C. M. Greenland. Feb 60, 47p. 22 refs. CWLR-2354.
Order from LC mi$3.30, ph$7.80 PB 148 029

Direct measurements were made of the intensity of direct solar radiation and of sources of diffuse radiation in a desert environment. These showed complex diurnal variation, but followed a regular pattern from day to day. The contributions of each source

to the thermal load on clothed men was also measured. Despite large differences in intensity between solar radiation and diffuse radiation, the actual amount of heat absorbed by clothed men from each of these sources is about the same. (Author)

Material Lab., New York Naval Shipyard, Brooklyn
INVESTIGATION OF CURRENT COMMERCIAL DEVELOPMENTS IN SUNGLASSES WITH POSSIBLE APPLICATIONS FOR MILITARY USE, by L. Banet. Final rept. 30 Dec 58, 31p. 6 refs. Lab. Project 5898-2; AD-225 236L.
Order from LC mi$3.00, ph$6.30 PB 147 241

Data on lens and frame materials were received from twelve manufacturers, including visible light transmission characteristics, optical tolerances, and current prices. The only improvement noted in the survey was the improved abrasion resistance of polarized lenses, which was corroborated by laboratory experiments; no significant improvement in plastic frame materials was observed. In the absence of a satisfactory substitute for the military sunglass specified in Jan-G-475, criteria were developed for desired improvements in design and materials of military sunglasses.

Material Lab., New York Naval Shipyard, Brooklyn, N. Y.
A LENS SYSTEM FOR THE MILITARY GENERAL PURPOSE GOGGLES, by L. Banet and M. Kleinman. Final rept. 24 Sep 59, 30p. 11 refs. Lab. Proj. 6159; AD-235 272.
Order from LC mi$2.70, ph$4.80 PB 147 251

The development of a double lens system was initiated to meet the objections which arise from fogging. The literature was reviewed for the purpose of eliciting useful methods for reducing fogging; anti-fog coatings, anti-dim discs, double-layer lenses, various types of air circulators and electrically heated coatings were employed with varying degrees of success. As a satisfactory solution to the fogging problem, a rubber gasket adapter was designed which fits over the standard frame and which secures a second, spare lens of the kit above the standard lens. Two additional modifications of the double-lens are suggested to improve the effectiveness of the system: The first is a thermo-double lens utilizing metallic coatings, and the second involves use of anti-dim inserts of an Ansco material. Prototypes of coated lenses and anti-dim inserts were fabricated. (Author)

EFFECTS OF PRESSURE ON PROTON SPIN-LATTICE RELAXATION IN SEVERAL ORGANIC LIQUIDS, by A. W. Nolle and P. P. Mahendroo. Technical rept. no. 10 on Contract Nonr-375(05). 6 Aug 59, 16p. 13 refs. AD-225 928.
Order from LC mi$2.40, ph$3.30 PB 148 142

The proton longitudinal nuclear magnetic resonance relaxation time (T_1) is measured at 29 mc for pressures up to 1400 kg/cm^2 in degassed samples of toluene, benzene, cyclohexane, methyl iodide, 1, 1, 1-trichloroethane, n-heptane, and chloroform. The results are compared with data of Benedek and Purcell [J. Chem. Phys. 22:2003, 1954], who found for several liquids that T_1 decreases with pressure much less rapidly than the reciprocal of the viscosity. For globular and linear molecules (e.g., methyl iodide, n-heptane), the earlier conclusions are not affected by use of degassed samples. For the aromatic molecules, however, T_1 in degassed samples varies roughly with the reciprocal viscosity or the self-diffusion coefficient, contrary to the result obtained without degassing. This is taken to mean that rotational and translational jump rates are reduced by comparable amounts upon application of pressure to these liquids. (Author)

THE NEAR-SOUND FIELD OF TURBULENCE, by G. J. Franz. Oct 59, 38p. 24 refs. Rept. 982.
Order from LC mi$3.00, ph$6.30 PB 148 855

General expressions for the velocity potential, particle velocity, instantaneous sound pressure, mean-square sound pressure, and sound intensity for the sound generated by turbulence are derived, starting from Lighthill's fundamental relations for the density fluctuations in the medium outside a turbulent region. The dipole radiation from the turbulent boundary layer of a rigid boundary, the quadrupole radiation from isotropic turbulence, and the lateral quadrupole radiation from turbulence in the presence of a large mean shear are discussed. The frequency spectra and directional patterns of the sound observed at points in the sound field that are much less than a wavelength from multipole sound sources are shown to differ significantly from the frequency spectra and directional patterns of the sound observed at points in the sound field that are many wavelengths from the multipole sound sources. (Author)

THE OSCILLATION AND NOISE OF AN OVER-PRESSURE SONIC JET, by Andrew G. Hammitt. Rept. on Contract AF 49(638)194. Nov 59, 40p. 4 refs. GASL Technical rept. no. 137; AFOSR-TN-59-1307; AD-233 878.
Order from LC mi$3.00, ph$6.30 PB 146 364

A series of experiments on plane 2-dimensional and axially symmetric over pressure sonic jets was performed to study the oscillating behavior of the jet and accompanying sound field. Shadowgraphs were obtained which show the oscillations and generation of the sound waves for the plane 2-dimensional jet in some detail; but similar results could not be obtained for the axially symmetric jet. Measurements from these pictures show that the oscillating jet and sound fields can be described in terms of the length of the shock wave cells. The importance of the sound waves acting upon the base of the jet is demonstrated, and it is found that the jet can be stabilized by shielding its base from these sound waves. (Author)

DETECTION OF SIGNALS OF UNCERTAIN FREQUENCY, by C. D. Creelman. Technical memo. no. 71 on Contract AF 19(604)2277. Sep 59, 25p. 10 refs. 2659-5-T; AFCRC-TN-59-60.
Order from LC mi$2.70, ph$4.80 PB 148 800

Alternative models for extension of frequency sensitivity in human observers are discussed. One decision procedure for a multiple filter model is considered in some detail as a general model for decision situations in which each available response specifies a subset of the signal alternatives. Two experiments were conducted in an attempt to choose between a sweeping-filter model and a multiple-filter model. Detection in a two-alternative forced-choice experiment in which the signal could be one of two possible signals was measured as a test of the two models. The data, in connection with other available studies, are taken to show the need for a more complex model for auditory discrimination. (Author)

THE THEORY OF SIGNAL DETECTABILITY AS IN INTERPRETIVE TOOL FOR PSYCHOPHYSICAL DATA, by W. P. Tanner, Jr. Technical memo. no. 78 on Contract AF 19(604)2277. May 60, 33p. 12 refs. 2659-9-T; AFCCDD-TN-60-13.
Order from LC mi$3.00, ph$6.30 PB 148 801

The theory of signal detectability is examined from the standpoint of determining a set of satisfactory assumptions for the purpose of developing an interpretive tool for use in psychophysical experiments. It is concluded that the assumption that the observer attempts to maximize the expected value of the outcome of the experiment is satisfactory for this purpose, and that a set of physical conditions can be established which justify a computation of the detectability of a signal in noise based on a finite sampling plan involving 2WT amplitude values over the open interval, O to T. SOUND ABSORPTION IN THE HALOGEN GASES, by F. D. Shields. Final rept. on Relaxation Process in Gases, Contract Nonr-2347(00). [1959] 20p. 16 refs. AD-225 391.
Order from LC mi$2.40, ph$3.30 PB 148 576

Apparatus has been constructed for measuring sound absorption by the tube method in corrosive gases at high temperatures. This apparatus has been used to measure sound absorption in chlorine, bromine and iodine vapors at temperatures between 25 and 256°C. The measurements revealed vibrational relaxation absorption peaks in all the gases. In Cl_2 the relaxation times varied from 4.90 μsec at 25°C to 1.55 μsec at 255°C. In Br_2 the variation was from 0.854 μsec at 28°C to 0.460 μsec 256°C. In I_2 the relaxation time was almost independent of temperature, changing only from 0.106 to 1.102 μsec when the temperature changed from 112 to 253°C. The heights of the absorption peaks were adequately predicted by assuming the relaxing vibrational specific heat to be C_p - 7/2 R. Neither the Schwartz-Herzfeld nor Cottrell-Ream theoretical equations for the relaxation time accurately predict the measured variation with temperature, molecular mass and vibrational frequency. BIOLOGICAL ENVIRONMENT AS RELATED TO THE TRANSMISSION OF SOUND IN THE SEA. THE DEEP SCATTERING LAYER, by Giorgio Soli. 28 July 59, 18p. 37 refs. NOTS TP 2309; NAVORD rept. 6581; AD-226 614.
Order from LC mi$2.40, ph$3.30 PB 148 447

The deep scattering layer is formed by a concentration of marine animals living at a depth of 300-800 meters. It can be found in every part of the world and has the characteristic of performing a diurnal vertical migration of several hundred meters. Only planktonic animals and certain fishes may show a vertical migration of the type pecular to the deep scattering layer. The organisms that constitute the layer have not been clearly identified.

ANTENNA PROBLEMS OF MEASUREMENT OF THE AIR-EARTH CURRENT, by Heinz W. Kasemir and Lothar H. Ruhnke. 15 Apr 59, 16p. 3 refs. USASRDL Technical rept. 2022; AD-228 435.
Order from LC mi$2.40, ph$3.30 PB 146 342

The antenna used to collect the air-earth current often distorts the lines of current flow in the air. It also introduces other voltage sources such as the volta potential from the wire or metal plate or piezoelectric charges from cables and insulators. These voltage sources may make the measurement of the air-earth current faulty. This report shows under what conditions a true current measurement is achieved and how the influence of the volta potential and piezoelectric effect can be avoided. A method is described whereby the model factor of even complicated antenna forms can be determined by a simple capacity measurement. (Author)

DEVELOPMENT OF MAGNETOSTRICTIVE AND RELATED MATERIALS, Final progress rept., Part 2, 10 Apr 52-9 Apr 54, on Contract AF 18(600)302. [1954] 60p. 25 refs. Rept. no. F-2306, Part 2; AFOSR-TR-54-24.
Order from LC mi$ .60, ph$9.30 PB 146 528

A study of the effects of the order-disorder transformation was made on alloys with compositions near Ni_3Mn, Fe_3Pt, and $FePd_3$. In the Fe-Pd alloys, the work was extended to include measurement of saturation moment at low temperatures and of the long-range order parameter. The kinetics of the ordering process in Fe_3Pt alloys were studied at temperatures from 450 to 750°C. Resistivity measurements on polycrystalline wires were used to follow the ordering process.

Geophysical Inst., U. of Alaska, College.
THE EFFECT OF TOPOGRAPHY AND GEOLOGY ON TELLURIC CURRENTS, by E. M. Westcott and V. P. Hessler. Scientific rept. no. 3 on Contract AF 19(604)3075. Apr 60, 64p. 25 refs. AFCRC-TN-60-431.
Order from LC mi$3.90, ph$10.80 PB 148 017

The electric field vectors E, associated with telluric currents are known to vary in comparative magnitude and principal direction at different locations. Large differences in the vectors from several Alaskan stations prompted a study to determine what effect topography and geology have on the telluric field. The results of this study show that the comparative magnitude may change by a factor of five and the principal direction may range over 33 degrees, and in one extreme case 70 degrees in the area. Model studies using a resistor network were made to determine the effects of some simple topographic and conductivity configurations upon the telluric field. Some of the interesting field results are explained on the basis of the model studies and the resistivity measurements.

IMPROVED MAGNETIC MATERIALS, by Ernest Costello, Arnold Holtzman, and Harry Suprinick. Quarterly progress rept. no. 2, 16 Oct 56-15 Jan 57, on Contract DA 36-039-sc-70120. [1957] 27p. 12 refs. AD-138 072.
Order from LC mi$2.70, ph$4.80 PB 149 365

A resume of the theoretical bases for the work on manganese alloys is presented. Additional alloys for the Mn_4C phase of the work have been prepared and are now being homogenized. Further alloy preparation in the Mn_3AlC phase of the work has included a nominal Mn_3CoC alloy which displayed weak ferromagnetism and a nominal Mn_3AlC alloy showing strong ferromagnetism. The X-ray analysis of the magnetic particles extracted from the Mn_3NiC alloy reported on the last report has not been completed. Specimens of a nominal 8% Si-Fe-Si alloy have been prepared for determination of the ordering temperature. Progress has also been made in spark machining rings of the same alloy for magnetic analysis and satisfactory metallographic techniques appear to have been arrived at for the microscopic study of these alloys. Further work on slag melting of alloys is underway. Following reconstruction of the magnetostriction equipment under the supplement to the preceding contract work has been progressing on adaptation of this equipment to high temperature magnetostriction measurements. INFLUENCE OF LIGHT ON FERROMAGNETISM, by Julian L. Thompson. 6 Jan 58, 26p. 7 refs. NOTS 1935; NAVORD rept. 5840; AD-162 984.
Order from LC mi$2.70, ph$4.80 PB 148 370

Nearly unmagnetized samples of certain iron-nickel alloys are rendered slightly more or less magnetic by the action of light falling on the surface, depending upon the magnetic history of the sample. The effect disappears as soon as the light is removed, the changes taking place in a few milliseconds. Under the same conditions, a certain iron-silicon alloy shows an effect which remains after the illumination is removed. Mechanical shock will produce the same effect as light. The response to light is roughly proportional to intensity and seems to be largely due to the red and near infrared portions of the spectrum. (Author)

FINAL REPT. FOR 1 SEPTEMBER 1958-30 AUGUST 1959, ON CONTRACT NONR-2665(00), by R. Stevenson. 30 Aug 59, 35p. 28 refs. AD-226 027.
Order from LC mi$3.00, ph$6.30 PB 148 191

Magneto-optical rotation by transmission through or reflection from solids is examined by the classical free electron theory, with the view of taking such a measurement using fields in the megagauss range. In general the rotation is a markedly non-linear function of the magnetic field, and in some cases can change in sign as the field increases. For very low fields the rotation varies directly with B, but in the high field limit the rotation varies inversely with the field. For substances in which the intercollision time of the electron is small, measurments of the Kerr rotation (i.e., by reflection) will give the electron mobility as a function of the magnetic field, and thus will give important data which can be used in conjunction with high-field magneto-resistance experiments. NONLINEAR ANTENNA STUDY, by C. O. Ball. Technical note on Contract AF 30(602)1873. Dec 58, 28p. Rept. no. 5341-TN-1; RADC-TN-58-305; AD-148 975.
Order from LC mi$2.70, ph$4.80 PB 146 594

This technical note presents the results of the first stage of investigation pursuant to a study concerned with nonlinear antenna systems. The purpose of this first stage was to evaluate the A-J characteristics of self-adjusting antennas. A self-adjusting antenna is a system of antennas with a combining method that involves automatically rephasing the inputs so that the jammer components are canceled upon additive combination. Effectively, this is a system for automatically placing a null of a linear array on a jammer location. A short evaluation was also made of a related antenna utilizing an analytic solution of an equation involving the jammer-plus-signal phasor.

David Sarnoff Research Center, Princeton, N. J.
THERMIONIC EMISSION STUDIES, by G. A. Morton, A. H. Sommer and others. Quarterly rept. no. 3, 1 Apr-30 June 59, on Contract DA 36-039-sc-78155. [1959] 49p. 17 refs.
Order from LC mi$3.30, ph$7.80 PB 147 272

Thermionic Emission: Work on the tungsten bronzes has been discontinued as showing insufficient promise. The reasons for this decision are discussed. Hot Electron Emission (HEE) from Silicon: The study of Cs-treated silicon junctions was continued, in particular the effect of the Cs on the rectification properties of the junction and the change of HEE with time. The relationship of HEE threshold voltage to breakdown voltage was investigated, leading to a preliminary interpretation deviating from earlier assumptions. Measurements were also made to distinguish the resistance of the junction from the resistance of the silicon in series with it. (Author) (See also PB 145 236)

Electronics Research Lab., U. of California, Berkeley.
RECIPROCITY THEOREMS FOR ELECTROMAGNETIC FIELDS WHOSE TIME DEPENDENCE IS ARBITRARY, by W. J. Welch. Rept. on Contract N7onr-295(29). 11 June 59, 15p. 4 refs. Rept. no. 88; Series no. 60, issue no. 237; AD-227 407.
Order from LC mi$2.40, ph$3.30 PB 146 583

Two reciprocity theorems are derived which are valid for fields whose sources may have arbitrary time dependence. The first theorem involves the electromagnetic potentials, and the second is in terms of the electric and magnetic fields directly. In both cases it is necessary to make use of the advanced as well as the retarded solutions to Maxwell's equations. Some properties of the theorems are discussed, and as an application, the second is used to derive a variational expression for scattering of electromagnetic waves from a perfect conductor. (Author)

SOME GENERAL PROPERTIES OF THE HEARING MECHANISM, by W. P. Tanner, Jr., J. A. Swets and others. Technical rept. no. 30 on Contract DA 36-039-sc-63203. Mar 56, 100p. 41 refs. 2262-108-T.
Order from LC mi$5.40, ph$15.30 PB 149 363

This report deals with the auditory processes of detection and frequency analysis. It presents a decision-making theory of detection and some data supporting the theory. Other data included are consistent with a theory of frequency analysis that characterizes the human observer as instantaneously sensitive to a limited range of frequencies, with a shifting of the frequency range of sensitivity requiring a measurable amount of time. Finally, the problem of speech perception is considered in terms of the mechanism inferred from these studies. The results of this investigation are regarded as contributing to the methodology of psychophysical testing, to auditory theory, and to general behavior theory. The data indicate directly a need for certain innovations in conventional testing procedures by virtue of exhibiting some properties of the auditory mechanism not previously considered. The nature of both the detection and frequency-analysis properties discussed calls for a recognition of the influence of central processes on sensory processes, and demonstrates the feasibility of studying central processes by sensory experiments. ON THE THEORY OF M-TYPE TUBES WITH THICK BEAMS, by Georges Mourier. Rept. on Contract AF 49(638)340. 22 Aug 58, 20p. 12 refs. Research rept. R-680-58; PIB-608; AFOSR-TN-58-926. AD-204 738.
Order from LC mi$2.40, ph$3.30 PB 147 446

The effects of space charge in crossed field, M-type tubes is considered qualitatively. The consideration of 2 surface waves associated respectively with the upper and low boundaries of the beam make possible a broad understanding of the behavior of M-type tubes with thick, heavy-current beams. No systematic comparison of theory with experiments is made. However, the gain calculation seems to be in general agreement with experiment, as is the prediction of a minimum efficiency for intermediate values of beam current. The most serious restriction on this analysis is probably the assumption of laminar flow. (Author)

Naval Research Lab., Washington, D. C.
SOURCE AND DETECTOR CORRECTIONS FOR ANGULAR CORRELATION MEASUREMENTS, by F. C. Young. Interim rept. 20 June 60, 9p. 4 refs. NRL rept. 5475.
Order from LC mi$1.80, ph$1.80 PB 145 718

The geometrical corrections to the angular correlation function for circular detectors with spherical and cylindrical sources have been calculated. The calculations were made to second order in terms of the various geometrical parameters, and curves were plotted showing the dependence of the corrections on these parameters, as well as on the correlation angle. The parameters were: the angle between the two gamma rays; the angle between the symmetry axes of the two detectors of solid angle $d\Omega_1$, and $d\Omega_2$; the radius of the detectors; the radius of the source; and the distance from the source to the center face of each detector. An extension of these corrections to include cylindrical detectors was investigated and the results were of the same mathematical form as for circular detectors. (Author)

SEQUENTIAL SIGNAL DETECTOR, RAYLEIGH CASE, by J. W. Caspers. 7 Nov 56, 33p. 5 refs. Research rept. 730.
Order from LC mi$3.00, ph$6.30 PB 149 187

A detector based on the sequential probability ratio test has been examined theoretically. It is shown that it will respond to signals more rapidly, on the average, than the best non-sequential detector. Equations and curves are given which predict the performance of the sequential detector and compare it with that of the Neyman-Pearson detector. Further analyses and experimentation are outlined which are directed toward a more comprehensive understanding of the sequential detector, toward its simplification, and toward an estimation of its value as a signal-to-noise ratio estimator. (Author)

ANTENNA PATTERNS FOR MAXIMUM INFORMATION RATE, by Paul A. Lux, H. Myron Swarm, and David D. McNelis. Technical rept. no. 41 on Contract AF 19(604)4098. Apr 60, 33p. 6 refs. AFCRC-TN-60-175.
Order from LC mi$3.00, ph$6.30 PB 148 236

This paper is concerned with finding the optimum directivity pattern of an antenna. Because of irregularities in the atmosphere, ionosphere, or meteor bursts a signal does not arrive at the receiver from a single direction. Therefore maximum directivity with its attendant narrow beam width may not be the best criterion of antenna performance. Nor is the performance of an omnidirectional antenna apt to be optimum regardless of how optimum is defined. However, a directivity pattern between these two extremes results in optimum performance when a logical definition of optimum is applied. The optimum directivity pattern is determined by the type of signal to be received and the type of receiver being used. In this paper, an optimum pattern is defined and determined as a function of the distribution of the incoming signal power in azimuthal angle. Systems similar to meteor-burst channels are considered, i.e., the signals are assumed to arrive in discrete, non-overlapping bursts. (Author)

AUTOMATIC COMPUTATION OF ELECTRONIC ENERGIES OF DIATOMIC MOLECULES, by Tadashi Arai. Technical rept. on Contract DA 36-061-ORD-466. [1960] 69p. 10 refs. OOR rept-1350.16-C; AD-233 992.
Order from LC mi$3.90, ph$10.80 PB 148 533

A general method for computing electronic energies and wave functions of diatomic molecules is described and arranged in such a way that the processes of the computation are carried through systematically and fully automatically by an electronic computer. In principle, therefore, we are able to compute the energy values and the wave functions by inserting the number of electrons in the molecule concerned, the spin multiplicity S, the angular momentum (its component L along the nuclear axis) and other symmetry requirements, if we decide what kind of basic functions we wish to use as orbitals. At the first step, an orthonormal set of orbitals is built up from the orbitals assumed as bases. By taking every possible combination of the orthonormal orbitals, candidate basic functions are generated. Each of them is tested to see if it satisfies the symmetry requirements of the molecule. Thus all the basic functions which should be obtained from the orbitals assumed are systematically generated. The energy matrix involving them is calculated by the use of the representation matrices of the permutation group. Every necessary permutation for computing the energy matrix is considered automatically by the computer. The only data required to be stored in the machine are spin functions and the representation matrices of the permutation group for a small number of electrons (say 6 electrons). Those are universal quantities for any kind of Fermi particles and are easily obtainable. (Author)

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
SENSITIVITY OF MICROWAVE SPECTROMETERS AND HYPERFINE SPECTRA OF $CFCl_3$, by Maurice W. Long. Doctoral thesis. Technical rept. no. 1 on Contract Nonr-991(07). 15 June 59, 110p. 41 refs.
Order from LC mi$5.70, ph$16.80 PB 147 451

Comparisons based on theoretical and experimental investigations are made on the following detection system for use with Stark spectrographs: crystal diodes and tuned amplifiers, bolometers and tuned amplifiers, and superheterodynes in conjunction with a microwave bridge. Equipment modifications are described which provide improved sensitivity for detecting small decrements in a relatively large amount of power; the modified equipment is sensitive to signal changes of one part in 10^{10}. Absorption lines at X-band having a calculated absorption coefficient at room temperature of 4×10^{-11} cm^{-1} were measured. It is believed that these are the weakest lines ever reported. A theoretical calculation is made for the hyperfine structure of the $J = 1 \rightarrow 2$ rotational transition for symmetric top molecules having three identical nuclei of spin 3/2. This calculation is used to analyze the $CFCl_3^{35}$ transition at 9.86 kmc, and provides the quadrupole coupling constant with respect to the molecular symmetry axis.

THE APPLICATION OF WAVE FUNCTIONS CONTAINING INTERELECTRON COORDINATES II. THE GROUND STATE ENERGY OF ATOMS, by Peter Walsh and Sidney Borowitz. Rept. on Contracts AF 19(604)4555 and DA 30-069-ORD-2581. Dec 59, 42p. 23 refs. Research rept. no. CX-45; AFCRC-TN-59-657; AD-233 304.
Order from LC mi$3.30, ph$7.80 PB 146 568

An attempt was made to explore further the use of interelectron coordinates in constructing atomic wave functions. A simple method is developed for constructing wave functions of this type which yields surprisingly good values for the energy of a variety of atomic systems in zero order. (See also PB 142 836)

Little, Arthur D., Inc., Cambridge, Mass.
INFRARED SPECTRA OF GASEOUS GROUP IV HALIDES: ZIRCONIUM FLUORIDE, ZIRCONIUM CHLORIDE AND HAFNIUM CHLORIDE, by Alfred Büchler. Interim technical rept. no. 1 on Study of High-Temperature Thermodynamics of Light-Metal Compounds, Contract DA 19-020-ORD-4829. 20 Apr 60, 10p. 10 refs. OOR rept. 006.1-C.
Order from LC mi$1.80, ph$1.80 PB 148 429

The infrared spectra of gaseous ZrF_4, $ZrCl_4$, and $HfCl_4$ have been observed between 3000 and 200 cm^{-1}. The observed frequencies are

	ν_3 cm^{-1}	ν_4 cm^{-1}
ZrF_4	668	200
$ZrCl_4$	423	---
$HfCl_4$	393	---

Lyman Lab. [of Physics] Harvard U., Cambridge, Mass.
N^{14} - N^{15} HYPERFINE ANOMALY, by L. Wilmer Anderson and Francis M. Pipkin. (Mallinckrodt [Chemical] Lab.). Rept. on Contract Nonr-1866, T.O. 14. [1959] 52p. 33 refs. AD-220 657.
Order from LC mi$3.60, ph$9.30 PB 148 151

The optical transmission of an optically oriented sodium vapor in spin exchange equilibrium with atomic nitrogen was used to measure the zero field hyperfine splitting of N^{14} and N^{15}. The nuclear moments of N^{14} and N^{15} were remeasured by observing the effects of saturating the nitrogen resonance on the proton resonance in NH_4^+. The N^{14} - N^{15} hyperfine anomaly obtained by combining measurements is

$$\Delta = \frac{A(15)/A(14)}{g(15)/g(14)} - 1 = 0.000981 \pm 0.000017.$$ A short discussion of the mechanism of spin exchange collisions is given.

Malinckrodt Chemical Lab., Harvard U., Cambridge Mass.
MICROWAVE SPECTRUM, STRUCTURE, DIPOLE MOMENT AND NUCLEAR QUADRUPOLE EFFECTS IN VINYL CHLORIDE, by Daniel Kivelson, E. Bright Wilson, Jr., and David R. Lide, Jr. (National Bureau of Standards). Rept. on Contract Nonr-1866, T.O. 14. [1959] 19p. 16 refs. AD-220 658.
Order from LC mi$2.40, ph$3.30 PB 148 152

The microwave spectra of nine isotopic species of vinyl chloride have been measured and analysed, yielding moments of inertia from which a molecular structure was calculated. The bond lengths found are (in A) C=C 1.33_2, C-Cl 1.72_6, average C-H 1.08. The bond angles are C_2C_1Cl 122°, $C_2C_1H_1$ 124°, $C_1C_2H_3$ (cis to Cl) 121°, $C_1C_2H_2$ (trans to Cl) 120°. Planarity was assumed. The chlorine nuclear quadrupole hyperfine lines were re-examined. From the data for several isotopic species it was shown that the C-Cl bond direction is within five degrees of a principal axis of the field gradient tensor. The lack of cylindrical symmetry of the field gradient about the C-Cl bond was confirmed. This is evidence that the observed shortening of the C-Cl bond is at least in part due to conjugation with the C=C double bond and not solely to hybridization effects. The component of dipole moment along the a inertial axis was found to be 1.42 ± 0.02 D. (Author)

National Bureau of Standards, Washington, D C.
STANDARDIZATION OF THERMAL EMITTANCE MEASUREMENTS, by William N. Harrison, Joseph C. Richmond and others. Rept. for 1 July 58-30 June 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)58-20. Mar 60, 37p. 3 refs. WADC Technical rept. 59-510.
Order from OTS $1.00 PB 161 879

The principles governing emission, transmission, reflection and absorption of radiant energy are briefly reviewed; definitions of pertinent terms as used in the text are given; and mathematical relationships between properties and quantities that are involved in the project are presented. A double-beam ratio-recording

spectrometer was modified so that it would compare radiant energy beams emitted by a blackbody furnace and a specimen at the same temperature, and record automatically a curve of normal spectral emittance of the specimen as a function of wavelength. Preliminary designs of equipment were formulated for the automati recording of spectral emittance data in a form suitable for direct entry into a computer, and for the on-line, automatic processing of data to obtain a single value for total emittance or for absorptance for radiant energy of any known spectral distribution. (Author)

THE INTENSITY OF THE INFRARED C≡N BAND OF p-ALKYLBENZONITRILES IN VARIOUS SOLVENTS, by Theordore L. Brown. Technical rept. no. 2 on Contract Nonr-2533(00). 10 Aug 59, 9p. 7 refs. AD-225 134.
Order from LC mi$1.80, ph$1.80 PB 148 127

The integrated intensities of the C≡N absorption in p-methyl, p-ethyl, p-isopropyl, and p-tert-butyl compounds were measured in CCl_4, $CHCl_3$, and CCl_4-pyridine solvents. In $CHCl_3$ and CCl_4 solutions the alkyl groups caused an increase in the C≡N intensity in the inductive order. This order was essentially absent in the mixed solvent containing 16% pyridine. The inverse order of intensities was found in CCl_4 and $CHCl_3$ rather than that which was expected from the correlation of the electrophilic substituent constants (σ^+) for the p-alkyl groups to the square root of the intensity. In the more basic mixed solvent, the changes in relative values were in the direction of the Baker-Nathan order. An attempt was made to estimate the quantities involved in the expression derived for the intensities from the observed dipole moment of the molecule. Essentially all of the intensity variation in the alkylbenzonitriles were reasonably accounted for by considering the polarizabilities of the alkyl groups. The conclusion is drawn that the intensity variations in CCl_4 can be explained without recourse to a hyperconjugation mechanism.

SOME PROPERTIES OF p-ALKYLBENZONITRILES AND ACETOPHENONES, by Theodore L. Brown. Final rept. on Contract Nonr-2533(00). 10 Aug 59, 4p. 3 refs.
Order from LC mi$1.80, ph$1.80 PB 148 128

The purpose of this study was to gain additional information which might be helpful in assessing the importance of C-H hyperconjugative electron release in determining the electronic properties of alkyl groups.

Ohio State U. Research Foundation, Columbus.
FUNDAMENTAL RESEARCHES IN THE LONG WAVELENGTH X-RAY REGION, by C. H. Shaw. T Technical rept. no. 8 on Contract N6onr-225(21). June 58, 13p. 25 refs. AD-161 665.
Order from LC mi$2.40, ph$3.30 PB 146 600

A brief summary of work concerned with x-ray investi gations of the structure and other fundamental physical properties of matter. It has long been recognized that an understanding of these properties ultimately rests upon a knowledge of atomic and electronic structure. Included in the report are:
Geometry of the two-crystal x-ray spectrometer, by J. A. Soules, pub. in the Ohio Jnl. of Science 54:304, Sep 54
Design of differential x-ray filters for low-intensity scattering experiments, by Jack A. Soules, William L. Gordon, and C. H. Shaw, pub. in the Review of Scientific Instruments 27:12-14, Jan 56.

INFRARED EMISSION SPECTRA OF GASEOUS B_2O_3 AND B_2O_2. FREQUENCY ASSIGNMENT AND THERMAL FUNCTIONS, by D. White, D. E. Mann and others. Technical rept. no. 2 on Contract Nonr-495(12) June 59, 30p. 20 refs. AD-219 358.
Order from LC mi$2.70, ph$4.80 PB 149 258

The infrared emission spectra of gaseous B_2O_3 and B_2O_2 in the temperature range 1400-1800°K was studied in the region 700-4000 cm^{-1}. Three distinct bands were found for gaseous natural B_2O_3 at 2040, 1302 and 742 cm^{-1} and the B^{10}-B^{11} isotope shifts measured. From the isotope shift data and other considerations the B_2O_3 molecule was assigned a V structure in the C_{2v} symmetry class. A force constant analysis was made and a frequency assignment from which thermal functions were computed is given. The observed frequencies lead to force constants which are consistent with the high stability of the molecule. Only one emission band of gaseous B_2O_2, at 1890 cm^{-1}, was observed. Assuming a linear structure, $D_{\infty h}$, for this molecule, a frequency assignment and thermal functions were estimated. (Author)

THE RATE OF VIBRATIONAL DEACTIVATION BY THE SPECTROPHONE METHOD. I. CARBON MONOXIDE, by G. C. Turrell, W. D. Jones, and J. C. Decius. Technical rept. no. 3 on Contract Nonr-1286(03). 1 Aug 59, 31p. 21 refs. AD-225 317.
Order from LC mi$3.00, ph$6.30 PB 148 189

An apparatus for observing the pressure signal generated by an infrared beam traversing a gas sample has been constructed. This spectrophone uses a modulation frequency of 600 cps. and is capable of measuring changes in the time lag between the incident infrared energy and the pressure with an accuracy of about 5 μsec. It has been applied to the study of vibrational relaxation times for pure carbon monoxide, as well as mixtures with the infrared inert gases H_2, He, Ne, A, N_2. At one atmosphere and at room temperature, the relaxation time for pure CO is 190 μsec.; other values range from 1.5 μsec. for CO-H_2 collisions up to 370 μsec. for CO-A. These results are compared with relaxation times for CO at elevated temperatures found by other methods. A discussion of the validity of spectrophone results and some of the complications are included. (Author)

ANALYSIS OF A MAGNETIC RESONANCE SPECTROMETER, by J. P. Goldsborough and M. Mandel. Rept. on Paramagnetic Resonance, Contract AF 18(603)131. June 60, 15p. 5 refs. Technical note no. 131-5; AFOSR-TN-60-533; AD-238 355.
Order from LC mi$2.40, ph$3.30 PB 148 412

This paper analyzes an electron paramagnetic resonance microwave bridge spectrometer and expressions are given for the relation between the signal and the imaginary part of the magnetic susceptibility. From these the conditions for maximum signal are obtained. The analysis is also applicable to many other types of magnetic resonance spectrometers. (Author)

s-TETRAZINE I. ELECTRONIC ADSORPTION SPECTRA AND, IN PARTICULAR, THE VISIBLE $n\rightarrow\pi^*$ VIBRONIC BAND SYSTEMS UNDER HIGH RESOLUTION, by Glenn H. Spencer, Jr. (Doctoral thesis), Paul C. Cross, and Kenneth B. Wiberg. Technical note 3 on Contract AF 18(600)1522. Jan 60, 38p. 38 refs. AFOSR-TN-60-69; AD-233 496.
Order from LC mi$3.00, ph$6.30 PB 146 746

The low resolution electronic spectrum of s-tetrazine vapor was measured down to about 190 mμ, and the complex systems of vibronic bands that comprise the $n\rightarrow\pi^*$ visible absorption spectrum were studied under higher resolution. These latter spectra were photoelectrically recorded in the third order of a 21 ft grating spectrograph, using path lengths from 0.05 to 48 m and temperatures from -70 to 70°C. In the absorption regions 4500 to 6100 Å, the spectrum consists of over 500 sharp, vibronic band peaks. Their collected Q-branch maxima were measured to the nearest cm^{-1}, but no discrete rovibronic structure was resolved. (Author)

Washington U., Seattle.
s-TETRAZINE II. INFRARED SPECTRA, by Glenn H. Spencer, Jr. (Doctoral thesis), Paul C. Cross, and Kenneth B. Wiberg. Technical note 4 on Contract AF 18(600)1522. Jan 60, 21p. 22 refs. AFOSR-TN-60-68; AD-233 513.
Order from LC mi$2.70, ph$4.80 PB 146 747

To aid in the vibronic analysis of the $n\rightarrow\pi^*$ visible absorption band systems of s-tetrazine vapor, infrared spectra of vapor, solution, and cold, solid film phases of natural and of deuterated mixtures of s-tetrazine have been obtained. By use of the product rule and by correlation of the fundamental modes of s-tetrazine with those of benzene and the other azines, it is possible to make tentative vibrational assignments for all seven of the fundamental bands that would be expected to be infrared active in the wavelength region from 2 to 15. However, the low frequency modes 16a and 16b, A_{μ} and $B_{1\mu}$, respectively, have not yet been observed, and the lack of knowledge of the frequencies of eight of the nine gerade modes (Raman active only) has prevented any definite assignment of combination bands. The interesting, peculiar observation of what is believed to be the totally symmetrical mode 6a near 730 $cm.^{-1}$ in the solid film spectra of the various deuterated mixtures is also reported. THE FABRICATION OF INFRARED FILTER WHEELS USING SPRAY TECHNIQUES, by Hugh R. Carlon. 31 Dec 58, 11p. 1 ref. CWL Technical memo. 32-39; AD-208 394.
Order from LC mi$2.40, ph$3.30 PB 148 445

The present model E33R2 LOPAIR instrument employs a monochromator for wavelength selection, but an instrument has been successfully demonstrated which utilizes a rotating wheel, consisting of two semicircles of selected filter materials, which alternately transmit and block radiation at the reference and analytical wavelengths, thus producing an AC signal when an absorption occurs. These filter wheels have previously been manufactured by the process of vacuum evaporation, which is tedious and time-consuming. The spray techniques described here yield filter surfaces of equal quality to those obtained by vacuum evaporation, yet require only a fraction of the time. In addition, the spray process has certain advantages which make it a very flexibie method of fabrication. (Author)

THE QUASI-PARALLEL LIGHT PRINCIPLE: FORMATION OF HOLLOW-CONICAL, FLAT, OR TUBULAR OPTICAL PATTERNS, by Harald W. Straub, Josef M. Arthaber, and Ward J. Moore. 13 Jan 60, 15p. TR-745; AD-232 434.
Order from LC mi$2.40, ph$3.30 PB 146 301

A light beam whose boundary rays are truly parallel for a limited, but relatively large distance, is discussed. Parallel boundary rays were obtained when the parameters of the optical system were chosen so that a real image of an extended source is formed not at infinity but at a finite distance, and this image is equal in size to the lens or mirror that projects the image. This beam can be converted to the pattern of a well defined hollow cone, a tube or an equally well defined thin, flat sheet without using nonconventional optical means. The reversal of the principle, that is, replacement of the source by a photodetector, leads to detection patterns which may be relatively narrow for a given distance, or thin-walled hollow cones, or tabular, or thin flat sheets. This method for forming quasi-parallel, flat; and tabular patterns not only avoids the necessity of nonconventional optical parts but also affords good definition of the pattern as well as optical gain especially in the near field.

Naval Research Lab., Washington, D. C.
INFRARED TRANSMISSION OF THE ATMOSPHERE, by H. W. Yates and J. H. Taylor. Final rept. 8 June 60, 43p. 22 refs. NRL rept. 5453.
Order from LC mi$3.30, ph$7.80 PB 144 636

The transmission of the atmosphere in the spectral range from 0.5 to 15 μ has been studied over three sea-level paths 0.3, 5.5, and 16.25 km in length, with an average spectral resolution, $\lambda/\Delta\lambda$, of 300. The conditions encountered covered a wide range, from 0.11 cm precipitable water in the 0.3-km path to a maximum of 38 cm precipitable water in the 16.25-km path, and values of the visual scattering coefficient were measured from 0.048 km^{-1} to 0.24 km^{-1}. Data have been evaluated on selective transmission vs water-vapor concentration for the infrared "window" regions, and the behavior of the scattering coefficient with wavelength has been plotted for representative atmospheres. Similar data were plotted for several measurements made over a range of 27.7 km at an altitude of 10,000 ft. (Author)

ECHELETTE GRATINGS AS FILTERS, by Ely E. Bell and Robert A. Oetjen. Scientific rept. no. 1 on Contract AF 19(604)4119. July 59, 19p. 7 refs. AFCRC-TN-59-668; AD-231 891.
Order from LC mi$2.40, ph$3.30 PB 149 257

In the existing far infrared spectrograph at Ohio State University, echelette gratings were used for filtering when investigating radiation of wavelength greater than about 70μ. However, little detailed information about the reflection characteristics of these gratings was available. Therefore, with an eye to improving the filtering in this instrument at these longer wavelengths, the following were undertaken: (1) A calculation of the reflection characteristics, hence the filtering properties, of an ideal echelette grating; (2) A measurement of the reflection characteristics of some actual gratings and comparison with the ideal; and (3) An investigation of the possibility of finding a combination of gratings that would provide filtering more efficient than that now used. THEORETICAL INVESTIGATIONS ON THE LIGHT SCATTERING OF COLLOIDAL SPHERES. VIII. THE ANGULAR LOCATION OF INTENSITY MAXIMA AND MINIMA IN THE RADIATION DIAGRAM OF COLLOIDAL SPHERES, by Masayuki Nakagaki and Wilfried Heller. Technical rept. no. 33 on Contract Nonr-736(00). 20 June 59, 31p. 17 refs. AD-219 587.
Order from LC mi$3.00, ph$6.30 PB 146 351

The angular position of scattering maxima and minima in the radiation diagram of nonabsorbing colloidal spheres is calculated for $(m-1)\rightarrow 0$ and for $m \geq 1.20$, using in the former case the Rayleigh-Gans approximation and in the latter the exact Mie scattering functions. By means of empirical equations based upon the discrepancies between the Rayleigh-Gans data and the Mie data, the approximate location of scattering maxima and minima is calculated also for the m-values 1.05, 1.10, 1.15, 1.25, and 1.30. The expected precision and accuracy of particle size determinations from the angular location of scattering maxima and minima is discussed and the minimum angular ranges to be covered in a given instance are defined. A few pertinent features of the related La Mer method (HOTS) are briefly discussed. (Author)

AN INVESTIGATION OF THE QUESTION OF FIBER ORIENTATION IN THIN IRON FILMS, by Roger W. Clapp, Jr. 28 Sep 59, 18p. ARGMA TR-1C33R; AD-227 426.
Order from LC mi$2.40, ph$3.30 PB 148 356

Iron films, in the thickness range 20 to 250Å, were condensed from the vapor phase onto Formvar or baked-out silica substrates at temperatures less than 50°C. The films were sufficiently thin to permit study of the film-substrate combination by means of transmission electron diffraction. No fiber orientation was observed for films deposited in vacuum (10^{-5}mm) or in helium at pressures of 10^{-2} mm or 10^{-1} mm. (Author)

EFFECT OF STRAIN-RATE ON THE FLOW-STRESS OF f.c.c. METALS, by P. B. Hirsch, T. E. Mitchell, and P. R. Thornton. Annual summary rept. no. 1 on Contract AF 61(052)98. Oct 59, 43p. 18 refs. AFOSR-TN-60-152; AD-234 224.
Order from LC mi$3.30, ph$7.80 PB 147 335

The initial results of an experimental study of the reversible flow-stress change which occurs when the strain-rate is increased by a factor of ten during a tensile test of a f.c.c. metal are presented. Polycrystalline α-brasses and polycrystalline neutron irradiated Cu were studied as a function of deformation from 4.2°k to 300°k. Single crystals of pure Cu and of 70/30 α-brass were also studied in the same manner.

Illinois Inst. of Tech., Chicago.
AN X-RAY DIFFRACTION STUDY OF CRYSTAL PERFECTION IN SILICON, by Robert H. Bragg and Leonid V. Azaroff. Rept. on Contract AF 49(638)425. 24 June 60, 8p. 6 refs. AFOSR-TN-60-632.
Order from LC mi$1.80, ph$1.80 PB 148 778

The results of a preliminary study of the perfection of single crystals of Si is described. A modified Laue focussing arrangement was used to examine neighboring regions of a relatively perfect slice taken out of a Si ingot. Small variations in the line-width and the total diffracted intensity were observed for regions separated by about two millimeters. It also turned out that only short-wavelength x-radiation could show up small differences in crystal perfection. Some of the implications of this study and comparison to etch-pit determinations are also described. (Author)

STUDIES ON POLYMORPHISM IN SINGLE CRYSTALS, by J. L. Amoros. Final technical rept. for 1 Mar 59-29 Feb 60 on Contract DA 91-591-EUC-1084. [1960] 87p. 87 refs. AD-235 150.
Order from LC mi$4.80, ph$13.80 PB 147 253

The study of certain crystal transformations was carried out and certain techniques were accommodated to the required conditions of the research. One completed piece of work is presented: the work on the mechanism of the transition IV - II in NH_4NO_3. A second one is presented in preliminary form: the work on the study of diffuse scattering during the paraferroelectric transition of $NaNO_2$ and that of $NaNO_3$. With these 2 research pieces it was intended to get a direct knowledge of crystal transitions of two very different types: a first and second order transitions.

Manufacturing Labs., Inc., Cambridge, Mass.
THE LATTICE STABILITY OF METALS. I. TITANIUM AND ZIRCONIUM, by Larry Kaufman. Technical rept. no. 1 on [Contract Nonr-2600(00)]. 1 Oct 58, 40p. 36 refs.
Order from LC mi$3.00, ph$6.30 PB 148 794

The difference in free energy between the b. c. c. and h. c. p. modifications of titanium and zirconium have been calculated between 0°K and 2000°K by using existing thermodynamic data. These results have been employed to investigate the energetics of the b. c. c. $\rightleftharpoons$ h. c. p. reactions in the Ti-Zr system and in a series of titanium-base alloy systems. It is found that the chemical driving force for martensitic b. c. c. $\rightarrow$ h. c. p. reactions in these systems is about 50 cal/mol. This value, compared to 300 cal/mol for iron-base alloys, can be explained by the difference in physical characteristics of martensitic transformations in iron-base and in titanium-base alloys. A method is suggested for estimating M_S vs. composition curves

for titanium and zirconium-base systems where such data are presently unavailable. (Author)

Maryland U., College Park.
THE ROTATION OF DIATOMIC MOLECULES IN MOLECULAR CRYSTALS, by Barbara Castle Kohin. Doctoral thesis. Rept. on Contract AF 49(638)399. Jan 60, 81p. 37 refs. Physics Dept. Technical rept. no. 164; AFOSR TN-60-58; AD-233 579.
Order from LC mi$4.80, ph$13.80 PB 146 677

Molecular rotation in crystals of N_2 and CO is investigated. The following contributions to the crystal field hindering free rotation are taken into account: (1) the interaction of the molecular quadrupoles, (2) the effect of the anisotropic molecular polarizabilities, and (3) the asymmetry in the short-range repulsive forces.

Massachusetts Inst. of Tech., Cambridge.
THE EFFECT OF PLASTIC STRAIN RATE ON DIFFUSION IN ALUMINUM-ZINC ALLOYS, by G. A. Bruggeman, M. Cohen, and B. L. Averbach. Rept. on Solid State Research and Properties of Matter, Contract AF 33(616)3264. Apr 60, 51p. 21 refs. WADD Technical rept. 60-218.
Order from OTS $1.50 PB 161 884

The effect of compressive strain-rate on interdiffusion and zinc self-diffusion in aluminum-zinc alloys has been investigated. At a strain rate of $2 \times 10^{-4} sec^{-1}$, the interdiffusion coefficient is increased by factors of 20, 13, and 8 at 375, 415, and 450°C respectively. At comparable strain rates, little enhancement of self-diffusion is detected. Quasi-hydrostatic pressure causes the interdiffusion coefficient to decrease much more than predicted theoretically. Factors are suggested which could account for the results, but existing uncertainties preclude a precise interpretation. (Author)

Materials Research Lab., Watertown Arsenal, Mass.
THE EFFECT OF CRYSTALLINE FIELDS ON CHARGE DENSITIES AND MAGNETIC FORM FACTORS, by A. J. Freeman and R. E. Watson. Jan 60, 17p. 14 refs. MRL rept. no. 70; AD-235 053.
Order from LC mi$2.40, ph$3.30 PB 146 967

The effects of crystalline fields on 3d charge densities and magnetic form factors for transition metal ions are discussed. It is shown that the crystalline field has two effects on the free ion 3d wave functions; (1) a differentiation or "splitting" of the two types of cubic 3d functions by an expansion of the t_{2g} (e_g) orbitals and a contraction of the e_g (t_{2g}) orbitals resulting in two different radial charge densities and (2) a net expansion of the charge distribution from the free ion value. The magnetic form factors due to this "splitting" effect when calculated according to the methods of Weiss and Freeman show measurable deviations from the free atom results. A form factor for Mn^{+2} based on optical absorption data shows a large expansion of the 3d charge density, in agreement with experiment. (Author)

Materials Research Lab., Watertown Arsenal, Mass.
RADIATION-ENHANCED HELIUM PRECIPITATION IN COPPER, by A. N. Goland. Feb 60, 7p. 3 refs. Rept. no. 73; AD-237 988.
Order from LC mi$1.80, ph$1.80 PB 148 201

Visual observation of radiation-enhanced diffusion has been accomplished by metallographic examination of the precipitation of helium in neutron-irradiated copper. Helium was injected into copper specimens by alpha-particle bombardment and vacancies were then introduced into some of the specimens by fast neutron irradiation. With both types of specimens held at temperatures high enough for diffusion to occur (425°C), considerably more precipitation was visible in the neutron-irradiated specimens than those not irradiated. Thus illustrating the enhancement of diffusion by radiation-induced excess vacancies. (Author)

Metals Research Lab., Carnegie Inst. of Tech., Pittsburgh, Pa.
THEORY OF D FOR SELF-DIFFUSION IN SOLID METALS, by G. M. Pound, W. R. Bitler, and H. W. Paxton. Rept. on Contract Nonr-760(08). [1959] 17p. 30 refs.
Order from LC mi$2.40, ph$3.30 PB 148 570

The kinetics of diffusion in solids is treated in terms of statistical mechanics from the point of view of absolute rate theory. An approximate description of the activated state leads to the conclusion that in the two degrees of freedom orthogonal to the jump direction only the lower vibrational energy levels are occupied. This circumstance gives rise to a negative contribution to the experimental entropy of activation for diffusion in solids which is negligible for the vacancy mechanism but very appreciable for the ring mechanism. It is suggested that a low D_o, perhaps of the order of 10^{-3} cm^2/sec, is an experimental criterion tor 4-atom ring diffusion and that the self-diffusion in pure chromium and uranium (b.c.c.) occurs by this mechanism. Further, a low Arrhenius frequency factor is predicted for all processes in solids which require simultaneous jump of n atoms, e.g. in the thermally activated movement of dislocation loops. (Author)

Minerals Research Lab., U. of California, Berkeley
A STUDY OF LOW TEMPERATURE CREEP MECHANISMS IN ALUMINUM SINGLE CRYSTALS, by L. A Shepherd and J. E. Dorn. Technical rept. no. 8 on Contract Nonr-222(49). 18 Sep 59, 54p. 27 refs. Series no. 103; issue no. 8.
Order from LC mi$3.60, ph$9.30 PB 148 896

A study was made of the effects of small abrupt changes in stress and temperature upon the creep rate of aluminum single crystals at low temperatures. With an important exception, the results were found to be in agreement with the predictions of the dislocation intersection mechanisms. Whereas intersection theory predicts that the change in the logarithm of the strain rate with stress,

$$\beta = \frac{\partial \ln \dot{\gamma}}{\partial \tau} = \frac{const}{kt},$$

β was found experimentally to increase by a factor of 5 between 78° and 160°K. A qualitative model is offered to explain this behavior in terms of pile-ups of dislocations aiding intersection at the higher temperature. (Author)

Naval Ordnance Lab., White Oak, Md.
MAGNETIC MATERIALS, by Louis R. Maxwell. 12 Jan 59, 34p. NAVORD rept. 6263; AD-225 661.
Order from LC mi$3.00, ph$6.30 PB 148 453

The free atom of the transition metals which possesses uncompensated electron spins is the elementary magnet with which ferromagnetism and ferrimagnetism is developed. The various types of magnetic materials and their important properties can be interpreted in terms of the free atom and its local atomic environment. High permeability, square loop materials, and special functional materials existing as alloys are discussed. Interesting examples of domain wall motion in iron whiskers are included. When the magnetic ions find themselves in a spinel environment the properties change to that described as ferrimagnetism. Various basic properties of ferrimagnetism are given including an example of the development of permanent magnetic materials having low symmetry as in the case of ferrooxdure. The garnets are described where the magnetic ions find themselves in three different sites. Recent work on the transparent properties of garnets and certain ferrites are presented showing unusual photographs of domain walls. Further basic developments and applications of magnetic materials are included which cover effects due to neutron irradiation. (Author)

New York U., N. Y.
STOICHIOMETRY AND ELECTRONIC PROPERTIES OF PbTe, by Edward Miller, Kurt K. Komarek, and Irving B. Cadoff. Rept. for 1 Dec 56-30 Sep 59 on Solid State Research and Properties of Matter, Contract AF 33(616)3883. Dec 59, 39p. 35 refs. WADC Technical rept. 59-570.
Order from OTS $1.00 PB 161 842

Off-stoichiometric single crystals of PbTe were grown by the Bridgman technique at a solidification rate of 0.35 cm/hr. At this low solidification rate the crystals were longitudinally segregated, the composition at any point corresponding to that dictated by the solidus curve of the phase diagram. The phase diagram shows that PbTe has an off-stoichiometric melting point; the difference in concentration between the maximum melting point and the stoichiometric point being 0.002 atomic percent, with the congruent melting point on the tellurium rich side of the stoichiometric point. Stoichiometric PbTe is in equilibrium with liquid 0.41 weight percent rich in lead, the equilibrium temperature being 923.2°C. The solubility of both lead and tellurium in PbTe is restricted, the maximum lead and tellurium excess being 5×10^{19} atoms/cm^3. The crystals were cut into thin sections perpendicular to the growth direction and the slices homogenized to yield samples of different impurity concentrations of lead or tellurium. Resistivity, Hall coefficient, and thermoelectric power measurements were made as a function of temperature on three slices corresponding to stoichiometric, excess lead, and excess tellurium. BETA SILICON CARBIDE, by D. M. Warschauer. Scientific rept. no. 1 on Contract AF 19(604)6133. 25 Apr 60, 35p. 6 refs. AFCRC-TN-60-555.
Order from LC mi$3.00, ph$6.30 PB 148 354

The results of tests for the optimum composition of gas for the vapor-decomposition method of growth indicate that best results are achieved when hydrogen and silicon tetrachloride are used alone, rather than with addition of a carbon-bearing compound. The best crystals have been grown at 1950°C; these crystals are stoichiometric to within 0.3 percent, and the impurity content does not exceed 0.003 percent of the impurity most abundant. It has been demonstrated that formation of methane and of high-molecular weight complexes of silicon dichloride are important factors in the growth process. Somewhat smaller crystals of a different shape are being grown by deposition from solution; advances have been in improving the purity of this material, and preliminary measurements of electrical properties are under way. ELECTRONIC WAVE FUNCTIONS IN PERTURBED METAL LATTICES, by N. H. March and A. M. Murray. Final technical rept. no. 2, 1 May 59-30 Apr 60, on Contract DA 91-591-EUC-1090. [1960] 41p. 13 refs.
Order from LC mi$3.30, ph$7.80 PB 148 520

The calculation of electronic wave functions round a vacancy in a finite metal has been completed, and the final results are reported here. Calculations are described for particle numbers of approximately

2×10^2, 2×10^3 and 10^0. A self-consistent von Weizsäcker calculation is also reported, and comparison made between this, the finite metal results, and existing Thomas-Fermi calculations. Calculations also reveal long-range oscillations in the total perturbed electron density for finite metals. Reference is made to a number of applications of the present results. Results obtained by a density matrix approach to the imperfections problem are discussed. (See also PB 143 112)

SPECTRAL RESPONSE OF SOLAR CELL STRUCTURES, by L. M. Terman. Rept. on Contract Nonr-225(31). 21 Sep 59, 25p. 3 refs. Technical rept. no. 1605-1; AD-226 436.
Order from LC mi$2.70, ph$4.80 PB 148 597

The purpose of this study was to measure the spectral response of silicon solar cell structures, and to observe how the response varied with the depth of the p-n junction. Spectral response was defined as the relative short-circuit current as a function of the wavelength of incident light for equal energy incident upon the cell at all wavelengths. Cells were made with the junction depths varying from 0.6 to 5.0μ, and having smooth (etched) surfaces and rough (lapped) surfaces. Response curves from these cells are presented. These curves indicate that in order to increase the relative short-wavelength response ($\lambda < 0.75\mu$) the junction should be made closer to the surface, while in order to increase the relative long-wavelength response ($\lambda > 0.75\mu$) the junction must be made comparatively far below the surface. The effect of having a lapped surface on the cell is to reduce the lifetime near the surface, thus reducing the response to short wavelengths of incident light. A simple theoretical model is then presented which appears to adequately describe the mechanism involved in determining the shape of the response curves. (Author)

INVESTIGATION OF SOME SEMICONDUCTOR SWITCHING ELEMENTS AND THEIR APPLICATION TO A SINGLE-POLE, EIGHT-THROW SWITCH, by Stephen N. Miller. Rept. on Contract AF 19(604)5474 1 Apr 60, 70p. 20 refs. Scientific rept. SR424-2; AFCRC-TN-60-399.
Order from LC mi$3.90, ph$10.80 PB 148 562

A four-terminal, T-network, equivalent circuit impedance representation is presented which satisfactorily predicts the microwave switching properties of three germanium diodes in single-pole, single-throw switches at 2.0, 3.0, and 4.0 kmc. Typical characteristics of these switches are average insertion loss $\leq$ 1.9 decibels, average switching ratio $>$ 15 decibels, and 10-percent to 90-percent power level changes of $T_{on} \leq 40$ nanoseconds, and $T_{off} = 20$ nanoseconds, all over a 5:1 frequency band to 4.0 kmc. General design formulas for a multithrow switch at three frequencies with satisfactory results. Performance data is presented for the eight-throw switch over a 5:1 band to 4.0 kmc. Compared to the SPST switch, some improvement in switching ratio and degradation in insertion loss are noted.

THE ARC IMAGE FURNACE FOR GROWING SEMICONDUCTOR CRYSTALS, by R. P. Poplawsky and J. E. Thomas, Jr. Technical note no. 3 on Contract AF 49(638)158. 1 Mar 60, 116p. 36 refs. AFOSR-TN-60-312.
Order from OTS $2.50 PB 161 868

The optical, mechanical, and electrical details of an arc image furnace are given. This furnace uses two 60" paraboloidal reflectors in vertical arrangement with a high intensity carbon arc as the source. It was designed to study "arc image" crystal growing techniques. Two crucible-free techniques, "pushing" and "pulling", which resulted in the growth of several arc image silicon crystals are discussed. Pushing a silicon crystal consists of melting the top surface of a single crystal seed disk, which is positioned at the image point of the furnace, and then feeding a long, small diameter, polycrystalline rod into this melt. Pulling a silicon crystal is accomplished by first dipping a small rectangular seed crystal into a melt produced on the top surface of a relatively large, polycrystalline, silicon cylinder. The seed is then slowly withdrawn and liquid material solidifies onto it. The results of measurements made on pushed and pulled silicon crystals show that they are essentially free of oxygen, have high resistivities when a good grade of bulk material is used, and have a dislocation density of the order of 10^4 cm.$^{-2}$. The factors which influence the growth and quality of arc image crystals are discussed. These include: maximum useful furnace power, shapes of floating zones, and radiant flux considerations.

Wayne State U., Detroit, Mich.
OBSERVATIONS OF SURFACE TRANSVERSE MAGNETORESISTANCE EFFECTS ON N-TYPE GERMANIUM, by Walter A. Albers, Jr. and J. E. Thomas, Jr. Technical note no. 2 on Contract AF 49(638)158. 1 Mar 60, 94p. 35 refs. AFOSR-TN-60-313.
Order from LC mi$5.40, ph$15.30 PB 148 762

Two techniques were developed for preparing large surface-to-volume ratio single crystal samples for surface studies. In both cases the methods depend on having, initially, thick slices of semiconductor single crystal material. This material is then either (1) made the anode of an electrolytic cell and illuminated with near-infrared so that the sample etches thin in the illuminated region or (2) is exposed to a flowing stream of an acid mixture and is subsequently etched thin by the resulting chemical reactions. Several thin samples of n-type germanium were prepared. The electrical conductivity and the magnetoresistance of these samples were simultaneously measured as a function of the surface conditions of the sample.

SURFACE PHENOMENA IN SEMICONDUCTORS AND GROWTH OF SEMICONDUCTOR CRYSTALS, by W. A. Albers, V. E. Noble and others. Technical rept. on Contract AF 49(638)158. 1 Mar 60, 41p. 14 refs. AFOSR-TR-60-41.
Order from OTS $1.25 PB 161 867

A photo-electric etching technique has been developed for the preparation of thin filaments of single crystal germanium. Magneto-resistance measurements made on these thin samples have yielded one of the first direct observations of the mobility of electrical carriers near the surface of a semiconductor. 1/f noise measurements have been made upon the thin filaments in order to relate the semiconductor surface properties to the process of carrier trapping by surface energy states. The problem of preparing hyper-pure crystals of semiconducting materials was attacked by employing a high intensity carbon arc. An interpretation of the results of vertical liquid zone and irradiance profile calculations, has indicated the feasibility of growing large, good quality crystals of the medium high melting point semiconductors using arc image techniques.

ON THE MECHANICAL AND THERMAL STABILITY OF LOW-ANGLE BOUNDARIES IN ZINC SINGLE CRYSTALS, by Sigmund Weissmann, Makato Hirabayashi, and Hiroshi Fujita. Final rept. on Contract DA 30-069-ORD-1777. 1 May 60, 51p. 18 refs. OOR rept. 1665.3-Met.
Order from LC mi$3.60, ph$9.30 PB 148 442

The mechanical and thermal stability of low-angle boundaries in zinc single crystals was studied by methods combining metallographic techniques with x-ray reflection microscopy and diffraction analysis. It was found that low-angle boundaries perpendicular to the basal plane do not offer any appreciable resistance to a shearing force parallel to the basel plane if they are pure tilt boundaries, but are substantial barriers if they are asymmetrical. If the external force exceeds a critical value these asymmetrical low-angle boundaries become sites where fracture may occur. The strengthening effect of the asymmetrical low-angle boundaries is attributed to the effective stress field of the screw dislocations, which are mechanically stabilized by the edge dislocations. The stress field of the screw dislocations is also responsible for the thermal instability of the asymmetrical low-angle boundaries, which on annealing are gradually converted into pure tilt boundaries. A coarse substructure established after annealing and consisting of pure tilt boundaries is thermally very stable. On solidification after partial melting of the crystal the coarse substructure is re-established, whereas the fine substructure is entirely modified. (Author)

QUANTUM CORRECTED STATISTICAL METHOD, by L. C. R. Alfred. Technical rept. no. 7 on Contract Nonr-1677(01). Sep 59, 22p. 9 refs. AD-228 394.
Order from LC mi$2.70, ph$4.80 PB 148 595

Quantum corrections are applied to the single particle density matrix in a semiclassical ensemble where the distribution is unrestricted. A form for the density matrix containing implicitly a function of the wave mechanical Hamiltonian operator is devised. A formalism is then developed to decompose this operator function into effectively classical and non-classical parts. The classical part corresponds to the semiclassical density matrix, and the quantum corrections are obtained from the nonclassical terms The quantum corrected density matrix for a spherically symmetrical and a 1 dimensional system were evaluated. The densities for a linear harmonic oscillator and a Coulomb potential for a Fermi-Dirac distribution were also examined. (Author)

QUANTIZATION OF NON-LINEAR SYSTEMS, by I. E. Segal. Technical note no. 2 on Contract AF 49(638)666. May 60, 71p. 23 refs. AFOSR-TN-60-575.
Order from LC mi$4.50, ph$12.30 PB 148 416

A direct method of quantization, applicable to a given non-linear hyperbolic partial differential equation, is indicated. From such classical equations alone, without a given Lagrangian or Hamiltonian, or a priori linear reference system such as a bare or incoming field, a quantized field is constructed, satisfying the conventional commutation relations. While mathematically quite heuristic in part, local products of quantized fields do not intervene, and there are grounds for the belief that the formulation is free from non-trivial divergences. THE WAVE MOTIONS OF SMALL AMPLITUDE IN A FULLY IONIZED PLASMA. PART II. WITH LONGITUDINAL APPLIED MAGNETIC FIELD, by S. I. Pai. Rept. on Contract AF 49(638)401. Apr 60, 30p. Technical note BN-207; AFOSR-TN-60-576.
Order from LC mi$2.70, ph$4.80 PB 148 211

Wave motions of infinitesimal amplitude in a fully ionized plasma, consisting of single charged ions and electrons, have been investigated by a two fluid theory under uniform external magnetic field. The interaction of the basic modes of wave due to external magnetic field has been discussed. The case where the external uniform magnetic field is in the direction of propagation of the waves has been analysed in detail. The effect of finite electrical conductivity on these transverse waves has been briefly discussed.

Institute of Mathematical Sciences, New York U., N. Y.
STATISTICAL MECHANICS AND THE BOLTZMANN EQUATION, by Robert M. Lewis. Rept. on Contract AF 49(638)341. Jan 60, 10p. 5 refs. Research rept. no. HT-4; AFOSR-TN-60-10; AD-233 307.
Order from LC mi$1.80, ph$1.80 PB 146 720

A very simple derivation of the Boltzmann equation is given. The derivation is based on the solution of the initial value problem for the hierarchy equations of statistical mechanics. (Author)

CORRELATION THEORY OF STATIONARY ELECTROMAGNETIC FIELDS. PART I: THE BASIC FIELD EQUATIONS, by E. Wolf and P. Roman (U. of Manchester). Technical note no. 1 on Contract AF 49(638)602. Oct 59, 22p. 8 refs. AFOSR TN-59-1188; AD-232 919.
Order from LC mi$2.70, ph$4.80 PB 146 336

In recent papers a class of second order correlation tensors was introduced and certain differential equations which govern their propagation were postulated. These correlation tensors, which may be regarded as natural generalizations of functions used in the analysis of partially coherent optical wavefields, characterize the correlations which exist between the electromagnetic field vectors at any 2 points in the field, at any 2 instants of time. A derivation of the basic differential equations is presented; and it is shown that the 2 sets into which equation naturally split are not independent, but follows from each other as a consequence of certain symmetry properties which the correlation tensors exhibit. (Author)

INVESTIGATION OF MICROWAVE PROPERTIES OF PLASMAS, by M. Chodorow. Scientific rept. no. 7, 1 Nov 59-31 Jan 60, on Contract AF 19(604)5226. Feb 60, 21p. M. L. rept. 697; AFCRC-TN-60-185.
Order from LC mi$2.70, ph$4.80 PB 148 168

Thermal Plasma: The major source of ion loss now appears to be from diffusion as well as from recombination. Noise in Plasmas: An analysis of the correlation measurement has been made, and simpler versions of the original experiment have been examined. Harmonic Generation in Plasmas: Theoretical work has been concerned with predicting the second harmonic output of a generator. Electron Beam Interaction with a Plasma: Numerical solutions Electron Plasma Waves: Propagation measurements on the enlarged plasma guide system. Parametric Effects: A re-examination of the theory of traveling-wave type parametric amplification in a plasma column has given some new insight on the rather marginal performance of the tubes used up to now. Electrostatic Sound Waves: Experiments attempting

to excite low-velocity plasma sound waves are described. Plasma Confinement: A new electrode configuration for imposing the rf field on the plasma confirmed earlier conclusions that the confinement phenomena is not a radiation pressure effect but more likely a sheath effect. Plasma Studies: This new project is presently concerned with two aspects of plasmas: analysis of nonlinear effects by Hamiltonian methods, and the investigation of a possible experiment to verify the concept of Landau damping. (See also PB 144 927)

LANDAU DAMPING OF CIRCUIT AND ION WAVES, by P. A. Sturrock. Technical note on Contract AF 49(638)415. Jan 60, 17p. 8 refs. M.L. rept. no. 665; AFOSR-TN-60-141; AD-233 751.
Order from LC mi$2.40, ph$3.30 PB 146 348

It is shown that the interaction of a slow circuit wave with the thermal electrons of a plasma column should lead to dissipation of the circuit wave by the mechanism of Landau damping. Numerical estimates indicate that this effect should be susceptible to experimental verification. Such an experiment, if successful, would offer a method for determining the electron velocity distribution of a plasma column. A circuit analogue for the ion-acoustic-wave mechanism is derived which facilitates calculation of the Landau damping of ion waves. This effect is found to be small and cannot account for the difficulty experienced in attempting to set up these waves. (Author)

RADIATION BY PLASMA OSCILLATIONS IN A BOUNDED PLASMA IN A MAGNETIC FIELD, by H. W. Wyld, Jr. 23 Oct 59, 28p. 3 refs. PRL-9-23.
Order from LC mi$2.70, ph$4.80 PB 147 000

The radiation by a thermal distribution of plasma oscillations in a bounded plasma in a magnetic field is calculated in the limit $(\omega_c/\omega_p)^{1/2} \ll 1$, where ω_c and ω_p are the cyclotron and plasma frequencies. The calculation is performed in two ways leading to the same result: (1) a "Fresnel formula" for the ratio of the intensity of the electromagnetic wave transmitted through the plasma boundary to the intensity of an incident plasma oscillation is derived; (2) the decaying modes, satisfying a radiation condition at infinity, of a bounded plasma in a magnetic field are found.

A BEAM-GENERATED BEAM-PLASMA SYSTEM, by C. C. Wang, J. E. Hopson, and L. P. Levine. Scientific rept. no. 1 on Contract AF 19(604)5555. Mar 60, 60p. 23 refs. Sperry rept. no. NA-8210-8191-1; AFCRC-TN-60-374.
Order from LC mi$3.60, ph$9.30 PB 148 316

The minimum pressure condition for plasma generation, the result of directing an electron beam through a residual gas (hydrogen in this study) along magnetic field lines, has been theoretically predicted and experimentally verified. For pressures greater than the minimum pressure, the equilibrium plasma density has been analyzed. Plasma growth greater than that expected from collisions of primary electrons with residual gas atoms was found; diffusion-controlled breakdown caused by a microwave generation process of the system explains this growth. Microwave interaction of the beam-generated plasma circuit with the primary beam is exhibited as a velocity modulation of the beam.

Experiments show a discrete bandwidth noise spectrum theoretically, discrete frequency oscillations over a prescribed bandwidth should be produced. Plasma circuit characteristics are not independent of microwave power level as assumed in the theory; the microwave power generated is apparently absorbed by the plasma. The plasma, then, is unstable. (Author)

WAVE PROPAGATION IN A PLASMA-CABLE, by G. Biener. Technical final rept. for 1 Oct 57-30 Sep 59 on Contract AF 61(052)11. [1959] 43p. 9 refs. AFCRC-TR-60-110; AD-233 778.
Order from LC mi$3.30, ph$7.80 PB 146 637

In the case of a time-varying plasma when the gaseous discharge increases or decreases within a short time, probe measurements cannot always be carried out. For studying time-varying gaseous discharges the classic probe method was discarded in favor of electromagnetic waves whose propagation characteristics will be influenced by the condition of the plasma. A phase measuring method was worked out, by which the phase difference between 2 different points of a progressing wave could be determined and which allows to observe time-varying processes in the gaseous discharge. By these 2 measuring methods (the wave and the probe method) the plasma parameters at stationary conditions were determined and wave propagation in the plasma cable was further investigated. By employing the phase difference method for these measurements it was possible to distinguish between a slow forward wave with a phase and group velocity of equal direction, and a backward wave with a phase and group velocity of opposite directions. Furthermore, the influence of the electronic drift velocity on the propagation was identified by experiments and quantitatively determined. (Author)

GENERALIZED HEAT TRANSFER FORMULAE AND GRAPHS, by R. W. Detra and H. Hidalgo. Rept. on Contract AF 04(645)18. Mar 60, 19p. 8 refs. Research rept. 72; AD-233 702.
Order from LC mi$2.40, ph$3.30 PB 147 211

Utilizing the research results of previously reported investigations of the laminar, turbulent and radiative heat transfer in dissociated air, some generalized formulae for calculating heat transfer are given. Graphs for determining the laminar heat transfer, momentum thickness Reynolds number, and turbulent heat transfer distributions around an axisymmetric body are also given. These heat transfer correlations are valid for velocities between 6000 fps and 26,000 fps and for altitudes up to 250,000 ft. This range of velocities and altitudes covers the important re-entry regime of practical re-entry trajectories having interest today. These generalized results are specjalized for ICBM nose cone re-entry applications. These formulae and graphs may be found useful for making rapid engineering estimates and preliminary design evaluations of the heating problems associated with re-entry into the Earth's atmosphere. A SHOCK TUBE INVESTIGATION OF HEAT TRANSFER IN THE WAKE OF A HEMISPHERE-CYLINDER, WITH APPLICATION TO HYPERSONIC FLIGHT, by William E. Powers, Kenneth F. Stetson, and Mac C. Adams. Rept. for Oct 56-June 57, on Contract AF 04(645)18. Aug 58, 41p. 9 refs. Research rept. 30; AD-205 513.
Order from LC mi$3.30, ph$7.80 PB 147 196

Wake heat transfer experiments, under conditions which simulate hypersonic velocities, were conducted in a constant area shock tube. The preliminary objective of establishing the utility of the shock tube for wake investigations was verified as steady state wake heat transfer rates and stable wake geometries were obtained in less than 100 μsec. The heat transfer coefficients for the wake of a sting supported hemisphere-cylinder configuration were obtained for laminar and turbulent flow on the body. Laminar heat transfer rates for the wake averaged about two-thirds

of the theoretical laminar heat transfer rate to a solid surface replacing the wake mixing line. The magnitude of the turbulent heat transfer rates was about one-third of the turbulent prediction for a solid surface replacing the wake boundary. No distinguishable variations of heat transfer rates to the sting or rear face of the model were observed for sting-to-body diameter ratios of 0.3 and 0.6, and observed variations within the wake were less than the experimental scatter of about ± 20%. SOME ASPECTS OF NON-EQUILIBRIUM FLOWS, by Raymond Sedney. Mar 60, 35p. 13 refs. Rept. no 1099.
Order from LC mi$3.00, ph$6.30 PB 148 238

Some of the general features of non-equilibrium flow are discussed and vibrational relaxation is discussed in detail. This case is somewhat simpler than dissociation and ionization but it illustrates some of the main new features of non-equilibrium flow. Those aspects of two-dimensional and axisymmetric flow behind shock waves are examined analytically which yield significant information without requiring numerical solution of the governing equations. The thermodynamics of a vibrational relaxing gas is discussed. The conditions for simulating flows are noted. Crocco's theorem and the characteristic equations are derived. Then a simple method of obtaining the initial gradients of the flow variables behind a shock is shown. These gradients are used in discussing two particular flows. An exact solution for flow over a cusped body is obtained. Flow over a wedge near the tip and far from the tip is considered. It is found that far from the tip a boundary layer type phenomenon occurs. (Author)

Brown U. Div. of Engineering, Providence, R. I.
STEADY-STATE HEAT CONDUCTION IN A CIRCULAR CONE, by Rokuro Muki and Eli Sternberg. Technical rept. no. 13 on Contract Nonr-562(20). Sep 59, 17p. 11 refs. Nonr 562(20)/13; AD-226 342.
Order from LC mi$2.40, ph$3.30 PB 148 584

A determination is made of the steady-state temperature distribution generated in a circular cone of infinite extent by a discontinuous distribution of the prescribed surface temperature. Specifically, the surface of the cone is exposed to a constant temperature up to a given distance from the vertex, the remainder of the boundary being maintained at a distinct uniform temperature. With the aid of the Mellin transform a solution to the foregoing problem (exact within the classical theory of heat-conduction) is deduced both in the form of an infinite residue expansion and in real integral form. The convergence of these 2 alternative representations is established and numerical results are obtained for the variation of the temperature along the axis of the cone if the opening angle is $\pi/3$. REFERENCES TO RESEARCH ON HIGH-EMISSIVITY SURFACES, by J. W. Holladay. 27 June 60, 11p. 20 refs. DMIC memo. 57.
Order from OTS $0.50 PB 161 207

In any space-vehicle heat balance solar absorptivity and emissivity are the principal factors which determine the vehicle temperature. Until recently, little work had been done on the determination of the emissivities of structural materials over a range of temperatures. In view of the new importance of emissivity information, a number of projects have been established to develop improved methods of measuring emissivity and to determine the emissivity of various materials at both high and low temperatures.

A FUNDAMENTAL EQUATION FOR STEAM IN TERMS OF TCHEBICHEF POLYNOMIALS, by Frank D. Skinner. Doctoral thesis. Technical rept. no. 1 on Contract Nonr-1841(60). Sep 59, 192p. 34 refs.
Order from LC mi$8.70, ph$30.00 PB 148 607

Since the appearance of the perfect-gas law over a century ago, an almost overwhelming number of equations of state have been suggested. A review of some of the more significant equations is presented with particular emphasis on Dr. F. G. Keyes' Equation VII for steam which appeared in 1949. Of the equations presented, most are simple enough to be manipulated into a fundamental form, but their accuracy is limited to fairly low pressures. Dr. Keyes' Equation VII which is accurate to very high pressures is too complex to allow a fundamental equation to be determined. Data obtained from the Keyes equation is used to determine a Tchebichef polynomial equation of a form recently suggested by C. J. Pings, Jr. and B. H. Sage of the California Institute of Technology. This equation which is accurate to very high pressures, can also be easily manipulated to form a fundamental equation for steam.

SURVEY OF BOUNDARY LAYER HEAT TRANSFER AT HIGH VELOCITIES AND HIGH TEMPERATURES, by Ernst R. G. Eckert. Rept. on Contract AF 33(616)5676. Apr 60, 115p. 415 refs. WADC Technical rept. 59-624.
Order from OTS $2.50 PB 161 843

Heat transfer in boundary layer flow at high velocities and high temperatures is discussed, and engineering relations for its calculation are presented. Aeronautical and space flight applications have pushed the conditions under which heat transfer knowledge is important to much higher velocities and temperatures. The influence of very large temperature differences, of dissociation and ionization, of low densities, and of chemical reactions on heat transfer has been well established in its general features. In addition, new cooling methods, like transpiration, ablation, or film cooling have been studied. The reference enthalpy method is extended and generalized in this report to include the additional effects mentioned above. This leads to simple relations by which heat transfer can be calculated with an accuracy which should be sufficient for engineering purposes. These relations additionally have the advantage that most of them are applicable to any gas or gas mixture; therefore, not only to the reentry problem but also to heat transfer problems arising in rockets or other propulsion systems and in other applications. EQUATION OF STATE OF WATER, by Andre N. Gleyzal and Hans G. Snay. 9 Dec 59, 28p. 5 refs. NAVORD rept. 6749.
Order from LC mi$2.70, ph$4.80 PB 148 220

Thermodynamic quantities such as γ, S, and p as functions of temperature are calculated for temperatures sufficiently high to cause dissociation of the molecule. Thermochemical equilibrium is assumed and the Wilson-Kistiakowsky equation of state is employed. Two types of corrections for the electrostatic force, an "Ulfsold correction" and a "Debye-Hückel correction" are discussed but not used in the numerical calculations reported here. (Author)

INVESTIGATION OF THERMAL INSULATION MATERIALS, by J. L. Abbott. 23 July 59, 50p. NOTS TP-2243; NAVORD rept. 6545; AD-225 996.
Order from LC mi$3.30, ph$7.80 PB 148 371

This investigation determined the relative heat transfer characteristics of a number of commercially available thermal insulation materials. Laboratory test methods were developed which closely simulated the results of full-scale aviation-fuel fire tests. The results from laboratory and field tests indicate that a 0.5-in. layer of commercial glass cloth can provide practicable protection of weapons and missiles against fuel fires for sufficient time to insure application of effective fire fighting techniques. The application of reflective metal foil, such as stainless steel, interlayered with the glass cloth further increases the insulation efficiency. Tests on new asbestos fiber insulation materials have shown results which indicate possible superiority to glass cloth, particularly, if they can be fabricated for interlayering with reflective foil. These materials also have the additional advantage of lower density than glass cloth. (Author)

TABLES OF THE EINSTEIN ENERGY, SPECIFIC HEAT AND DERIVATIVE SPECIFIC HEAT FUNCTIONS, by W. C. Overton, Jr. and J. H. Hancock. Final rept. 6 July 60, 21p. 14 refs. NRL rept. 5502.
Order from LC mi$2.70, ph$4.80 PB 146 403

The purpose of the tables given in this report is to provide numerical values of the functions $F_1(x)$, $F_2(x)$, and $F_3(x)$ in order to facilitate the calculation of thermodynamic properties of solids such as the internal energy and specific heat. The function F_1 is the Einstein quantum-theory expression for the average energy of a harmonic oscillator mode. The specific heat of a mode, F_2, is obtained from the derivative of F_1 with respect to temperature, which is proportional to $1/x$, while F_3 is the derivative of F_2 with respect to x. Using NRL's Narec electronic digital computer we have computed tables of these useful functions, F_1, F_2, and F_3, for the range $0.01 \leq x \leq 24.00$, with the interval 0.01. The values in these tables are accurate to ± 1 in the eighth significant digit and provide accuracy to ± 2 in the sixth significant digit with only linear interpolation.

REACTION KINETICS, THERMODYNAMICS, AND TRANSPORT PROPERTIES IN THE OZONE-OXYGEN SYSTEM, by Edwin S. Campbell and Carole Nudelman. Rept. on A Survey of Properties for Flame Studies, Contract AF 49(638)169. [1959] 122p. 69 refs. AFOSR-TN-60-502.
Order from LC mi$6.30, ph$19.80 PB 147 913

This review was undertaken to collect and evaluate the information required for a detailed theoretical analysis of the ozone flame. Although this is one of the simplest possible chemical systems, much data had to be taken from conflicting information and untested extra-polations. The thermodynamic properties are the most satisfactory of the available data. There is information on the three species of interest in this system and meaningful estimates for the accuracy of the data can be given. These data include energy, enthalpy, free energies, and heat capacities. The most important assets of this system from the standpoint of flame studies are its chemical simplicity and the possibility of varying the relative importance of the reactions by varying the concentration of ozone in the fuel gas and, therefore, the maximum flame temperature. The important transport properties for flame studies are the thermal conductivity and the diffusion coefficients. The only direct experimental information is on the thermal conductivity of oxygen at temperatures from about 80° to about 350°K.

Pennsylvania U., Philadelphia.
THE IRREVERSIBLE THERMODYNAMICS OF NONLINEAR PROCESSES AND NOISE IN DRIVEN SYSTEMS, by William Bernard and Herbert B. Callen Technical rept. no. 13 on Contract Nonr-698(00). June 59, 140p. 15 refs. AD-217 512.
Order from LC mi$6.90, ph$21.30 PB 147 449

The theory of irreversible thermodynamics is reviewed and extended. The irreversible behavior of a system driven by externally applied forces was studied extensively, but attention was focussed primarily on the first order term in the driven response. Also considered are the higher order terms in the driven response and the random fluctuations, or noise, occurring during an irreversible process. In addition to the well known relations between the linear response and the equilibrium fluctuations, several new relations involving the non-linear response, the driven noise, and the equilibrium fluctuations are proved. (Author)

NON-EQUILIBRIUM CENTERED RAREFACTION FOR A REACTING MIXTURE, by Luigi G. Napolitano. Rept. on Contract AF 40(600)732. June 60, 66p 5 refs. AEDC-TN-60-129.
Order from LC mi$3.90, ph$10.80 PB 148 581

General equations are derived which describe the dynamics and thermodynamics of an ideal dissociating gas when only one relaxation time, the chemical one, is different from zero. The equations are applied to the study of an expansion around a two-dimensional corner by the methods of the characteristics. The initial value problem is posed, the equations suitably transformed, and the numerical procedure, based on the usual finite difference approximation to the characteristics and regularity conditions, outlined. The expansion wave around the corner is investigated from a different viewpoint. Two series solutions are given in terms of the parameter $r = R/L$ where R is the distance from the corner and L a characteristic length which essentially depends upon both the energy involved in the reaction process and the rapidity of the reaction itself as compared to the macroscopic convective motion. (Author)

HEAT CONDUCTION AND THERMAL STRESSES IN A SOLID HAVING UNEQUAL SPECIFIC HEATS, by E. W. Parkes. Rept. on Contract AF 49(638)223. Feb 60, 24p. 9 refs. SUDAER no. 90; AFOSR-TN-60-320.
Order from LC mi$2.70, ph$4.80 PB 148 506

It is usual in thermoelastic analyses to separate the heat conduction and stressing problems. This division can only be justified if the specific heat at zero stress for the material is closely equal to that at zero strain. For some materials at present under consideration for missile construction, the ratio of specific heats may depart from unity by 25%. The paper investigates the transient temperature distribution and thermal stresses in a solid subjected to one-dimensional heat flow and various kinds of stress-inducing restraints, when the specific heats are unequal. Allowance is made for the stress terms in the heat conduction equation (which are ignored when the analysis is divided) and for the variation of specific heat with temperature. It is concluded that the errors introduced by the conventional approach, although not entirely negligible, are not such as to justify the labor involved in the more correct analysis. (Author)

Stanford U., Calif.
THERMODYNAMIC FOUNDATIONS OF THE THEORY OF DEFORMATION, by J. F. Besseling. Rept. on Contract AF 49(638)223. Aug 59, 31p. 9 refs. SUDAER no. 86; AFOSR-TN-59-871.
Order from LC mi$3.00, ph$6.30 PB 148 503

It is shown that the theory of deformation can be founded on thermodynamic principles, the Galilean principle of relativity, and the concept of a natural reference state which at any instant is locally reproducible by a reversible process. The theory is a priori restricted to small inelastic strains. Explicit relations in terms of material properties are presented for small deviations from the natural reference state. Attention is drawn to the inherent nonlinearity of the thermoelastic equations in dynamic problems. (Author)

Course of lectures on thermal and elastic constants; Maxwell's equations and the relations between the thermoelastic constants; the thermoelastic equations; boundary conditions; the heat conduction equation; elastic thermal stresses and their effects on stiffness; inelastic thermal stresses and a design philosophy for repeated thermal loading.

Theoretical Chemistry Lab., U. of Wisconsin, Madison.
THE AVAILABLE CHEMICAL ENERGY IN THE UPPER ATMOSPHERE, by Curtis A. Wagner. Rept. on Contract DA 11-022-ORD-2526. 2 May 60, 92p. 31 refs. WIS-OOR-28, Series 5; OOR rept. 1898. 10-C.
Order from LC mi$5.40, ph$15.30 PB 148 435

The total amount of available chemical energy in the atmosphere is determined for various altitudes. This is compared with approximations to the energy required to orbit a fuelless recombination ramjet missile at these same selected altitudes. Since thermodynamic, temperature, pressure, and especially composition data are extremely critical to these calculations, a discussion of sources is included. Details of the thermodynamic calculations and the computational techniques employed in conjunction with the Bendix G-15 high speed computer are also discussed. Tables of important data and results are presented

for future reference and checking; new temperature, pressure, and composition data will undoubtedly be available soon for more accurate calculations. These calculations, using presently available data, indicate that operation of such a vehicle would be marginal around 120 kilometers and impractical elsewhere. (Author)

TROPOSPHERIC SCATTER PROPAGATION INVESTIGATION, by Wilfred K. Klemperer. Final rept. on Contract AF 19(604)1835. 19 Feb 60, 74p. 29 refs. Rept. no. C-1074-P-1; AFCRC-TR-60-132.
Order from LC mi$4.50, ph$12.30 PB 147 909

A receiving station of a 395 mile scatter link operating at 915 mc was established and operated for three years. Probability amplitude distribution and power spectra were obtained for the received signal and analyzed to determine the degree to which the data verified existing theories on tropospheric scatter propagation. Some evidence exists which indicates that amplitude distribution of the received signal is distributed in accordance with Rayleigh statistics for periods up to about 100 seconds. Investigation of the relationship of characteristics of the received signal with meteorological phenomena shows that a correlation exists between the fading range and wind shear in the scatter volume. No correlation was observed between the signal characteristics and the height of the tropopause. Peaks in the received signal due to forward scattering by lightning discharges were identified.

A CRITICAL ANALYSIS OF FIELD STRENGTH MEASUREMENTS AT FREQUENCIES ABOVE 30 MCPS, by A. H. LaGrone and Tadao Inami (Doctoral thesis). Rept. on Contract AF 19(604)5504. 3 June 60, 213p. 193 refs. Rept. no. 6-35; AFCRC-TN-60-557
Order from LC mi$9.60, ph$33.30 PB 148 209

Although the study of propagation of radio waves with frequencies above 30 mcps began in relatively recent years, numerous field-strength measurement data are now available. In this paper, the authors have analyzed, compared, and criticized these data. Problems concerning the propagation of radio waves at frequencies above 30 mcps are considered for the optical and diffraction regions, and for scattering in both the troposphere and ionosphere. Original and comprehensive mass plots of signal strength are made to more effectively present the information. Absorption due to oxygen and water vapor molecules in the atmosphere and attenuation caused by scattering due to water drops are also treated. (Author)

Electrical Engineering Research Lab., U. of Texas, Austin.
RAINFALL ATTENUATION OF 2.15 mm RADIO WAVELENGTHS, by C. W. Tolbert, J. R. Gerhardt, and W. W. Bahn. Rept. on Contract Nonr-375(01). 14 June 59, 20p. 4 refs. Rept. no. 109.
Order from LC mi$2.40, ph$3.30 PB 147 394

The attenuation of 2.15 millimeter radio frequency energy by rainfall has been measured and found to be in fair agreement with the attenuation calculated from the precipitation rates. Some discrepancy between the measured and calculated attenuations is due to the inhomogeneity of the rainfall along the propagation path and to the spectra of drop sizes associated with the various precipitation rates. (Author)

Electrical Engineering Research Lab., U. of Texas, Austin.
WAVE PROPAGATION THROUGH A TURBULENT TROPOSPHERIC LAYER, by H. D. Wade and B. M. Fannin. Rept. on Contract AF 19(604)5504. 30 May 60, 66p. 27 refs. Rept. no. 6-34; AFCRC-TN-60-556.
Order from LC mi$3.90, ph$10.80 PB 148 208

The analysis of wave propagation phenomena induced by homogeneous tropospheric layers is adequately accomplished through the use of conventional wave theory (microwave optics). Propagation through homogeneous tropospheric turbulence can be handled theoretically by the use of a first Born approximation (single scattering) approach in many cases. The choice of the proper theory to apply to the case of propagation through a tropospheric layer of anisotropic turbulence is not clearly established. This report presents a preliminary analysis of wave propagation through such a layer. A comparison is made of single scattering and wave theory analyses of wave propagation through a homogeneous non-turbulent tropospheric layer in order to gain insight into the validity of single scatter theory for a limiting case. The single scattering approach is then applied to an assumed mathematical model of an anisotropically turbulent tropospheric layer, and integral expressions are derived for the cross-correlation functions of the amplitude and phase, respectively, of a wave which has passed through the layer.

Electronics Research Lab., U. of California, Berkeley.
ANALYSIS OF THE IMAGE PLANE METHOD FOR MEASURING RADAR CROSS-SECTIONS, by Andrejs Olte. Rept. on Contract N7onr-29529. 2 Sep 59, 54p. 11 refs. Rept. no. 92; Series no. 60, issue no. 249; AD-230 400.
Order from LC mi$3.60, ph$9.30 PB 148 619

Investigation concerns the development of a technique to measure scattered field patterns and scattering cross sections with a high degree of precision and accuracy. Emphasis is on extension of the image plane technique previously developed. The discussion covers a description of the measuring system in use and some order of magnitude calculations, an analysis of the system, and the range and accuracy of the CW image plane technique. The following equivalent techniques are compared and discussed: the Doppler technique, the pulse technique, the continuous wave full space technique, and the continuous wave image plane technique.

Electronics Research Lab., U. of California, Berkeley.
BACK-SCATTERING FROM CONES, by G. August and D. J. Angelakos. Rept. on Contract N7onr-29529. 22 Sep 59, 25p. 8 refs. Rept. no. 95; Series no. 60; issue no. 252; AD-230 508.
Order from LC mi$2.70, ph$4.80 PB 148 621

The purpose of this experimental investigation was to determine the back-scatter cross sections of a family of right-circular metallic cones with a greater accuracy than measured in a previous investigation. Three cones in the resonance region were examined, using the image plane method of measurement. Back-scatter was measured at about 9328 mc. as a function of the aspect angle between the incident radiation propagation direction and the cone axis. The cones and a comparison sphere were halves of volumes of revolution, thus allowing use of the image technique. A 4.5" diameter metallic sphere was used as a reference target. The theory of scattering from a metallic sphere is well-known, and its absolute back-scatter cross section may be calculated. Consequently, the absolute back-scatter cross sections of the cones may be computed by comparison of the data of this report with the absolute cross-section of the reference sphere. By use of a suitable measurement procedure, it was possible to largely eliminate a characteristic error of the image plane technique. The accuracy of the measurements was improved by an averaging process, and the measurements themselves gave an estimate of the error in the data. (Author)

Electronics Research Lab., U. of California, Berkeley.
SOME NEW FORMS OF HUYGENS' PRINCIPLE, by V. H. Rumsey. Rept. on Contract N7onr-29529. 18 Sep 59, 43p. 19 refs. Rept. no. 93; Series no. 60, issue no. 250; AD-230 483.
Order from LC mi$3.30, ph$7.80 PB 148 620

Several theorems are derived by using the reaction concept. They apply to single frequency sources of finite extent, and to fields which are finite and continuous on a hypothetical closed surface S whose inside or outside is source free. The field on the source-free side of S is uniquely determined by the normal components E_n and H_n on S. For measurements on the source-free side of S, the primary source can be replaced by any of the following secondary sources on S: (a) normal electric and magnetic dipoles in free space; (b) normal electric and magnetic quadrupoles backed by a medium which makes $E_n = 0$ and $H_n = 0$; and (c) a certain combination of electric and magnetic normal dipoles and quadrupoles, which gives zero field on the source side of S. The prescription for (a) requires the solution for the field of the primary source when it is inside a cavity on whose walls $E_n = 0$ and $H_n = 0$. The surface densities of the various components of secondary sources (b) and (c) are given in terms of the free space primary field. The formulas are comparatively simple when S is plane. Many applications are cited including a combination of multipoles, consisting of vertical electric and magnetic dipoles, which is equivalent to a horizontal electric dipole. (Author)

UHF PROPAGATION STUDY, VOL. I, by M. H. Latour. Final rept. on Contract Nonr-580(04). Sep 59, 75p. 10 refs. AD-228 623.
Order from LC mi$4.50, ph$12.30 PB 148 589

Results of a UHF experimental trans-horizon propagation study are presented. The propagation path of 300 miles was entirely over sea. Received pulse signals at 1260 mc were sorted into 30 levels approximately one db apart and amplitude distribution recorded in real time. Summer time signals were found to be generally higher than those received during the Winter. Any diurnal variations were masked by other factors which produced greater signal variations. The signal level appeared to be related to the absolute value of the surface refractive index of the atmosphere. Refractometer data indicated greater fluctuations of atmospheric refractivity with height during the summer months. The short term variation of the signal appeared to be Rayleigh distributed except during periods of super-refraction. The fluctuation rate varies inversely with signal amplitude, with higher rates associated with low signal periods. Evidence of multipath propagation was observed frequently. Many cases of extreme delays were obviously caused by the ionized paths of lightning discharges. Other cases are suspected of being caused by foreward scatter from rain. (Author)

Göttingen U. (West Germany).
ABSORPTION AND TRANSMISSION OF ELECTROMAGNETIC WAVES. PHASE G: EFFECTIVENESS OF ABSORBERS FOR ELECTROMAGNETIC CM-WAVES UNDER OBLIQUE ANGLES OF INCIDENCE, by G. Kurtze. Technical final rept. on Contract AF 61(514)1041. 31 July 58, 28p. 5 refs. RADC-TR-59-26C; AD-210 939.
Order from LC mi$2.70, ph$4.80 PB 146 709

In the development of absorbers for electromagnetic cm-waves main emphasis has mostly been laid on getting minimum reflection for normally incident waves. For laboratory use and also for RADAR camouflage under certain conditions, however, also the specular reflection of absorbers under oblique angles of incidence should be small. For absorbers with layer thicknesses of about one wavelength or larger this demand will mostly be fulfilled. The present study has been started in order to find out how resonance type absorbers with layer thicknesses small in comparison with the wavelength behave in this respect, and how the angular response of their reflection factor can be improved. It is the first step towards the development of wide angle resonance absorbers.

Institute of Mathematical Sciences, New York U., N. Y.
MULTIPLE DIFFRACTION BY AN APERTURE IN A HARD SCREEN, by Samuel N, Karp and Joseph B. Keller. Rept. on Contract AF 19(604)5238. Nov 59, 22p. 8 refs. Research rept. EM-143; AFCRC-TN-59-995; AD-233 253.
Order from LC mi$2.70, ph$4.80 PB 147 344

Two methods previously applied to diffraction by an aperture in a soft screen (one on which the field vanishes) are adapted to the case of a hard screen (one on which the normal derivative of the field vanishes). These methods are the geometrical theory of diffraction and the self consistent field method. They are both applied to diffraction by an infinite slit and both yield the same result at distances greater than several wave lengths from the edges of the screen. The former is also applied to diffraction by a circular aperture. Expressions for the diffracted fields, the diffraction patterns and the transmission cross sections are obtained for the problems of the slit and the circular aperture. (Author)

RADIO PROPAGATION AND IONIZED GASES. A SURVEY, by H. D. Rix. Scientific rept. no. 123, part A on Ionospheric Research, Contract DA 36-061-ORD-577. 1 Sep 59, 53p. 49 refs. AD-233 394.
Order from LC mi$3.60, ph$9.30 PB 147 248

This report surveys electromagnetic wave propagation effects relating to the problem of radio interference encountered during powered flight of large missiles. An expression for the absorption of a radio signal traversing a plasma is developed from the approximate theory of plasma conductivity. Properties of several types of plasma - flames, gaseous discharges and shock waves - are described in terms of methods of measuring electron density, mechanisms of ionization and means of controlling free electron concentration. Specific propagation effects treated include high frequency antenna breakdown and ionospheric effects. A guide to the relevant literature of these various subjects is provided. (Author)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
DIFFRACTION BY AN ABSORBING HALF-PLANE, by C. J. Marcinkowski. Rept. on Contract AF 19(604)4143. 29 Sep 59, 93p. 36 refs. Research rept. R-750-59; PIB-678; AFCRC-TN-60-153; AD-234 015.
Order from LC mi$5.40, ph$15.30 PB 146 321

The 2-dimensional electromagnetic problem of plane-wave scattering by a half-plane with a constant impedance is solved by the Wiener-Hopf technique. Previous solutions have dealt with small surface impedance and were formulated by the classical Fourier transform procedure. In contrast, results of this study are applied to the (no longer small) surface impedance of a half-plane which absorbs perfectly a plane wave incident at a prescribed angle. Moreover, a transmission line formulation of the problem is employed. A saddle point evaluation of the scattered far-fields shows that the back-scattered fields are appreciably influenced by the surface impedance while the forward-scattered fields are relatively unaffected. A null appears in the back-scattered fields. Another variant of the factorization technique for dielectric surfaces was discovered and illustrated by obtaining the well-known solutions for a perfectly reflecting half-plane. (Author)

Raytheon Co., Waltham, Mass.
IONOSPHERE PROPAGATION STUDIES, by Leonard C. Edwards, and Donald A. Hedlund. Final scientific rept., Pt. 1, 15 June 57-15 Sep 59, on Contract AF 19(604)2246. 15 Oct 59, 38p. 7 refs. AFCRC-TR-60-104(1); AD-233 734.
Order from LC mi$3.00, ph$6.30 PB 146 813

An experimental investigation of some characteristics of ionospheric forward scattering was conducted in the HF band. The nature of the scattering process was investigated, and an indication of the usefulness of this mode of propagation was provided at frequencies ordinarily employed for communication only when normal ionospheric modes prevail. An experimental HF radio link was established between Greencastle, Indiana and South Dartmouth, Massachusetts. Measurements were made over a 3-yr period to describe the diurnal and seasonal variations in the scatter signal level. Special attention was given to describing the variations in signal level which occur when operating very near the classical MUF for the path. Several experiments were also conducted to investigate the area extent and possible movement of ionospheric regions which contribute to the received scatter signal. Experiments of this type emphasized the effectiveness which can be obtained for any given antenna applied to an ionospheric scatter path. A search was made in the data regularly recorded, and in data obtained in several special experiments, to determine if sufficient ionization is associated with earth satellites to be detected using HF techniques. Stanford Electronics Lab., Stanford U., Calif.
A NEW MECHANISM FOR ACCELERATING ELECTRONS IN THE OUTER IONOSPHERE, by R. A. Helliwell and T. F. Bell. Technical rept. no. 4 on Contract AF 18(603)126. 23 Feb 60, 10p. 7 refs. AFOSR-TN-60-151; AD-234 472.
Order from LC mi$1.80, ph$1.80 PB 147 336

The phenomena of high energy trapped particles are studied in the earth's outer ionosphere using a new device for particle acceleration, the geocyclotron. Through this device, trapped electrons in the outer ionosphere can be accelerated to high energy utilizing circularly polarized radiation, traveling in the whistler-mode, and the inherent phase stability of the particle-wave interaction. It is shown that this interaction is roughly analogous to the well-known synchrotron interaction. Implications of the theory are discussed and experiments are suggested which might lead to important new information concerning the behavior of particles trapped in the earth's magnetic field. (Author)

Stanford Electronics Labs., Stanford U., Calif.
A THEORY OF TRAPPING OF WHISTLERS IN FIELD-ALIGNED COLUMNS OF ENHANCED IONIZATION, by R. L. Smith, R. A. Helliwell, and I. W. Yabroff. Technical rept. no. 3 on Contract AF 18(603)126. 31 Dec 59, 22p. 15 refs. AFOSR-TN-60-139; AD-233 813.
Order from LC mi$2.70, ph$4.80 PB 146 359

A ray theory of whistler propagation in ducts is developed for the purpose of explaining discrete whistler components. By use of refractive index surfaces and a Snell's Law construction, it is shown that the only feature of the electron distribution affecting the trapping conditions is the ratio of the electron density in the column to that of the background. In most practical cases the electron density in the column required for trapping must be greater than the background level. However, under certain conditions the density in the column must be less than the background level. Using the theory, it is found that the enhancement required for trapping increases markedly toward the equator, providing a possible explanation for reduced whistler occurrence at the lower latitudes. (Author)

RESEARCH METHODS, TECHNIQUES AND EQUIPMENT

Avco-[Everett] Research Lab., Mass.
DEVELOPMENT OF THE CALORIMETER HEAT TRANSFER GAGE FOR USE IN SHOCK TUBES, by Peter H. Rose. Rept. on Contract AF 04(645)18. Feb 58, 52p. 13 refs. Research rept. 17; AD-159 547.
Order from LC mi$3.60, ph$9.30 PB 147 396

A heat transfer gage suitable for measuring extremely high heat transfer rates under the quasi-transient conditions occurring in shock tubes has been developed. The instrument is based on a colorimetric principle and is made possible by the short steady state times inherent in shock tubes. The technique developed supplements, verifies and extends the shock tube heat transfer measurements made by thin film resistance thermometers. Much heat transfer data has already been collected by this type of instrument and has been reported. The operating principles and experimental experiments with calorimeter heat transfer gages are reported in some detail. (Author)

California U., Los Angeles.
ON THE THEORY OF ADAPTIVE CONTROL SYSTEMS, THE LEARNING MODEL APPROACH, by M. Margolis and C. T. Leondes. Rept. on Contract AF 49(638)438. Oct 59, 29p. 4 refs. AFOSR-TN-59-1200; AD-233 275.
Order from LC mi$2.70, ph$4.80 PB 146 736

The main objective of feedback control is to maintain satisfactory performance despite adverse environmental effects. A process adaptive system is one which determines the values of the significant parameters in the physical process and used these values to program the controller according to the specified controll laws. The use of a process adaptive system makes it possible to design the complete control system for a specified requirement without compromising the setting of the controller parameters for the range of dynamic characteristic variation. The learning model will determine these variations and present the exact values to the proper computing circuits for adjusting the parameters in the controller. The particular method for determining the dynamic characteristics of the physical process makes use of a model, referred to as the learning model, and a mechanism to adjust the parameters of the model. The model is a computer mechanization of the physical process with undetermined parameters. (Author)

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
INVESTIGATION OF HIGH TEMPERATURE RESISTANT MATERIALS, by C. R. Mason, J. D. Walton and others. Quarterly rept. no. 14, 1 Feb-30 Apr 59, on Contract NOrd-15701. [1959] 30p.
Order from LC mi$2.70, ph$4.80 PB 148 059

Thermal Protection Systems: The thermal diffusivity-temperature relationship was determined by considering K and Cp separately and calculating the diffusivity at specified temperatures. The thermal conductivity of slip-cast fused silica (density 117 lb/cu ft) was found to vary linearly with temperature over a range from 420° to 1350°F with values of 0.36 and 0.42 (Btu)-(ft)/(hr)(sq ft)(°F) respectively. Coatings: A technique for forming thin shapes by flame spraying onto a removable brass pattern was developed. Thermets: Certain physical properties of beryllium-chromic oxide thermets were determined using either beryllia or chromium as the reaction throttler. (See also PB 142 326)

Naval Ordnance Lab., Corona, Calif.

Air Force Cambridge Research Center, Bedford, Mass.
PROCEEDINGS OF SEMINAR ON SPEECH COMPRESSION AND PROCESSING, 28-30 SEPTEMBER 1959, VOLUME I. Dec 59, 208p. 55 refs. AFCRC-TR-59-198, vol. 1; AD-233 717.
Order from LC mi$9.30, ph$31.80 PB 146 623

Contents:
Basic factors in speech perception and applications to speech processing
Effects of multiple narrow pass band filtering on the intelligibility of speech
Some aspects of intonation and stress
The effective use of digital simulation for speech processing
Experiments with a dynamic analog of the vocal tract
Automatic resolution of speech spectra into elemental spectra
Some progress with vocoder-type systems
Characteristics of modern vocoders and remaining problems
Vocoders for military use
A twelve-channel transistorized vocoder
Simulation of a vocoder
The SRDE speech bandwidth compression project
The Formoder as a tool for speech studies
A digitalized continuous-analysis speech compression system
A review of Stromberg-Carlson research programs in Formant tracking and word recognition

International Telemeter Corp., Los Angeles, Calif.
FINAL REPORT. Rept. [on Contract AF 30(602)1566] 15 Nov 57, 10p. RADC-TR-58-4; AD-148 548.
Order from LC mi$1.80, ph$1.80 PB 146 724

The ultimate objective of this work is the construction of a billion-bit memory with 10 millisecond access time. The immediate objective, which was accomplished, was the construction of one module - with a single reading head - of a capacity of 30 million bits and random access of 50 milliseconds. In order to obtain results on its performance, it was considered important to build the memory as part of a useful system. A Mechanical Translator was chosen because there is a definite military requirement for MT, a minimum amount of input-output is necessary and the contents of the store are already well organized (in dictionaries). The objective of the Mechanical Translation system is to provide an automatic means of working satisfactory translations of Russian technical material, in large volume without the need of pre-or-post-editing. This report then covers the work done in building a photostore as the heart of a Mechanical Translation system. It also includes the preparation of the contents and loading the memory with the information.

Photographic Equipment

International Telemeter Corp., Los Angeles, Calif.
FILM-TO-DISC TRANSFER UNIT OPERATION MANUAL. Technical rept. no. 16 [on Contract AF 30(602)1566] 20 Oct 57, 12p. RADC-TN-57-387; AD-131 383.
Order from LC mi$2.40, ph$3.30 PB 146 726

International Telemeter Corp., Los Angeles, Calif.
TAPE-TO-FILM TRANSFER UNIT OPERATION MANUAL. Technical rept. no. 14 [on Contract AF 30(602)1566] 20 Oct 57, 27p. RADC-TN-57-385; AD-131 381
Order from LC mi$2.70, ph$4.80 PB 146 725

This manual has been prepared in such a manner as to enable the operator to understand basically, the working of the machine. While this is not entirely essential, it is the best way to avoid unnecessary errors. The making of a film from paper tape is fundamentally a simple process, but as a great many operations are required, and many of them being repetitive, great care is needed if a perfect film is to be the result. In the construction of the machine, every effort has been made to eliminate possible operator errors. This has been accomplished by the use of a complicated system of interlocks. Even the most thoughtful interlock system will be of no avail if the operator is unaware of their presence. It is for this reason that every part of the operation manual must be understood and studied closely before commencing to operate the machine.

SOCIAL SCIENCES

California U., Los Angeles.
AN EMPIRICAL STUDY OF ARRIVAL, SERVICE TIME, AND WAITING TIME DISTRIBUTIONS OF A JOB SHOP PRODUCTION PROCESS, by Ross T. Nelson. Rept. on Management Sciences Research Proj. Contract [Nonr-233(02)]. 19 June 59, 41p. 13 refs. Research rept. no. 60.
Order from LC mi$3.30, ph$7.80 PB 146 682

There were two principle purposes for this empirical study: To collect arrival and service time data in a typical job shop and analyze the data with respect to the basic questions of time stability and distribution forms. To evaluate waiting line theoretical models as potential aids in job shop production control systems on the basis of empirical data. Time stability tests were applied to both the arrival and service time data. The hyper-Erlang model, proposed on the basis of the service time analysis of Section 2, is described more precisely in Section 3 by the equations of detailed balance, the secular equation, and a discussion of the computational requirements. It is concluded that, while this model might provide more accurate results in many cases, numerical computation would probably require a computer program.

Harpur Coll., State U. of New York [Endicott, N. Y.]
OFFSHORE CLAIMS IN NORTHWESTERN EUROPE, by Lewis M. Alexander. Technical rept. no. 1 on Contract Nonr-1349(03). Sep 59, 53p. 58 refs. AD-226 983.
Order from LC mi$3.60, ph$9.30 PB 148 580

The problems of national claims to offshore areas have in recent years become a major topic of international concern. In the conflict between offshore rights and the freedom of the seas the states of Northwestern Europe have stood out as leaders in the formulation of national and international policy. The nature and extent of the offshore claims of these states are summarized. (Author)

Brown U., Providence, R. I.
PRICE EQUILIBRIUM AND THE "GREATEST GOOD FOR THE GREATEST NUMBER", by David Gale. Technical rept. no. 3 on Contract Nonr-562(15). 1959, 20p. 4 refs.
Order from LC mi$2.40, ph$3.30 PB 146 411

The present note was prompted by the observation that the idea of equilibrium prices plays a central role in many other economic situations besides that of price formation for an economy as a whole. Our concern here will be with situations in which it makes sense to assume that each individual in the economy places a definite monetary value on the various objects of goods bundles under consideration.

Documentation

Directorate of Engineering Standards, Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
MICROFILM APERTURE CARD SYSTEM, by Thomas H. Korte, Thomas C. Myers, and John W. Berry. [1959] 160p. WADC Technical rept. 59-746; AD-232 960.
Order from OTS $3.00 PB 161 871

The microfilm aperture card system, which is a new concept in the storage, reproduction, and distribution of engineering drawings, and associated data is discussed. The microfilm aperture card is a common, ordinary tabulating punch card. A rectangular hole or aperture is die-cut into this card. The hole is edged with a narrow, transparent adhesive ledge. To this adhesive ledge is affixed a segment, or frame, of microfilm containing a transparency of an engineering drawing. Factual information to the drawing is punched into the card and automatically printed along the top edge. The new system will operate as follows: instead of furnishing full-size vandykes of drawings

by contract, the aircraft and supporting industries of the US will furnish microfilm and punched tabulating cards to the central AF automation control. From these, master microfilm aperture cards will be generated for the AF central drawing repository. The new method combines the advantages of microfilm with the operational precision and speed of automatic tabulating equipment. The system overcomes the problems of excess storage space and shipping-weight as well as the problems of high-cost and low-output-rate formerly associated with comprehensive handling of engineering drawings.

Herner and Co., Washington, D. C.
THE RELATIONSHIP OF INFORMATION-USE STUDIES AND THE DESIGN OF INFORMATION STORAGE AND RETRIEVAL SYSTEMS, by Saul Herner. Technical note no. 1 on Contract AF 30(602)1857. 8 Dec 58. 30p. 20 refs. RADC-TN-59-136; AD-213 781.
Order from LC mi$2.70, ph$4.80 PB 147 028

A review is presented of the results of past studies of the information-gathering methods of workers in various fields, and the general applicability of these results to the design and improvement of information programs and systems is shown. Two cases from the literature are used to illustrate storage and retrieval systems that do and do not meet the requirements of their users, and to show the contrasting need of the pure scientist for mere references to information and of the applied scientist for direct access to actual information. The applied scientist is shown to require the services of large storage and retrieval programs manned by highly trained personnel, while the pure scientist is best served by a conventional library in which the publications are arranged on the basis of a classification scheme reflective of the scientist's customary association of subjects. Low redundancy in manual and machine systems is cited as a means of improving input and output. Differences in the required information coverage of systems serving pure scientists, applied scientists, and social scientists and humanists are indicated, with the pure scientist requiring a narrow collection going back comparatively far in time, the applied scientist requiring a broad but shallow coverage, and the social scientist requiring both depth and breadth. Investigations of the various media used by user groups to communicate and obtain different kinds of information are advanced as a further means of knowing what should and should not be put into a storage and retrieval system. (Author)

MISCELLANEOUS

Naval Research Lab., Washington, D. C.
REPORT OF NRL PROGRESS, Aug 60.
Order from OTS $1.25, $10.00/year PB 161 284

Contents:
Articles:
A fision-product detector for water-cooled reactors, by C. M. Gordon, J. H. Miller, and R. E. Larson
Basic hydrogen-producing processes in electrolytic cells. III--Influence of the electronic configuration of palladium alloys on their catalytic activity, by S. Schuldiner
Precision frequency standards and millisecond timing, by H. F. Hastings
Scientific program:
Astronomy and Astrophysics: Fission product radioactivity in the air along the 80th meridian (west) during 1959
Chemistry: Properties of paints as affected by ultraviolet radiation in a vacuum. Microbial inhibitors for systems of jet fuel and water. Homogeneous ionic polymerization of alpha-methylstyrene
Mechanics: Dynamic design-analysis method for calculating the shock response of Navy shipboard equipment
Metallurgy and Ceramics: Exploratory titanium alloy research. Crack propagation tests of air-melted and consutrode AMS 6434 steel. Oil-ash corrosion in marine boilers. New technique and apparatus for high-temperature measurements of strain in sheet metal specimens. Preliminary study of the mechanisms of oxidation of iron-chromium binary alloys in water vapor
Nuclear and Atomic Physics: New method for the analysis of lithium hydride uses on-the-shelf equipment, permits careful handling of specimen, and protects against unwanted side reactions
Optics: Typical absolute spectral irradiance curves of upwelling of light over an area of the North Atlantic Ocean
Radio: Impedance-matching network for a two-band, "discage" antenna. Data transmission facility for the NRL space surveillance system. Luminance required of opaque and transparent crt phosphors. Spiral-grating antenna array without doublets eliminates problem of spacing between elements
Solid-State Physics: Modification in growing technique imporves optical quality of single crystals of ZnF_2:Mn. Elevated temperature diffusion of the systems Nb-Pt, Nb-Se, Nb-Zn, Nb-Co, Ni-Ta, and Fe-Mo. Effect of O_2 on the magnetoresistance of Cu
Sound: Mutual mechanical radiation resistance for all values of ka of an unbaffled circular rigid piston with pressure-released back. Use of spheroidal wave functions in the empirical description of scalar wave fields.

Kinetics of reactions between two liquid phases, by L. H. Fister, and others. [Massachusetts Inst. of Tech., Cambridge. Dept. of Metallurgy]. 1955. 24p. Contract AT(30-1)-1985. Order from LC. Mi $2.70, ph $4.80. AECU-4570

Organic coolants and moderators for nuclear reactors, by E. U. Kauer. Du Pont de Nemours (E. I.) & Co. Savannah River Lab., Aiken, S. C. Dec 59. 10p. Order from LC. Mi $1.80, ph $1.80. AECU-4590

Progress report on development of radioisotope tracer techniques for studying decomposition of complex organic wastes, by R. E. McKinney. Massachusetts Inst. of Tech., Cambridge. Feb 59 to Jan 60. 8p. Contract AT(30-1) 2329. Order from LC. MI $1.80, ph $1.80. AECU-4712

Progress report No. XXVI, Massachusetts Inst. of Tech., Cambridge Lab. for Insulation Research. Jan 60. 73p. Contract Nonr-1841(10); Nonr-1841(50); AT(30-1)-1937; AF19(604)-5482; and AF32(616)-5920. Order from LC. Mi $4.50, ph $12.30. AECU-4715

Electrochemical studies of hafnium, zirconium and yttrium, Bureau of Mines. Boulder City Metallurgy Research Lab., Nev. and Bureau of Mines. Reno Metallurgical Research Center, Nev. Oct 50 to Dec 59. 6p. Contract AT(11-1)-475. Order from LC. Mi $1.80, ph $1.80. AECU-4726

The vaporization, thermodynamics, and phase behavior of uranium monosulfide, by E. D. Cater. Argonne National Laboratory, Argonne, Illinois. Mar 60. 178p. Contract W-31-109-eng-38. Order from OTS. Price $3.00. ANL-6140

Kinetics of particle growth in a fluidized calciner, by B. S. Lee. Argonne National Laboratory, Argonne, Illinois. June 60. 125p. Contract W-31-109-eng-38. Order from OTS. Price $2.50. ANL-6171

Absorption spectra in fused salts, by H. M. Haendler. Brookhaven National Laboratory, Upton, N. Y. Jan 60. 13p. Contract No. AT-30-2-GEN-16, Subcontract No. S-284. Order from OTS. Price 50. BNL 599 (T-172)

Comparison of two colorimetric methods for uranium, by R. L. McCutchen. Oak Ridge National Lab., Tenn. Mar 59. 10p. Order from LC. Mi $1.80, ph $1.80. CF-59-3-108

Apparent copper rate constants determined in in-pile loop experiment L-2-22, by G. H. Jenks and others. Oak Ridge National Lab., Tenn. Mar 60. 13p. Order from LC. Mi $2.40, ph $3.30. CF-60-3-88

The preparation of uranium dioxide from a molten salt solution of uranyl chloride, by W. L. Lyon, and others. Hanford Atomic Products Operation, Richland, Washington. Oct 59. 20p. Order from OTS. 75 cents. HW-62431

Studies of hydrogen sorption on Pal palladium and the separation of hydrogen from gas mixtures, by R. H. Boice, and others. Knolls Atomic Power Lab., Schenectady, N. Y. Feb 52. 74p. Contract W-31-109-eng-52. Order from LC. Mi $3.60, ph $9.30. KAPL-660

Counting techniques in the radio-chemical determination of U-235 fission burn-up, by D. G. Miller. Knolls Atomic Power Lab., Schenectady, N. Y. Mar 60. 29p. Contract W-31-109-eng-52. Mi $3.00, ph $6.30. KAPL-M-DGM-5

Free energy functions for gaseous monoxides, by L. Brewer and others. Lawrence Radiation Lab., Berkeley, Calif. June 60. 17p. Contract No. W-7405-eng-48. Order from OTS. 50 cents. UCRL-8713(Rev.)

An investigation of a "dynamic" theory for mass transfer, by R. B. Schappel. Union carbide nuclear company, Division of union carbide corp., Oak Ridge, Tennessee. May 60. 115p. Contract No. W-7405-eng-26. Order from OTS. $2.75. Y-1298

Geology and Mineralogy

Exploratory diamond drilling in the No Name Canyon area, White Canyon Dristrict, San Juan County, Utah, by E. V. Mace. Grand Junction, Colorado. Jan 58. 17p. Order from OTS. 50 cents. RME-105

Mobile and portable units for geochemical exploration for uranium, by C. T. Illsley, and others. Grand Junction, Colorado. July 59. 27p. Order from OTS. 75 cents. RME-131

Health and Safety

AEC group shelter, by R. L. Corsbie. AEC Facilities Division, Holmes & Narver, Inc., Los Angeles, California. Jan 60. 33p. Order from OTS. 50 cents. CEX-58.7

Fallout program, quarterly summary report, by E. P. Hardy, Jr., and others. United States Atomic Energy Commission, New York Operations Office. July 60. 250p. Order from OTS. $3.50. HASL-88

Estimating safety probabilities from fallout forecasts for Nevada test site, by Jack W. Reed. Sandia Corp., Albuquerque, New Mexico. Feb 57. Reprinted July 60. 26p. Order from OTS. 75 cents. SC-4073(TR)

Instruments

A slide rule type of device to measure logarithmic decay times as presented by oscillograph records, by R. N. Leach. Sandia Corp., Albuquerque, New Mexico. Mar 60. 19p. Order from OTS. 75 cents. SC-4418(RR)

Final report on investigation of dynamic characteristics of relays, Sandia Corp., Albuquerque, New Mexico. June 60. 74p. Order from OTS. $2.00. SC-4423(RR)

Metallurgy and Ceramics

Phase diagram studies, by R. F. Domagala. General Electric, Aircraft Nuclear Propulsion Dept., Cincinnati 15, Ohio. May 60. 7p. U. S. Air Force, Contract No. AF33(600)-38062, and U. S. Atomic Energy Commission, Contract No. AT(11-1)-171. Order from OTS. 50 cents. APEX-554

Characterization of inclusions in dingot uranium, by D. M. Cheney, and others. Battelle Memorial Institute, Columbus 1, Ohio. Jan 57. 22p. Order from OTS. 35 cents. BMI-1158

Progress relating to civilian applications during May 1957, by R. W. Dayton, and others. Battelle Memorial Institute, Columbus 1, Ohio. June 57. 64p. Order from OTS. 50 cents. BMI-1189

Corrosion of the Zircaloy-2-Niobium couple, by R. E. Campagnoni, and others. General Electric Co., Knolls Atomic Power Laboratory, Schenectady, N. Y. Contract No. W-31-109-Eng-52. Mar 60. 15p. Order from OTS. 50 cents. KAPL-2079

Progress in carbide fuels, prepared by Battelle Memorial Institute, Columbus, Ohio. Contract No. W-7405-eng-92. Apr 60. 90p. Order from OTS. $2.25. TID-7589

Metallurgical progress report, prepared by U. S. Dept. of Interior. Albany Metallurgy Research Center, Albany, Oregon. Mar 60. 22p. AEC Contract No. AT(11-1)-599. Order from OTS. 75 cents. USBM-U-699

Irradiation of UO_2 fuel rods-the X-1-L experiment, by J. D. Eichenberg, and others. Bettis Atomic Power Lab., Pittsburgh, Pa. Contract AT-11-1-GEN-14. Apr 60. 20p. Order from OTS. 75 cents. WAPD-208

Particle Accelerators and High-Voltage Machines

Longitudinal space charge effects - influence of energy loss, by C. E. Nielsen, and others. Midwestern Universities Research Association, Madison, Wisconsin. Contract No. AT(11-1)-384. Mar 60. 15p. Order from OTS. 50 cents. MURA-488

On Robinson's multiple frequency accelerator, by G. Bronca. Midwestern Universities Research Association, Madison, Wisconsin. Contract No. AT(11-1)-384. Feb 60. 18p. Order from OTS. 75 cents. MURA-558

Adiabatic behavior near transition energy, by G. Bronca. Midwestern Universities Research Association, Madison, Wisconsin. Contract No. AT(11-1)-384. Mar 60. 12p. Order from OTS. 50 cents. MURA-560

Physics and Mathematics

Interaction of Neutrons with He^3, by A. R. Sayres. Columbia University Dept. of Physics, New York 27, N. Y. Contract No. AT(30-1)-Gen-72. Mar 60. 82p. Order from OTS. $2.00. CU(PNPL)-200

Electrical Resistivity of plutonium metal between 1.73°K and 298°K, by T. A. Sandenaw, and others. Los Alamos Scientific Lab., U. of Calif., Los Alamos, New Mexico. Contract W-7405-ENG-36. Feb 60. 15p. Order from OTS. 50 cents. LA-2392

The electrical resistivities of samarium and europium between 1.4°K and 300°K, by C. E. Olsen. Los Alamos Scientific Lab., U. of Calif., Los Alamos, New Mexico. Contract W-7405-ENG. 36. Feb 60. 21p. Order from OTS. 75 cents. LA-2406

The application of the mandelstam representation to photoproduction of pions from nucleons, by J. S. Ball. Lawrence Radiation Lab., U. of Calif., Berkeley, Calif. Contract No. W-7405-eng-48. Apr 60. 80p. Order from OTS. $2.00. UCRL-9172

A further study of antiproton interactions and the annihilation process, by R. Silbererg. Lawrence Radiation Lab., U. of Calif., Berkeley, Calif. Contract No. W-7405-eng-48. Apr 60. 76p. Order from OTS. $1.75. UCRL-9183

Progress Reports

Plutonium recycle program annual report, fiscal year 1959, by J. M. Atwood. Hanford Atomic Products Operation, Richland, Washington. Contract No. AT(45-1)-1350. Oct 59. 138p. Order from OTS. $2.75. HW-62000

Oak Ridge Gaseous diffusion plant staff publications, by E. L. Hoey. Union Carbide Nuclear Co., Div. of Union Carbide Corp., Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. July 60. 37p. Order from OTS. 75 cents. K-1449

Radiation Effects on Materials

Effect of irradiation of solid catalysts, by H. C. Andersen, and others. Engelhard Industries, Inc., Newark, N. J. Feb 60. 27p. Contract AT(30-1)-2402. Order from LC. Mi $2.70, ph $4.80. AECU-4733

Fission gas generation and consequent high temperature irradiation effects on natural uranium, including creep properties. Du Pont de Nemours (E. I.) & Company, Savannah River Lab., Aiken, S. C. Dec 59. 13p. Order from LC. Mi $2.40, ph $3.30. AECU-4589

Radioactive Waste

Decontamination, by P. S. Kingsley, and others. Hanford Atomic Products Operation, Richland, Washington. June 60. 35p. Contract No. AT-(45-1) - 1350. 35p. Order from OTS. $1.00. HW-63110

Reactors—General

Argonne low power reactor health physics manual, by E. D. Graham, and others. Argonne National Laboratory, Argonne, Illinois. Contract W-31-109-eng-38. Aug 59. 125p. Order from OTS. $2.50. ANL-6016

Experiments on the explosive decompression of water, by E. A. Brown. Armour Research Foundation, Chicago 16, Illinois. Contract No. AT(11-1)-528. Nov 59. 73p. Order from OTS. $2.25. ARF 4132-9

Liquid metal fuel reactor experiment. Induction welding for remote maintenance -- final report, by D. E. Dean. Alliance, Ohio. Contract No. AT(30-1)-1940. Mar 60. 142p. Order from OTS. $2.75. BAW-1090

Liquid metal fuel reactor experiment. Spectrographic methods for bismuth analysis, by C. H. Anderson. The Babcock & Wilcox Co., Alliance, Ohio. Contract No. AT(30-1)-1940. Apr 60. 19p. Order from OTS. $1.25. BAW-1091

Hazards summary report for the VMR critical-assembly experiments, by R. A. Egen. Battelle Memorial Institute, Columbus 1, Ohio. June 60. 72p. Order from OTS. $2.00. BMI-1445

Preliminary consideration of the effects of a zircaloy-water reaction during a loss of coolant accident in a nuclear reactor, by J. I. Owens, and others. Atomic Power Equipment Dept., General Electric, San Jose, Calif. Sept 59. 36p. Contract No. AT(04-3)-189. Order from OTS. 75 cents. GEAP-3279

The kinetics of metal-water reactions-feasibility study of some new techniques, by S. C. Furman. Vallecitos Atomic Lab., General Electric, Pleasanton, Calif. Contract No. AT(04-3)-189. Jan 60. 46p. Order from OTS. $1.25. GEAP-3338

Symposium on high flux materials testing reactors. Held in Brussels, Belbium. Sept 59. June 60. 447p. Order from OTS. $4.50. TID-7584

Survey of industrial requirements for general testing reactors. United States Atomic Energy Commission. Oct 59. 23p. Order from OTS. 50 cents. TID-8205

Reactors—Power

Experimental gas cooled reactor, by Kaiser Engineers Div., Henry J. Kaiser Co., Oakland, Calif., and Nuclear Power Dept., Allis-Chalmers Mfg. Co., Washington, D. C. 95p. Aug 59. $4.00. AECU-4701(Pt. 2)

Instrumentation and controls study for SM-1 nuclear power plant, by R. E. May and others. Alco Products, Inc., Ft. Belvoir, Va. Contract No. AT(30-3)-326. Oct 59. 340p. Order from OTS. $6.00. APAE-52(Vol. 1)

Instrumentation and controls study for SM-1 nuclear power plant, by K. Brown. Alco Products, Inc., Ft. Belvoir, Va. Oct 59. 114p. Order from OTS. $6.00. APAE-52(Vol. 11)

Liquid metal fuel reactor experiment. Chemical analytical procedures, by The Chemical Section, Research Center, The Babcock & Wilcox Co., Alliance, Ohio. Contract No. AT(30-1)-1940. May 60. 216p. Order from OTS. $3.50. BAW-1099

Liquid metal fuel reactor experiment. Quarterly technical report. The Babcock & Wilcox Co., Alliance, Ohio. Contract No. AT(30-1)-1940. Apr 58. 166p. Order from OTS. $3.00. BAW-1116

Externally cooled lmfr. A reference design for low cost power. The Babcock & Wilcox Co., Alliance, Ohio. Contract No. AT(30-1)-1940. Mar 60. 125p. Order from OTS. $2.75. BAW-1147

The liquid metal thorium breeder reactor. The Babcock & Wilcox Co., Alliance, Ohio. Contract No. AT(30-1)-1940. Feb 60. 192p. Order from OTS. $3.50. BAW-1171

RESEARCH REPORTS

November 18, 1960
Vol. 34, No. 5

. . . A monthly listing of Government research reports available to industry . . .

UNIVERSITY OF MICHIGAN
DEC 1 1960
ENGINEERING LIBRARY

In this issue

Transistorized Building Blocks for Data Instrumentation

RADC Reliability Notebook

Investigation of Physical Properties of Semiconductors

Research on New High Temperature Semiconducting Materials

Fundamentals of Solid Rocket Propulsion

The Kinetics of Gases

Micro-Module Production Program

A Study of Vaporizable Extinguishants

New Developments in the Welding of Metals

Design Information of Nickel-Base Alloys for Aircraft and Missiles

Complete list of printed reports begins on page 519

The PB Reports . . .

announced in this publication have just been released, usually by agencies of the U. S. Government, for dissemination to the public. In most instances they result from Government or Government-sponsored research.

The Office of Technical Services is responsible, under Public Law 776, 81st Congress, for the collection and distribution of these technical reports in the interest of American science and industry.

The more important reports are reprinted for sale to the public by OTS. Many of the reports are so specialized that the demand for them does not warrant reproduction of printed copies; originals of these documents are deposited at the Library of Congress. There they may be inspected in the Annex Reading Room, or copies may be ordered from the Library in either photocopy or microfilm.

PB reports of special interest to smaller businesses are abstracted in OTS's monthly *Technical Reports Newsletter*, available from the Superintendent of Documents, Washington 25, D. C., at $1 a year domestic, $1.50 foreign.

Since 1945 thousands of business firms have used PB reports in their research programs. These reports now constitute one of the world's largest collections of non-confidential technical information, numbering over 250,000 items. OTS has published catalogs of related reports in more than 300 areas of industrial interest. For further information relative to any of its activities, you are invited to write OTS, U. S. Department of Commerce, Washington 25, D. C.

Except to the extent indicated by acknowledgment of authorship, OTS does not edit PB reports, nor does it accept responsibility for the information and conclusions contained in them. If copyrighted material appears, permission for its use should be requested from the copyright owners. Any national security restrictions that may have applied to these reports have been removed. Patents may cover the subject matter of any report, and the reader is advised to make patent searches before developing applications based on the reports.

How To Order

ALWAYS USE COMPLETE TITLE AND PB NUMBER of each report ordered. The letter "s" accompanying some PB numbers means "supplement," "t" means "translation," and "r" means a partial or complete revision. These letters should be included as part of the PB number. Prepayment is required.

TO ORDER FROM LC • Address your order to Library of Congress, Photoduplication Service, Publications Board Project, Washington 25, D. C. Make check or money order payable to Chief, Photoduplication Service, Library of Congress. State whether report is desired in microfilm or photocopy. Microfilm copies are in 35 millimeter film and require special reading equipment. If you do not have such a machine you may be able to use one at a library in your area.

TO ORDER FROM OTS • Address your order to Office of Technical Services, U. S. Department of Commerce, Washington 25, D. C. Make check or money order payable to OTS, Department of Commerce. Reports available from OTS may also be ordered through Department of Commerce field offices.

TO ORDER FROM OTHER SOURCES • When an agency other than OTS or LC is the source, use the full address included in the abstract of the report. Make check or money order payable to that agency.

Printed Reports Available From OTS Announced in This Issue

BIBLIOGRAPHY

Platinum and allied metals. July 60. 8p. (OTS SB-420) 10 cents ... 623

BEHAVIORAL SCIENCES

Accuracy of information on line work orders for armament-electronics maintenance. Dec 58. 40p. (PB 151 705) $1.00 ... 525
Conference on integrated aircrew training (March 1960). July 60. 63p. (PB 161 923) $1.75 ... 526
Research on the effects of isolation on cognitive functioning. Mar 60. 26p. (PB 161 922) 75 cents ... 531

CHEMISTRY

Kinetics of gases. July 60. 156p. (PB 161 908) $3.00 ... 541
Kinetics of reactions in shock tubes. Apr 60. 109p. (PB 161 904) $2.50 ... 540
Rapid determination of the order of chemical reactions from time-ratio tables. Aug 60. 23p. (PB 161 563) 75 cents ... 542

EARTH SCIENCES

Scientific studies at Fletcher's Ice Island. Apr 60. 122p. (PB 161 939) $2.75 ... 550
Study of the filtration and permeability characteristics of IPC 1478 filter paper. Feb 60. 178p. (PB 161 917) $3.00 ... 552

ENGINEERING

An improved dc current-interrupter unit. July 60. 22p. (PB 161 437) 75 cents ... 576
An integral processing unit using a secondary refrigerant. Aug 60. 51p. (PB 161 906) 50 cents ... 559
Apparatus for zone refining highly reactive metals. July 60. 12p. (PB 161 929) 50 cents ... 560
Brightness intensifier study. May 60. 54p. (PB 161 945) $1.50 ... 578
Characteristics of a VOR on a 200-foot tower. Apr 60. 37p. (PB 161 949) $1.00 ... 575
Characterization of the Mk 1 Mod O Squib: Impedance measurements in the frequency range 50-1500 megacycles. May 60. 35p. (PB 161 934) $1.00 ... 587
Development of printed cables and connectors. June 59. 25p. (PB 161 927) 75 cents ... 562
Development of WOX-73A and WOX-74A primers. June 60. 18p. (PB 161 935) 50 cents ... 588
Inspection for maintenance of public works and public utilities. Volume 2. Inspection guides - Electrical. June 58. 64p. (PB 161 959) $1.50 ... 560
Inspection for maintenance of public works and public utilities. Volume 3. Inspection guides - Mechanical. June 58. 78p. (PB 161 960) $2.00 ... 560
Inspection for maintenance of public works and public utilities. Volume 4. Inspection guides - Structural. June 58. 48p. (PB 161 961) $1.25 ... 560
Instrumentation for the classification of space signals. July 60. 19p. (PB 161 515) 50 cents ... 576
Interim aerospace terminology reference. Oct 59. 79p. (PB 161 913) $2.00 ... 586
Micro-module production program. 1959. 157p. (PB 161 911) $3.00 ... 579

ENGINEERING (con.)

Page

Programming of digital computers for determination of stability and control characteristics. Volumes I and II. July 59. 596p. (PB 161 924) $7.00 ... 557
Programming of digital computers for determination of stability and control characteristics. Volume III, Appendix II. July 59. 417p. (PB 161 925) $6.00 ... 557
Programming of digital computers for determination of stability and control characteristics. Volume IV and V, Appendix III. July 59. 312p. (PB 161 926) $5.00 ... 557
RADC reliability notebook. Oct 59. 281p. (PB 161 894) $4.00 ... 579
Research and reports on an optical amplifier. May 60. 82p. (PB 161 944) $2.25 ... 583
Research on new high temperature semiconducting materials. June 60. 167p. (PB 161 938) $3.00 ... 566
Studies on the fuel-ignition-suppression capability of foam-covered runways for aircraft. July 60. 68p. (PB 161 783) $1.75 ... 558
Study of vaporizable extinguishants. Jan 60. 124p. (PB 161 942) $2.75 ... 559
The actuator, explosive WOX-23A, an actuator to replace actuator Mk 3 Mod O in the explosive switch Mk 46 Mod O. May 60. 33p. (PB 161 933) $1.00 ... 587

MACHINERY, FABRICATION, AND ACCESSORY EQUIPMENT

Department of Defense titanium sheet-rolling program. June 60. 80p. (PB 151 087) $2.00 ... 595
Fundamentals of solid rocket propulsion. Jan 60. 49p. (PB 161 907) $1.25 ... 592
Investigation of the unnotched and notched fatigue behavior of several heat resistant materials for engine bolts. Feb 60. 59p. (PB 161 930) $1.50 ... 596
New developments in the welding of metals. June 60. 50p. (PB 151 089) $1.25 ... 595

MATERIALS

Air flow characteristics of parachute fabrics at simulated high altitudes. Mar 60. 165p. (PB 161 902) $3.00 ... 601
Investigation of the effects of sea water immersion on the properties of glass reinforced polyester laminates. Dec 59. 42p. (PB 161 912) $1.25 ... 602
Marine borer control. Part X. Evaluation of creosote-resin solutions and creosote distillation fractions. July 60. 11p. (PB 161 695) 50 cents ... 603
Measuring field handling and transportation conditions. Feb 60. 39p. (PB 161 918) $1.00 ... 597
Solution and evolution of gases and vapors in aircraft fuels. Apr 59. 165p. (PB 161 900) $3.00 ... 599
Storage of brake wheel cylinders with mineral oil. Apr 60. 14p. (PB 161 662) 50 cents ... 599

PARTIAL FUEL GAGE BIBLIOGRAPHY. Rept. on Contract AF 33(038)22632. [1952] 99p. 233 refs. ATI-163 321.
Order from LC mi$5.40, ph$15.30 PB 150 301

This report released for sale to the public 19 Sep 60.

Selected patent classes and selected files of journals were searched, with a view to determining the amount of material present, and the resources required to assemble it into a useful critical bibliography. About five percent of the applicable U.S. and foreign patent classes were searched, and perhaps ten percent of the American, English, and German literature was surveyed carefully. The U.S. patents searched covered fuel gages other than float types. The foreign patents included those classes (British Group XIX, German Klasse 42(c), Gruppen 26-30, and French Group XII(3) directly concerned with aircraft fuel quantity gages. The Anglo-American and German literature was skimmed for both fuel gages themselves, and for flowmeter theory and practice.

STUDIES OF RATE OF ACCRETION OF INTERPLANETARY MATTER BY THE EARTH, by Fred L. Whipple and Paul W. Hodge. Final rept. on Contract AF 19(604)1901. 4 Apr 60, 31p. AFCRC-TR-60-253.
Order from LC mi$3.00, ph$6.30 PB 147 552

The problems of how much material the earth accretes and in what precise way the accretion occurs have not yet been solved. To solve them, we must learn as much as possible about both the falls of large meteorites and the accretion of meteoritic particles and dust. Our first investigation involved an exhaustive survey of the soil around the Arizona Meteorite Crater In the soil, we found numerous tiny meteoritic particles (approximately 100 microns in diameter). The total mass of the original meteoritic material which these particles represented was estimated to be 12, 300 short tons. Our second attack on the problem involved the collection of armospheric dust by various types of high-flying vehicles, and the search for the meteoritic component of this material. Preliminary results indicate that the amount of terrestrial dust at heights of 50, 000 feet and more is somewhat greater than many investigators have supposed and that the probable influx of meteoritic particles into the earth's atmosphere is smaller than the values generally quoted.

Kiruna Geophysical Observatory (Sweden).
A SWEPT FREQUENCY INTERFEROMETER FOR 35 - 65 Mc/s, by Bengt Hultqvist. Technical summary rept. Task 4, 15 Oct 57-15 Oct 59, on Contract AF 61(514)1314, 20 Oct 59, 42p. 8 refs. AFCRC-TN-60-146.
Order from LC mi$3.30, ph$7.80 PB 148 808

The swept-frequency interferometer is described and its most important properties are discussed. The records obtained in single frequency and swept frequency operation are analyzed with regard to the influence of the length of the base line and the declination of the radio source. For the swept-frequency record formulas are given for the slope of the interference ridges, the number of interference maxima, frequency difference between consecutive interference maxima, the rate of increase of the number of maxima and the frequency of the first harmonic of the low frequency signal. The development work performed on the interferometer is described. (Author)

GAMMA-RAY BURST FROM A SOLAR FLARE, by L. E. Peterson and J. R. Winckler. Technical rept. no. 2.12 Cosmic Ray Intensity at High Altitude, Contract [Nonr-710(19)]. Dec 58, 27p. 17 refs.
Order from LC mi$2.70, ph$4.80 PB 148 796

An observation was previously reported of a burst of high energy radiation during a cosmic ray balloon flight in time coincidence with a class II solar flare. The burst has been interpreted as Bremsstrahlung γ-rays of about 0.5 Mev, from electrons accelerated to 1.0 Mev during the growth of the flare stopping in the solar photosphere. These same electrons, spiralling in the intense magnetic fields of the flare region, can account for solar radio bursts at 3 cm and 21 cm by betatron radiation. The observations and their consequences are examined in greater detail.

Naval Ordnance Test Station, China Lake, Calif.
INFRARED RADIANT INTENSITIES OF THE SUN AND OF THE MOON IN THE 2- TO 6-MICRON REGION (MEASURED BY AN AIRBORNE RADIOMETER) by Gordon C. Augason. 3 May 60, 17p. 5 refs. NOTS TP-2443; NAVWEPS rept. 7050.
Order from LC mi$2.40, ph$3.30 PB 149 081

In the design and use of infrared-sensing devices, it is often necessary to consider the effects of direct and reflected sunlight on the studies to be made with that equipment. This report presents in graphic form measurements of radiation from the sun and from the moon. The measurements were recorded by an airborne radiometer sensitive in the 2- to 6-micron region of the spectrum. A method is given for using these data to determine the effects of the radiation, and a suggestion is made as to the possible use of such information. (Author)

MEASUREMENTS OF THE POSITIONS, FLUXES AND SIZES OF CELESTIAL RADIO SOURCES AT 10.2 CM, by R. M. Sloanaker and J. H. Nichols. Interim rept. 13 July 60, 24p. 29 refs. NRL rept. 5485.
Order from LC mi$2.70, ph$4.80 PB 146 037

The positions of eight bright discrete celestial radio sources at 10.2 cm have been measured with the U. S. Naval Research Laboratory 84-ft antenna to estimated accuracies of ±1 min of arc probable error. For six of the sources, for which accurate optical positions are available, the measured radio positions coincide with the positions of the optical centers of the sources to within the uncertainties in the radio measurements. The equivalent gaussian diameters and flux densities were also determined. (Author)

Oklahoma State U. Research Foundation, Stillwater.
ACOUSTIC DETECTION OF METEORIC PARTICLES, by Richard F. Buck. Final rept. v. 1 on Contract AF 19(604)1908. 14 Apr 60, 162p. AFCRC-TR-60-272.
Order from LC mi$7.80, ph$25.80 PB 149 098

The technique used for detection has been based upon acoustic activation of suitable devices by the impact of such meteoric material upon metallic surfaces carried by high altitude rockets. Related laboratory investigations have been concerned with two general aspects of the basic investigation: the establishment of a working technique and verification of the validity of information obtained through this technique, and in a more indirect approach, a secondary series of investigations performed in order to establish the suitability of the specific electronic devices developed for use in the technique. Specific details regarding rocket experimentation are given for a number of rocket flights and an up-to-date tabulation of the data is included. A discussion of the problems of interpretation of the information acquired from each specific rocket experiment system accompanies the data.

Oklahoma State U. Research Foundation, Stillwater.
AN ANALYSIS OF ROCKET AND EARTH SATELLITE MEASUREMENTS OF MICROMETRIC INFLUX, by Curtis W. McCracken. Master's thesis. Final rept., vol. II, on Acoustic Detection of Meteoric Particles, Contract AF 19(604)1908. 14 Apr 60, 129p. 52 refs. AFCRC-TN-60-272.
Order from LC mi$6.30, ph$19.80 PB 149 099

The primary purpose of this paper is an attempt to attach a meaningful significance to recent measurements of micrometeoric influx, as determined by high-altitude rockets and Earth satellites. Other known data on meteoric influx are introduced to support the micrometeor data and to provide a framework onto which the micrometeor data can be added in the analysis. Some of the data on meteoric influx, as well as the recent data on micrometeoric influx, suggest a major change in the mass distribution function from the function in prevalent use at the present time. OPERATING CHARACTERISTICS, SIGNAL DETECTABILITY AND THE METHOD OF FREE RESPONSE, by James P. Egan, Gordon Z. Greenberg, and Arthur I. Schulman. Technical rept. on Research Concerning the General Problem of Information Reception by Means of Speech Communication, Contract AF 19(604)1962. 15 Dec 59, 87p. 7 refs. AFCRC-TR-59-58.
Order from LC mi$4.80, ph$13.80 PB 148 882

This paper is concerned with an experimental analysis of the following problem in signal detection: a weak signal of brief duration is presented a number of times in a long observational interval. The temporal intervals between the presentations of the tones are randomly selected, and the listener is not given any information as regards the distribution of these random intervals.

Personnel and Training

Adjutant General's Office, Washington, D. C.
APTITUDE DISTRIBUTION IN THE COMBAT ARMS, by Robert F. Boldt and Dennis Seidman. Rept. on Combat Allocation a-31. Apr 60, 23p. 2 refs. Technical Research rept. 1119.
Order from LC mi$2.70, ph$4.80 PB 149 458

As a result of expressed concern that the quality of manpower being supplied to combat divisions was substantially below that being supplied to the rest of the Army, a study was undertaken to find how aptitude levels in combat divisions compared with aptitude levels in the Army as a whole. Data obtained for the combat sample (approximately 10,000 enlisted men from 6 Pentomic divisions) were compared with total Army statistics with respect to (1) aptitude area score distributions and (2) relative frequencies of aptitude area scores officially recorded as unsatisfactory. Study was further made, within combat divisions, of aptitude levels of men in different MOS, using the primary assignment MOS. Combat division personnel were found to average 2 points below total Army in scores on the various aptitude areas, including combat. They had 2 to 6 percent more men with scores below 90 in six of seven aptitude areas, again including the combat area. The combat aptitude of men in combat MOS averaged 6 points below combat aptitude of men in other than combat jobs. It was concluded that substantial benefit would be expected to the Army as a whole--not solely the combat arms--from implementation of an optimal allocation procedure using differential aptitude measures. (Author)

Adjutant General's Office, Washington, D. C.
DIFFERENTIAL VALIDITY OF THE ACB FOR COURSES IN SEVEN JOB AREAS, by William H. Helme. Rept. on New Classification Techniques c-00. Apr 60, 18p. 11 refs. Technical research rept. 1118.
Order from LC mi$2.40, ph$3.30 PB 149 457

Analysis was made of findings from studies in which the Army Classification Battery was validated against performance in 73 courses representing seven job areas. Four tests--Army Clerical Speed, Automotive Information, Electronics Information, and Army Radio Code Aptitude--were highly effective differential selectors for the related job areas. Three tests had high across-the-board validity, but each test has served a particular classification need as well--Verbal Test for Clerical MOS, Arithmetic Reasoning for Infantry MOS, and Pattern Analysis for Precision Maintenance MOS, Validity patterns of tests in the mechanical-electrical domain indicated need for addition of content to develop optimal differential predictors. (Author)

American Inst. for Research [Pittsburgh, Pa.]
ACCURACY OF INFORMATION ON LINE WORK ORDERS FOR ARMAMENT-ELECTRONICS MAINTENANCE, by Richard L. Krumm and Paul H. Newman. Rept. on Contract AF 41(657)119, Phase 2. Dec 58, 40p. WADC TR-58-490; AD-207 335.
Order from OTS $1.00 PB 151 705

Ten weeks were spent at two Armament-Electronics squadrons observing representative troubleshooting tasks. Observations were made of time spent by mechanics in performing 76 typical steps of a troubleshooting job. The observer then obtained from Line Work Orders the mechanics' statements of time required. Comparison of actual time worked with reported time indicated that (a) although the relationship between observed and reported time was curvilinear, there is reason to expect that the relationship would be linear if certain changes are made in squadron procedures; (b) errors in reporting time worked are largest for shorter jobs and for jobs requiring a time greater than four hours per man; (c) depending on the number of men available for assignment, squadrons may differ significantly in the number of man-hours spent on each job even though the jobs are of comparable difficulty; and (d) there is a marked consistency in the amount of time spent in accomplishing subtasks

of a troubleshooting job which are necessary, but which are not "troubleshooting" per se. (Author)

Behavioral Sciences Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
CONFERENCE ON INTEGRATED AIRCREW TRAINING (MARCH 1960), by Paul D. Hood, Richard L. Krumm and others. Rept. on Human Factors in the Design of Devices for Operator Training and Evaluation. July 60, 63p. 8 refs. WADD Technical rept. 60-320.
Order from OTS $1.75 PB 161 923

A conference was held to review information and stimulate discussion on the use of interconnected crew station simulators for aircrew training. The four presentations reveiwed recent research on this topic and specific problems associated with the further research and use of integrated aircrew training. The early history and theory of integrated crew training, as well as recent research into this area were presented. Equipment problems associated with B-52 integrated training were presented from the operational viewpoint; and the role of integrated aircrew training in a flight training program was discussed. THE APPLICATION OF POINT SOURCE PROJECTION TECHNIQUES TO AIR-TO-SURFACE TRAINING, by Edwin K. Smith, Frank J. Anastasio and others. Rept. on Contract Nonr-1628(00). June 59, 62p. 9 refs. Technical rept. NAVTRADEVCEN 1628-7; AD-235 074.
Order from LC mi$3.90, ph$10.80 PB 150 309

This report released for sale to the public 19 Sep 60.

The results are presented of an investigation to determine if a satisfactory visual presentation can be obtained with point light source techniques for application to an air-to-surface attack trainer. It includes an analysis of the training task to determine the skills to be developed and the cues required for its performance. The study has developed point source projection systems which will provide some training in air-to-surface attack. However, before proceeding with design and construction of a training device, certain limitations to the scope of the possible training exercises derived from limitations of the point source system should be reviewed and evaluated by persons fully conversant with the requirements of the training task. In addition, the concepts and configurations involved should be evaluated by the experiments described. (Author)

THE APPLICATION OF POINT SOURCE PROJECTION TECHNIQUES TO GROUND OPERATION TRAINING, by Edwin K. Smith, Frank J. Anastasio and others. Rept. on Contract Nonr-1628(00). June 59, 35p. 3 refs. Technical rept. NAVTRADEVCEN 1628-10; AD-233 915.
Order from LC mi$3.00, ph$6.30 PB 150 312

This report released for sale to the public 19 Sep 60.

This report describes the results of a study to determine if a satisfactory visual presentation can be obtained with point light source techniques for application to a multi-vehicle ground reconnaissance operational trainer. The scope and important elements of the problem were determined from analysis of the training task as called out in the contract specification. The investigation revealed that a point light source projection system cannot be devised to meet the requirements of this task as specified. However, during the investigation it developed that the point source system might well be applicable to ground-level training tasks where the trainee follows predetermined general routes, such as roads and where terrain contour is not essential. In view of this development, it is recommended that point source visual displays be investigated further for application to training tasks with these characteristics; e. g., driver training devices. (Author) (See also PB 150 311)

THE APPLICATION OF POINT SOURCE PROJECTION TECHNIQUES TO SURFACE VESSEL OPERATION TRAINING, by Edwin K. Smith, Frank J. Anastasio and others. Rept. on Contract Nonr-1628(00). June 59, 54p. 4 refs. Technical rept. NAVTRADEVCEN 1628-9; AD-233 914.
Order from LC mi$3.60, ph$9.30 PB 150 311

This report released for sale to the public 19 Sep 60.

An investigation was undertaken to determine if a satisfactory visual presentation can be obtained with point light source techniques for application to a destroyer docking trainer. It includes an analysis of the training task to determine the skills to be developed and the cues required for its performance. The study has developed point source projection systems which will provide valuable training in shiphandling and destroyer docking. However, the scope of training will be limited to some extent by limitations inherent in point light source systems. These should be fully investigated and evaluated by experiments described. (Author) (See also PB 150 310)

deFlorez Co., Inc., Englewood Cliffs, N. J.
THE APPLICATION OF POINT SOURCE PROJECTION TO AIR-TO-SURFACE OBSERVATION TRAINING, by Edwin K. Smith, Frank J. Anastasio and others. Rept. on Contract Nonr-1628(00). June 59, 45p. 9 refs. Technical rept. NAVTRADEVCEN 1628-8; AD-233 913.
Order from LC mi$3.30, ph$7.80 PB 150 310

This report released for sale to the public 19 Sep 60.

An effort was made to determine if a satisfactory visual presentation can be obtained with point light source techniques for application to an air-to-surface observation trainer. It includes an analysis of the training task to determine the skills to be developed and the cues required for its performance. A very promising point source projection system has been devised for use in air-to-surface observation training. It is recommended that his system be evaluated through the experiments described. (Author) (See also PB 150 309)

Human Resources Research Office, George Washington U., Washington, D. C.
BASIC ELECTRONICS FOR MINIMALLY QUALIFIED MEN: AN EXPERIMENTAL EVALUATION OF A METHOD OF PRESENTATION, by S. James Goffard, Norman W. Heimstra and others. Rept. on Limit I, Contract DA 49-106-qm-1. Feb 60, 29p. 3 refs. HumRRO Technical rept. 61; AD-233 596.
Order from LC mi$2.70, ph$4.80 PB 149 460

Methods of training were designed to improve the achievement in technical course of men with minimal qualifications for technical training. The three-week Basic Electronics section of the Field Radio Repair course (MOS 296.1) was reorganized according to the principle of "functional context." No item of information or training was presented until it could be fitted into a context of material already learned; training was in whole-to-part rather than in the conventional part-to-whole order. One group of standard input classes (a total of 184 men) was trained by the functional context method and another group (a total of 202 men) was trained by the conventional method. A battery of 10 tests on basic electronics was administered after the three weeks of training. The functional context training proved to be superior, particularly for men at the lower levels of aptitude for electronics training. (Author)

Human Resources Research Office, George Washington U., Washington, D. C.
DETERMINING TRAINING REQUIREMENTS FOR ELECTRIC SYSTEM MAINTENANCE: DEVELOPMENT AND TEST OF A NEW METHOD OF SKILL AND KNOWLEDGE ANALYSIS, by Edgar L. Shriver. Rept. on Contract DA 49-106-qm-1. June 60, 108p. 5 refs. Technical rept. 63.
Order from LC mi$5.70, ph$16.80 PB 149 202

The object of this study was to develop methods of analysis that would (1) accurately define the skills and knowledges needed for the operation and repair of electronic systems, and (2) be applicable to such systems in preproduction stages so that they could be used in forecasting training needs. Methods of analyzing the operation and maintenance (through fourth echelon) from the system itself were developed for the M33 radar system, and a cue-response training content was derived. A nine-day performance test (including about the same number and type of field malfunction problems that an average MOS 232.1 repairman would encounter during his first 8 to 12 months on the job) was used to evaluate the proficiency of about 40 students trained by the experimental and the standard courses. Although the experimental training required less than half as much time as the standard course, there was no practical difference in the proficiency of the two groups. (Author)

Human Resources Research Office, George Washington U., Washington, D. C.
EXPERIMENTAL COMPARISON OF TWO BASIC ELECTRONICS COURSES FOR FIRE CONTROL TECHNICIANS, by Lloyd Hitchcock, Jr. Rept. on Maintrain I, Contract DA 49-106-qm-1. Feb 60, 25p. 5 refs. HumRRO Technical rept. 60; AD-233 597.
Order from LC mi$2.70, ph$4.80 PB 149 459

Data is provided on the effectiveness of an experimental subcourse in basic electronics developed in earlier research as part of a training program for air defense electronics technicians. One class of trainees was given the standard 12-week subcourse in basic electronics and another received the shorter experimental course; both groups completed the standard program of instruction for maintenance of M33 equipment. Results of performance and written tests revealed no significant differences of proficiency between graduates of the two courses. The shorter basic electronics subcourse is recommended for adoption as standard preliminary instruction in electronic fire control maintenance courses and for possible application to maintenance training programs for other electronic equipment. DEVELOPMENT OF A DEVICE FOR SELECTING RECRUITERS, by Leonard Wollack and David Kipnis. Mar 60, 23p. 6 refs. BuPers Technical Bulletin 60-1.
Order from LC mi$2.70, ph$4.80 PB 149 318

Scores on the Persuasive Scale of the Kuder Preference Record were found to be statistically associated with success as a Navy recruiter, although the absolute magnitude of correlation was relatively small. Operational utility of the test would depend upon the numbers of applicants available who meet current eligibility requirements. (Author)

DEVELOPMENT OF PROBABILITY TABLES FOR PREDICTING GRADUATION FROM RADIOMAN CLASS "A" SCHOOL, by Bert T. King and Estella H. Gregory. Nov 59, 21p. 2 refs. BuPers Technical Bulletin 59-34.
Order from LC mi$2.70, ph$4.80 PB 149 349

In each week of the 24-week course given at Class "A" Radioman (RM) School, Bainbridge, large and significant differences in speed of reception of Morse Code messages were found between trainees who were eventually graduated and those who were dropped at some intermediate point. Probability tables were constructed which present, for each week and each code score, the chances in 100 that a given trainee would fail to graduate. Analysis indicated that such a predictions were reliable. Cumulative percentage curves were also presented which show the proportion of cases in the groups of Graduates and Drops

who earned code scores at or below a given point. These curves indicated that in any week of the course code scores could be used to screen out trainees who would be dropped in some later week.

Naval Personnel Research Field Activity, Washington, D. C.
SCHOOL GRADES AS CRITERIA FOR VALIDATION OF ENLISTED SELECTION TESTS, by John J. La Gaipa and David Kipnis. Dec 59, 23p. 9 refs. Technical Bulletin 59-31; AD-235 301.
Order from LC mi$2.70, ph$4.80 PB 147 791

Research was conducted on the criteria and predictors at Class A Schools in order to improve selection and classification processes. Analyses were made of Navy Basic Test Battery scores and school grades at the Yeoman Class A School, Bainbridge, for the year 1957. Ability to type and fleet experience were factors associated with higher school grades. It is suggested that typing ability testing be continued in the selection of applicants for the Yeoman School. Separate validity analyses of Fleet and Recruit input data confirm the use of separate standards for the two groups. (Author)

A STUDY OF THE LEARNING OF SELECTED DRIVING SKILLS THROUGH EXPOSURE TO A SPECIALLY PRODUCED MOTION PICTURE FILM, by Leon Brody. Rept. on Contract N61339-78. Apr 60, 20p. 3 refs. Technical rept. NAVTRADEVCEN 78-2.
Order from LC mi$2.40, ph$3.30 PB 148 798

The purpose of this study was to determine to what degree a relatively complete and complex skill might be learned by the sole use of an instructional film. Four driving skills were selected for investigation. Subjects were 51 male high school students, divided into an experimental and a control group. Both groups showed a significant and substantial increase in knowledge, after instruction, as measured by the Written Achievement Test. The group subjected to live instruction demonstrated statistically significant superiority over the film-instructed group on the road-performance tests held immediately after the experimental sessions, and again, one month later. In a practical sense, these absolute differences were quite small. No significant differences between the groups were found on the Written Achievement Test. Learning achieved by instruction was retained by both groups without significant loss as measured by the road performance re-test.

THE USE OF CONTEXT CUES IN TEACHING MACHINES, by Robert E. Silverman. Rept. on Contract N61339-507. 17 Mar 60, 32p. 14 refs. Technical rept. NAVTRADEVCEN 507-1.
Order from LC mi$3.00, ph$6.30 PB 148 755

Three experiments were conducted to investigate context cues in teaching machines. Experiment I with 120 subjects tested whether ancillary, background cues of colors and designs facilitated learning of paired-associates. It was found that these background cues interfered with learning. Experiment II, performed on 60 students, determined if isolating some items by making them vivid facilitated learning, and if such influence is enhanced when a given vivid context is consistently associated with a given work. Data showed that isolated vivid words are learned faster and that the entire list is also learned faster. Experiment II was comparable to Experiment I, only very difficult words were learned. The results showed no facilitations of learning. (Author)

BEHAVIOR TRAIT RATINGS BY PEERS AND REFERENCES, by Robert J. Wherry, Norman E. Stander, and John J. Hopkins. Technical rept. on Contract AF 41(657)222. Dec 59, 55p. 7 refs. WADC-TR-59-360.
Order from LC mi$3.60, ph$9.30 PB 149 293

Experience has shown that reliable trait ratings by peers can be secured during officer training that have appreciable validity for later ratings of officer effectiveness. This investigation tests the hypothesis that equally reliable and valid ratings can be secured from individuals listed as references by applicants for officer training. Four rating forms were developed, each using the same descriptive adjectives selected by factorial analysis of peer nominations. From the results of tryouts with college students, a check-list form and a modified forced-choice form were selected for mailing to references listed by the criterion sample of male under-graduate college students. Results from a 71-per-cent return of reference ratings showed that: (a) reliability, assuming an equal number of raters, was consistently lower than for peer ratings; (b) correlation with the criterion of peer nominations was markedly lower than for peer ratings, but was reasonably high for one class of raters (educators); (c) the check-list rating form brought a higher proportion of returns and yielded a higher validity than the modified forced-choice form. A FACTOR-ANALYTIC STUDY OF THE USAF OFFICER ACTIVITY INVENTORY, by Lonnie D. Valentine, Jr. Mar 60, 25p. 13 refs. WADD-TN-60-40.
Order from LC mi$2.70, ph$4.80 PB 149 292

This analysis was designed to determine the actual number of distinct fields of interest that can be identified by an interest inventory scaled for 16 officer career fields. Two factor-analytic techniques were applied to the 16 job-interest scores from the USAF Officer Activity Inventory for a sample of new officers. The analyses each yielded five significant factors (Combat and Operations Interest, Administrative Interest, Technical Interest, Quantitative Interest, and Administrative (Personnel) Interest) with corresponding factors defined by almost identical clusters of interest scales. In each analysis, one of the factors, Administrative (Personnel), was a subset of scales included in the broader Administrative factor. Thus, four distinct interest areas were defined, whose definition established their equivalence to the four interest measures included in the Air Force Officer Qualifying Test, and confirmed the judgment that four interest scales were adequate in the officer test battery. The factor analyses, presented in detail in the appendixes, are of special interest in showing how an incomplete hierarchical

structure can be handled by the Schmid-Leiman hierarchical factor model. (Author)

THE ACCEPTABILITY AND EFFECTIVENESS OF THE CASUAL USE OF AUDITORY TRAINING AIDS, by Harold Edgerton. Rept. on Contract N61339-373. Mar 60, 76p. 21 refs. Technical rept. NAVTRADEVCEN 373-1.
Order from LC mi$4.50, ph$12.30 PB 148 797

This study investigated the acceptability and effectiveness of recorded lesson reviews as supplementary aids to instruction in naval schools. Trainees from two schools, AN(P) and AE(A), at the Naval Air Technical Training Center, Jacksonville, Florida, participated in the study. In the AN(P) program, the total running time required for a single presentation of all the lesson reviews was 628 minutes. Each trainee listened, on the average, a total of 226 minutes, or 36% of the time. In the AE(A) program, the total running time was 198 minutes, with each trainee listening, on the average, a total of 120 minutes, or 61% of the time. Little relationship was found between the amount trainees listened to the lesson reviews and their intellectual ability. The groups who had the lesson reviews available did no better in course examinations than comparable groups who did not have the reviews available. Further, the trainees who listened most to the lesson reviews did no better in course examinations than those who listened least.

SOCIOMETRIC STATUS AND ATTITUDE CHARACTERISTICS OF SUCCESSFUL AND UNSUCCESSFUL WAVE RECRUITS, by Marilyn K. Rigby, Elizabeth D. Ossorio, and Walter L. Wilkins. Technical rept. no. 11 on Contract [Nonr-1304(04)] Sep 59, 42p. 6 refs.
Order from LC mi$3.30, ph$7.80 PB 148 886

Two instruments intended to discriminate successful from unsuccessful Wave recruits and to describe the Wave recruit group were administered to nine successive companies. A sociometric questionnaire discriminated successful from unsuccessful recruits in two independent samples. It is now in use at the Naval Training Center. An opinion survey was administered to four companies for the purposes of developing a key; when the papers from five additional companies of recruits were scored with the key, no significant discrimination between criterion groups was found. Neither were relationships found between scores derived from the opinion survey and sociometric standing. The opinion survey was subjected to both a linkage and a cluster analysis; descriptions of various recruit attributes were derived from the analyses of the resulting nine types and 13 clusters. Two clusters and two types from the linkage analysis also discriminated the criterion groups of the second sample. Among the discriminators were a cluster and a type both of which described women who are likely to complain at almost every opportunity. It was suggested that these women could be readily identified during an interview with a recruiter. (Author)

FOUNDATIONS OF STATISTICAL LEARNING THEORY. II. THE STIMULUS SAMPLING MODEL, by W. K. Estes and Patrick Suppes. Technical rept. no. 26 on Contract Nonr-225(17). 22 Oct 59, 143p. 8 refs. AD-229 275.
Order from LC mi$7.20, ph$22.80 PB 149 509

Principal axioms and general theorems of stimulus sampling theory are given. A few results for particular experimental cases are given for illustrative purposes, but the systematic working out of special cases, especially those involving various types of reinforcement and discrimination schedules, is deferred for later presentation. (Author) (See also PB 137 998)

Army Medical Research Lab., Fort Knox, Ky.
AN OBSERVER CONSTANT IN THE PERCEPTION OF STEREOSCOPIC DEPTH, by W. C. Gogel. 3 Feb 58, 27p. 4 refs. Rept. no. 316; AD-160 344.
Order from LC mi$2.70, ph$4.80 PB 146 315

Two experiments were conducted to determine whether the amount of binocular disparity necessary to perceptually duplicate a frontal extent in depth is proportional to the angular size of the frontal extent, is independent of convergence distance and is particular for a subject. The following results were obtained: The magnitude of the adjusted binocular disparity required for the depth duplication (1) increased with the increase in the magnitude of the horizontal extent being duplicated, (2) showed no statistically significant change with a 2^{o} change in convergence, (3) was relia-

bly different between subjects. The results suggest that an observer constant occurs which specifies the amount of binocular disparity perceptually equivalent to an angular unit of frontal extent. (Author)

THE OBSERVING RESPONSE IN DISCRIMINATION LEARNING, by Richard C. Atkinson. Technical rept. 4 on Contract Nonr-233(58). 1 Sep 59, 25p. 9 refs. AD-225 664.
Order from LC mi$2.70, ph$4.80 PB 148 888

Observing responses in discrimination learning are analyzed. The experimental situation consists of a sequence of discrete trials as follows: [1] ready signal to which S (subject) makes either an O_1 or O_2 (observing) response; [2] following the observing response, one of three cues, s_1, s_2, or s_c (stimulus events) is presented; [3] to the onset of s_i, S makes an A_1 or A_2 (discrimination) response; and [4] either E_1 or E_2 (reinforcing events) occurs and terminates the trail. E_1 indicates that A_1 was the correct response on that trial. The model provided a fairly adequate account for such measures as (1) the asymptotic probability of an O_1 response; (2) the asymptotic probability of an A_1 response on an S_i trial and (3) the asymptotic probability of the joint event of an O_k response and an A_1 response. An analysis of certain sequential effects indicates marked differences between theory and observation. The observed proportions of observing responses conditionalized on correct and incorrect A_1 responses were markedly different from theoretical predictions.

Educational Testing Service, Princeton, N. J.
DIMENSIONS OF SOCIAL DESIRABILITY, by Samuel Messick. Rept. on Contract Nonr-2214(00). Apr 59, 28p. 22 refs.
Order from LC mi$2.70, ph$4.80 PB 147 806

Attempted controls in personality inventories for the tendency to respond in a socially desirable way usually assume that the domain of desirability is unidimensional. The present study attempted to evaluate this assumption and to explore the nature of any multidimensional structure uncovered. Ratings of the desirability of personality items from the Edwards Personal Preference Schedule were intercorrelated and factor analyzed. Nine factors were extracted and rotated to oblique simple structure. The factors were labeled and interpreted in terms of different "points of view" as to what is desirable. The finding of several dimensions of desirability suggests that the equating of items in terms of a single average desirability scale would leave much of the consistent variance of the ratings uncontrolled. Such a control method would provide inconsistent effectiveness for individual assessment, depending upon the subject's conformity to the group consensus of desirability. (Author)

Fels Group Dynamic Center, U. of Delaware, Newark.
THE MINORITY NEWCOMER IN OPEN AND CLOSED GROUPS, by Robert C. Ziller, Richard D. Behringer and Jacqueline D. Goodchilds. Technical rept. no. 1 on Perception Variables and Communication Efficiency, Contract Nonr-2285(02). 19 Oct 59, 18p. 8 refs. AD-228 089.
Order from LC mi$2.40, ph$3.30 PB 149 473

This laboratory experiment was concerned with the assimilation of the newcomer under conditions where the host group expected membership changes (an open group) or did not expect membership changes (a closed group) and the perceived relative status of the donor group or culture (represented by a Negro or White newcomer). While the results with reference to the initial hypotheses were not statistically significant there was some evidence that under the closed-Negro conditions the newcomer was the least well assimilated. However, it was noted that the Negro newcomer and confederate tended to be rated significantly higher than the White counterparts. Moreover, the "halo effect" between ratings tended to be more pronounced with reference to the Negro newcomer. Finally, the relationship between attitude toward the confederate and actual change of opinion on a given task was more pronounced under the Negro conditions. It was concluded that interpersonal orientation is a more critical consideration in interracial groups or in groups where there are distinct differentiating characteristics among the various subgroups. The higher ratings of the Negro confederates were attributed to "overcorrection for possible prejudice." (Author)

ATTITUDES, OPPOSITES STRUCTURING AND F SCORES, by Helen Peak. Technical rept. no. 5 on Contract Nonr-1224(10). 1 May 59, 18p. 9 refs.
Order from LC mi$2.40, ph$3.30 PB 146 604

Evidence is presented in support of the hypothesis that people tend to be consistent in structuring different situations as opposites. There was little evidence that a tendency toward opposites structuring was related to direction of attitude toward the ingroup and the outgroup as has been suggested by some writers (Adorno, et al. 1950). There was a tendency for opposites measures to correlate with the extremeness of attitude rather than its direction as had been expected. F scores were not related to general opposites structuring. However, there was a significant positive relation between F and the attitude difference score (ingroup minus outgroup attitude scores.) The prediction that a combination of high F and high opposites would yield the most favorable ingroup attitudes and the least favorable outgroup attitudes was not borne out. The theory of displacement of hostility from the ingroup to the outgroup implies that there should be a negative correlation between ingroup and outgroup attitudes in those situations where displacement might be expected to occur; namely among Ss with high F scores. The only sign of a negative correlation (and this was not significant) occurred in the high F-low opposite groups. There was no support for the displacement hypothesis but it is suggested that it needs testing in a sample with a wider range of attitudes.

Michigan U. [Ann Arbor].
CORRELATES OF OPPOSITES STRUCTURES, by Helen Peak. Technical rept. no. 7 on Contract Nonr-1224(10). 1 June 59, 52p. 18 refs.
Order from LC mi$3.60, ph$9.30 PB 147 260

The Report describes a pretest and a major study, Opposites IIIb, which has attempted to predict attitudes toward the ingroup and outgroup from a combination of information about opposites structure and defense preferences.

Michigan U., Ann Arbor.
THE EFFECTS OF AROUSED MOTIVATION ON ATTITUDES, by Helen Peak. Technical rept. no. 8 on Contract Nonr-1224(10). 1 Sep 59, 18. 5 refs. AD-230 477.
Order from LC mi$2.40, ph$3.30 PB 148 864

Two hypotheses were investigated: (1) attitudes toward situations or objects will be a function of subjects' perception of the good or bad consequences of the situation; and (2) attitudes are a function of the degree of arousal (intensity) of those consequences. Hypothesis I was supported clearly. The analysis of hypothesis II based on achievement scores and change in achievement scores showed no significant relations of any kind. Another test of the hypothesis was possible through observing the significance of change in attitude from neutral to arousal conditions in those who regarded a given policy as instrumental when compared to those who did not see any relevance of a policy to making good grades. When tested by this method Hypothesis II was supported.

Ohio State U. Research Foundation, Columbus.
A STUDY OF SELECTED FACTORS AFFECTING THE MEASUREMENT OF TOTAL TEAM PRODUCT IN GUNFIRE SUPPORT TRAINING, by John E. Horrocks, Emil Heermann, and Michael Kalk. Rept. on Contract Nonr-1939(00). 25 Nov 59, 19p. 2 refs. Technical rept. NAVTRADEVCEN 1939-0-4.
Order from LC mi$2.40, ph$3.30 PB 146 994

A summed error score in which cancelling-out effects of errors were eliminated did not provide a more consistent predictable measure of team performance than did the resultant error score in which cancelling-out errors were present. A technique for the measurement of team performance is recommended.

Research Center for Mental Health, New York U., N. Y.
RESEARCH ON THE EFFECTS OF ISOLATION ON COGNITIVE FUNCTIONING, by Robert R. Holt and Leo Goldberger. Rept. for 15 Oct 58-14 Oct 59 on Biophysics of Flight, Contract AF 33(616)6103. Mar 60, 26p. 5 refs. WADD Technical rept. 60-260.
Order from OTS $0.75 PB 161 922

The study was undertaken to compare the effects of 100 gamma of LSD-25 with those of 8 hours of perceptual isolation, carried out in the McGill style. Fifteen civilian subjects (actors) showed impairment on only 1 of 9 cognitive tests after the 8-hour isolation. The same test (Robinson's Rhymes) was not quite significantly impaired by LSD, but the time score for Serial Sevens was significantly impaired. On a questionnaire designed to elicit reports of the main symptoms of the drug, there was almost no overlap between the post-isolation and post-LSD scores, the latter being very much higher. The qualitative patterns of symptoms were quite different also. LSD produces a state subjectively more striking and qualitatively different from the effects of 8 hours of isolation. A battery of cognitive tests did not prove differentially sensitive to the reported deleterious effects of both conditions on mental functions. (Author)

Rochester U., N. Y.
THE EXPERIMENTAL ANALYSIS OF MOOD [and] A FACTOR ANALYTIC STUDY OF THE DOMAIN OF MOOD WITH INDEPENDENT VALIDATION OF THE FACTORS, by Vincent Nowlis and Russel F. Green. Technical repts. no. 3 and 4 on Research Program on Mood and Attitude Change, Contract Nonr-668(12). 21 Sep 57, 26p. 19 refs. AD-231 243.
Order from LC mi$2.70, ph$4.80 PB 148 900

A discussion is presented of (1) the development of hypotheses about mood and about the main dimensions of the verbal report of mood; (2) the development of an instrument of eliciting verbal report of mood in quantifiable form; (3) repeated factor analyses of the verbal reports to develop the most useful hypothetical factors; (4) search for lawful changes in mood in response to controlled changes in important environmental factors; and (5) search for relations between induced changes in mood and other behavioral factors.

Rochester U., N. Y.
LEVEL OF HOSTILITY AND ATTITUDE CHANGE, by Sheldon Alexander (U. of Illinois). Doctoral thesis. Technical rept. no. 2 on Research Program on Mood and Attitude Change, Contract Nonr-668(12). 21 Sep 59, 12p. 13 refs. AD-231 244.
Order from LC mi$2.40, ph$3.30 PB 148 899

An experiment was conducted to examine the effect of personality hostility on attitude change and the interaction between externally-induced hostility and personality hostility. Four messages were given to 357 male high school students. These included: (1) a high hostility arousal message; (2) a moderate hostility arousal message; (3) a low hostility arousal message; and (4) a control message, on another topic, designed to produce no emotion arousal. Results were interpreted as providing no support for the hypothesis of an inverse and as providing some support for the hypothesis of a direct relation.

Rochester U., N. Y.
THE RELATIONSHIP OF MOOD AND MOOD SHIFT TO ATTITUDE, by Joel Axelrod (Dancer-Fitzgerald-Sample, Inc.). Technical rept. no. 5 on Research Program on Mood and Attitude Change, Contract Nonr-668(12). 21 Sep 59, 15p. 7 refs. AD-231 245.
Order from LC mi$2.40, ph$3.30 PB 148 901

An experiment was designed (1) to determine the validity of using moods as goals in predicting attitude structure; and (2) to determine if shifts in mood can be systematically related to shifts in attitude. The results generally tend to support the use of moods as goals, and to indicate a systematic relationship between mood shift and attitude shift. (Author) (See also PB 148 900)

Texas A. & M. Research Foundation, College Station.
ADAPTIVE BEHAVIOR AND ADAPTATION LEVEL THEORY, by Warren C. Bonney and Clay E. George (Arizona State U.). Technical rept. no. 3 on Contract Nonr-2119(01). Sep 59, 22p. 6 refs. AD-226 432.
Order from LC mi$2.70, ph$4.80 PB 148 858

An experiment was designed to determine the relationship involved in affective adaptation, and a second experiment was designed to measure the relationship between affective adaptation and improvement in reading during a course in remedial reading, both being measured by the pictorial preference series. In addition, an investigation of group adaptation trends was made which included analysis of data, based on responses to form-color stimuli presented in a variety of serial orders and collected from several widely differing groups. Results indicated that nonauthoritarian subjects of low peer status are much less readily bored than are the subjects in the other categories. The results further indicated that the most adaptable subjects were those characterized by at least 2 of the following attributes: (1) high in peer acceptance; (2) above the reference group median on the SCAT; and (3) below the reference group medium on the F-scale. Data from achromatic, appropriate, and inappropriate slides indicated that throughout the slide series, the high peer group with low F scores tended to have an increasing dislike for outline and appropriate slides, and an increasing like for inappropriate slides, while the low peer status group with low F scores tended to like the outline and appropriate slides and tended to increasingly dislike the inappropriate slides.

RADIATION AND THERMAL BURNS, by R. S. Goldsmith, B. W. Evans and others. Annual research progress rept. on Proj. 6X59-06-001. 30 June 60, 182p. 57 refs.
Order from LC mi$8.40, ph$28.80 PB 149 149

The projects reported are: serotonin metabolism in burned patients and experimental animals; a study of serum haptoglobin levels in man following thermal injury; environmental factors in burns; ventilation studies in the burned patient; riboflavin metabolism in burned rats; effect of varying the calorie: nitrogen ratio on predetermined levels of nitrogen required by the burned patient; wound management and nitrogen metabolism in burned rats; role of the eschar on post-burn weight of rats; studies of urinary tract infections in burned patients; limited use of antibiotics in the seriously burned patient; in vitro evaluation of new antibiotics concerned in treatment of burned patients; the hemagglutination inhibition test for serologic diagnosis of pseudomonas endotxemia in the burned patient measurement of pseudomonas antibody in normal and burned patients by a mouse protection test; serodiagnosis and bacteriophage typing of pseudomonads; serologic demonstration of existence of a "burn toxin" in the serum of newly burned individuals and the antibody of this toxin in convalescent burned patients; determination of properdin levels in the serum of burned individuals as a measurement of host response in eventuating bacteremia; bacteriophage typing of staphylococcus aureus; clinical operation, burn center; the effect of massive occlusive dressings on normal adult male; early excision and grafting of extensive areas of full-thickness burns; clinical-pathological study of fatal burn injuries.

Brooke Army Medical Center, Fort Sam Houston, Tex.
TRAUMATIC SURGERY AND SHOCK, by Paul E. Teschan, Thomas F. O'Brien and others. Annual research progress rept. for 1 July 59-30 June 60, on Proj. 6X59-01-001. 30 June 60, 183p. 56 refs.
Order from LC mi$8.40, ph$28.80 PB 149 148

The projects reported are: clinical operation, renal center; prophylactic hemodialysis in the treatment of acute renal failure; dialyzer testing; acute renal insufficiency in experimental animals; persistance of antibiotic activity in serum of anuric patients (less than 100 cc. of urine per 24 hours), after a single intramuscular does; humoral factors in kidney regeneration; behavioral factors in acute renal failure; surgical management of upper abdominal trauma (pancreatic injury); experimental investigation of intra-abdominal hemorrhage control - "canine survival following intraluminal occlusion of the aorta above the celiac artery"; energy metabolism in tissues.

Naval Ordnance Test Station, China Lake, Calif.
WATER FLOW ABOUT A SWIMMING FISH, by Moe William Rosen. Master's thesis. May 59, 100p. 9 refs. NOTS TP 2298.
Order from LC mi$5.40, ph$15.30 PB 148 351

A series of experiments were conducted with a very small fish in an attempt to determine the nature of the water flow about the swimming animal's variable form. The endeavors were failing until discovery was made of a very sensitive method which showed the entire field of water flow without inhibiting the action or the life processes of the fish. The experiments discovered a flow process and phenomena that are unfamiliar and surprising, involving discrete unit quanta of fluid energy. The observed flow is not in conformance with presently accepted ideas of laminar or of turbulent flow about a fish. Easily distinguishable particles flowed about the fish. A flow pattern was observed about a dolphin as it leaped into the air, emerging at high speed from below the water surface. This experiment showed a remarkable flow similarity with the small fish experiments. The observed behavior of the water on the small fish's body exhibits correlation with the actions of a fish when taken out of the water. A method was developed, making possible the construction of the relative streamlines about the fish's undulating body. A simple mathematical equation was derived relating the speed of a fish or dolphin to its body motions. The equation was reasonably verified by the measurements made in the experiments.

Naval Research Lab., Washington, D. C.
A FORCE-AREA STUDY OF CATALASE FILMS, by J. D. Bultman and J. M. Leonard. Final rept. 27 July 60, 7p. 18 refs. NRL rept. 5490.
Order from LC mi$1.80, ph$1.80 PB 146 162

An investigation of the surface chemical behavior of the enzyme, beef liver catalase, was undertaken. Monomolecular layers were deposited on ammonium sulfate solutions, the surface concentration varying from 7.8×10^{13} to 16.4×10^{13} molecules per film. Force-area (F-A) curves obtained by compression of these films show two inflections corresponding to different orientations of the catalase molecule. Extrapolation of the linear portions of the curves to zero film pressure gave cross-sectional areas per molecule of $(25.6 \pm 1.0) \times 10^3$ Å^2 and $(7.9 \pm 1.6) \times 10^3$ Å^2, respectively, as calculated at these two inflections.

A VEGETATION TRANSECT OF THE THULE PENINSULA, by Ronald A. Nelson. Apr 58, 16p. 16 refs. Research Study Rept. RER-18.
Order from LC mi$2.40, ph$3.30 PB 150 004

This report released for sale to the public 26 Aug 60

Vegetation of the Thule Peninsula was sampled along a 16-mile transect between Thule Air Base and Camp Tuto. The general vegetation is small and sparse. Grasses and sedges, found in marshy areas, are the largest plants; most of the trees and other plants are less than five inches high. The vegetation may be used in an emergency for fuel, food, and insulation by individuals or small groups; it is of no value for providing opportunities for cover or concealment. (Author)

NONOGRAPHS FOR MULTIPHASE ACCELERATION PROFILES, by Hubert C. Feder. June 60, 85p. 7 refs. AFMDC-TR-60-9.
Order from LC mi$4.80, ph$13.80 PB 149 176

Experimental investigations of the technological and physiological effects of unidirectional accelerations require the computation of the parameters of the acceleration pattern. This report develops explicit equations between distance, velocity, acceleration, and time, thus greatly reducing the computational work of test analysis and evaluation. Two nomographs were designed which permit reading distance with an error of less than 2 percent and velocity with error less than 0.2 percent. The three principal phases of the acceleration pattern are used to define a set of descriptive parameters. An impulse-dependent onset parameter, called relative onset rate, is discussed and, if used as a standard, would facilitate the comparison of tests made by different investigators. (Author)

THE BLOOD CHEMISTRY OF THE CASTRATED MALE GOAT, by Paul F. Robinson. Apr 60, 8p. 16 refs. CWLR-2386; AD-236 946.
Order from LC mi$1.80, ph$1.80 PB 148 909

Biochemical analysis of the blood of forty-four castrated male angora goats, of uniform size and condition, yielded values that did not seem to differ markedly from those obtained by other authors in goats of a different physiological status. The mean value obtained for plasma sodium was 148.8 mEq/L; for plasma potassium 4.9 mEq/l; for total plasma cholesterol 44.8 mg/100 ml; for whole blood glucose 81.4 mg/100 ml; for plasma chloride 106.8 mEq/L; and for plasma protein 7.2 gm/100 ml. THE RESISTANCE OF RABBIT EYE TO STEEL SPHERES AND CUBES, by George M. Stewart. Jan 60, 16p. 6 refs. CWLR 2332; AD-231 038.
Order from LC mi$2.40, ph$3.30 PB 147 236

The resistance of the rabbit eye to penetration by steel spheres and cubes in the weight range of 0.85 grain through 225.0 grains was studied. Rabbits varying in age from 5 to 7 mo were killed and their eyes were removed and mounted in gelatin for ballistic evaluation. Cubes striking at velocities near the ballistic limit were frequently rejected even after penetrating the cornea. Under the same conditions of test, spheres were often retained. Partially penetrating missiles, except very small ones, were almost always rejected. (Author)

X-IRRADIATION AND ACCELERATION STRESS, by John W. Taylor. Rept. no. 1 on Task MR005.15-0002.14. 1 Mar 60, 9p. 3 refs. NADC MA-6003; AD-234 596.
Order from LC mi$1.80, ph$1.80 PB 146 962

It was determined whether a correlation existed between the stress due to ex-irradiation and the stress due to acceleration. Sprague-Dawley rats were exposed to an acute dose of 600 r ± 20% x-irradiation

and then centrifuged at 20 G for 7 minutes. The data resulting from this procedure was then compared with data for two control groups, one centrifuged and one irradiated. There appeared to be no significant correlation between irradiation stress and acceleration stress at the experimental levels used in the study. (Author)

AN ENGINEERING ANALYSIS OF CARGO HANDLING. X. ENERGY EXPENDITURE OF LONGSHOREMEN, by Frank C. Hale and John J. O'Hara. Rept. on Contract Nonr-233(07). June 59, 58p. 59 refs. Dept. of Engineering rept. no. 59-20; AD-230 108.
Order from LC mi$3.60, ph$9.30 PB 147 573

A study was carried out of longshoring in the maritime cargo transport industry in the Los Angeles - Long Beach harbors, combining the methods of physiological measurement of energy cost and industrial engineering methods of activity measurement. Energy cost was assessed by the indirect methods of oxygen consumption, heart rate and ventilatory responses. Activity measurements were made by systematic work sampling techniques. (See also PB 143 700)

FUNCTION OF THE HUMAN ADRENAL CORTEX, by C. L. Cope. Annual technical status rept. for 1 Feb 59-31 Jan 60 on Contract DA 91-591-EUC-1055. [1960] 15p. AD-234 400.
Order from LC mi$2.40, ph$3.30 PB 146 957

Effort was directed toward the development of analytical methods for aldosterone metabolism. The purity and stability of the tritiated aldosterone was determined. The behavior of aldosterone on a variety of chromatographic systems was measured. A major metabolite of aldosterone was recovered from urine samples; measurements were made of its running rate on a variety of chromatographic systems, its concentration in urine, and also its stability. The reagent ^{14}C-acetic anhydride was used to estimate the quantities of both aldosterone and of aldosterone metabolite. Doses of tritium-labeled aldosterone were administered intravenously to suitable subjects and the distribution of this tritium in various fractions of the excreted urine was measured. The aldosterone metabolite was extracted and its specific activity in various urine samples measured.

THE COMPARATIVE EFFECTIVENESS OF SOME PSYCHOLOGICAL AND PHYSIOLOGICAL MEASURES IN RANKING THE IMPACT OF DIVERSE ENVIRONMENTAL CONDITIONS, by Edward J. Fine. Jan 58, 11p. 13 refs. Research Study Rept. PB-15.
Order from LC mi$2.40, ph$3.30 PB 150 000

This report released for sale to the public 13 Sep 60.

Two studies are presented, both of which compare the effectiveness of a subjective rating scale with two physiological measures, mean weighted skin temperature and average increase in metabolic rate, in ranking eight environmental conditions (varying in ambient temperature, humidity and wind speed) from warmest to coldest. The results of both studies indicate a high degree of consistency between individual responses on each measure and a very high degree of agreement between the subjective rating method and both mean weighted skin temperature and metabolic rate methods of ranking the conditions. MEASUREMENT OF RELATIVE BODY SURFACE TEMPERATURE VARIATION AND A CONCEPT OF SKIN TEMPERATURE STRESS, by Warren H. Teichner. June 58, 10p. 3 refs. Research Study Rept. PB-22.
Order from LC mi$1.80, ph$1.80 PB 150 001

This report released for sale to the public 26 Aug 60.

The skin temperature of ten body points taken from nude men after 45 minutes of rest in an environment of 80°F., 50 percent R.H., still air was defined as a general standard against which it was proposed that all other similar measures be compared in studies of surface temperature variation, skin temperature stress, comfort, and performance. Two procedures for making such comparisons were proposed; one involved the use of a skin temperature profile based upon general standard and the other involved the use of the standard error of fit of experimental measure- to the general standard as a measure of amount of relative skin temperature variation or stress. Data were presented illustrating application of the concepts under a variety of experimental conditions. (Author)

OXYGEN CONSUMPTION AND BODY TEMPERATURE DURING SLEEP IN COLD ENVIRONMENTS, by M. B. Kreider and P. F. Iampietro. Mar 60, 9p. 10 refs. Technical rept. EP-127; AD-236 834.
Order from LC mi$1.80, ph$1.80 PB 147 796

Six young soldiers slept at the following ambient temperatures: 25.5 to 26°C (78 to 80°F), 15 to 18.5°C (60 to 65°F) and -32 to -34.5°C (-25 to -30°F). Rectal (T_r) and skin temperatures were recorded and mean weighted skin temperature (T_s) was calculated at half-hour intervals every night; oxygen consumption (VO_2) was measured at 6-min intervals on occasional nights. During sleep at a comfortable temperature (25.5°C) T_r, T_s and VO_2 decreased below the resting levels measured just before retiring. During sleep in cold environments, T_r and T_s dropped to still lower levels, with the lowest values recorded at an earlier hour of the night. VO_2 during sleep in the cold did not differ from values recorded during sleep at 25.5°C. Lowest values measured during sleep in the coldest environment were 35.5°C, 30.5°C, and 78 Cal/m^2 for T_r, T_s and body heat debt, respectively. These values may represent the limits of body cooling compatible with substantially continuous sleep in the cold. (Author)

Texas U., Austin.
RELATIONSHIP BETWEEN ALTERNATE BINAURAL BIFREQUENCY LOUDNESS-BALANCE TEST AND THRESHOLD TONE-DECAY TEST RESPONSES IN NORMAL AND SUBNORMAL EARS, by Lennart L. Kopra, Roger W. Fullington, and Lee E. Strickland. Apr 60, 13p. 12 refs. AFSAM 60-19.
Order from LC mi$2.40, ph$3.30 PB 149 351

The alternate binaural bifrequency loudness-balance test (500 cps versus 4000 cps) and the threshold tone-decay test were administered to 20 male subjects with bilateral normal hearing and to 14 subjects with significant bilateral high-frequency sensori-neutral loss. Results showed that (a) when a span difference of 30 db was used as the criterion for abnormal loudness increase, 13 of the subnormal subjects demonstrated abnormal loudness at 4000 cps in both right and left ears, and one of the normal subjects showed abnormal loudness increase in one ear; (b) in the threshold tone-decay test the differences between median sensation levels required for 60-second awareness by normal and subnormal subjects were not significantly different at any test frequency from 250 cps through 6000 cps; and (c) no systematic interrelationships were observed between alternate binaural loudness balance test results and threshold tone-decay test results. (Author)

University Hospitals, Iowa City.
SHEARING MOTION IN SCALA MEDIA OF COCHLEAR MODELS, by Juergen Tonndorf. Apr 60, 11p. 14 refs. AFSAM rept. 60-41.
Order from LC mi$2.40, ph$3.30 PB 149 243

The occurrence of shearing motion within the cochlear duct, together with the fact that it is this mode of motion which constitutes the adequate stimulus for hair cells, was first reported by Bekesy in 1953. Two modes of shearing motion were reported: (1) radial, directed in the region proximal to the place of maximal amplitude of the traveling-wave pattern; and (2) longitudinal. directed distal to that point. This phenomenon was studied in cochlear models. The envelopes over both modes of shearing motion were found to be much smaller than that over the traveling-wave pattern. A simple explanation presented itself: The direction of the shearing motion in each domain coincides with the dominant curvature produced by the traveling waves in that section of the cochlear duct.

Yale U., New Haven, Conn.
DEVELOPMENT OF CRITERIA OF PHYSICAL PROFICIENCY, by Edwin A. Fleishman. Annual rept. for 15 Nov 58-15 Oct 59 on Contract SAR/Nonr-609(32). 15 Oct 59, 6p. AD-228 843.
Order from LC mi$1.80, ph$1.80 PB 149 479

This study is designed to develop improved measures for the assessment of physical proficiency. These measures may be useful in providing a more comprehensive evaluation of students in physical education programs. Other implications would be possible use in classification and selection programs, especially for jobs that require physical strength, coordination, and endurance.

General Biology

Air Crew Equipment Lab., Naval Air Material Center, Philadelphia, Pa.
WAVE ANALYSIS OF TISSUE NOISE AND MUSCLE ACTION POTENTIAL, by Keith J. Hayes. 22 June 59, 16p. 5 refs. NM 17 01 13 1; NAMC-ACEL-404; AD-218 206.
Order from LC mi$2.40, ph$3.30 PB 146 703

The sensitivity attainable in bio-electric measurement may commonly be limited by tissue noise, rather than by amplifier noise. The spectrum level of tissue noise increases with decreasing frequency down to at least 2.5 c/s where it may exceed amplifier noise by 5 to 25 db. It is ordinarily weaker than amplifier noise at frequencies above 1000 c/s. The spectrum of muscle action potentials is characterized by a rather narrow maximum in the region of 30 to 100 c/s. Amplifiers for surface electromyography may advantageously be designed with a pass-band as narrow as one octave, for maximum signal-to-noise ratio. However, extending the upper frequency limit to 1000 c/s facilitates audio and oscilloscopic monitoring. (Author)

THE USE OF SHORT WAVE ULTRA-VIOLET RAYS FOR THE SEGREGATION OF COMMINGLED SKELETAL REMAINS, by Thomas W. McKern. Aug 58, 13p. 5 refs. Technical rept. EP-98.
Order from LC mi$2.40, ph$3.30 PB 150 003

This report released for sale to the public 26 Aug 60.

When bone surfaces are exposed to short wave ultraviolet irradiation, most of them reflect a variety of

colors. The wide range of color emission, as well as the fixed relationship of these colors to the substances that emit them, is justification for attempting to apply these qualities to the segregation of commingled skeletal remains. After demonstrations of the results of ultra-violet exposure on a large sample of skeletal material, it is suggested that short wave ultra-violet lamps can be used in certain instances for the accurate sorting of commingled remains. RESEARCH IN THE INVESTIGATION OF THE FEASIBILITY OF AN OPTICAL DENTAL DRILLING DEVICE. Final rept. on Contract Nonr-2681(00). [1959] 18p. RAD-SR-59-50; AD-227 144.
Order from LC mi$2.40, ph$3.30 PB 148 887

The feasibility of developing an electro-optic monitoring system for observation of the oral cavity was investigated. Such a system would incorporate a closed circuit television arrangement so that dental procedures could be simultaneously presented to others. Two concepts were taken under investigation for attainment of the goal. The first pertained to an examination of miniaturized vidicon tubes which might be incorporated directly on or into the handpiece or contra-angle. This approach was abandoned after demonstrating that miniaturized vidicon tube development had not progressed sufficiently, whereby direct application could be obtained. One approach introduced the concept of fiber bundles linked with a closed circuit television system. These bundles are made up of a multitude of individual flexible fibers which transmit light as a result of multiple total internal reflections from one end to the other. Attachment of the distal end of the bundle to the handpiece or contra-angle, or held separately, and the proximal end linked to a television camera, provided the methodology whereby selected portions of the oral cavity could be portrayed on a standard television monitor. Experimental studies utilizing this method are presented and the feasibility of developing an operational device demonstrated. Recommendations pertaining to a suitable development program providing for the synthesis of an operational device are incorporated. (Author)

COLLECTION OF GB VAPOR FROM EXPIRED AIR DURING SIMULATED RESPIRATION AND THE DETERMINATION OF LOSSES OF GB BY SORPTION ON SURFACES OF A ONE-WAY VALVE SYSTEM, by James W. Crook, William S. Koon and others. Mar 54, declassified 17 Oct 58, 16p. 8 refs. Medical Labs. Research rept. no. 252.
Order from LC mi$2.40, ph$3.30 PB 146 547

No direct evidence was found indicating an appreciable loss of GB from air passing through the one-way valve system. The rate of airflow was from 1-50 l./min., and the GB vapor concentration was from 0.12 to 1.3 mg./m^3. The use of cotton gauze treated with isopropyl alcohol is an excellent media for collecting GB vapor from expired air. The resistance offered against breathing is low and is not perceptible to man. EFFECTS OF 1-1'-TRIMETHYLENEBIS(4-FORMYLPYRIDINIUM BROMIDE) DIOXIME (EA 1814) ON ChE ACTIVITY AND NEUROMUSCULAR BLOCK IN RATS FOLLOWING POISONING WITH GB AND DFP, by Joseph H. Fleisher, Paul J. Killos and others. Apr 60, 24p. 23 refs. CWLR-2392.
Order from LC mi$2.70, ph$4.80 PB 148 910

Neuromuscular blockade following poisoning with DFP is rapidly antagonized by the bis-quaternary oxime, EA 1814, in vitro and in vivo. Concurrent study of the ChE activity of rat diaphragm following the addition of EA 1814 shows greater recovery of ChE activity of intact than of homogenized diaphragm muscle. No reactivation of brain ChE activity was found following EA 1814 treatment of GB poisoned rats, a result consistent with the apparent inability of quaternary compounds to penetrate the blood barrier, and the potentiating action of atropine on the chemotherapeutic effectiveness of EA 1814 demonstrated previously. (Author)

[Army] Chemical Warfare Labs., Army Chemical Center, Md.
INHIBITION OF RED BLOOD CELL CHOLINESTERASE AND RETENTION OF GB IN ANESTHETIZED DOGS EXPOSED TO GB VAPOR AT VARIOUS RATES OF PULMONARY VENTILATION, by Francis N. Marzulli, John F. Callahan, and Doris L. Steiner. Technical rept. 3 May 56, declassified 19 Aug 59, 25p. 10 refs. Chemical Warfare Labs. rept. no. 2020.
Order from LC mi$2.70, ph$4.80 PB 146 459

Anesthetized dogs, exposed in the laboratory to 4 to 10 μg. GB vapor/kg. by the oronasal route, retained 96 to 98% of the inhaled agent independent of ventilatory rate. Tracheal valves employed during the administration of the vapor served to eliminate mask dead space. In experiments involving a retained dose of 10 μg. GB/kg., RBC ChE (Red blood cell cholines terase) was significantly less inhibited where the ventilatory rate was increased 2-fold or greater. This effect was not found at a dose of only 4 μg. GB/kg. Both laboratory and field results demonstrated that the amount of intoxication is directly related to the minute volume at the time of the inhalation exposure. (Author)

[Army Chemical Warfare] Labs., Army Chemical Center, Md.
QUANTITATIVE PHYSIOLOGICAL STUDIES OF GB, by Francis N. Marzulli, Paul F. Robinson and others. Sep 51, declassified 28 Mar 58, 40p. 16 refs. Medical Labs. Research rept. no. 85.
Order from LC mi$3.00, ph$6.30 PB 146 548

In the first series of experiments, 17 anesthetized dogs were subjected to the inhalation of GB. Dosages from 0.2 to 37 micrograms (mmg.)/kg. were inhaled directly into the lower respiratory tract. The calculated retained GB varied from 27 to 97%, the average retention for all experiments being about 73%. In a second series of experiments, inhaled air was passed through one lumen, so that it contacted the animal at the bifurcation of the trachea. The animals retained 89 to 99% of the inhaled agent, the average retention for all members of the group being 95%. The Ct (Lethal index) values ranged from 48 to 121 mg. min./m^3. These dosages reduced the RBC-ChE (Red blood cell cholinesterase) to 15-84% of the initial value. In experiments involving 9 anesthetized dogs, gas-laden air, inhaled in the upper respiratory tract, was led through a by-pass from the trachea to a GB adsorber, back to the lower trachea and thence to the lungs. It was found that 95-100% of the inhaled GB, varying from 160 to 916 gamma, was retained by the upper respiratory tract. Dosages of GB up to about 3 mmg./kg. produced no fall in RBC-ChE when GB was injected or when it was inhaled.

Pfleiderer, Gerhard.
CHEMISTRY OF SNAKE VENOMS, by Gerhard Pfleiderer. Final technical status rept. for 1 Mar 59-29 Feb 60 on Contract DA 91-591-EUC-1089. [1960] 7p.
Order from LC mi$1.80, ph$1.80 PB 149 337

The investigations were concerned with the chemistry of the cobra and rattlesnake venoms in the following three specific research areas: (1) isolation and study of the cobra (Naja nivea) venom toxic peptides; (2) isolation of two phosphoric acid ester hydrolyzing enzymes from cobra venom and investigation of their biochemical and toxic properties; (3) separation of rattlesnake (Crotalus atrox) venom proteinases and determination of their specificities.

Radiobiology

Institute of Engineering Research, U. of California, Berkeley.
THE MEDICAL PROBLEM OF EXPOSURE TO EXTERNAL RADIATION IN A FALLOUT FIELD: THE CONCEPT OF PARTIAL EXPOSURE AND FRACTIONIZATION AND PROTRACTION OF DOSAGE COMPARED TO THE CONCEPT OF WHOLE BODY RADIATION AND ACUTE EXPOSURE, by Crawford F. Sams. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 30 June 59, 207p. 280 refs. Series no. 2, issue no. 24.
Order from LC mi$9.30, ph$31.80 PB 149 930

Analysis of the dosimetry factors indicate the need for a new method of computing dosage through integration of varying energy levels absorbed at more than one point within the body. Emphasis was given to the effect of energy absorption on the more highly specialized tissues in the body, such as the central nervous system and the endocrine glands. The application of external energy to these highly specialized tissue results in an initial accelerating effect through a change in dissociation constants. In the central nervous system this affects the rate at which the conversion of chemical into electrical energy occurs. In hormonal glands, which together with the central nervous system, control entire body metabolism, the rate of synthesis of hormones from substrates is correspondingly affected. In low dose exposures, it appears that the acceleration phase of the biologic response curve may not go into the depressive phase. A new list of the comparative radio-sensitivity of tissues responding functionally to radiation has been presented. The functional response of highly specialized tissues may account for the preventive effect of various substances injected prior to radiation and their subsequent non-effectiveness when injected during the depressive phase of the biologic response curve. Analysis of available data on partial exposures, and fractionation or protraction of dosage, indicate that in terms of lethality the order of magnitude of lethal dosages is increased by greater than a factor of 10.

Radiobiological Lab., U. of Texas, Austin.
THE EFFECT OF ACUTE DOSES OF NUCLEAR RADIATION ON THE PERIPHERAL BLOOD PICTURE OF THE MONKEY (MACACA MULATTA), by Thomas P. Leffingwell, George S. Melville, Jr. and Quentin L. Hartwig. Apr 60, 13p. 19 refs. AFSAM rept. 60-43.
Order from LC mi$2.40, ph$3.30 PB 149 244

Male Macaca mulatta monkeys were exposed to three different doses of combined neutron and gamma radiations which derived from an uncontrolled nuclear reaction. Changes which were observed in the peripheral blood picture may be attributed solely to the effects of the ionizing radiations to the 1 percent confidence limit.

Results, compared with those obtained by other investigators, show the hematologic effects of neutron-gamma exposure to be similar to those resulting from exposure to x-radiation. (Author)

Radiobiological Lab., U. of Texas, Austin.
EFFECTS OF RARE-EARTH NITRATE AND OXIDE ON IRRADIATED AND NONIRRADIATED RATS, by George S. Melville, Jr. and Robert W. Riess. June 60, 10p. 4 refs. AFSAM 60-26.
Order from LC mi$1.80, ph$1.80 PB 149 352

Two salts of a rare-earth mixture were given to rats both intraperitoneally and subcutaneously: In addition, certain of the groups so treated received 800 r of gamma rays regardless of route of administration of the chemical. With or without irradiation, rare-earth nitrate was more damaging to the animals than rare-earth oxide. Animals which received the more soluble nitrate deomonstrated diarrhea, anorexia, and "fluffing." These symptoms, which were not seen in the rare-earth oxide animals, subsided in approximately 7 days. When given subcutaneously, the nitrate caused abscesses which healded in 30 days and the oxide caused nodules which disappeared slowly. Mortality was higher in the irradiated groups of animals. (Author).

Fowles, G. W. A.
A STUDY OF THE CHEMICAL PROPERTIES OF THE COMPLEX NITROGEN, PHOSPHORUS, OXYGEN, AND SULPHUR COMPOUNDS OF THE TITANIUM, VANADIUM, AND CHROMIUM SUB-GROUP METALS, by G. W. A. Fowles and E. Cartmell. Annual Final technical rept. no. 2, 1 May 59-30 Apr 60, on Contract DA 91-591-EUC-1126, continuation of Contract DA 91-508-EUC-307. [1960] 21p.
Order from LC mi$2.70, ph$4.80 PB 149 423

The work is divided into two sections, one dealing with complexes of quinquevalent molybdenum, and the other with complexes of ter- and quadri-valent titanium. In each case the complexes are those prepared by reacting the halides of the metals with amines - usually aliphatic. Work is described on the reaction of molybdenum (V) chloride with tertiary amines (NR_3, with R = Me, and Et), with secondary amines (NHR_2, with R = Me, Et, and n-Pr), and with primary amines (NH_2R, with R = Me, Et, n-Pr, and n-Bu). The interaction of molybdenum (V) chloride with several aromatic amines, and oxygen and sulphur compounds is briefly reported. A number of complex oxychloro compounds of molybdenum (V) have been made. The reaction of titanium (IV) chloride with primary (NH_2R, R = Me, Et, and Pr^n), and secondary amines (NHR2, R = Me, and Et) and of titanium (IV) bromide with methylamine and dimethylamine are reported. (See also PB 143 110)

North Carolina U., Chapel Hill.
APPLICATIONS OF COMPLEMENTARY TRISTIMULUS COLORIMETRY, by Charles N. Reilley and Ellis M. Smith. UNC Technical rept. Chem. no. 5 on Contract AF 49(638)333. 9 May 60, 34p. 4 refs. AFOSR-TN-60-497; AD-240 176.
Order from LC mi$3.00, ph$6.30 PB 149 582

The principles of complementary tristimulus colorimetry have been extended in mathematical form to several problems of analytical interest. Colorimetric analysis of multicomponent mixtures is one possible application. While the analysis of a single component is trivial, the use of complementary tristimulus colorimetry in the case of two and three components with overlapping spectra is feasible. The technique has the advantage that more than the minimum number of wavelengths can easily be employed. While the tristimulus approach is limited to a maximum of three components, an analogous multi-stimulus approach can be used for a system containing more components more components. Other applications include calculation of the pK's of acids, and the formula and stability constant of complex ions. As an aid in computation, an inexpensive analog computer was built which permits calculation of chromaticity coordinates (by the weighted ordinate method at 10 selected wavelengths) in about 2 to 3 minutes. SYDNONES. III. PREPARATION AND INTERCONVERSATION OF MERCURATED DERIVATIVES OF N-(3-PYRIDYL)SYDNONE, by Jack M. Tien and L. Moyer Hunsberger. Rept. on Contract AF 18(603)127. 31 May 60, 19p. 33 refs. AFOSR-TN-60-583; AD-239 167.
Order from LC mi$2.40, ph$3.30 PB 148 877

Mercuration of N-(3-pyridyl)sydnone (II) has produced either the sydnone-mercuric chloride "adduct" (V), C-chloromercuri-N-(3-pyridyl)sydnone (VI), or C,C'-mercuri-bis-[N-(3-pyridyl)sydnone] (VII), depending on the reaction conditions. The adduct (V) has been converted to VI and to VII. Transformation of VI to VII was accomplished in pyridine solution at room temperature, while VII was converted to VI with excess mercuric chloride. All reactions proceeded in high yield. Sydnones undergo electrophilic substitution virtually as easily as thiophene. Objections to the tropone-like formulation (XI) of sydnones are presented. Preparation of N-(3-pyridyl)glycine hydrochloride via a Strecker-type reaction between 3-aminopyridine and glycolonitrile is more convenient than the earlier process and permits the preparation of large quantities of sydnone II. THE IONIZATION OF CITRIC ACID STUDIES BY THE NUCLEAR MAGNETIC RESONANCE TECHNIQUE, by A. Lowenstein and John D. Roberts. Technical rept. no. 5 on Contract Nonr-220(26). 1 Sep 59, 24p. 12 refs. AD-225 556.
Order from LC mi$2.70, ph$4.80 PB 148 860

The chemical shift of the methylene hydrogens in citric acid was measured as a function of the pH and the concentration of the solution. From these measurements it was possible to evaluate the chemical shifts associated with each ionization step in citric aicd. Measurements were also made of methylene resonance line positions for ionized and non-ionized methyl esters of citric acid. Analysis of the results indicates that the first and second ionizations of citric acid take place predominantly at the terminal carboxyl groups. (Author)

THE MECHANISM OF THE REIMER-TIEMANN REACTION, by Jack Hine and James M. Van Der Veen. Technical rept. no. 4 on Contract Nonr-991(03). 6 May 59, 23p. 21 refs.
Order from LC mi$2.70, ph$4.80 PB 146 605

Chloroform reacts with aqueous sodium phenoxide only very slowly at 35°, but in the presence of sodium hydroxide it reacts rapidly to give ortho- and para-hydroxybenzaldehydes (the Reimer-Tiemann reaction). This observation shows that the Reimer-Tiemann reaction is not initiated by the nucleophilic attack of phenoxide ion on chloroform. The reaction instead appears to involve the reaction of chloroform with hydroxide ion to give dichloromethylene which then reacts with phenoxide ion. From the effect of sodium phenoxide concentration on the yields of aldehydes, the relative rate constant for the combination of dichloromethylene with the oxygen atom as well as the ortho and para carbon atoms of the phenoxide ion may be calculated (relative to the rate constant for combination with water). (Author)

A STUDY OF THE EFFECT OF SUBSTITUENTS AND OF SOLVENT ON THE REACTIVITY OF THE NORMAL AND ABNORMAL POSITIONS OF UNSYMMETRICAL ORGANIC EPOXIDES, by R. E. Parker. Annual technical rept. for 1 May 59-30 Apr 60 on Contract DA 91-591-EUC-1127. 25 May 60, 13p. 16 refs; AD-238 719.
Order from LC mi$2.40, ph$3.30 PB 149 424

For the investigation of the effect of substituents on the reactivity of the normal and abnormal positions of unsymmetrical epoxides, a kinetic study has been made of the reactions of various m- and p- substituted styrene oxides with benzylamine in ethanol. For the investigation of the effect of the solvent on the reactivity of the normal and abnormal positions of unsymmetrical epoxides, the reaction between styrene oxide and benzylamine has so far been studied kinetically at three temperatures in methyl cyanide and methanol, and at one temperature in tert-amyl alcohol.

Washington, U., Seattle.
UNIMOLECULAR DECOMPOSITION OF CHEMICALLY ACTIVATED ETHYL-d_2 RADICALS FROM H ATOMS PLUS trans-ETHYLENE-d_2, by B. S. Rabinovitch, D. H. Dills and others. Technical rept. no. 3 on Contract Nonr-477(14). 15 Sep 59, 24p. 18 refs. AD-226 337.
Order from LC mi$2.70, ph$4.80 PB 148 859

Addition of H atoms to trans-ethylene-d_2 produces chemically activated ethyl-d_2 radicals. This choice of the reactant ethylene permits all subsequent secondary processes of the hot ethyl radicals to be counted. The system has been studied between -78° and 160°C, and in most detail at room temperature, as a function of ethylene pressure. Experimental details are similar to those given in previous work on butyl. The relative energy spread of the formed ethyl radicals is here effectively greater than that observed for butyl radical since the thermal spread is not superimposed upon a minimum excess above the critical energy, as was the case for butyl. Nevertheless, relative to high temperature thermal decompositions, the product ethyl radicals are comparatively mono-energetic, especially at the lowest temperature. The observed rate constant for decomposition k_a was evaluated from the amounts of stabilization vs decomposition by C-H rupture. The decomposition rate is compared with theoretical expressions. A very crude average isotopic rate ratio for transfer of H and D in the disproportionation of ethyl-d_2 radicals is 6:1 at 25°. (Author)

DEPOSITION OF A SINGLE CRYSTAL THIN FILM OF GERMANIUM ON ROCK-SALT BY EVAPORATION, by Donald J. Kay. Master's thesis. Sep 59, 50p. 26 refs. GE-59-B-#10; AD-228 288.
Order from LC mi$3.30, ph$7.80 PB 149 291

Thin films of germanium deposited by evaporation in a vacuum on a rock-salt substrate possess single crystal characteristics. Electron diffraction patterns obtained show this single crystal structure of the deposit. The (100) plane of rock-salt has a 0.355% degree of misfit to the (100) plane of germanium. This is within the 9% maximum misfit allowed for epitaxial growth. Temperature control of the rock-salt substrate is necessary to insure orientation and continuity of the film. Various forms and materials for an evaporation source were unsatisfactory because the molecular ray did not include the desired area for the deposition nor could the materials withstand the desired temperatures. MEASUREMENT OF LAMINAR FLAME SPEEDS OF ETHYLENE-AIR AND PROPANE-AIR MIXTURES BY THE DOUBLE KERNEL METHOD, by S. D. Raezer and H. L. Olsen. Rept. on Contract NOrd 7386. June 59, 23p. 8 refs. CM-951; AD-225 994.
Order from LC mi$2.70, ep$6.30 PB 150 324

A new method of measuring laminar flame speeds of combustible gas mixtures is described. Flame speeds thus obtained for a range of ethylene-air and propane-air mixtures were compared with those obtained by the flame-kernel technique. The results suggest that the calculated adiabatic flame temperatures may be higher than the actual values by as much as 15 per cent for both gas mixtures. (Author)

MOLECULAR DIFFUSION STUDIES IN BINARY GAS SYSTEMS, by Ronald E. Walker (Doctoral thesis) and Arthur A. Westenberg. Rept. on Contract NOrd-7386. Aug 58, 62p. 43 refs. Bumblebee Series rept. no. 279; AD-227 550.
Order from LC mi$3.90, ph$10.80 PB 149 556

Experimental apparatus and technique for a new method of measuring the diffusion coefficients of gases are described and critically discussed. The method makes use of the steady injection of a trace gas from a fine, hypodermic tube (essentially a point source) into a slow, uniform, laminar stream of a second (carrier) gas. Measurements of the trace gas concentrations downstream permit the binary diffusion coefficient to be determined. Results of about ±1% precision over the temperature range 300-1150°K are presented for the systems He-N_2 and CO_2-N_2. These results are discussed in terms of intermolecular potential energies. The He-N_2 data, including extremes of concentration, can be satisfactorily represented by a purely repulsive potential. At their upper temperature limit, the data come within 150° of overlapping the range of validity for the diffusion coefficient predicted from the repulsive potential obtained by Amour et al. from molecular scattering experiments. A slight extrapolation indicates remarkable agreement between the types of experiments. A modified Buckingham (Exp-Six) potential is obtained which covers both the diffusion and scattering potentials. For CO_2-N_2, the data are fitted with a Lennard-Jones (6-12) potential. For both gas systems the predictions derived from viscosity parameters for the pure components and simple combining rules are quite unreliable at high temperatures. (Author)

FINAL REPORT, by J. Kestin. Technical rept. no. 13, 1 Oct 53-1 Oct 59, on Contract AF 18(600)891. Mar 60, 9p. AF 891/13; AFOSR-TR-60-53; AD-238 994.
Order from LC mi$1.80, ph$1.80 PB 148 819

A completely new analytic theory has been developed for the oscillating disk type viscometer. Two viscometers were designed and built in the laboratory. One was adapted for work at moderate pressures but room temperatures. The second instrument was adapted for work at elevated temperatures (up to 300°C). Measurements were made and reliable data were collected on the viscosity of about 15 gases and one system of mixtures (N_2-CO_2).

FLUOROCARBON NF COMPOUNDS, by J. A. Young and R. D. Dresdner. Quarterly technical rept. no. 4 for 1 Apr-30 June 60, on Contract DA 01-009-ORD-772. [1960] 16p. 2 refs. ARPA Order no. 40-59, Task 3; [OOR rept. 007.4-C]
Order from LC mi$2.40, ph$3.30 PB 148 884

Nuclear magnetic resonance data are given for the compound previously obtained by CsF catalyzed addition of c-$C_5F_{10}NF$ to $CF_3CF{=}CF_2$. The product, obtained in good yield, was identified as perfluoro-N-methylpiperidine. No reaction was observed between NF_3 and SF_4 at 100-150° in a closed vessel or at 300 to 500° in a flow system. It was found, however, that NF_3 and SF_4 form a solid addition compound at low temperatures. Thermal decomposition of the mercury derivative of N,N'-bis(trifluoroacetyl) hydrazine under vacuum at 350-400° gives a product very tentatively identified as a substituted oxadiazolone. Formation of N-F compounds by cleavage of acyl groups from nitrogen has been extended to perfluorodimethylacetamide. As usual, both the fluoroamine and the coupled product are found. Fluorination of N-bromoperfluoroglutarimide gives a fairly stable silver fluoride complex, which may then react further to give $FCO(CF_2)_3NCO$. Evidence is given regarding the identification of the rearrangement product of the bromoimide as the ω - bromoacyl isocyanate, $Br(CF_2)_3CONCO$. (Author) (See also PB 147 006)

Gas Dynamics Lab., Northwestern U., Evanston, Ill.
THE KINETICS OF GASES, by Thomas P. Anderson, Richard F. Hoglund and Ali Bulent Cambel, eds. Rept. on Contract AF 40(600)748. July 60, 156p. 135 refs. AEDC-TN-60-130.
Order from OTS $3.00 PB 161 908

The fundamental features of real gas effects are reviewed with emphasis on high temperature effects. Topics considered include the thermal and caloric equations of state, basic effects in flow processes, and the speed of sound in reacting gases. The kinetics of the processes of dissociation and recombination and ionization and charge neutralization are discussed along with some applications. Analyses are presented describing chemical non-equilibrium effects in some flow situations, among them inviscid flow after sudden changes in fluid properties and the mixing of parallel streams. DOUBLE LAYER STRUCTURE AND RELAXATION METHODS FOR FAST ELECTRODE PROCESSES: THE DOUBLE PULSE GALVANOSTATIC METHOD, by Hiroaki Matsuda and Paul Delahay. Technical rept. no. 35 on Contract Nonr-300(00). July 59, 20p. 13 refs. AD-225 751.
Order from LC mi$2.40, ph$3.30 PB 148 731

An equation is derived for the overvoltage-time characteristic in the double pulse galvanostatic method, the structure of the double layer being considered in the boundary value problem. Abnormally high transfer coefficients recently reported by other investigators are interpreted. A detailed mathematical analysis is given.

Louisiana State U., Baton Rouge.
INFLUENCE OF REACTANT ADSORPTION IN TRANSIENTS METHODS FOR FAST ELECTRODE PROCESSES, by Hiroaki Matsuda and Paul Delahay. Technical rept. no. 39 on Contract Nonr-300(00). Oct 59, 23p. 12 refs.
Order from LC mi$2.70, ph$4.80 PB 149 477

The effect of adsorption of the discharged species is considered in galvanostatic and potentiostatic methods, the reaction products being not adsorbed. It is shown that extrapolation methods for the determination of exchange current densities still apply but that the slopes of the resulting linear plots differ from their values in the absence of adsorption. Exchange current densities obtained by such extrapolation methods are formal quantities which depend on adsorption charac-

teristics. Separation of the adsorption terms appears quite difficult. The following results are derived for application of the extrapolation methods: equation of potential-time curves in the single pulse galvanostatic method; equation for the potential at the end t_1 of the first pulse for potential-time curves with a horizontal tangent at t_1 in the double pulse galvanostatic method; and equation of current-time curves in the potentiostatic method. EXPERIMENTAL INVESTIGATION ON THE KINETICS OF FLAME INHIBITION, by A. Van Tiggelen. Final technical rept. no. 2, 1 Mar 59-29 Feb 60, on Contract DA 91-591-EUC-1072. Mar 60, 45p. 17 refs. AD-234 395.
Order from LC mi$3.30, ph$7.80 PB 147 254

The influence of Cl in H-O flames: Small amounts of Cl inhibited H-O flames more efficiently than conventional diluents such as N, but larger amounts accelerated the flame in rich mixtures. Almost no inhibition was observed when the composition corresponded to the mixing of two separate binary flammable mixtures (one of which contained Cl and H) which had compositions corresponding to the maximum burning velocity. The results were too erratic to allow definite conclusions to be drawn. Inhibition effects in ethylene-vinyl chloride-O flames: Small inhibition was observed. A continuous change occurred in the activation energy of the branching process passing from a pure ethylene to a pure vinyl chloride flame. Comparative study of ionization in ethylene and vinyl chloride flames: The total concentration of ions in both flames was nearly the same at a flame temperature of about 2500°K. At lower temperatures, ethylene flames contained more ions, while the vinyl chloride flame was more completely ionized at higher temperatures. Analysis of the flames by mass spectroscopy revealed HO_1^+ and $H_3O_2^+$ ions in the vinyl chloride flames, which were not present in the ethylene flames. This indicated a change in the reaction mechanism caused by the Cl. A new method is described for the determination of flammability limits which is based on the appearance of a stronger ionization in the premixed flames as compared to the diffusion flames.

Michigan U. Research Inst., Ann Arbor.
STABILIZATION OF GASEOUS DETONATION WAVES WITH EMPHASIS ON THE IGNITION TIME DELAY ZONE, by J. A. Nicholls. Technical note on Contract AF 49(638)562. June 60, 167p. 46 refs. 2874-6-T; AFOSR-TN-60-442; AD-240 064.
Order from LC mi$7.80, ph$25.80 PB 149 305

The characteristics of gaseous detonation waves are considered insofar as they influence the dynamic conditions that must be met in order to generate a standing gaseous detonation wave. Experiments are described werein stationary shock wave-combustion configurations were realized. A theoretical analysis of the ignition delay zone of hydrogen-oxygen combustion is presented. The main results of this study are: (1) standing detonation waves have been successfully generated; such waves offer many advantages to the study of combustion processes and represent a possible mode of combustion in hypersonic ramjets; (2) a new experimental technique for the study of ignition time delays of gaseous mixtures at high temperatures has evolved; other applications to chemical kinetic problems are possible; (3) a theoretical prediction of ignition time delay of hydrogen-oxygen mixtures is presented which is consistent with the experimental results of this investigation as well as those of other investigations.

THERMAL PROPERTIES OF METHYL BORATE, by C. E. Hansen and R. L. Hughes. Rept. on Project Zip, Callery Chemical Co. Contract NOa(s) 58-454-d. 2 Feb 59, 48p. 11 refs. CCC-454-TR-303.
Order from LC mi$3.30, ph$7.80 PB 150 307

This report released for sale to the public 19 Sep 60.

This report is a continuation of the physical properties program for methyl borate. Pressure-temperature-enthalpy data are presented here, together with the Joule-Thomson effect and the heat of vaporization. Thermodynamic charts and tables have been prepared from the experimental data, and these data have been extrapolated over regions not covered experimentally. (Author)

Midwest Research Inst., Kansas City, Mo.
VAPOR PRESSURE AND CRITICAL CONSTANTS OF METHYL BORATE, by R. L. Hughes, A. R. Pittaway, and F. T. King. Rept. on Project Zip, Callery Chemical Co. Contract NOa(s) 58-454-d. 27 Mar 59, 16p. 3 refs. CCC-454-TR-307; AD-220 684.
Order from LC mi$2.40, ph$3.30 PB 150 308

This report released for sale to the public 19 Sep 60.

The vapor pressure versus temperature for methyl borate was measured from the normal boiling point to the critical point. The critical temperature was observed to be 229°C ± 0.5°C, and the critical pressure 502 psia (34 atmospheres). Log $P_{(mm.Hg)}$ vs. reciprocal temperature fits the equation:

$$\log P_{(mm.Hg)} = 7.6949 - \frac{1648.8}{T^{\circ}C}$$

The compressibility data of methyl borate were calculated from a modification of the generalized Beattie-Bridgemann equation of state. (Author)

RAPID DETERMINATION OF THE ORDER OF CHEMICAL REACTIONS FROM TIME-RATIO TABLES, by Joseph H. Flynn. Aug 60, 23p. 7 refs. Technical note 62.
Order from OTS $0.75 PB 161 563

A table of ratios of reaction times corresponding to 15%/5%, 20%/10%, ..., 95%/85% reaction for orders of chemical reaction from -10 to +10 is presented. Use of this table allows the rapid calculation of the order of chemical reactions that are kinetically simple and involves only one subjective step. Methods are discussed for interpreting deviations from constant order resulting from errors in the initial times and concentrations, from errors in stoichiometry, and from the reaction following a more complicated rate expression. THE MEASUREMENT OF THE VAPOR PRESSURE OF ATOMIC SPECIES FROM SPECTROMETRIC MEASUREMENTS OF THE ABSORPTION OF THE RESONANCE LINE. III. THE THERMODYNAMICS OF VAPORIZATION OF SODIUM FROM SODIUM SILICATE GLASSES, by G. L. Vidale. Rept. on Contract AF 04(647)269. June 60, 37p. 19 refs. Technical Information Series R60SD390.
Order from LC mi$3.00, ph$6.30 PB 148 764

The equilibrium constant of the reaction $Na_2O \cdot SiO_2(s, sol) = 2Na(g) + 1/2\ O_2(g) + SiO_2(sol)$ has been determined for sodium orthosilicate and for four glasses containing a molar excess of SiO_2. The vapor pressure of sodium atoms has been determined by absorption spectrophotometric measurements on the sodium 5890 Å resonance line. The results obtained are compared with other thermodynamic data avaliable for this system and are found to be consistent with them. The value of $P_{Na}\,P_{O_2}^{1/4}$ is given from 1200 to 2000°K for four glass compositions having a molar ratio of SiO_2 to Na_2O varying from 1.69:1 to 3.88:1. (Author)

BORON-NITROGEN COMPOUNDS, by Charles A. Brown and Lewis J. Schupp. Terminal rept. for Aug 52-June 54 on [Subcontract to Contract NOas-52-1023c] Aug 54, 36p. 9 refs. Technical research rept. MCC-1023-TR-65.
Order from LC mi$3.00, ph$6.30 PB 150 295

This report released for sale to the public 19 Sep 60.

The behavior of boron trifluoride and boron trichloride as Lewis type acids is demonstrated further by the formation of the addition compounds acetamide-BF_3, urea-BF_3, and urea-BCl_3. The low thermal stability of urea-BCl_3 compared to urea-BF_3 is due primarily to the ease with which hydrogen chloride is formed as a decomposition product as condensation occurs. The thermal decomposition of urea-BF_3 does not produce hydrogen fluoride, and the formation of boron-nitrogen polymers from this or similar substances does not appear to be promising. The phenylenediamines react readily with boron trichloride. In view of the ease with which hydrogen chloride is evolved from these adducts, the formation of new substances containing boron-nitrogen bonds appears to be possible.

AN INTERPRETIVE CODE FOR THE WEATHER RADAR, by Roland J. Boucher. Scientific rept. no. 6 on Contract AF 19(604)5204. 10 Feb 60, 26p. 7 refs. AFCRC-TN-60-451.
Order from LC mi$2.70, ph$4.80 PB 149 152

An alpha-numerical code consisting of three basic six-letter-digit groups and two supplemental groups is described. The code is an operational one designed to supply the synoptic meteorologist with significant information on the immediate state of that portion of the synoptic situation within range of the radar. The code omits transitory details of echo configuration but gives general areas where echoes are found and a measure of their density. Stress is laid on the over-all echo character such as the texture on the PPI and the structure on the RHI, since these features relate to the dynamic processes. Two supplemental groups provide a means of transmitting accurate positions of squall lines and the position of the hurricane eye, as well as the speed and direction of movement of these important phenomena. BALLOON ASCENT RATE, LAPSE RATE, AND WIND CORRELATION, by J. T. Kurman and M. B. Sharenow. 20 Apr 59, 9p. USASRDL Technical rept. 2023; AD-220 786.
Order from LC mi$1.80, ph$1.80 PB 147 564

This report covers work completed in an effort to determine whether a correlation exists between balloon-ascent rate and the factors of lapse rate, winds speed, and wind direction. Balloon tests made and evaluation methods used are described. Further, an attempt was made to discover a possible relation between the passage of certain types of cold fronts and an increase in average ascent rate of a balloon. (Author)

BALLOON BEHAVIOR EXPERIMENTS, by Gwendolyn L. Killen. 15 Jan 60, 29p. USASRDL Technical rept. 2093. AD-237 033.
Order from LC mi$2.70, ph$4.80 PB 148 539

A study was made of the balloon as a device for wind measurement. Experiments were conducted in which the trajectories of meteorological balloons were tracked when released in still air inside a closed building. It was found that the balloons developed aerodynamic lift forces which caused them to develop considerable horizontal components of velocity, and that these velocities varied with the amount and location of ballast below the balloon. CLOUD REFRACTIVE INDEX STUDIES. PART III, by Edward L. Harrington. Final rept. on Contract AF 19(604)1931. 2 May 60, 101p. 4 refs. Cloud Physics Lab. Technical note no. 21; [AFCRC] TR-60-266.
Order from LC mi$5.70, ph$16.80 PB 149 310

Statistical analysis of refractive index gradients has been applied to some measurements made in the subcloud layers at altitudes from 1,000 ft to 3,000 ft over the Caribbean Sea. The data were arranged in bivariate frequency tables of ΔN versus ΔS and tests were made to determine if these distributions changed with respect to altitude and horizontal location, and to see if the distributions representing cloud air were different from the clear-air distributions. The distributions of ΔN show that over ninety per cent of the values are less than one N unit, reflecting the high humidity encountered at these altitudes. Autocorrelograms of three low-altitude passes are inconclusive because lag sizes were too large to detect the gradient activity and the records were too short for meso-scale variation to be verified. The integrated refractive index change along the aircraft flight path in cloud has been computed for a number of clouds from both the subtropical oceans and the continental United States. Gross refractive index measurements have been made on additional cloud samples. (See also PB 137 910)

WIND AND DENSITY DISTRIBUTION IN THE FREE ATMOSPHERE. Final technical rept. for 15 Apr 59-15 Apr 60 on Contract DA 91-591-EUC-1124. [1960] 13p; AD-238 746.
Order from LC mi$2.40, ph$3.30 PB 149 432

Complete basic data were compiled for a climatological study of the free atmosphere over several European areas. The available data were checked according to scientific principles, errors were corrected and missing reports supplemented as far as possible. The available sources of data are of different quality: original recordings and evaluations of soundings are first-

ranking; such records could only be secured from Berlin-Tempelhof. Publications based on original sounding records also give good data. Other sources, however, which are mainly a collection of data as received by radio or teletype facilities, are subject to a variety of errors, among which those arising with communication and printing are the most frequent. Since there is always a deadline to be met, these sources contain all kinds of other errors in addition. Thus, a careful checking is unavoidable. Even the official weather maps have often to be completed in a limited time and quite frequently with incomplete data coverage. A subsequent checking, therefore, with enough time given the employ all corresponding scientific principles, would result in a considerable improvement of the basic data.

Lees, Sidney, Cambridge, Mass.
STUDY ON WIND SHEAR MEASUREMENTS, by Sidney Lees. Final rept. for 1 Apr 57-30 Apr 58 on Contract DA 36-039-sc-73204. 31 May 58, 140p. 5 refs. AD-203 442.
Order from LC mi$6.90, ph$21.30 PB 149 409

The first chapter is a statement of the concepts and limitations of wind shear measurement in the atmosphere. The range of wind shear is estimated to be 0.001 to 0.1 inverse seconds. The uncertainty of wind shear measuring systems should be no greater than 0.001 inverse seconds. The second chapter reviews the work included in previous reports. The wind shear probe is described in Chapter 3. A program for developing the wind shear probe is given in Chapter 4. Various aspects of the theory are presented in Chapters 5, 6, 8, 9 and 10. Multiple airborne vehicle systems are discussed in Chapters 7, 12, and 13. A theory has been developed based on second differences that offers the possibility of measuring the change in displacement between two targets. The information can be obtained directly in Cartesian coordinates, so that all nine components of the velocity variation matrix can be computed. A program is presented in Chapter 7 for further work in this area.

THE QUANTITATIVE DISPLAY OF RADAR WEATHER PATTERNS ON A SCALE OF GREY, by T. H. Legg. Doctoral thesis. Rept. on Contract AF 19(604)6617. June 60, 117p. 28 refs. Stormy Weather Group Scientific rept. no. MW-31; AFCRC-TN-60-466.
Order from LC mi$6.00, ph$18.30 PB 149 167

At 100 miles range, radar can detect variations of 10^4 in rainfall intensity; the signals cover 64 db in power of which many radars can display less than 16 db at a time. Equipment has been designed and studied which displays successive factors of signal power, corrected in a known way for distance, as equally discernable steps of grey. One gain control adjusts the factors to display at a given time all or a chosen fraction of the 64 db. The control is inserted between a logarithmic receiver and an exponential amplifier. Photographs of a radar screen, corrected optically to improve uniformity, have enough contrast for seven grey steps. A test pattern appears in each picture (Author)

CLOUD SHIELD AND RADAR PRECIPITATION ECHO RELATIONSHIPS WITH SATELLITE APPLICATIONS, by F. L. Ludwig and R. E. Nagle. Scientific rept. no. 1 on Contract AF 19(604)5982. Apr 60, 106p. 6 refs. AFCRC-TN-60-478.
Order from LC mi$5.70, ph$16.80 PB 149 791

Fifteen mid-United States composite radarscope pictures are presented showing radar precipitation echoes, frontal positions, and total cloud cover. These are accompanied by analyses of the low, middle, and high cloud shields. Thirteen other composites from West Coast and Picket Ship pictures are presented in an Appendix. These latter are without cloud analyses. Three strip composites using radarscope pictures, taken during aircraft reconnaissance flights over the eastern Pacific, are included with their corresponding cloud and frontal analyses. The fifteen cloud-analyzed continental composites and the reconnaissance composites are discussed in the text with respect to the cloud-precipitation relationships. The probable character of satellite photographs is discussed. Characteristics of the cloud patterns which seem, from the composite analyses, to be associated with precipitation or storm systems are discussed in terms of the likelihood that they could be discerned from satellite photographs. (Author)

FORECASTING MICROMETEOROLOGICAL VARIABLES, by Guy A. Franceschini. Final rept. on Contract AF 19(604)2250. Dec 59, 73p. 4 refs. Reference 59-9F; AFCRC-TR-60-225.
Order from LC mi$4.50, ph$12.30 PB 149 010

An objective evaluation was conducted on the utility of a specialized analogue for micrometeorology. Values of parameters simulated by the computer are compared with values observed. Parameters of concern were: air temperature at a height equal to the roughness parameter (z_0); air temperature at 2 m; temperature difference between 1/2 m and 4 m; wind speed at 2 m; vapor pressure at 2 m; and relative humidity at 2 m. Results are shown in graphs of simulated and observed values as a function of time, and tables of statistical parameters of the verification. Comparisons were made for five (5) different periods involving four (4) locations. The locations, all in Texas, represented appreciably different surfaces. Meteorological conditions were varied and included the following air mass types: arctic, maritime polar, continental polar and maritime tropical. A brief description of each site with a summary of its attendant meteorological conditions is given. (Author)

MARINE METEOROLOGY: CLOUD AND ENVIRONMENT VERTICAL VELOCITIES, TEMPERATURES, HUMIDITIES AND WATER CONTENTS ASSOCIATEL WITH A SHEAR ZONE IN THE TRADE WINDS, by Andrew F. Bunker. Technical rept. no. 44 on Contract Nonr-1721(00). Sep 59, 34p. 18 refs. Reference no. 59-42; AD-226 030.
Order from LC mi$3.00, ph$6.30 PB 148 892

Airplane measurements of turbulent and convective vertical velocities of gusts with sizes from 60 to 6000 m were made during a 160 km flight through a clear area and a cloudy shear zone at a level about 50 m above cloud base. During the straight, level flight, 19 parcels, identified as cumulus clouds, were penetrated. These parcels were cooler than both the shear zone air and the clear air. Some clouds were observed with only downdrafts while others were observed with internal ascending parcels warmer than the cloud air. These and other characteristics substantiate the concept of one type of cumulus cloud as a semi-permanent mass of inactive air with occasional bubbles of buoyant air. The environment is nearly as turbulent as the cloudy air and contains extensive regions of updrafts and downdrafts. An east-west shear zone at 10°N was established by the penetration of a cold front into the North Atlantic Ocean trade winds. North of the shear line, the air was diverging, subsiding, and forming an oval area about 100 by 200 km which was free of cumulus clouds. The southern boundary of this area was defined by cumulus clouds building up to 2 km. From ship reports of wind velocity, the air in the clear area was found to be subsiding several tenths cm sec^{-1} while the air of the southern wall was ascending faster than 1 cm sec^{-1}. The divergence pattern in this area is found to be an extension of a larger pattern covering a part of the North Atlantic Ocean. (Author)

EXPERIMENTAL STUDY OF FROST HEAVING, by Akira Higashi. Rept. on Dynamics of Frost Heaving. Aug 58, 24p. 6 refs. Research rept. 45; AD-214 672.
Order from LC mi$2.70, ph$4.80 PB 147 353

Laboratory studies on the effects of the soil-temperature regime on the type of ice segregation and the rate of frost heaving are described in detail, and the results are analyzed quantitatively on the basis of thermodynamic and hydraulic theory, assuming that suction is created by ice formation. The heaving rate varied with the type of ice segregation, which in turn depended on the rate of frost penetration. Ice-filament layers or sirloin-type freezing were observed at low penetration rates and concrete-type freezing at high penetration rates. The heaving rate decreased with increasing frost-penetration rate, and varied, in the case of filament-type freezing, according to the amount of sensible heat lost at the freezing interface. The sensible heat loss was 0.62 cal/cm-sec in the case of maximum heaving (7 mm/day); higher values resulted in thermal conditions favoring sirloin-type freezing. The moisture content of frozen soil was found to be related to the heaving ratio, inasmuch as the amount of heaving is attributed to the amount of segregated ice. (Author)

THE FLOW LAW FOR ICE, by T. R. Butkovich and J. K. Landauer. Rept. on Mechanics of Plastic Deformation on Ice, Aug 59, 11p. 18 refs. Research rept. 56; AD-235 263.
Order from LC mi$2.40, ph$3.30 PB 149 131

The results of laboratory creep tests in a shear apparatus at ±5°C on 2 x 2 x 3/8 in. samples of commercial ice, artificial single crystals, and 6 types of ice from the Greenland Ice Cap, at shear stresses of about 0.5 - 3 kg/cm^2 are reported. Some uniaxial tests were made at stresses from 6 - 28 kg/cm^2 to supplement the shear tests. Creep data could usually be represented approximately by one or more linear sections on a log-deformation vs log-time plot. The linear sections of the double logarithmic curve imply a creep curve of the form $\epsilon = ct^m$, where ϵ is the strain. For all samples tested, except single crystals sheared in easy glide, m averaged 0.5 for shear deformations up to about 1% and approached unity for more deformation. For single ice crystals oriented for easy glide, m averaged 1.7, implying a strain softening. Single crystals oriented for hard glide behaved similarly to polycrystals, indicating a rate-controlling process such as dislocation climb. For all but single easy-glide crystals, the minimum creep rate was tangent to the deformation curve at the end of the experiment. Creep rates for single easy-glide crystals were several hundred times larger than for the other crystals, the flow laws being similar. (Author)

MECHANICAL PROPERTIES OF SINGLE CRYSTALS OF ICE. PART I. GEOMETRY OF DEFORMATION, by Ukichiro Nakaya. Rept. on Thickness and Strength of Ice Surface Layers. Oct 58, 94p. 19 refs. Research rept. 28; AD-216 992.
Order from LC mi$5.40, ph$15.30 PB 147 352

Bending tests were performed on nearly 300 rectangular bars of glacier ice cut from large single crystals (up to 16 in.) at varying orientations, and deformation was studied through measurements of vertical displacement of a median loaded wedge by means of a screw micrometer. The phenomena observed can be explained by assuming that: single crystals of ice have a layer structure stacked in the direction of the optic axis; plasticity is due to gliding between these elementary layers; a small-angle boundary is likely to occur at the point of intense stress concentration and the elementary layer is flexible but not stretchable.

Army Snow Ice and Permafrost Research Establishment, Wilmette, Ill.
ON THE MECHANICAL PROPERTIES OF SEA, ICE THULE, GREENLAND, 1957, by T. R. Butkovich. Aug 59, 27p. 6 refs. Research rept. 54; AD-235 872.
Order from LC mi$2.70, ph$4.80 PB 149 130

The investigations on sea ice, conducted at Thule, Greenland, during February and March 1957 included: unconfined compressive strength, ring tensile strength, and flexural strength tests on simple beams for borth horizontal and vertical test specimens. Additional tests were made to determine the modulus of elasticity with the simple beams in flexure. Tests were also made for creep in uniaxial compression. Although there is a high scatter of results, a dependence of strength and creep on temperature and brine volume is evident. Higher compressive, tensile, and flexural strengths, along with higher values of the elastic modulus were obtained at lower temperatures or brine volumes. The minimum creep rate decreases with decreasing temperature and brine volume. (Author)

Army Snow Ice and Permafrost Research Establishment, Wilmette, Ill.
SEISMIC SURVEY 1957, THULE AREA, GREENLAND, by Hans Roethlisberger. Rept. on Approach Roads, Core Drilling in Permafrost, and Elastic and Visco-Elastic Properties of Snow and Ice. Sep 59, 17p. 10 refs. Technical rept. 64; AD-235 203.
Order from LC mi$2.40, ph$3.30 PB 149 125

Seismic reflection soundings were carried out in the vicinity of Camp TUTO, Thule, Greenland, on the edge of the ice cap. Ice thicknesses ranging from 200 to 800 ft were determined. With a short shot point to geophone distance only sporadic results could be obtained, while with a long distance, up to 3.5 times the ice thickness, very strong reflection signals were recorded. Evidence was found that some of the reflections did not occur at a single clear interface, indicating the presence of alternate layers of moraine and ice at the bottom of the ice cap. At one location, where the result of the seismic sounding could be compared with drilling results, the error was found to be less than 10 ft, the depth at the place being about 200 ft. Later reflection signals on the seismic records are analyzed by means of a master chart. The usefulness of the refraction method was established along the ice tunnel. (Author)

Army Snow Ice and Permafrost Research Establishment, Wilmette, Ill.
SOME STRUCTURAL PROPERTIES OF GREENLAND SNOW, by Alfred Fuchs. Rept. on Structure of Snow and Ice. Dec 59, 28p. 7 refs. Research rept. 42.
Order from LC mi$2.70, ph$4.80 PB 149 129

The results of petrofabric studies in the laboratory on 5 samples of high-density snow collected in 1954 and 1955 at depths of 8.0, 15.5, 23.0, 34.2, and 46.3 m in a pit at Site 2 are reported. The porosity of the samples, the number of grains/sq. cm, the mean number of adjacent grains per grain, the mean grain cross section, the size distribution of grain cross sections, and the orientation of c-axes were determined from enlarged photomicrographs of thin sections, using reflected light and transmitted polarized light. The number of adjacent grains per grain, the ratio of free to occupied grain surface, and the sphericity clearly depended on porosity and on each other. There was no strong relation between these data and the number of grains/sq. cm. Hence, the structure of high-density snow can be satisfactorily described by the porosity and the number of grains/sq cm. Conclusions from a two-dimensional thin section can be applied to a spatial sample only if the sample is isotropic by strata. (Author)

Army Snow Ice and Permafrost Research Establishment, Wilmette, Ill.
STRENGTH DATA ON LAKE ICE, by Guenther E. Frankenstein. Rept. on Bearing Capacity of Floating Ice Sheets. Dec 59, 24p. Technical rept. 59.
Order from LC mi$2.70, ph$4.80 PB 149 124

The results of in-place cantilever beam tests and small-beam tests with center loading, conducted in 1956-57 on lake ice in Minnesota, Wisconsin, and Michigan, are reported; the testing procedures and equipment used are described; and the data are tabulated and graphed. The tests were made on clear ice, snow-ice (dense, medium, and rough), and a combination of clear ice and snow-ice.

Army Snow Ice and Permafrost Research Establishment, Wilmette, Ill.
VISCO-ELASTIC PROPERTIES OF PROCESSED SNOW, by Ukichiro Nakaya. Rept. on Elastic and Visco-Elastic Properties of Snow and Ice. Sep 59, 26p. 6 refs. Research rept. 58; AD-235 329.
Order from LC mi$2.70, ph$4.80 PB 149 133

The results of investigations at Site 2 (Greenland) on rectangular samples of Peter snow (2 x 20 x 1.0 - 1.6 cm) of varying ages are reported, and the methods of study are described. Young's modulus was obtained from the frequency of resonance vibration and viscosity from the rate of damping, using a new visco-elastic meter. A simple relation was obtained between Young's modulus and density when the specimens were grouped according to structure, and the results of the experiments were analyzed for each of the groups, taking age as the parameter. Peter snow 2-3 yr old had almost the same modulus of elasticity as snow naturally compacted for 10 yr. The modulus of elasticity vs density curve for new Peter snow was similar to that of naturally compacted snow, except that the absolute value of the modulus of elasticity was smaller for the same density. Young's modulus however, increased with time, and the curve approached that of naturally compacted snow. When the grain-size distribution was heterogeneous, Young's modulus was larger than for naturally compacted snow of the same density. Mechanical vibration immediately after processing effected an increase in snow density, but did not accelerate age hardening. (Author)

Barodynamics, Inc.
EXCAVATIONS IN FROZEN GROUND. PART II. EXPLOSION TESTS IN FROZEN GLACIAL TILL, FT. CHURCHILL, by C. W. Livingston and Glenn Murphy. Final rept. on Contract DA 11-190-ENG-17. July 59, 43p. 8 refs. SIPRE rept. 30; AD-233 474.
Order from LC mi$3.30, ph$7.80 PB 149 121

Explosion tests were conducted in frozen ground near Fort Churchill, Manitoba, Canada, as an extension of previous tests in Keweenaw silt. Atlas 60 Percent Straight Gelatin Dynamite, Demolition Block M5 Composition C-3, and Atlas Coalite 7S Ammonia-Base Permissible Dynamite were used as the explosives in amounts ranging from 0.5 to 20 lb. Approximately 150 craters were produced. The charges were cylindrical with height-diameter ratios ranging from 0.12 to 9.12, but the majority were in the interval between 2.5 and 4.0. The depths of charges varied, some being quite shallow and others sufficiently deep that no surface effect was observed. In general the results verify scaling laws and show that the critical depth varies as the cube root of the weight of charge. Consistent differences in performance of the explosives were observed. The shape of the charge also influenced the results, but scatter of the data preclude establishing conclusive trends of the influence. (Author)

TEMPERATURE DISTRIBUTION OF SNOW WITH GAMMA RAY RADIATION, by Chi Tien. Rept. on Thermal Properties of Snow and Ice. Rept. on Contract DA 11-190-ENG-34. Jan 60, 7p. 2 refs. SIPRE Research rept. 67; AD-237 172.
Order from LC mi$1.80, ph$1.80 PB 149 135

The temperature distribution in snow subjected to gamma radiation from an operating nuclear reactor is analyzed mathematically, assuming that the effect of radiation is equivalent to a continuous heat source, the intensity of which is a function of the radial distance from the reactor. Steady-state solutions are derived for two cases: when the radial distance is 13 ft and when it is 19.1 ft. The results indicate that the temperature of the snow in certain regions in the several feet immediately below the foundation will exceed the design limit of 20F. Increasing the shielding of the reactor will reduce the snow temperature. Other possible ways to reduce the snow temperature include the use of refrigeration coils and the forcing of atmospheric air through the snow. (Author)

EXPLICIT INTERIOR-EXTERIOR ORIENTATION OF THE CAMERA IN SPACE, by E. L. Merritt. 9 Aug 50, 24p. 1 ref. Rept. no. 121-50.
Order from LC mi$2.70, ph$4.80 PB 149 824

This report released for sale to the public 25 Aug 60.

The purpose of this paper is to describe an explicit solution to the elements of interior and exterior orientation of the camera in space. This solution is presented (1) as an expedient means of obtaining camera data in the field and (2) as a means of partially answering the questions posed above.

Naval Photographic Interpretation Center, Washington, D. C.
EXPLICIT EXTERIOR ORIENTATION OF THE CAMERA IN SPACE, by E. L. Merritt. 20 Apr 51, 12p. 3 refs. Rept. no. 105-51.
Order from LC mi$2.40, ph$3.30 PB 149 826

This report released for sale to the public 25 Aug 60.

Exterior orientation of the camera in space is defined as the determination of the space coordinates (XL, YL, ZL) of the lens and the space orientation (tilt, swing, azimuth) of the camera coordinate system with respect to a geographic coordinate system. The solution described in this paper is an implicit one, in that functions of the elements of exterior orientation are uniquely determined with the given data without recourse to iteration. The explicit functions are then equated directly for the desired unknowns.

EXTERIOR ORIENTATION BY ITERATION, by Everett L. Merritt. 30 May 51, 18p. 13 refs. Rept. no. 117-51.
Order from LC mi$2.40, ph$3.30 PB 149 827

This report released for sale to the public 25 Aug 60.

Two solutions are given in this report; each requires three imaged survey stations in conjunction with certain approximations: (1) One is based on a preliminary determination of the length of the photographic pyramid edges by Finsterwalder's method of iteration. (2) The second is based on a determination of tilt, swing, and altitude by iteration. Initial values are approximated by any means whatsoever.

Naval Photographic Interpretation Center, Washington, D. C.
FOCAL LENGTH DETERMINATION BY VANISHING POINT METHOD ON LOW-OBLIQUE PHOTOGRAPHY, by G. T. McNeil. 15 Aug 49, 5p. Rept. no. 111-49.
Order from LC mi$1.80, ph$1.80 PB 149 823
This report released for sale to the public 25 Aug 60.

The purpose of this report is to determine the approximate focal length of low-altitude low-oblique photography solely by means of vanishing points. No known dimensions are required. A perpendicular system of parallel lines, such as streets and buildings, are required in the photographic perspective to determine two horizontal and one vertical vanishing point. Occasionally, terrestrial and aerial photographs are received whose focal lengths are unknown. This report demonstrates an elementary solution for this special case. (Author)

LATITUDE DETERMINATION AND CAMERA CALIBRATION WITH STAR EXPOSURES, by Everett L. Merritt. 22 Aug 51, 14p. Rept. no. 125-51.
Order from LC mi$2.40, ph$3.30 PB 149 828

This report released for sale to the public 25 Aug 60.

The purpose of this report is to describe a procedure for determining latitude without chronometer time and calibration data with plane calibration equations from measurements made on star exposure plates.

Naval Photographic Interpretation Center, Washington, D. C.
STAR EXPOSURE METHOD OF CAMERA CALIBRATION, by E. L. Merritt. 15 Nov 50, 51p. 6 refs. Technical Bulletin 131-50, supersedes PIC repts nos. 121-48, 124-48, 104-49 and 105-49.
Order from LC mi$3.60, ph$9.30 PB 149 825

This report released for sale to the public 25 Aug 60.

The purpose of this technical bulletin is to present a method of calibrating cameras from zenithal exposures of stars. The method consists of making exposures of the zenith and calculating the camera constants ($f, \Delta x, \Delta y$) and residual lens distortion, with the plate and celestial coordinates of the stars imaged as given data. The concept of a negative exposure of the zenith for calibrating purposes is illustrated. Reasonable accurate camera calibration data can be calculated because of the multiplicity of star images and the relatively high accuracy of the star's celestial coordinates.

PROCESSES OF DELTAIC SEDIMENTATION IN THE LOWER MISSISSIPPI RIVER, by Frank A. Welder. Technical rept. no. 12 on Contract N7onr-35608. 1 July 59, 99p. 69 refs. Contribution no. 59-7; AD-219 944.
Order from LC mi$5.40, ph$15.30 PB 147 181

The Mississippi delta and related alluvial processes are physiographically described and the principles and processes of deltaic sedimentation are analyzed. Physiographically the area consists of active and abandoned river channels, their respective natural levee ridges and inter-levee basins and a limited beach section. The problem was to map and describe these features and to study the processes of nature by which they were created. A restricted area of active deltaic sedimentation was periodically subjected to concentrated field observation. The results make it possible to understand many of the processes associated with the formation of the Mississippi delta, as well as the hydraulic and sedimentary principles involved.

Quartermaster Research and Engineering Center, Natick, Mass.
A QUANTITATIVE SYSTEM FOR CLASSIFYING LANDFORMS, by Walter F. Wood and Joan B. Snell. Feb 60, 24p. 5 refs. Technical rept. EP-124; AD-233 221.
Order from LC mi$2.70, ph$4.80 PB 149 763

A landform classification system based on quantitative terrain data was devised, and tested in a part of Central Europe. Measurements for 6 terrain factors - grain, relief, average elevation, elevation-relief ratio, average slope and slope direction changes - were taken for 413 sample areas within a larger area of over 100,000 square miles. The individual samples were grouped into 25 homogeneous regions in accordance with the similarity of the above measurements. A map of Central Europe delineating these 25 regions was drawn and was found to compare favorably with physiographic maps of the same area drawn solely from qualitative interpretations. The similarity of the quantitatively-described landform regions with those described qualitatively is further proof of the validity of quantitative terrain analysis and demonstrates the usefulness of earlier qualitative geographic work. FEASIBILITY STUDY OF A MAGNETIC FIELD SURVEY TO 1 GAMMA, by D. E. Wiegand. Rept. no. 1 (Final) on Contract DA 44-009-eng-1103. 23 Oct 53, declassified 16 May 58, 12p. 7 refs. ARF Proj. no. A 037-1; AD-162 097.
Order from LC mi$2.40, ph$3.30 PB 150 212

This report released for sale to the public 15 Sep 60.

A system for surveying the total magnetic field vector, to a limiting and relative accuracy of 1γ is described. The following points represent the desired goal of a magnetic field survey: (1) contour map of total field strength, (2) contour map of vertical component of field strength, (3) points to be measured and plotted every 6 in. where rate of change of field strength with distance equals or exceeds 2γ per ft or where gradient is less than 2γ per ft points are to be plotted at 1γ spacings, and (4) sensitivity of measurements of 1γ.

The detecting device must be an instrument which lends itself to the requirements of field survey work, namely portability, mechanical ruggedness, ease of operation, quick setup time, and detection of field at or close to the earth's surface. The most likely instrument adaptable to the proposed survey is the AN/ASQ-3A magnetic airborne detector. The instrument aligns to and measures the total component of the earth's field. The data would consist of continuous profiles of total magnetic field of fixed length which, when indexed and laid parallel in proper order and spacing, would permit immediate and adequate interpretation for most all investigations. Magnetic anomalies of mines and other objects could be immediately determined by re-surveys.

EDGE WAVE MOTION OVER A SHELF, PART I, by R. M. Durstine. Rept. on Contract Nonr-1866(20). June 59, 66p. 7 refs.
Order from LC mi$3.90, ph$10.80 PB 147 258

The purpose of the present paper is to give an analysis of the problem for a hypothetical ocean which has constant depth B out to a certain distance A from the shoreline. Beyond this point, a constant but greater depth L is assumed. Thus the existence of a continental shelf is introduced into the analysis. In reality both the sloping beach and the shelf geometries show characteristics which are observed in the Atlantic Ocean off the coast of North America. The sloping beach is particularly suitable since the wave forms deduced have been shown to decay to a very small fraction for their shoreline magnitude at distances out to sea for which the continental shelf still exists.

Lamont Geological Observatory, Palisades, N. Y.
SOUNDING AND MAGNETOMETER EQUIPMENT FOR A DRIFTING ICE STATION, by A. C. Hubbard and B. Luskin. Technical rept. no. 19 on Contract NObsr-64547. Dec 59, 31p. 3 refs. CU-52-59-NObsr-64547-Geol.
Order from LC mi$3.00, ph$6.30 PB 149 163

The major objectives of the design were compactness in size, weight and power, and simplicity of circuit design and operation. The instruments described here have been in successful and near-continuous operation since July 1959 and provide a good foundation for design of future instruments of this type.

PRELIMINARY REPORT OF SOUTHERN HEMISPHERE OCEANOGRAPHY, by E. C. Stephan. Rept. on Operation Deep Freeze 60 and Chiper Oceanographic-Hydrographic Observations. 25 July 60, 7p. Serial 5159.
Order from LC mi$1.80, ph$1.80 PB 149 531

Two phases of activity were conducted. Phase I was the underway program and consisted of hourly or half-hourly bathythermograph casts, continuous recording of sea surface and shade air temperatures, collection of surface water samples, and sea and swell (or ice) observations. Phase II, accomplished while hove to, consisted of standard oceanographic stations. These included the collection of temperature data and sea water samples at pre-selected depths extending from sea surface to the bottom. Dissolved oxygen analysis and salinity determination were completed on many samples.

SURVEY OF THE LITERATURE ON TEMPERATURE DETERMINATION AT ALTITUDES ABOVE 120,000 FEET, by James L. George and William H. Peake. Rept. on Contract DA 36-039-sc-84516. 15 Feb 60, 133p. 230 refs. Rept. 973-1; AD-235 897.
Order from LC mi$6.90, ph$21.30 PB 149 379

The first part of this analysis provides a brief introduction to properties of the atmosphere above 120,000 feet, a discussion of the concept of temperature at high altitudes, and a review of the several methods that have been used or proposed for temperature determination in the upper atmosphere. The second part of the analysis consists of the bibliography proper (each entry containing an abstract), itself divided into thirteen sections. The first five sections are concerned with properties of the upper atmosphere, the sixth with vehicles for research at altitudes above 120,000 feet, and the remainder with the various specific methods for temperature measurement, classified according to the quantity under consideration (e.g., scale height, "rotation" temperature, etc.). (Author)

WATER VAPOR DISTRIBUTION ABOVE 90,000 FEET, by David G. Murcray, Frank H. Murcray and others. Scientific rept. no. 5 on Contract AF 19(604)2069. 24 May 60, 28p. 31 refs. AFCRC-TN-60-452.
Order from LC mi$2.70, ph$4.80 PB 149 811

The absorptions due to the 6.3μ band of water vapor have been measured for altitudes up to 92,000 ft. On the basis of these absorptions the humidity mixing ratio for the region above 92,000 ft has been calculated. The calculated values range from 1.5×10^{-4} gm/gm to 3.4×10^{-4} gm/gm. The mixing ratio from 40,000 to 92,000 ft has also been calculated and yields values at least an order of magnitude lower than the values obtained above 92,000 ft. It is concluded that there was at least 20 microns of precipitable water above 92,000 ft over Alamogordo, New Mexico on June 19, 1959. (Author) (See also PB 147 647)

Institute of Paper Chemistry, Appleton, Wis.
A STUDY OF THE FILTRATION AND PERMEABILITY CHARACTERISTICS OF IPC 1478 FILTER PAPER. Final rept. on Contract DA 29-044-XZ-549. 13 Feb 60, 178p. 6 refs. DASA 1168; AD-235 318.
Order from OTS $3.00 PB 161 917

A study was made of the filtration and pressure drop-flow rate characteristics of IPC 1478 filter paper over wide ranges in pressure and temperature. The project was done in two phases: In the first, a wind tunnel was designed and constructed for operation at a pressure of 1/20 atm., a temperature of 7°F and a flow rate of 5000 ft./min. at 1/20 atm. The aerosol was monodisperse spherical particles of SiO_2 whose size distribution function was narrow, peaking at about 0.02 micron. The retention of IPC 1478 paper for these particles was essentially 100%. The study revealed an apparently anomalously high diffusion of these particles in air. In the second phase, the wind tunnel was modified for operation at temperatures down to -40°F and a generator for the production of very small (about 40 A.) particles of aluminum oxide was developed. Retention for the aluminum oxide particles and pressure drop were determined over wide ranges in pressure, temperature, and flow rate. Data reduction theory was developed, and applied to the pressure drop-flow rate observations. Modern kinetic theory was applied to the diffusion of very small particles in a gas, and the theory of diffusion of particles from a streaming gas to the tube wall was evolved and applied to the estimation of particle size. (Author)

CORRELATION STUDIES OF THE Es REGION, by Juhani O. Oksman and Sidney A. Bowhill. Scientific rept. no. 132 on Ionospheric Research, Contract AF 19(604)4563. 1 May 60, 52p. 15 refs. AFCRC-TN-60-484.
Order from LC mi$3.60, ph$9.30 PB 149 312

In studying the sporadic E region, two approaches are possible: either its world-wide occurrence, or the behavior of separate Es "clouds" may be studied. A dense network of observing stations is ideally needed for the latter approach. Since this network is not available, a statistical method is developed which gives the average time and space structure of Es clouds. Unlike conventional statistical methods, allowance is made for gaps in the measured sets of values of foEs caused by various complicating factors. The autocorrelation coefficients, as functions of time and space, of a new quantity fiEs, with an assumed Gaussian probability distribution, have been calculated from observed Es data. The results indicate that Es clouds have sharp edges; that Es occurrences last frequently for more than four hours; that correlation exists between Es occurrences at places more than 700 km apart; and that the direction of apparent Es movements is random, with a velocity of about 70 m/sec. Further use of this method on a world-wide basis is recommended. (Author)

A PRELIMINARY STUDY OF SUNRISE EFFECTS IN THE D-REGION, by A. C. Aiken. Scientific rept. no. 133 on Ionospheric Research, Contract AF 19(604)4563, and National Science Foundation Grant G 5939. 1 June 60, 31p. 11 refs. GRD-TN-60-491.
Order from LC mi$3.00, ph$6.30 PB 149 784

A theoretical determination is made of the electron density distribution in the region between 60 and 100 km for times around sunrise. It is shown that the radiations responsible for ionization are Lyman alpha acting on NO and cosmic ray ionization of O_2 and N_2. This leads to a twilight D region consisting of two strata. The upper layer is under direct solar control, increasing as the optical depth at Lyman alpha decreases. After an initial increase due to photodetachment from O_2^- the lower region, formed by cosmic rays, remains constant. A comparison is made between this model and the behavior of the ionosphere deduced from low and very low frequency radio soundings. (Author)

Ionosphere Research Lab., U. of Pennsylvania, University Park.
STRUCTURE OF THE THERMOSPHERE, by Marcel Nicolet. Scientific rept. no. 134 on Ionospheric Research, Contract AF 19(604)4563. 1 July 60, 82p. 86 refs. GRD-TN-60-496.
Order from LC mi$4.80, ph$13.80 PB 149 785

The vertical distribution of the density in the thermosphere, deduced from satellite observations, must be explained by an increase of the scale height with altitude. An examination of the interrelationships between the absolute values of density in a dark atmosphere

and diurnal conditions of heat conduction reveals that the varying gradient of the scale height above 200km is essentially due to the decrease of the molecular weight, mg, of the atmospheric constituents subject to diffusion. In the night atmosphere the isothermy above a certain altitude (>200km) is the critical factor characterizing the vertical distribution of density. The effect of diffusion has been clearly shown by establishing a thermo-isobaric relation connecting the temperature of the isothermal region with an isobaric level where atomic oxygen has a specific concentration. The gradient of temperature in a sunlit atmosphere is related to the fraction of the ultraviolet sun's energy absorbed, which determines the magnitude of the variation of the scale height with altitude.

Johns Hopkins U., Baltimore, Md.
SOME ASPECTS OF GEOSTROPHIC AND AGEOSTROPHIC SPECTRA OF LARGE SCALE ATMOSPHERIC PHENOMENA, by Arthur B. Kahn. Doctoral thesis. Final rept., vol. 2, on Contract AF 19(604)2056. 15 Nov 59, 171p. 44 refs. AFCRC-[TR]-60-260.
Order from LC mi$8.10, ph$27.30 PB 149 080

The techniques of spectral analysis are used to probe some of the details of large scale atmospheric turbulence and the role it plays in the fundamental problem of the general circulation of the atmosphere. A considerable amount of data at 200 mb is presented and compared with previously available spectra at other levels. In computing such data, it is common practice to make use of data at a discrete number of points around a latitude circle, and also to use the geostrophic assumption. The effects of these procedures are investigated, and it is found that they are of secondary importance. Finally, the occurrence of contragradient fluxes in the atmosphere is investigated. It is found that the direction of the flux of dry enthalpy is explicitly dependent solely upon the tilt with height of synoptic systems, which must in turn be related to the meridional gradient. (Author)

SLIDE RULE FOR COMPUTING THE DENSITY OF ATMOSPHERIC AIR AT GROUND LEVEL, by Paul H Miller. 18 Feb 59, 9p. NOTS TP-2185; NAVORD rept. 6465; AD-213 432.
Order from LC mi$1.80, ph$1.80 PB 146 469

A slide-rule calculator for determining the density of atmospheric air at ground level in slugs per cubic foot is described. Densities are determined as functions of pressure (in millibars), temperature (in degrees Fahrenheit) and relative humidity (expressed as a percent and with respect to water), and are accurate to the nearest 10^{-5} slugs/foot^3. (Author)

Ohio State U. Research Foundation, Columbus.
NUMERICAL EVALUATION OF RADIATION ERRORS OF RADIOSONDE TEMPERATURE ELEMENT ML 419 AT ALTITUDES UP TO 150,000 FEET, by J. H. Shaw. Technical rept. no. 3 on Contract DA 36-039-sc-78153. Mar 59, 52p. 7 refs. AD-218 344.
Order from LC mi$3.60, ph$9.30 PB 148 547

Typical and extreme values of the daytime and nighttime radiation errors (in °K) of the unshielded thermistor temperature element ML-419 currently used by the U. S. Army Signal Corps in radiosonde soundings are evaluated for pressure levels of 100, 12, and 1.2 mb (corresponding to altitudes of about 52,000, 97,000 and 149,000 ft. respectively) and for atmospheres of different temperature distributions. (Author)

Ohio State U. Research Foundation, Columbus.
THEORETICAL ANALYSIS OF RADIATION ERRORS OF RADIOSONDE TEMPERATURE ELEMENTS, by J. H. Shaw. Technical rept. no. 2 on Contract DA 36-039-sc-78153. Jan 59, 58p. 16 refs. AD-218 342.
Order from LC mi$3.60, ph$9.30 PB 148 546

Methods for estimating typical and extreme values of solar and thermal radiation fluxes for different atmospheric conditions and for altitudes above 50,000 ft are formulated. A theoretical investigation is then made of the factors which influence the equilibrium temperature of a body in the atmosphere exposed to this radiation flux and also exchanging heat by convection with the surrounding air. A relation is then developed from which a numerical evaluation of the radiation error of the ML-419 temperature element can be made. (Author)

ADAPTATION OF AN ELECTROLYTIC WATER VAPOR DETECTOR FOR BALLOON MEASUREMENT OF WATER CONTENT OF THE ATMOSPHERE, by James L. Waters. Final rept. on Phase 2, Contract AF 19(604)5464. Apr 60, 13p. AFCRC-TR-60-45(II).
Order from LC mi$2.40, ph$3.30 PB 148 934

The adaptation of an electrolytic water vapor detector for the measurement of water content in the atmosphere between 6 and 16 kilometers is described. The instrument is designed for balloon operation. A discussion outlines present limitations of the instrument and how its performance can be improved. (Author)

Waters Associates, Framingham, Mass.
THE USE OF SELECTIVE DETECTORS FOR ATMOSPHERIC MEASUREMENTS, by James L. Pritchard. Final rept. on Phase 1, Contract AF 19(604)5464. Apr 60, 46p. 6 refs. AFCRC-TR-60-245(I).
Order from LC mi$3.00, ph$7.80 PB 148 933

An investigation of how the phenomena of pressure broadening would effect the use of the selective detector when used to measure the concentration of atmospheric gases has been investigated. Both self broadening and foreign gas broadening have been considered. It has been determined that changes in pressure cause changes in absorption of the same order of magnitude as changes in concentration within the range of concentration and pressure of interest. The use of the selective detector to measure "temperature" of atmospheric gases was explored, and the results indicate that its use in this application might be substantial. Finally, the question of using the selective

detector for the measurement of O_3 was studied. While this application is not as straightforward as with gases that are chemically inert, there seems to be no reason to believe that intelligent design cannot overcome the difficulties. (Author)

THE COMPARISON OF STRAIN AND KINETIC ENERGY IN A PLASTIC WAVE MOVING THROUGH SAND, by A. A. Thompson. Apr 60, 12p. 1 ref. Memo. rept. no. 1263.
Order from LC mi$2.40, ph$3.30 PB 149 012

The time-histories of strain and kinetic energy for a unit volume of material have been measured in sand plastically deformed when traversed by a stress wave. Most of the total energy in the medium was strain-energy, practically of which was lost to the medium during propagation. Considerably less than 50% of the total energy appeared as kinetic energy. The dynamic stress-strain curve used for these strain-energy determinations showed that, in the very plastic region, most of the strain energy was applied to the medium after the time of peak stress. The above facts are quite different from phenomena encountered in elastic or viscoelastic propagation. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
A COMPARISON OF THE DYNAMIC AND THE STATIC STRESS-STRAIN CURVE IN SAND UNDER CONFINED AND UNCONFINED CONDITIONS, by A. A. Thompson. Apr 60, 9p. Memo. rept. no. 1262.
Order from LC mi$1.80, ph$1.80 PB 149 011

Measurements of the dynamic and static stress-strain curves in sand show a very large change in shape with change in the rise time of the stress. When the sand is confined on all sides so as to minimize lateral expansion, the slope of the static stress-strain curve becomes much steeper after a 1% strain. If much of the air space in the sand is removed, the static loading curve becomes considerably steeper. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
THE RELATION OF SEISMIC ENERGY ATTENUATION TO THE AREA UNDER THE STRESS-STRAIN CURVE, by A. A. Thompson. Apr 60, 12p. 1 ref. Memo rept. no. 1261.
Order from LC mi$2.40, ph$3.30 PB 148 904

Seismic energy attenuation in a sand medium has been determined by measuring the total energy at various distances from an explosive source and also by measuring the area between the loading and unloading parts of the stress-strain curve. Theory and experiment show that the value of attenuation determined from the stress-strain curve may be less than the true value when the attenuation is very large. (Author)

ENGINEERING

Naval Civil Engineering Lab., Port Hueneme, Calif.
DEVICE FOR REPLACING TIE RODS IN PONTOON ASSEMBLIES, by J. V. Stalcup and R. C. Towne. Final rept. 26 May 60, 17p. 2 refs. Technical rept. 079.
Order from LC mi$2.40, ph$3.30 PB 148 554

Wedge clamps, which joins bottom pontoon angles, were tested as a replacement for tie rods. They are satisfactory for joining pontoon strings, especially pontoon structures wider than three strings but do not resist vertical shear between strings during side lauching. The clamps are not hindered by sea water corrosion. When they can be used, P-5 or AP-1 plates are better than clamps. An improved jacking device for installing and removing the wedge clamps is recommended as a further development study. (Author)

DEVELOPMENT OF STANDARD TEST INDUCTOR CRITERIA, by J. D. Segrest. Phase 1, rept. no. 1. 23 July 59, 28p. 4 refs. TED Proj. ADC EL-5006; rept. no. NADC-EL-L5941.
Order from LC mi$2.70, ph$4.80 PB 148 065

This report covers the development of criteria upon which a series of standard 28-V d-c test inductors should be based. These criteria were developed from the results of an engineering investigation of the parameters encountered in 28-V d-c equipment, the present methods of inductive load testing, and the adequacy of the present AN3179 laboratory test inductors.

Armour Research Foundation, Chicago, Ill.
STUDIES AND INVESTIGATION OF AIR TRAFFIC CONTROL SYSTEMS, by G. W. Bond, K. S. Gale and others. Final rept. for 10 Jan 57-9 Jan 58, on Contract DA 36-039-sc-73104. 9 Jan 58, 38p. ARF Project E079.
Order from LC mi$3.00, ph$6.30 PB 147 944

Results of a systems analysis and simulation study of a postulated 1965 enroute traffic control system in the New York-Washington area are reported: (1) system description, (2) preliminary analysis, (3) traffic sample considerations, (4) assignment of traffic demand, (5) simulation model considerations, (6) graphical simulation, (7) computer simulation. (Author)

Armour Research Foundation, Chicago, Ill.
STUDIES AND INVESTIGATIONS OF TRAFFIC CONTROL SYSTEMS, by G. W. Bond, K. S. Gale, and J. W. Haake. Quarterly progress rept. no. 2, 9 Apr-9 July 57, on Contract DA 36-039-sc-73104. 9 July 57, 54p. 1 ref. ARF Proj. E079; AD-151 453.
Order from LC mi$3.60, ph$9.30 PB 147 943

A new traffic sample was made which reflects more realistically the available forecasts of 1965 air traffic. Graphical simulations were made of various airways within the study area. The entry and exit points and the climb and descent regions were heavily loaded. The climb and descent phases of enroute flight present the most difficult traffic control problems. A simulation of air traffic along an airway was programmed on the IBM 650 computer. Rules for use in simulating and/or controlling off-airways traffic were studied.

Avco Corp., Nashville, Tenn.
DESIGN, DEVELOPMENT AND FABRICATION OF A LIGHT WEIGHT AIRFRAME. Monthly progress rept. no. 1, 6 May-31 May 60, on Contract DA 33-008-ORD-1968. [1960] 39p.
Order from LC mi$3.00, ph$6.30 PB 149 302

The lightweight airframe structure consists of a tangent ogive of 195.0-inch radius 48-inches long. The diameter at Sta. 48.0 is 12-inches. The design is based on an aluminum honeycomb construction which design studies have shown best satisfies the optimum requirements of weight, shell stability, aerodynamic smoothness, deflection and strength criteria.

Ballistic Research Labs., Aberdeen Proving Ground, Md.
ON THE PROPERTIES OF LADDER NETWORKS, by Keats A. Pullen, Jr. Apr 60, 64p. 13 refs. Rept. no. 1102.
Order from LC mi$3.90, ph$10.80 PB 148 902

The properties of the repetitive ladder (or L) network are analyzed in terms of their repetitive properties and of their associated tree relations. The relation of the transfer elements to the ladder network matrix, and methods of matrix reduction by use of partial uncoupling is considerd. Number relations for the ladders are derived and tables of numerical coefficients presented. (Author)

RESEARCH INVESTIGATION OF CATHODE EMISSIVE MATERIALS, by W. E. Danforth and D. L. Goldwater. Scientific rept. no. 8 on Contract AF 19(604)3904. 15 Apr 60, 21p. 6 refs. AFCRC-TN-60-385.
Order from LC mi$2.70, ph$4.80 PB 148 517

Life tests to date with thorium impregnated matrix cathodes have yielded the result that at least 10,000 hours is readily attainable at the 2.3 amp./cm^2 (1650^oC_B) level. Tests at higher levels are in progress. An investigation is described in which a high sensitivity analytical balance of standard design is used for determination of the surface density of that thorium layer which corresponds to maximum thermionic emission with the thorium-on-tungsten system. Metallographic studies are described of the polycrystalline specimens used in the above investigations and also of a single crystal tungsten ribbon to be used in future experiments. GENERAL AIR-GROUND COMMUNICATION STUDY [AND] EXPERIMENTAL AIR TRAFFIC CONTROL COMMUNICATION SYSTEM, by J. H. Craig, M. M. Ditta and others. Interim rept. Task A, pt. 4 and Task D, pt. 3, 1 July 56-15 May 57, on Air Traffic Control Communications, Contract DA 36-039-sc-64567. 15 May 57, 143p. AD-139 519.
Order from LC mi$7.20, ph$22.80 PB 147 947

Task A, part 4: The present air traffic control system is discussed with reference to the following: (1) the interrelation of airway structure, communication time, and delays to aircraft; (2) the number of VFR flights predicted versus IRF experience; (3) airway and fix usage; (4) air-to-ground radio channels; (5) the characteristics of air traffic in the New York terminal area; and (6) the relations between the number of operations during peak and average hours. An exploratory study was directed towards the development and provision of an experimental data link. Task D, part 3: Engineering assistance was provided in (1) the planning and establishing of an experimental arrangement which permits the routing of flight plans through an 81D1 teletypewriter switching system and the printing of appropriate flight strips; (2) a study of the flow of air traffic in the Indianapolis Center; and (3) the programming of a high-speed computer for use in the experimental system.

Bell Telephone Labs., Inc. [New York]
HIGH-VOLUME WEATHER INFORMATION COMMUNICATION SYSTEM, by E. E. Schwenzfeger. Final rept. Task D, pt. 2, 1 Jan 56-20 Nov 57, on Air Traffic Control Communications, Contract DA 36-039-sc-64567 20 Nov 57, 28p.
Order from LC mi$2.70, ph$4.80 PB 147 948

The proposed system is in effect based on the old telephone party line concept in which any or all subscribers could listen in on any or all conversations if they wished. It is a party line arranged for transmitting data and messages at the rate of 1,000 words per minute. There may be as many as 1,000 stations

which transmit data and perhaps as many as 5,000 which receive it. However, the proposed system is unlike the old telephone party line in that the transmitting stations get on the line only at the invitation of a master control station which is programmed by operating personnel to call in the stations as required. Receiving stations are programmed, that is to say, "instructed" by operating personnel to monitor the line and automatically cut in to receive desired data from transmitting points in which they are interested. The program at receiving stations may be arranged to select any number of transmissions from the line. This program may also be readily altered by non-technical operating personnel to meet changing data requirements.

Bell Telephone Labs., Inc. [New York].
STUDY OF AIR TRAFFIC IN THE HIGH-DENSITY AREA OF NORTHEASTERN USA AND FORECASTS FOR 1960-65, by J. H. Craig, C. C. Scanlan and others. Interim memo. Task A, pt. 4 on Air Traffic Control Communications, Contract DA 36-039-sc-64567. 31 Dec 56, 53p. 14 refs.
Order from LC mi$3.60, ph$9.30 PB 147 946

An essential element in the design of any communication system is knowledge of the number of subscribers to be served. In the absence of traffic data sufficiently complete for planning effort, work was initiated which has culminated in the preparation of traffic statistics covering a fairly large-sized area. These data cover the traffic for 1955 and are extended into forecasts for 1960 and 1965.

Bureau of [Naval Weapons] Washington, D. C.
A BRIEF DESIGN STUDY OF A GROUND-EFFECT-LIMITED FLIGHT VEHICLE, by H. O. Hollenberg. Aug 57, declassified 8 Apr 60. 20p. 1 ref. Rept. no. DR-1887.
Order from LC mi$2.40, ph$3.30 PB 146 983

Recent experiments by the NACA have shown that a thrust augmentation can be obtained from an annular nozzle in proximity to the ground when compared to a conventional circular nozzle of equal flow area. This principle led to the concept of the ground-effect flight vehicle. This machine flies close to the ground and achieves a large portion of its lift from the sustaining high pressures contained within the annular jet sheet.

Cook Research Labs., Morton Grove, Ill.
PRELIMINARY STUDY OF EMERGENCY LANDING SYSTEMS FOR NON-AUTOROTATING AIRCRAFT AND/OR CREW, by A. H. Solarski and J. A. Fratamico. Final study rept. for June 59-June 60 on Contract DA 44-177-TC-598. 3 June 60, 149p. 12 refs. Rept. P-1890.
Order from LC mi$7.20, ph$22.80 PB 149 441

A preliminary study has been conducted to determine the feasibility of providing emergency landing systems for non-autorotating aircraft and/or crew. Various emergency systems, and techniques are evaluated for their utility in emergency situations peculiar to VTOL aircraft operation. The systems are evaluated with respect to their operational limitations and to the weight penalty imposed on the aircraft. Minimum weight systems are derived in the instance of multiple element systems. Systems qualifying under the above evaluation are further assessed with respect to their utility relative to aircraft type and to material malfunction type. The relative applicability of the qualified systems under the latter considerations is estimated quantitatively. (Author)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
A TEST APPARATUS FOR SMALL ROTORCRAFT. VOLUME I. DEVELOPMENT AND OPERATIONAL CHECK OUT, by Edward M. Sullivan. Rept. on Contract DA 44-177-TC-440. Nov 59, 51p. 2 refs. Rept. no. SG-1195-S-3; AD-235 202.
Order from LC mi$3.60, ph$9.30 PB 148 396

This report describes in detail the design features of a test apparatus that can be utilized to determine the full scale static and dynamic stability characteristics of small rotorcraft. The comparison that is made between the data obtained for a test rotorcraft mounted on the test apparatus and those obtained by NASA for a similar rotorcraft during wind tunnel tests indicates that accurate aerodynamic data can be obtained by the use of the C. A. L. test equipment. (Author) (See also PB 136 564)

David Taylor Model Basin, Washington, D. C.
A PRELIMINARY DESIGN TECHNIQUE FOR ANNULAR-JET GROUND-EFFECT MACHINES (GEM'S), by Harvey R. Chaplin. Sep 59, 15p. Rept. 1371; Aero rept. 966.
Order from LC mi$2.40, ph$3.30 PB 149 822

This report released for sale to the public 26 Aug 60.

Mathematical approach consists of "Mathematical Model" incorporating all of significant descriptive dimensions of vehicle. Provides formulas and curves sufficient to describe vehicle and its hovering performance. In addition, several efficiency factors have been introduced to account for effects to be encountered in operation. Method allows comparisons of different vehicle designs. (Author)

David Taylor Model Basin, Washington, D. C.
SHROUDED PROPELLER THRUST RATIO AS A MEASURE OF SHROUD AND PROPELLER STATIC PERFORMANCE, by Harvey R. Chaplin. Jan 59, 37p. 5 refs. Aero rept. 951; AD-212 203.
Order from LC mi$3.00, ph$6.30 PB 146 588

Formulas for shroud efficiency and propeller efficiency are derived from the one-dimensional momentum theory. These formulas provide a means for approximate evaluation of the static performance of the shroud and propeller individually, in addition to the over-all static performance, from measurements of the total thrust, the propeller thrust and the power input. The formulas are applied to a typical set of experimental data, and are found to provide a quite reasonable interpretation of the experimental results. An extension of the theoretical results to the case of forward flight with axially symmetric flow is presented in an appendix. The one-dimensional momentum theory is still, despite its obvious oversimplification of the flow processes, the keystone of our working knowledge of shrouded propellers. It has furnished the commonly accepted definitions of static efficiency (or "figure of merit") and the commonly accepted standards for ideal division of thrust between the shroud and the propeller. (Author)

De Havilland Aircraft Co., Ltd. (Canada).
PRELIMINARY DESIGN STUDIES TO APPLY HIGH FLOTATION ROUGH TERRAIN LANDING GEAR SYSTEM TO THE YAC-1 DH AIRCRAFT. Final rept. Subcontract on Contract DA 44-177-TC-580. July 60, 317p.
Order from LC mi$11.10, ph$48.60 PB 149 209

This report covers the feasibility and preliminary design of high flotation landing gear structure on YAC-1 DH Aircraft for operation under rough field conditions. Considering weight, aerodynamic drag, simplicity, rough field adaptability and necessary changes to existing aircraft structure, the final proposal pointed to a 4 wheel, independent suspended, non-retractable 54" dia. 12 psig tyred main gear mounted to the sides of the fuselage along with a two 35" diam. 10 10 psig tyred nose gear, fixed. Due to lack of advanced information at this time, this scheme presupposes that a suitable tyre rebound damping system is feasible. (Author)

PROGRAMMING OF DIGITAL COMPUTERS FOR DETERMINATION OF STABILITY AND CONTROL CHARACTERISTICS. VOLUMES I AND II, by D. E. Drake, E. R. Keown, and J. R. Matlock. Rept. for 1 July 58-1 July 59 on Contract AF 33(616)5953. 1 July 59, 596p. 2 refs. WADC Technical rept. 59-290, Vol. I and II; AD-228 822.
Order from OTS $7.00 PB 161 924

The analysis of the stability and control characteristics of a flight vehicle configuration is a long, complicated problem. The compilation of the USAF Stability and Control Handbook (M-03671) represents a major contribution to the solution of this problem. The purpose of the research reported is to simplify the necessary computations by replacing the nomograms of M-03671 with numerical tables and procedures and to place the resulting calculation on a large-scale, digital computer. It was found that the graphical techniques of M-03671 lent themselves readily to numerical analysis and no special difficulties were encountered in programming the procedures. The entire calculation for the longitudinal characteristics of a given configuration requires approximately 6 seconds. (Author)

Garbell Research Foundation, San Francisco, Calif.
THE TIMING OF AIRPORT TRAFFIC CONTROL AS INFLUENCED BY WEATHER AND AIRCRAFT PERFORMANCE, by Maurice A. Garbell. Rept. on Contract Cwb-8175. Sep 51, 390p. 86 refs. Garbell Aeronautical Series no. 4.
Order from LC mi$11.10, ph$69.10 PB 147 951

The present study of airport traffic control timing as influenced by weather and aircraft performance was motivated by the established fact that "bad" weather reduces the acceptance rate of a given airport. The immediate objective of the present investigation is to supplement existing intuitive procedures by a substantial method of engineering planning. The first step undertaken was to assess dependably the extent to which meteorological phenomena and aircraft performance affect the timing of air traffic control in a crowded terminal area. A generalized method has been developed whereby meteorological data, both observational and prognostic, can assist effectively in the prediction of airport acceptance rates.

Kellett Aircraft Corp., Willow Grove, Pa.
PRELIMINARY DESIGN OF AN AIRBORNE SUPPORT PLATFORM (ASP). Rept. for 23 June 59-8 Jan 60 on Kellett Model no. K-28, Contract DA 44-177-TC-597. 7 Jan 60, 126p. 16 refs. Rept. no. 173X90-2.
Order from LC mi$6.30, ph$19.80 PB 149 817

Presented in this report are the results of a preliminary design study of a tandem unshrouded rotor aircraft which would satisfy the Army's concept of an aerial jeep; the Kellett version is a more versatile vehicle and is designated as an Airborne Support Platform. Special design considerations, such as low silhouette, narrow operating width, provisions for rotor protective guards, and a vehicle that can be readily transported by the C-130 airplane, are of primary importance. The design study considers the effect of payload (500 lbs. versus 1000 lbs.) on the size, weight and power plant, with particular emphasis placed on the 1000 lb. payload vehicle. The power plant recommended is the T-63-A-3 shaft turbine engine planned for the 1960 - 1963 time period.

Lansdale Tube Co., Pa.
DIFFUSED-BASE R. F. POWER OSCILLATOR JUNCTION TRANSISTORS, by James D. McCotter. Quarterly progress rept. no. 1, 20 June-30 Sep 58, on Contract DA 36-039-sc-78051. [1958] 46p. Philco no. R-220-1.
Order from LC mi$3.30, ph$7.80 PB 149 114

The equipment necessary to fabricate the diffused-base rf power oscillator junction transistor has been assembled, and the fabrication process has been substantially determined. Testing and evaluation of experimental model transistors has shown that an extremely thin base width, and consequently a low collector diode breakdown voltage, is necessary to obtain the electrical characteristics for this device. The suggested specification limits reflect this fact. A mechanized electrolytic clean-up etcher, being developed, should result in a much higher degree of reproducibility and, consequently, a greater yield. (Author)

Naval Air Material Center, Philadelphia, Pa.
THE XEE EXPERIMENTAL ELECTRIC CATAPULT, by J. B. London. 15 Oct 43, declassified 27 Sep 58, 91p. 6 refs. Rept., Part 1 of 2, on TED no. NAM-3404.
Order from LC mi$5.40, ep$16.80 PB 149 613

This report released for sale to the public 11 Aug 60.

Naval Research Lab., Washington, D. C.
STUDIES ON THE FUEL-IGNITION-SUPPRESSION CAPABILITY OF FOAM-COVERED RUNWAYS FOR AIRCRAFT, by H. B. Peterson, E. J. Jablonski, and R. L. Tuve. Final rept. 22 July 60, 68p. 22 refs. NRL rept. 5492.
Order from OTS $1.75 PB 161 783

A comprehensive study has been made of foam-covered runways as a means of suppressing fuel ignition by friction sparks produced by emergency landings of disabled aircraft. The effectiveness of foam as a spark suppressant was found to be dependent on many variables, such as the type of runway construction, the type of aircraft metal, the flammability of fuel, and the depth and age of the foam. Aluminum alloy was found to be the least hazardous of the aircraft metals, since no friction sparks could be produced with this metal. Titanium was the most hazardous aircraft metal tested with respect to fuel ignition by friction sparks, and foam was found to be entirely ineffective as a spark suppressant. Foam spark-suppression effectiveness varied from 57 percent to 100 percent for magnesium alloy, stainless steel, and other aircraft steels tested. Incendive-spark suppression was attributed to the coating effect of the water layer at the runway-foam interface resulting from the continuous drainage of water from the foam mass. Optimum results were obtained with a 2-in. depth of foam (expansion 12, containing 0.1 gal water per square foot) that was evenly laid on the runway surface and that had aged for a 10-15 period. Procedures for properly outfitting existing Navy field equipment (MB-1 and MB-5 crash vehicles) and the material requirements for runway foaming have been established. (Author)

[Pacific] Missile [Range] Point Mugu, Calif.
DEVELOPMENT OF THE KDG-1 AND KD3G-1 TARGET PILOTLESS AIRCRAFT, by W. C. Slowey. Final rept. on Proj. TED MTC PA-604 (formerly TED PAU 1803). 24 June 49, declassified 12 June 56, 39p. 11 refs. Technical rept. no. 51.
Order from LC mi$3.00, ph$6.30 PB 148 629

A total of 66 KD3G-1 and 44 KDG-1 flights were conducted to determine the controllability, maneuverability, stability, rate of climb, maximum air speeds, and endurance of the target P/A. Several modifications that appeared necessary as a result of these tests were incorporated in production versions of the KDG-1 and KD3G-1, which were later designated as the KDG-2 and the KD3G-2, respectively. (Author)

Princeton U., N. J.
THE EFFECT OF CONFIGURATION ON THE LIFT AUGMENTATION RATIO OF A TWO DIMENSIONAL OPEN PLENUM GROUND EFFECT MACHINE, by Dean E. Wright. Rept. on Contract DA 44-177-TC-524. May 60, 133p. 2 refs. Rept. no. 516.
Order from LC mi$6.90, ph$21.30 PB 149 527

This report deals with the base pressure distributions of a two-dimensional open plenum ground effect machine model in simulated hovering flight. The following design parameters were varied, nozzle area/base area, side depth, mass flow, side inclination, and flow diversion. The effect of the variation of these parameters on the pressure distribution, hence lift augmentation was investigated. Flow patterns have been deduced from these distributions and from smoke studies. Also included are a brief theoretical investigation and an investigation into the effect of inclining the model. (Author)

Stanford U., Calif.
ON THE OPTIMUM RESPONSE OF THIRD ORDER CONTACTOR CONTROL SYSTEMS, by I. Flügge-Lotz and Mih Yin. Rept. on Div. of Engineering Mechanics Contract AF 49(638)513. 25 Apr 60, 144p. 13 refs. Technical rept. no. 125; AFOSR-TN-60-476.
Order from LC mi$7.20, ph$22.80 PB 148 921

This investigation is concerned with the optimum response for contactor or relay control systems. The systems are described mathematically by second and third order differential equations with constant coefficients and with a discontinuous forcing term, $\pm$ N. The performance criterion is that the time interval required for the control system to reduce an initial disturbance to zero should be minimum. Significant results toward the solution of the problem have been obtained either intuitively or rigorously by various previous investigators. In the present investigation an attempt toward the optimum solution is made with the aid of the maximum principle for systems with three characteristic roots.

Transistor Applications, Inc., Boston, Mass.
RESEARCH DIRECTED TOWARD THE STUDY, ANALYSIS AND DESIGN OF TRANSISTOR by A. W. Carlson. Scientific rept. no. 3, 1 Nov 59-29 Feb 60, on Contract AF 19(604)4089. Apr 60, 29p. AFCRC-TN-60-395.
Order from LC mi$2.70, ph$4.80 PB 148 556

This report describes work with nonlinear lines having a constant series inductance and voltage dependance shunt capacitance (such as a reverse biased junction diode). Experimentally, it is found that a signal applied to such a line acting to decrease line capacitance has its slope increased as it progresses

down the line. A solution for a wave traveling along a uniform lossless distributed line having a voltage dependent shunt capacitance or a current dependent series inductance is obtained. (Author) (See also PB 145 283)

Wichita U., Kansas.
SHROUDED PROPELLER INVESTIGATIONS: SHROUD AND CENTERBODY PRESSURE DISTRIBUTIONS OF A SHROUDED PROPELLER WITH A 17-BLADED ROTOR, INLET AND EXIT STATORS AND LONG CHORD SHROUD, by Vernon O. Hoehne. Rept. on Contract Nonr-201(01). Oct 59, 100p. 1 ref. Engineering rept. no. 213-9; AD-230 440.
Order from LC mi$5.40, ph$15.30 PB 149 484

The static pressure distribution on the surface of the shroud and centerbody of a shrouded propeller model was measured in the wind tunnel. The shrouded propeller model embodied 18 adjustable inlet guide vanes, 17 propeller blades, and 19 exit stator vanes; and was equipped with a centerbody or hub having a hub-tip ratio of 0.4. The model incorporated 3 interchangeable shroud inlets: 2 designed for static and low speed operation, and 1 for high speed flight. Pressure distributions were obtained for a range of external advance ratios from approximately 0.20 through 1.50. at angles of attack from zero to 90° and with 3 inlet vane settings. Results are presented as pressure coefficient plotted against model axial location in per cent of chord at various constant values of advance ratio. (Author) (See also PB 140 348)

Wichita U., Kansas.
A METHOD OF DESIGN OF SHROUDED PROPELLERS, by Vernon O. Hoehne and Richard E. Monical. Rept. on Contract Nonr-201(01). Oct 59, 37p. 9 refs. Engineering rept. no. 213-8; AD-228 388.
Order from LC mi$3.00, ph$6.30 PB 149 483

One method of designing shrouded propellers using information derived by several authors was developed and used to design several wind tunnel models. An outline of the resultant design procedure is included along with appropriate discussion pertaining to the method. Results of tests of one of the models designed by these procedures are compared with predicted data to establish, for one case only, the validity of the method. The comparison shows that this system of design predicted performance within the range of normal design accuracy. Predicted efficiency was several percentage points lower than achieved efficiency. California Inst. of Tech., Pasadena.
VISCOSITY OF FLUIDS AT HIGH PRESSURES. A ROTATING CYLINDER VISCOMETER AND THE VISCOSITY OF n-PENTANE, by H. H. Reamer, G. Cokelet, and B. H. Sage. Rept. on Project Squid, Contract Nonr-1858(25). Jan 59, 36p. 34 refs. Technical rept. CIT-4-P.
Order from LC mi$3.00, ph$6.30 PB 146 540

A rotating cylinder viscometer suitable for measurements at pressures up to 25,000 pounds per square inch in the temperature interval between 0° and 500°F. is described. Experimental measurements which have been obtained for n-pentane are included as an example of the results to be expected with this instrument. (Author)

Cornell U., Ithaca, N. Y.
AN INTEGRAL PROCESSING UNIT USING A SECONDARY REFRIGERANT, by H. F. Wiegandt. Rept. on Saline Water Conversion by Freezing, Contract 14-01-001-107. Aug 60, 51p. 13 refs. Saline Water Research and Development Progress rept. no. 41.
Order from OTS $1.50 PB 161 906

Large sea water conversion plants which in their operating cycle produce ice with the use of a direct-contact, immiscible refrigerant should ultimately be able to produce potable water with a work-energy requirement of less than 6 Btu per pound of product. The present design for a 10 million gallon per day plant shows a requirement of 11.8 Btu per pound of product with an estimated product cost of $0.38 per thousand gallons. The plant cost is equivalent to $0.67 per daily gallon. An integral unit is projected in which a washing zone serves as a hydraulic seal between the freezing and melting zones. A rapid direct-freezing step, a washing operation in which the ice bed is propelled by a hydraulic piston action, and a melting step in which refrigerant is condensed directly on dumped bulk ice are the major contributions of this work. (Author)

A STUDY OF VAPORIZABLE EXTINGUISHANTS, by David L. Engibous and Theodore R. Torkelson. Rept. for 1 July 58-Aug 59 on Contract AF 33(616)5838. Jan 60, 124p. 73 refs. WADC Technical rept. 59-463.
Order from OTS $2.75 PB 161 942

Bromochloromethane (CB) is now used as the vaporizing liquid fire extinguishing agent on crash trucks as a supplement to mechanical protein foam, which is the primary means of combatting flammable liquid fires. CB is recognized to present a toxicity problem of ill-defined magnitude. Other agents have been proposed as replacements for CB and this study evaluated the

following compounds for this purpose: Dibromodifluoromethane, Halon 1202; Bromochlorodifluoromethane, Halon 1211; Bromotrifluoromethane, Halon 1301; 1, 2-Dibromotetrafluoroethane, Halon 2402; CB was used as a standard of comparison throughout. A comprehensive survey and analysis of existing literature on these agents which covers effectiveness, toxicity, physical properties, test methods, and dispensing techniques is included. As a result of this study, Bromochlorodifluoromethane (Halon 1211) appears as a promising agent for optimum ground fire protection.

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
APPARATUS FOR ZONE REFINING HIGHLY REACTIVE METALS, by G. E. Spangler, M. Herman, and J. L. Rutherford. Rept. on Contract AF 18(600)1581. July 60, 12p. Interim rept. I-A1878-5; AFOSR-TN-60-693.
Order from OTS $0.50 PB 161 929

The development of improved apparatus for the purification of highly reactive metals by the floating zone technique is described. The resultant design consists of a hermetically sealed, all-glass system using a static inert atmosphere which is internally gettered. The apparatus is simple to construct, easy to operate, and provides an absolute minimum of contamination from gaseous impurities. (Author)

HOLD-DOWN CLAMP FOR 3 x 15 PONTOON CAUSEWAY, by J. V. Stalcup. Final rept. 28 June 60, 21p. Technical rept. 076.
Order from LC mi$2.70, ph$4.80 PB 149 156

Hold down clamps secure causeways to an LST during side carry operations. Ten hold down clamps were tested and all held a greater load then 32,000 lb. BuDocks No. 2, PHIBCB Two No. 1, and NCEL No. 3, appeared comparable on the basis of strength weight, cost, and ease of installation. It is recommended that these three clamps be in-service tested for securing 21-ft wide causeways for side carry. (Author)

NEW AND MODIFIED ANCHORS FOR MOORINGS, by R. C. Towne and J. V. Stalcup. Final rept. 14 Mar 60, 141p. 9 refs. Technical rept. 044.
Order from LC mi$7.20, ph$22.80 PB 149 998

This report released for sale to the public 9 Sep 60.

This report describes the design and development of a family (200 lb, 6,000 lb, 9,000 lb, 12,000 lb) of new mooring anchors which is lightweight, performs efficiently in sand or mud bottoms, and provides a range of holding powers of 6,000 to 10,000 lb. (Author)

Naval Civil Engineering Lab., Port Hueneme, Calif.
WAREHOUSE AND PRESERVATION METHODS AND ECONOMICS FOR STORING MATERIAL, by R. J. Zablodil and J. C. King. Interim rept. 28 June 60, 114p. 9 refs. Technical rept. 075.
Order from LC mi$6.00, ph$18.30 PB 149 233

To evaluate storage and preservation methods, paired equipment is being stored for 5 years in open air, shed and standard, 40% R H and 50% RH warehouses. One of each pair is domestic and the other contact preserved. Results after 2-1/2 years show open air poor, shed fair, standard warehouse good and the RH warehouses best in protective ability. Contract preservation prevents rust better than domestic preservation, and it is cheaper to store non-automotive, metal equipment in the 50% RH warehouse. The test will continue for 2-1/2 more years. ANALYSIS OF TINKERTOY TECHNIQUES AS APPLIED TO RADAR SET AN/APN-22. Phase rept. on TED Proj. ADC EL-44020. 25 Jan 55, 16p. 2 refs. Rept. no. NADC EL-L5502
Order from LC mi$2.40, ph$3.30 PB 146 966

The Tinkertoy technique, i.e. the Modular Design of Electronics (MDE), is the assembly of electronic equipment by the use of modules which are dimensionally standardized yet have a wide range of electronic applications. A module is a stacked assembly of ceramic wafers imprinted with circuit patterns and bearing miniature electronic parts. The automatic method of manufacturing wafers, processing the imprinted circuits, applying the parts and components, assembling the modules, and performing complete inspections and tests, are referred to as Mechanized Production of Electronics (MPE), but more specifically as the application of Tinkertoy techniques.

EVAPORATIVE COOLING OF AIRBORNE ELECTRONIC EQUIPMENT BY SPRAY AND PACKED CHAMBER TECHNIQUES, by Leonard F. Tomko. Phase rept. on TED Proj. ADC EL-9021. 19 Apr 57, 26p. 4 refs. Rept. no. NADC-EL-5712; AD-139 012.
Order from LC mi$2.70, ph$4.80 PB 148 423

An investigation of a spray chamber cooling system and a packed chamber cooling system was made to determine their performance characteristics and to determine whether a theoretical mathematical analysis could be correlated with empirical data. A simulated model of an electronic package was used to gather the data. Air and water flowed countercurrently through a diffusion chamber within the simulated electronic package where the simultaneous heat and mass transfer occurred. A mathematical design technique is described and equations are derived relating the average electronic equipment case temperature to the variables in the simultaneous heat and mass transfer system. The results of the tests showed that a spray chamber cooling system is adequate to maintain case temperatures from 80° to 130° F under the following conditions: (1) airflow and water-flow rates varying from 40 to 100 lb/hr; (2) air temperatures varying from 90° to 260° F; (3) water temperatures varying from 35° to 160° F; (4) an average dewpoint temperature of 52° F for the incoming air; and (5) a 500-watt load at sea level. The packed chamber cooling system is adequate to maintain case temperatures from 116° to 154° F under the following conditions: (1) airflow rates from 40 to 160 lb/hr; (2) water-flow rates from 40 to 106 lb/hr; (3) average air temperature of 109° F; (4) average dewpoint temperature of 55° F; (5) average water temperature of 112° F; and (6) a 1000-watt load at sea level. (Author)

Airborne Instruments Lab., Inc., Mineola, N. Y.
RADIO NAVIGATION AIDS IN COMMON AIR-TRAFFIC CONTROL SYSTEMS, by L. A. Hartman, J. P. Hektner, and A. Tatz. Final engineering rept. on Contract AF 30(602)1444. May 57, 84p. 4 refs. Rept. no. 3580-1; RADC TR-57-132; AD-131 200.
Order from LC mi$4.80, ph$13.80 PB 149 255

Existing and proposed navigation systems were studied to determine their potential usefulness in the common system of air-traffic control (ATC). The system included Decca, Cytac, Tacan, VOR, the Radio-Web system of the French Society of Telecommunications, Doppler navigators, Navatec, and Egecon (electronic geographic coordinate navigation facility). The following conclusions were reached. Increased navigation accuracy is needed for more efficient airspace use to provide safe, efficient, and expeditious aircraft movements in major multiple-airport complexes. For optimum airspace use, the navigation equipment must provide flight paths independent of the lines of position determined by the radio navigation aid. The ATC system should be based on the economic use of facilities commensurate with the requirement in the particular airspace covered. LF hyperbolic systems can provide greater accuracy at a much lower cost for ground installations than the presently planned navigation aids if (1) means can be found to integrate Cytac or Decca into the ATC system, (2) noise interference will not be a serious limitation, and (3) sufficiently lightweight and economic airborne receivers can be built. The ability of an aircraft to fly a prescribed ground-referenced flight path depends on the accuracy of the navigation aid, the aircraft's control characteristics, and knowledge of the rate of displacement from the path. If the latter is supplied by airborne sensors, the information rate from the ground aid can be greatly reduced.

Airborne Instruments Lab., Inc., Mineola, N. Y.
SITE REFLECTIONS ON ILS GLIDE-SLOPE FACILITIES, by A. Tatz. Final engineering rept. on Contract Cca-28688. Oct 53, 94p. 2 refs. Rept. no. 830-2.
Order from LC mi$5.40, ph$15.30 PB 147 954

The ILS glide-slope facilities are considered with respect to the effects of reflecting surfaces in the propagation path. Reflection from terrain is the main feature that determines the quality of system performance. Ground-reflected energy is shown to have variable phase and amplitude, and this variation causes deterioration from ideal performance. Charts are presented to allow calculation of the variable phase and amplitude and of the deterioration of performance. Flight data are submitted to corroborate the extent of deterioration in performance factors. Site criteria are provided to determine the expected performance under various conditions of sites and flight paths. (Author)

Aircom, Inc., Winthrop, Mass.
INVESTIGATION OF HIGHLY DISPERSIVE LOW LOSS TRANSMISSION LINE DEVICES, by R. A. Rivers. Final rept. for 1 Feb 57-30 June 58, on Contract AF 19(604)2136. [1958] 46p. 4 refs. AFCRC-TR-58-155; AD-152 433.
Order from LC mi$3.30, ph$7.80 PB 146 675

A figure of merit is given for comparing dispersive structures for the ratio of dispersion to losses. This figure of merit is employed in comparing several dispersive structures. The figure of merit is related to group velocity and Q. Design data is given for dispersive structures employing periodic loading in ridge guide and in a newly developed ridge trough guide. One structure matched to a 50 ohm input and output has a phase shift of 2.27π between input and output for a 10% frequency shift. This unit has an input VSWR of 1.6 or less over a 10% frequency band and has an insertion loss of 1.8 db or less. (Author)

Applied Physics Lab., U. of Washington, Seattle.
ASTOR RELIABILITY PROGRAM. Rept. on Subcontract NOrd-12937 to Contracts NOrd-17542 and 17647. 1 Aug 58, rev. 1 Feb 60. [1960] 43p. 5 refs. APL/UW/TE/58-25; AD-213 398.
Order from LC mi$3.30, ph$7.80 PB 148 456

Various methods of obtaining circuit reliability are discussed and some methods of computing circuit reliability are shown. A detailed description is given of the Reliability Program. The group organization, and methods of applying reliability concepts to the complete ASTOR program, are discussed. (Author)

Armour Research Foundation, Chicago, Ill.
HIGH POWER TRANSDUCERS, by H. B. Karplus and R. R. Whymark. Quarterly rept. no. 1 on Contract [Nonr]-2900(00). 14 Oct 59, 4p. ARF 1149-1.
Order from LC mi$1.80, ph$1.80 PB 149 877

Several aspects of high power magneto-striction transducer design have not been dealt with adequately in the past. Two of these are the primary concern of this project. One is the loading of the transducer and the other is the utilization of nonlinear parameters.

Army Ballistic Missile Agency, Redstone Arsenal, Ala.
DEVELOPMENT OF PRINTED CABLES AND CONNECTORS, by Wilhelm Angele. 30 June 59, 25p. DG-TR-14-59.
Order from OTS $0.75 PB 161 927

Presented at the 3rd National Convention on Military Electronics in Washington, D. C. Sponsored by the I. R. E., June 30, 1959.

Army Ballistic Missile Agency, Redstone Arsenal, Ala.
PRINTED CABLES AND CONNECTORS. Development rept. no. 3. 18 Feb 60, 95p. Rept. no. DG-TR-4-60.
Order from LC mi$5.40, ph$15.30 PB 149 095

The materials and their features are reviewed and compared with other applicable products. From this comparison conclusions may be drawn as to the advantages of these materials. The product details discussed provide useful information for manufacturers and customers. Mechanical and electrical characteristics of printed cables are outlined and test results are discussed and graphically presented. A complete section of the report establishes requirements for connectors and the necessary application and functional data. Installation, routing, cable end preparation, and fastening techniques are suggested which demonstrate the application and service capabilities of printed cables. Proposals are submitted for printed cable standardization.

Army Signal [Research and Development Lab.] Fort Monmouth, N. J.
DESIGN AND DEVELOPMENT OF A PRECISION 400-CYCLE GENERATOR, by Stanley S. Schodowski. 28 Feb 58, 28p. 4 refs. Engineering rept. no. E-1225; AD-160 088.
Order from LC mi$2.70, ph$4.80 PB 149 417

This report describes in detail the design of a 400-cps generator having a high degree of frequency stability and reliability. Considerations given to the choice of resonator, frequency divider and power amplifier are thoroughly treated in connection with meeting all technical requirements. A proven crystal oscillator design procedure is employed in arriving at an optimum design of a highly stable crystal oscillator. Frequency dividers and power amplifiers are designed for maximum performance reliability. Test results are given which indicate the satisfactory performance of the ABMA Precision 400 cps Generator. (Author)

STATIC CAPACITANCE FORMULA FOR A QUARTZ BAR EXCITED IN THE Y'X MODEL OF FLEXURE, by Arthur D. Ballato. 15 Dec 58, 17p. 4 refs. USASRDL Technical rept. 2009; AD-220 105.
Order from LC mi$2.40, ph$3.30 PB 149 414

Quartz oscillators for operating in the Y'X mode of flexure have 2 pairs of electrodes arranged on the major surfaces of the plate, in contrast to most other modes where all the electrodes are parallel. Thus the simple formula for the static capacitance of parallel plates cannot be used. By considering the basic relations between capacitance and energy stored in an electric field, a formula is obtained for the static capacitance, C_o, for the Y'X mode. (Author)

TECHNICAL MINUTES OF THE HYDROGEN THYRATRON SYMPOSIUM [NO. 3] HELD AT THE PENTAGON, WASHINGTON, D. C., ON 27-2o MAY 1953, by H. J. Sullivan and M. H. Zinn. 1 Aug 55, 201p.
Order from LC mi$9.30, ph$31.80 PB 149 386

Contents:
Purpose of symposium and general discussion of the results of second symposium
Use of the JAN hydrogen thyratron specification by equipment manufacturers
Design and measurement of hydrogen thyratron modulator characteristics
Thyratron drive requirements and trigger circuits
Miniature tube drivers for high power hydrogen thyratrons
Universal hard tube driver
Use of hydrogen thyratrons as clippers
Effects of driver voltage and source impedance and peak anode charging voltage on pulse time jitter in the 5948 hydrogen thyratron
Arcing behavior in pulsed magnetrons
Magnetron softening circuits
Operation of hydrogen thyratrons at conditions other than JAN Test
Multiple operation of hydrogen thyratrons
System jitter requirements and jitter measuring equipment
Measurement of time jitter of thyratron pulses
Hydrogen reservoirs in hydrogen thyratrons
The multiple line modulator

Army Signal [Research and Development] Lab., Fort Monmouth, N. J.
TEMPERATURE RISE STUDY, by Abraham Rand. 1 Aug 57, 37p. 1 ref. Engineering rept. no. E-1207.
Order from LC mi$3.00, ph$6.30 PB 147 819

A practical approach is presented for measuring temperature rise rapidly and accurately. It is shown that it is possible to measure temperature rise on an open bench in a varying ambient with better accuracy than present methods in a carefully controlled chamber. The feasibility of eliminating the constant temperature test chamber for most tests is demonstrated. Correlation is of the order of $1^{o}C$ per $40^{o}C$ rise, and repeatability is of the order of a few tenths of a degree centigrade.

Arnold Engineering Development Center, Tullahoma, Tenn.
THE DESIGN AND EVALUATION OF A SIX CHANNEL, D-C COUPLED, TRANSISTORIZED GALVANOMETER DRIVER AMPLIFIER WITH CURRENT LIMITERS, by W. M. Crouch. Rept. on ARO, Inc., Contract AF 40(600)800. June 60, 28p. 3 refs. AEDC-TN-60-96; AD-237 627.
Order from LC mi$2.70, ph$4.80 PB 148 099

A d-c amplifier to drive recording galvanometers and to work in conjunction with analog magnetic tape systems has been designed and fabricated at AEDC. This amplifier has an input impedance compatible with the tape systems, unity or greater voltage gain, very low output impedance, and a frequency response which allow its use with all existing recording galvanometers The unit has built-in current limiters which allow its use with low frequency, low current galvanometers without subjecting the galvanometer to the possibility of being overdriven from random signals or noise. The amplifier was tested for gain, frequency response. drift, phase shift, distortion, common mode rejection, input and output impedance, linearity, output noise level, line voltage interaction, and cross talk. (Author)

AN EXPERIMENTAL MAGNETOHYDRODYNAMIC POWER GENERATOR, by Richard J. Rosa. Rept. on Contract AF 04(647)278. Jan 60, 9p. 3 refs. AMP 42; AFBMD-TN-60-1; AD-233 684.
Order from LC mi$1.80, ph$1.80 PB 147 217

A description is presented of an experimental magnetohydrodynamic generator that was constructed at the Avco-Everett Research Laboratory. Some basic aspects of its performance are summarized. Included is a discussion of the term efficiency as applied to magnetohydrodynamic generators. (Author)

Avco-Everett Research Lab., Mass.
MAGNETOHYDRODYNAMIC ENERGY CONVERSION TECHNIQUES, by Richard J. Rosa and Arthur R. Kantrowitz. Apr 59, 20p. 5 refs. Research rept. 86, formerly Research note 120; AD-233 689.
Order from LC mi$2.40, ph$3.30 PB 147 216

An introductory account is presented of the basic theory of magnetohydrodynamic (MHD) generators, the characteristics of such devices, and the electrical properties of gases. Shock tube experiments which demonstrate some of the fundamentals of MHD flow are described. (Author)

Battelle Memorial Inst., Columbus, Ohio.
INVESTIGATIONS OF RHENIUM FOR ELECTRON-TUBE APPLICATIONS, by D. J. Maykuth, G. B. Gaines and others. Final rept. for 1 July 56-31 Mar 60 on Contract AF 19(604)1741. Mar 60, 94p. 40 refs. AFCRC-TR-60-153.
Order from LC mi$5.40, ph$15.30 PB 149 169

The reactions of unalloyed and thoriated rhenium with carbonaceous and boron-containing atmospheres and with Al_2O_3 were investigated. Rhenium is relatively inert to Al_2O_3, is hardened by carbon, and reacts readily with boron trichloride to form brittle borides. Rhenium and rhenium-coated tungsten show excellent resistance to water-cycle attack. While rhenium does not show unusual properties in alkaline-earth cathodes, rhenium matrices containing tungsten and molybdenum show promise for application in pressed-dispenser-type cathodes. The workability to fine wire and properties of molybdenum-, tungsten-, and tantalum-base alloys containing rhenium were studied. Increasing additions of rhenium to molybdenum and tungsten greatly improve the hot workability, hot strength, low-temperature ductility, recrystallization characteristics, and weldability of these metals. Alloys based on Mo-28Re or W-25Re show optimum properties which should make them of interest for use as high-temperature structural and electrode components in electron-tube devices. (Author) (See also PB PB 151 523)

Bell Telephone Labs., Inc. [New York]
IMPROVED ELECTROLYTIC CAPACITORS, by D. A. McLean, N. Schwartz and others. Final rept. for 1 Feb 58-15 Jan 60 on Contract DA 36-039-sc-74996. 15 Jan 60, 48p. 5 refs. Rept. no. 25309-E; AD-232 690.
Order from LC mi$3.30, ph$7.80 PB 149 024

Al, Ti, W, Zr, and Cb were investigated as anodes for solid electrolytic capacitors. Clear interference-colored anodic oxide films can be formed on titanium and tungsten, but both oxides are unstable in either wet or solid capacitors. A rating of 35V at 150°C appears possible for aluminum wire anode capacitors. Thermal treatment and selective etching of the dielectric film yielded improved capacitance, dissipation factor, and leakage for porous anode aluminum capacitors. The initial leakage remains undesirably high but decreases markedly during life test. Zirconium wire anode capacitors were prepared with a tentative rating of 60V at 85°C; similar results with porous anodes were not achieved because purification of the metal does not occur at a sintering temperature 200°C below the melting point. Porous anode niobium capacitors with 6V and 20V ratings have electrical properties comparable to tantalum units, but have the advantage of yielding a higher capacitance-per-anode weight. Although resintered niobium foil can be anodized to 225V, porous pellets start to develop a crystalline film at about 100V. The crystallization is believed responsible for the poor life test stability of 35V rated capacitors. A selective etching process of the oxide film was used to improve the leakages of niobium capacitors. Models were prepared of 6V and 20V rated niobium capacitors. (Author)

MICROWAVE SOLID-STATE DEVICES. Interim rept. no. 11, 1 July-30 Sep 59, on Contract DA 36-039-sc-73224. 15 Nov 59, 36p. 11 refs. AD-232 689.
Order from LC mi$3.00, ph$6.30 PB 149 016

Slow-wave structures to be used in traveling wave masers have been studied for a frequency of 2390 mc. Resonance isolators have been operated using yttrium iron garnet at liquid helium temperature and at the magnetic field called for by the ruby maser operation. On the basis of these results, the development of a ruby traveling wave maser for this frequency has been initiated. A theory of high power performance of traveling wave masers has been developed. It suggests a novel utilization of traveling-wave masers as energy storage and conversion elements. Low-temperature noise measurements on a diffused germanium varactor diode have been obtained for amplification in the degenerate mode at a frequency of 6 kmc/sec. Excess noise temperature is determined as a function of the diode operating temperature in the range from near liquid nitrogen temperature to room temperature. Harmonic generation at relatively high-power levels has been achieved using diffused-silicon-junction diodes. The diodes used are "gradual grade" units, in the sense that their impurity gradients are substantially less than those of the silicon varactor diodes, although they are designed to minimize series resistance to ensure maximum cut-off frequency. (Author) (See also PB 144 934)

Bell Telephone Labs, Inc. [New York].
MICROWAVE SOLID-STATE DEVICES. Interim rept. no. 12, 1 Oct-31 Dec 59, on Contract DA 36-039-sc-73224. 15 Jan 60, 29p. AD-235 853.
Order from LC mi$2.70, ph$4.80 PB 149 017

Starting with a four terminal network representation, the impedance transformation from the semiconductor region of a mesa diode to a transmission line is discussed. It is shown that, under certain assumptions, the transformation between measured reflection coefficient and device impedance can be formulated in a simple way, and may be arrived at through a series of operations on a Smith chart. Proper use of impedance standards can determine the transformation. Experiments (conducted at a single frequency only) indicate validity of the assumptions, one of which is the appropriateness of the impedance concept itself. Using these measurement techniques, the impedance of a considerable number of diffused silicon mesa varactor diodes has been evaluated. The experimental results, obtained using diffused silicon from a single run with a fixed impurity gradient, indicate a dependence of Q (measured at 1 kmc per sec.) on the area of the diffused junction. This is attributed to the presence of an equivalent series resistance, some of which must be attributed to losses near the active region of the device. The magnitude of this series component is enough to begin limiting the cut-off frequency obtainable with diffused wafers when the junction capacity sizeably exceeds two or three pf. Possible reasons for these losses are discussed. (Author) (See also PB 149 016)

STUDY OF SOLDERLESS WRAPPED CONNECTIONS FOR MILITARY COMMUNICATION EQUIPMENTS, by S. J. Elliott. Final rept. on Task BN; Technical rept. no. 15 on Engineering Services on Task Studies of Military Communication Systems, Contract DA 36-039-sc-52593. 21 June 56, 50p. AD-133 953.
Order from LC mi$3.30, ph$7.80 PB 147 920

Pertinent information, accumulated during the development of solderless wrapped connections for Bell System use, is reviewed in this report. The solderless wrapped connection is described, its advantages and disadvantages are enumerated, and parameters that influence its reliability are discussed. Solderless wrapped connections have a reasonable prospect of performing reliably in military communication equipments. Additional tests should be made, however, to evaluate their reliability under the environmental conditions of military service. Solderless wrapping would be advantageous in the manufacture of military communication equipments, provided the equipments are designed for solderless wrapping. Guidance for design is included. The problem of changing connections (where insufficient slack is available in an existing lead) would limit the usefulness of solderless wrapping for maintenance. This limitation, however, would not preclude the use of solderless wrapping in manufacture. (Author)

Bendix Aviation Corp., Eatontown, N. J.
Ge PNP DRIFT BASE POWER TRANSISTOR, by Charles Z. Leinkram, H. Newman, and W. C. Waldron. Final rept. no. 4, 15 July 58-15 Dec 59, on Transistors, Power, Drift Base, Germanium PNP, Contract DA 36-039-sc-78149. [1959] 113p. AD-235 673.
Order from LC mi$6.00, ph$18.30 PB 149 117

The production refinement program is presented for the 2N1430 drift base power transistor. This device is characterized by very fast switching times at high collector currents, high-frequency response, low saturation resistance, and excellent high temperature stability. The refinement of development techniques so that production of the drift base power transistor could be readily achieved required the optimum employment of conventional transistor technology and the use of new and imaginative fabrication methods. The resulting processes not only yielded production techniques capable of low cost manufacture of the unit but also gave a greater understanding of the technology of the devices. The introduction of new concepts in diffusion and slice preparation, and the use of special emitter alloys resulted in better yields, greater reliability and better performance of the transistor. Testing and evaluation of the product has continued beyond completion of the contract requirements. The results of this further evaluation indicates a greater device capability than called for in the contract specifications. Some parameter measurements of a higher current transistor, B1037B, are included. (Author)

SHUNT SUSCEPTANCE OF PLANAR ARRAYS OF CONDUCTING DISCS, by Ronald A. Gardner. Master's thesis. Scientific rept. no. 13 on Contract AF 19(604)3887. 25 Apr 60, 71p. 8 refs. AFCRC-TN-60-533 (or 553).
Order from LC mi$4.50, ph$12.30 PB 148 745

The value of shunt susceptance is computed for a planar array of conducting discs using small aperture theory. Static and dynamic interaction effects are considered. Computed values of shunt susceptance are compared with experimental values. Using experimental values of shunt susceptance, a propagation constant is determined for disc type artificial dielectric. Case Inst. of Tech., Cleveland Ohio.
A TRANSISTOR REGULATED POWER SUPPLY FOR A HIGH CURRENT MAGNET, by Kenneth C. Brog. Master's thesis. Technical rept. no. 2 on Contract Nonr-1141(07). Aug 59, 42p. 9 refs. AD-229 365.
Order from LC mi$3.00, ph$6.30 PB 148 179

Current regulation of a high current electromagnet utilizing power transistors in series was achieved. A sampling voltage, obtained from a sensing resistor in series with the magnet, is compared with a reference voltage; the error signal is sufficiently amplified and fed back to the series transistors thru a 2 stage transistor driver. Magnetic fields from 845 gauss to 8550 gauss with field regulation of a few parts per million over this range were obtained. (Author)

DESIGN AND DEVELOPMENT OF UHF PROTOTYPE CARCINOTRON TUBES WITH MAGNETS. Final rept. on Contract AF 61(514)917. Dec 57, 113p. 1 ref. WR.204; RADC TR-58-62; AD-148 714.
Order from LC mi$6.00, ph$18.30 PB 147 808

Development was conducted on 2 UHF prototype carcinotron tubes with magnets to cover the 200- to 400-mc band. Design requirements called for a minimum HF output power of 5 kw. The 2 tubes are the CM 32 covering the 200- to 300-mc band the the CM 34 covering the 300- to 400-mc band. A convenient interdigital line was chosen to deliver the wanted RF power in the given tuning range. Main disadvantages of the tubes are the large dimensions. These dimensions can be reduced with a short finger line and the CM 34 will be designed with a finger length of 140 mm and the CM 32 with a finger length of 200 mm. The RF properties, especially the dispersion characteristics and matching problem of the line and output device, were examined. The main difficulty experienced was the rather close-by cutoff of the line. The design of the sole and collector is given, and only a very closely shielded collector suppressed parasitic plate current. Means were tried for improving the heat transfer between the absorbing layer and the cooling medium. The most satisfactory device for heat transfer is a glass tube with Kovar contacts covered by an inner aquadag layer protected by Araldite. To avoid heat transfer between 2 faces of an insulator, the cooling liquid is made a conductory (salt water with a concentration of 30 to 40 g/liter is satisfactory).

IMPROVED BALLAST TUBE FILAMENT MATERIALS, by R. Spencer and W. Buchanan. Final rept. for 15 July 58-14 Oct 59 on Contract DA 36-039-sc-78158. [1959] 75p. 4 refs. AD-234 904.
Order from LC mi$4.50, ph$12.30 PB 149 025

Comparison information is presented in the data and in the graphs for various types of iron filaments operated in hydrogen, helium, neon, argon, and xenon. The tube life test data was obtained by running the filaments on various continuous and intermittent operation. The results indicate that most promising filament type is the gold-platinum plated iron filaments operating in 100% helium. No burnouts or changes in current out of prescribed limits have been observed for this filament type in over 5000 hours of life test operation. (Author)

RESEARCH ON NEW HIGH TEMPERATURE SEMICONDUCTING MATERIALS, by Shaun S. Devlin, Jacob M. Jost, and Lebo R. Shiozawa. Rept. on Contract AF 33(616)3923. June 60, 167p. 87 refs. WADD Technical rept. 60-11.
Order from OTS $3.00 PB 161 938

Three years of research on the preparation, purification, crystal growth, and measurement of the fundamental properties of CdS, CdSe, ZnTe, and mixed crystals of CdS·CdSe are summarized. The basic requirements of high-temperature semiconductor devices for operations to 500°C were closely examined and led to the choice of the above materials for further investigation. A detailed account, with liberal references to previous quarterly reports, is presented on the following topics; (1) purification of elemental zinc, cadmium and tellurium by zone refining and vacuum distillation using spectrographic and radioisotopic techniques for evaluation; (2) mechanism of crystal growth in the Reynolds-Czyzak process, including analog studies of soap-bubble and iodine-crystal models; (3) measurement of basic properties. Measurements taken of a variety of doped and undoped crystals include; (1) X-ray crystallographic data; (2) thermal expansion data from 25 to 200°C; (3) optical absorption (energy gap) data, including the variation of ΔE with composition of mixed CdS-CdSe crystals; and (4) data on the temperature dependence of Hall effect and conductivity from 77°K to 800°K. The room-temperature energy gaps are typical values of interest and for CdS, CdSe, ZnTe and ZnSe are 2.38, 1.70, 2.21 and 2.43 ev, respectively. ΔE of mixed crystals are nonlinear with composition (ΔE of $Cd(S_{.5}Se_{.5})$ - 1.91 ev). Room temperature carrier mobilities in doped crystals ($P \simeq 10^{-2}$ to 1 ohm cm) are 350, 550, and 100 cm^2/volt sec., respectively, for CdS(n-type), CdSe(n-type), and ZnTe (p-type). At high temperatures $\mu_n \propto T^{-3/2}$ for In-doped CdS, $\mu_n \propto T^{-1}$ for Ga-doped CdSe, and $\mu_p \propto T^{-3/2}$ for Cu-doped ZnTe. Low temperature electron mobility in Ga-doped CdSe ≥ 1000 cm^2/volt sec. with $n \leq 10^{17}$ cm^{-3}. Thermoelectric power of Ga-doped CdSe ≥ 250 μV/°K. (Author)

Compagnie Générale de Télégraphie Sans Fil (France)
INFLUENCE OF THE MANUFACTURING PRECISION OF AN ANTENNA ON ITS PERFORMANCE, by J. Robieux. Technical note no. 1 on Contract AF 61(514)737. C. 27 May 55, 80p. (p. 65-66 omitted). AD-83 556.
Order from LC mi$4.50, ph$12.30 PB 150 090

The purpose of the present study is to investigate the influence of manufacturing lack of precision on the performance of an antenna. The problem is stated in the introduction. The field radiated by an antenna results from the addition of the fields radiated by each one of its elements. A lack of precision in manufacturing does not modify in any substantial manner the amplitudes of these elemental fields. It is necessary, however, to add to their theoretical phases, calculated by utilizing the surface, assumed perfect, an aleatory angle which corresponds to the aleatory deviation between the actual surface the the theoretical surface. The problem is thus an aleatory problem and it is necessary to use the methods of the calculus of probabilities.

Computation Lab., Harvard U., Cambridge, Mass.
SOME APPLICATIONS OF LOGICAL SYNTAX TO DIGITAL COMPUTER PROGRAMMING, by Richard Manning Carp. Doctoral thesis. Rept. on Theory of Switching to Bell Telephone Labs. Jan 59, 200p. 54 refs. Rept. no. BL-22.
Order from LC mi$8.70, ph$30.30 PB 147 350

In this thesis the methods of logical syntax are applied to the analysis of programming languages. The programming languages considered include not only computer languages, but also flowcharting languages and the source languages of automatic programming systems. Syntactic models are defined and used for the development of analytic check-out procedures and techniques for improving the efficiency of programs. (See also PB 147 351)

BARRIER GRID STORAGE TUBE DISTURBANCE, by John K. Robe. Rept. on Contract DA 36-039-sc-56695. Aug 58, 37p. 3 refs. Rept. no. R-103; AD-202 487.
Order from LC mi$3.00, ph$6.30 PB 149 400

Storage tube disturbance is defined as the positional fluctuations of the input-output characteristic. An attempt to characterize this single concept by a single number or "Figure of Merit" is complicated by the fact that disturbance has been found to be a function of several variables. The periodic and aperiodic structure of the barrier grid of a barrier grid storage tube is used to illustrate disturbance. It is found that a portion of the disturbance is independent of the signal level, whereas another portion is directly dependent on it. In considering the frequency distribution of the disturbance it is found that the aperiodic variations cause a disturbance which is spread throughout the tube's pass band, while the periodic variations produce a disturbance at particular frequencies. The amplitude of the periodic disturbance which appears in the output is shown to be a function of the ratio of beam diameter to barrier grid mesh size. (Author)

A LOOP ANTENNA COUPLED ELECTROMAGNETICALLY TO A FOUR-WIRE TRANSMISSION LINE TO ACHIEVE THE CIRCULARLY POLARIZED RADIATION, by Kun-Mu Chen. Scientific rept. no. 5, series 2, on Contract AF 19(604)4118. 25 Jan 60, 67p. 3 refs. AFCRC-TN-60-365; AD-237 668.
Order from LC mi$3.90, ph$10.80 PB 148 321

A loop antenna coupled electromagnetically to a four-wire transmission line is studied theoretically and experimentally when the line is driven as two mutually perpendicular two-wire lines that are 90° out of phase in time. The size of the loop at which resonance occurs is determined. The zeroth-order and first-order solutions of the current distribution are evaluated and it is found that at resonance the antenna currents due to each two-wire line oscillate in a dipole mode of the loop. The currents induced by the four-wire line circulate as a traveling wave. The radiation fields pattern is also evaluated. The square loop is first studied; later, it is shown that the circular loop resembles the square loop closely. An array that consists of many loop antennas coupled electromagnetically to a four-wire transmission line has a very high gain with circularly polarized radiation. (Author)

Cruft Lab., Harvard U., Cambridge, Mass.
THE RADIATION PATTERNS PRODUCED BY A LINEAR ARRAY OF HALF-WAVE DIPOLES COUPLED ELECTROMAGNETICALLY TO A TWO-WIRE TRANSMISSION LINE, by Dipak L. Sengupta. Scientific rept. no. 4, series 2, on Contract AF 19(604)4118. 20 Jan 60, 21p. 6 refs. AFCRC-TN-60-371; AD-237 669.
Order from LC mi$2.70, ph$4.80 PB 148 322

The effects of the different physical parameters on the radiation pattern are studied both from physical and theoretical considerations. The theoretical conclusions are verified by actual measurements. The electromagnetic coupling principle used in this antenna provides more flexibility for controlling the radiation pattern than in the case of the usual method of coupling the dipole arrays to a two-wire transmission line. A step-by-step design procedure is given; this can be used in order to obtain the best radiation pattern from the antenna. (Author)

David Sarnoff Research Center, Princeton, N. J.
STORAGE LIGHT INTENSIFIER DISPLAY PANEL, by E. E. Loebner, H. O. Hook, and D. C. Darling. Quarterly rept. no. 6, 1 July-30 Sep 57, on Contract DA 36-039-sc-71194. 15 Oct 57, 30p. 3 refs. AD-151 525.
Order from LC mi$2.70, ph$4.80 PB 149 366

Progress is reported for work accomplished on following: (1) complex circuit optical feedback light intensifiers for feedback control and multitone storage, (2) design, fabrication and test of perforated and pedestal photoduct and lateral flow structure light intensifier panels, (3) fabrication techniques of interlayer conductor patterns and master patterns for test structures, (4) device analysis of light intensifiers including photoconductivity, electroluminescence and photoduct transmission, (5) simulated device tests, and (6) the adaptation of a logarithmic preamplifier for use with photomultiplier. RADIO FREQUENCY ROTARY COUPLER CU-64[MSQ-16(XW-1) by Robert W. Silberberg. Rept. no. 2 on Contract AF 30(602)1931. 20 Dec 59, 21p. 5 refs. RADC TN-59-42; AD-210 394.
Order from LC mi$2.70, ph$4.80 PB 147 361

This report describes the efforts and work accomplished during the second quarter period of the subject contract for the development of a Four Channel Rotary joint. Two channels will transmit signals in the frequency range of 1-4 Kmc, and the other two channels cover the range of 4-15 Kmc. The VSWR will be limited to less than 1.8 to 1, and its variation as a function of rotation shall be less than 1.1 to 1. The portion of the task reported here includes the test results of the prototype 1-4 Kmc channel, #3, and the 4-15 Kmc channel, #1. Some results of a theoretical investigation are presented together with the suggested modifications. It is shown that the channel #1 unit is satisfactory in its present form, however some improvement is expected following subsequent changes. (Author)

BASIC RESEARCH INVESTIGATIONS FOR AMMONIA VAPOR ACTIVATED BATTERIES, by J. M. Freund, V. M. Bryant, Jr. and J. B. Schliff. Final rept. for 15 Sep 57-14 Sep 59 on Contract DA 36-039-sc-74902. [1959] 63p. 10 refs. AD-235 814.
Order from LC mi$3.90, ph$10.80 PB 149 109

The densities of several ammonium salts, KSCN, and $Pb(NO_3)_2$ together with mixtures of the last with NH_4NO_3 have been measured, mostly at -34°C. With the exception of KSCN, these solutions are non-ideal. Conductance of the same substances has also been measured. The KSCN solutions have the highest specific conductance at the optimum concentration. At the maximum, NH_4SCN is a better conductor than is NH_4NO_3. In highly concentrated solutions, however, NH_4NO_3 is the better conductor. KSCN at its peak is a 30% better conductor at -60°C. and a 20% better conductor at -40°C. than NH_4SCN. Studies of liquid $Zn/NH_4SCN/PbO_2$ cells at -40°C. show that essentially 100% of theoretical cathode capacity was obtained at current densities up to 31 ma/cm^2, although there were less than 4 moles NH_4SCN per mole PbO_2 available in the electrolyte. Liquid $Pb/NH_4SCN/PbO_2$ cells, discharged at current densities between 0.15 and 15 ma/cm^2, delivered the theoretical capacity of the PbO_2. Vapor activated $Pb/NH_4NO_3/PbO_2$ cells, discharged at room ambient temperature, show susceptibility to concentration polarization as the ammonium ion available is decreased. (Author) (See also PB 145 878)

Edison, Thomas A., Industries, West Orange, N. J.
HIGH CAPACITY VENTED NICKEL-CADMIUM CELLS, by Arthur Fleischer, Edward C. Kopper and others. Quarterly rept. no. 1, 30 Nov 59-29 Feb 60, on Contract DA 36-039-sc-84555. [1960] 59p. 20 refs.
Order from LC mi$3.60, ph$9.30 PB 149 118

The task of manufacturing six types of high capacity nickel-cadmium cells varying in capacity from 3.5 to 36 amp-hrs. was set up in three phases, experimental design, and manufacture. The experimental program for the Type 4 cell was set up after a preliminary estimate of elements for the six sizes of cells. A sufficient number of cells was planned to permit testing two concentrations of lithium hydroxide in the 30% potassium hydroxide electrolyte. In addition, cells were included to study the effect of a 5% cobalt addition to the fused nickel nitrate impregnating bath in the Edison process for preparing positive plates. The design of cells, cell parts and hardware, and tools and fixtures has proceeded up to the point at which further progress must be delayed till decisions can be reached on the basis of the experimental program.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
RATIONAL APPROXIMATION OF ARBITRARY REAL FUNCTIONS WITH SPECIFIED WEIGHTS, by Tao-Nan Tang. Doctoral thesis. Technical note. no. 14 on Contract AF 49(638)63. 1 May 60, 99p. 25 refs. AFOSR-TN-60-613.
Order from LC mi$5.40, ph$15.30 PB 148 766

The problem of obtaining the Tchebysheff approximation of a real continuous function in a closed interval by a polynomial or a rational function under a specified weighting function is treated. Solutions of such problems are obtained by numerical methods involving iterative procedures which may be carried out by modern computing machines. The effect of shifting a zero or several zeros of an error function on the weighted error function itself is obtained by multiplying the amount of shift by the sensitivity, defined as the partial derivative of the weighted error function with respect to the zero shifted. The successive equalization of the weighted error function at the points of extrema gives an iterative procedure with assured convergence of the process.

Electro-Optical Systems, Inc., Pasadena, Calif.
DESIGN AND DEVELOPMENT OF VERY HIGH SPEED SWITCHING TECHNIQUES, by R. M. Aron, M. P. Ernstene, and F. R. Marshall. Final technical rept. on Contract DA 04-495-501-ORD-1097. 15 May 59, 76p. 12 refs. Rept. no. 120-Final; AD-218 844.
Order from LC mi$4.50, ph$12.30 PB 147 609

The hydrogen thyratron and the atmospheric triggered spark gap were studied. With the hydrogen thyratron used in the normal circuit configuration, current commutation times as low as 4.5 millimicroseconds were achieved, and times as brief as two millimicroseconds are believed possible by making use of design improvements demonstrated to be advantageous. With the hydrogen thyratron in a special pulsed-anode circuit configuration, a current commutation time of two millimicroseconds was achieved, and fractional millimicrosecond times appear to be obtainable. With the triggered spark gaps at atmospheric pressure, current commutation times as brief as 7 millimicroseconds were achieved. The operation of the high pressure triggered spark gaps follows simple scaling laws which show that commutation times can be expected to vary inversely with pressure, up to pressures of 10 to 20 atmospheres; hence commutation times under a millimicrosecond are possible. OPTIMAL SPARES PROVISIONING FOR ELECTRONIC SYSTEMS, by Jorgen P. Jorgensen. Rept. on Contract DA 36-039-sc-78281. 30 Mar 60, 91p. 13 refs. Technical memo. no. EDL-M237; AD-235 936.
Order from LC mi$5.40, ph$15.30 PB 148 340

Spare parts kits were designed for the AN/MLQ-19 (XL-2), ESGM I, and EP-EDL-16 systems. The kits provide spares for a one-year operating period at an assurance level of 0.85 to 0.90.

Electronic Engineering Co., of California, Santa Ana.
MODIFICATION OF FIRE CONTROL SYSTEM, AA, M-33, by R. F. Akers. Final technical rept. for 1 May-5 Nov 59 on Contract DA 36-039-sc-78317. 15 Dec 59, 21p.
Order from LC mi$2.70, ph$4.80 PB 149 377

The primary modification involved the installation of a system to provide high accuracy digital data. This involved: installation of precision encoders on the azimuth, elevation, and range shafts of the radar; addition of slip rings to accommodate the encoder data: and design, fabrication, and installation of electronic equipment to provide the precision digital data output. Other modifications involved: the addition of a sighting telescope on the antenna; the design, fabrication, and installation of a remote control unit so that an operator at the antenna can position the antenna; and changes to the plotting board to provide for various map scales. The accuracy tests performed on the high-precision data system are included, and reveal that linearity errors in azimuth and elevation were less than 20 seconds of arc. Backlash and range data errors were too small to be detected. Approximately 95% of the circuitry of the precision data system is transistorized. The data output is presented in two forms: a binary-coded-decimal display of azimuth, elevation, and range, and a decimal display of time on a panel which is photographed; and a binary-coded-decimal output of azimuth, elevation, range, and time suitable for recording on magnetic tape. (Author)

Electronics Research Lab., U. of California, Berkeley.
STABILITY OF SYSTEMS WITH RANDOMLY TIME-VARYING PARAMETERS, by A. R. Bergen. Scientific rept. no. 1 on Contract AF 19(604)5466. 9 Feb 60, 20p. 10 refs. Series no. 60, issue no. 268; AFCRC-TN-60-174.
Order from LC mi$2.40, ph$3.30 PB 148 499

Consider a system which alternates between two known configurations at random times; one of these configurations is stable, the other is unstable. Since the unstable mode is intermittent it is entirely possible for the system to be stable despite the unstable mode. Since the system is random, stability must be defined in a probabilistic sense. In this report a system is defined to be stable if the return to equilibrium of the system after any finite disturbance is "almost sure," i.e., if the system returns to equilibrium with probability one. The randomness of the system resides entirely in the intervals between successive alterna-

tions of system configuration. Assuming these intervals to be independent, the expected values of the state variables after an arbitrary number of alternations of system configuration may be determined. By use of the Kronecker product the expected values of the squares of the state variables may also be determined; the expected values of the squares of these state variables tend exponentially to zero with the number of alternations if the eigenvalues of a specified matrix lie within the unit circle. Furthermore, because of this exponential convergence the stronger condition of convergence with probability one may be established. The problem of determining conditions for stability then reduces to the investigation of the eigenvalues of a matrix. If stability with variation of a parameter is to be investigated a root-locus plot of the eigenvalues with parameter adjustment is convenient. (Author)

Electronics Research Lab., U. of California, Berkeley.
STUDY OF CROSSED-FIELD AMPLIFIERS, by J. R. Whinnery, C. K. Birdsall and others. Interim final rept. for 15 Oct-30 Nov 59, on Contract DA 36-039-sc-74981. [1959] 22p. 3 refs. AD-236 172.
Order from LC mi$2.70, ph$4.80 PB 149 410

Fabrication of the second model of the crossed-field velocity analyzer has continued. This model includes means for reducing the effects of secondaries and for water cooling the anode. In the derivation of the crossed-field diode equations reported earlier, all transverse derivatives were neglected. This implies that the magnetic fields produced by the displacement and convection currents are unimportant. A study was made to determine the range of conditions under which this is true. This work incidentally answers similar questions for the Llewellyn-Peterson equations. (Author) (See also PB 148 108)

Farnsworth Electronics Co., Fort Wayne, Ind.
MODIFICATION OF VIDEO INTERCONNECTION EQUIPMENT ANDB TYPE 2. 3NS4a. Final development rept. on Contract NObsr-64276. [1959] 23p. 2 refs.
Order from LC mi$2.70, ph$4.80 PB 147 955

This report covers the modifications to the ANDB Type 2. 3NS4a Video Interconnection Equipment in accordance with Addendum No. 3 to ANDB Specification 2. 3NS4a. Complete technical information is contained in the instruction book for this equipment (Navships 92770). This report details the modifications necessary to increase the capabilities of the equipment to provide compatability with the latest ANDB radar safety beacon system. (Author)

MULTICOLOR PLAN POSITION INDICATOR FOR USE IN THE AIR TRAFFIC CONTROL RADAR SAFETY BEACON SYSTEM. Final engineering rept. for 1 Jan-28 Feb 58 on Contract NObsr-72571. 7 Mar 58, 31p. 1 ref.
Order from LC mi$3.00, ph$6.30 PB 147 961

The objective of this contract is to provide a radar Plan Position Indicator on which pulse coded beacon returns can be displayed in seven color hues depending on the code-to-color assignment.

Horizons, Inc., Cleveland, Ohio.
FERROELECTRIC MEMORY CELLS, by Richard A. Fotland. Final rept. on Contract AF 19(604)5498. Apr 60, 4 refs. AFCRC-TR-60-140.
Order from LC mi$3.60, ph$9.30 PB 148 816

Techniques have been developed for obtaining 20 micron films of sodium niobate and barium-lead titanate ceramics. Inferences derived from the switching voltage-film thickness curves indicate that the sodium niobate crystallites are surrounded by a 10^{-6} cm parelectric skin. Switching voltages as low as 20 volts have been utilized with switching pulse lengths of 50 μsec. A 15 megacycle read-out voltage functions effectively. The second-harmonic phase of an output current provides a nondestructive read-out. Ten by ten matrices have been examined with a static address and found to possess good uniformity. Coincidence switching is effective due to the high loop squareness when operating in the second-harmonic output mode. Indications are presented which show the feasibility of large matrix sizes. (Author)

TESTS OF TACAN SYSTEM WITH REDUCED BEACON SPECTRUM, by A. Biagi and J. Hobbs. Final rept. on Contract NOas-51-1227. 20 July 56, 136p. Technical memo. no. 576; includes Technical momo. no. 569.
Order from LC mi$6.90, ph$21.30 PB 147 960

A series of measurements was conducted of the effects of co-channel and adjacent-channel interference on the AN/ARN-21 in accord with procedures prepared by the Air Navigation Development Board. The first results of the work gave some performance figures concerning the effect of co-channel and adjacent-channel interference on range accuracy, bearing accuracy and identity fidelity, using ARN-21 equipments manufactured in the Summer of 1955. These figures showed that, under the conditions of the tests, the "hole-punching" effect of the airborne Ferris discriminator degraded the otherwise excellent bearing accuracy of the Tacan System. While such deterioration had never been observed in actual flight, there was reason to believe that the problem might become of some importance in the future when many more beacons would cover a given area. The present memorandum describes the greatly improved results obtained by removing the Ferris discriminator from the airborne equipment, while simultaneously reducing the beacon spectrum. This change not only reduces errors but increases the operating range and reduces vulnerability to jamming. Minor improvements have also been made to the airborne decoding circuitry in order to reduce co-channel interference.

PHASE STABLE OVERTONE CRYSTAL STUDY, by Robert E. Christian. Quarterly rept. no. 1, 1 July-1 Oct 57, on Contract DA 36-039-sc-74884. [1957] 34p. 4 refs.
Order from LC mi$3.00, ph$6.30 PB 149 105

A literature survey disclosed that a lateral force applied along a diameter of a crystal would cause a frequency deviation. The magnitude of the frequency deviation varied with changes in diameters in which the force was applied and points of minimum frequency deviation was noted. Mathematical calculations show that nodal points of AT crystals are located $\pm 40^{\circ}$ from the Z axis. The static capacitance of the experimental crystals was lower than outlined in the specs. The temperature coefficients of the crystal were measured. Representation crystals were tested for phase shift and the data obtained showed no clear trend. A new crystal vibration holder has been designed which equals the JPL holder in performance but is superior in convenience to use. Two Teflon mounted crystals were tested for phase stability. They appeared promising in the Y and Z plane but were very unsatisfactory in the X plane.

PHASE STABLE OVERTONE CRYSTAL STUDY, by Robert E. Christian. Quarterly rept. no. 2, 1 Oct 57-1 Jan 58, on Contract DA 36-039-sc-74884. [1958] 45p. 2 refs.
Order from LC mi$3.30, ph$7.80 PB 149 106

Modification of the constant acceleration apparatus has minimized frequency shift due to the apparatus. Application of pressure along various diameters of an AT crystal showed that a point of minimum frequency shift occurs at 30° off the Z axis at room temperature (23°C). Six groups of crystals were mounted every five degrees from $15\text{-}40^{\circ}$ off the Z axis and phase stability measurements were made. An analytical proof is presented verifying the theory that the reorientation of the nodal points with respect to temperature is a function of the changes in the elastic coefficients with temperature. (See also PB 149 105)

Knights, James, Co., Sandwich, Ill.
PHASE STABLE OVERTONE CRYSTAL STUDY, by Robert E. Christian. Quarterly rept. no. 3, 1 Jan-1 Apr 58, on Contract DA 36-039-sc-74884. [1958] 25p. 1 ref. AD-200 892.
Order from LC mi$2.70, ph$4.80 PB 149 107

Analytical and experimental investigations are being made of crystallographic orientations and crystal plate mountings in order to minimize phase instability when the crystal unit is subjected to mechanical vibration. Distributed capacity changes in the leads between the crystal and the external oscillator were minimized by the use of a series mode oscillator. A series mode oscillator constructed with vacuum tubes for mounting on the shaker head proved unsatisfactory. A transistor grounded base oscillator also proved unsatisfactory because of inadequate output. Laboratory test results on 3 crystal units were in agreement with phase stability measurements made at Fort Monmouth. Solder mounting of crystals resulted in improved resistance characteristics but not of phase stability. The elastic properties of AT cut crystals differed from those of α quartz. (See also PB 149 106)

Knights, James, Co., Sandwich, Ill.
PHASE STABLE OVERTONE CRYSTAL STUDY, by Robert E. Christian. Quarterly rept. no. 4, 1 Apr-1 July 58 on Contract DA 36-039-sc-74884. [1958] 25p.
Order from LC mi$2.70, ph$4.80 PB 149 108

When compressional stress is applied to an "AT" crystal, the frequency of thickness-shear modes would vary due to the deformation of the crystal. The change of frequency Δf of the plate in the strained state as a function of the components of strain tensor has been derived. For an infinitesimal deformation, the strain is linearly related to the stress through a matrix $S' = a_c^{-1} S a^{-1}$. The matrix elements S'_{jk} were expressed in terms of elastic modulii of α quartz and the skew angle Ψ in "AT" plane. Consequently Δf as a function of Ψ and stress was obtained. Analysis showed that at a particular angle Ψ, compressional stress would cause a zero phase shift for an "AT" crystal of a definite strain distribution. An "AT" crystal subjected to a constant lateral force resulted in points of minimum frequency shift 30° on each side of the z axis. The points of minimum frequency shift are the same regardless of the magnitude of stress. Preliminary evidence indicates that there may be no point of zero frequency shift in the bending direction. (See also PB 149 107)

Lansdale Tube Co., Pa.
GERMANIUM PNP OR NPN JUNCTION TRANSISTOR, by James A. Sluss, Jr. Quarterly progress rept. no. 1, 26 May-26 Aug 58, on Contract DA 36-039-sc-75046. [1958] 38p. Philco no. R-218.
Order from LC mi$3.00, ph$6.30 PB 149 372

The necessary techniques for electrochemically etching and plating large area etch pits and electrodes on diffused germanium material have been developed, and large area, micro-alloyed, diffused-base transistors have been fabricated. The fabricative procedure of the device is being modified to meet the specification limits. The loss of the collector diode during the micro-alloying operation has considerably reduced the yield of units that have a satisfactory VCE of 60 volts. Micro-alloying of indium electrodes into diffused germanium blanks is being accomplished through the use of a focused light beam, which heats the electrode. A profile curve which will permit accurate placement of the emitter and collector in the diffused field and yield units which will closely approach the specification limits has been determined. An optical concentricity gauge for determining the concentricity and diameter of the emitter and collector electrodes has been devised. A new thermal stud mount which theoretically achieves a 400mw dissipation to free air has been designed. (Author)

Lansdale Tube Co., Pa.
GERMANIUM PNP OR NPN JUNCTION TRANSISTOR, by James A. Sluss, Jr. Quarterly progress rept. no. 2, 26 Aug-26 Nov 58, on Contract DA 36-039-sc-75046. [1958] 27p. Philco no. R-218.
Order from LC mi$2.70, ph$4.80 PB 149 373

An increased yield in the accurate placement of the emitter diode was the result of a modification of the gradient of diffusion in the base material. Emitter diode placements in the 10 to 20 volts V_{EB} range are easily accomplished. A reduction of the bulk resistivity of the base material has considerably improved the punchthrough condition of this device. Loss of collector voltage during the microalloying operation was studied through the use of specially constructed equipment that monitors the punchthrough condition as the collector or emitter breakdown voltage is measured. Modification of the testing requirements for the V_{CE} measurement might possibly provide a means of surmounting a seemingly incompatible relationship between V_{CE}, V_{EB}, and high current β. Test data indicates that some value of emitter-to-base resistance or an $\approx$0.1 volt reverse bias will produce a considerable improvement in the V_{CE} characteristic. (Author)

Lansdale Tube Co., Pa.
NUCLEAR RADIATION RESISTANT POWER TRANSISTORS, by A. Byer. Quarterly progress rept. no. 3, 15 Nov 59-15 Feb 60, on Contract DA 36-039-sc-78307. [1960] 28p.
Order from LC mi$2.70, ph$4.80 PB 149 376

The first group of power transistors was sent to MIT for the required irradiation. A higher temperature was experienced for those transistors receiving the 10^{14} NVT dosage. To combat this, the next group sent will call for successive smaller amounts of radiation, leading to the same total dosage. Collector-to-header soldering was causing BV_{CBO} degradation. Through extensive experimentation with heating techniques, solder composition, and type of electrode, this problem has been eliminated. The emitter pits were found to be concave in shape. This causes a higher resistivity at the center of the electrode than at the outer edges. Considerable improvement has been made in the pit geometry. The base tab connection, and its subsequent removal operation, have both been altered. The gold-arsenic whisker has been eliminated. The base index tab is now soldered to the base pin to serve as the electrical connection, and the excess tab is sheared off. Another collector degradation problem is that which occurs with the passage of time. This is separate and distinct from the collector degradation that was caused by header mounting. Attempts thus far have not eliminated this condition and are still being continued. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
PELTIER EFFECT AND THERMAL-CONDUCTIVITY MEASUREMENT TECHNIQUES FOR THERMOELECTRIC MATERIALS, comp. by Kenneth D. Carroll. June 59, 137p. 450 refs. LMSD-288 195. AD-237 470.
Order from LC mi$6.90, ph$21.30 PB 148 068

This selective bibliography covers the period 1950-1958. The literature of particular interest is that of the Peltier, Seebeck, and Joule-Thompson Effects as well as certain studies of thermal conductivity. The tellurides, in particular lead telluride, was the only thermoelectric material designated as being of primary interest. There was, therefore, no attempt to cover the rapidly expanding field of thermoelectric materials. Semiconductors were only of tangential interest; hence, reference is made only to those writings that were of interest to those who had originally requested compilation of the bibliography. The literature of both thermoelectric materials and semiconductors has been treated extensively in other publications. Sources for materials cited included: Chemical Abstracts, Nuclear Science Abstracts, Science Abstracts ASTIA, and Lockheed Missile and Space Division, Technical Information Center. (Author)

Mallory, P. R., and Co., Indianapolis, Ind.
RESEARCH AND DEVELOPMENT IN CONNECTION WITH MINIATURE VARIABLE RESISTORS, by Howard Reeve. Final rept. for 1 Mar 53-30 Sep 55 on Contract DA 36-039-sc-42655. [1955] 90p. 7 refs.
Order from LC mi$4.80, ph$13.80 PB 149 013

Efforts have been directed toward the research, development, and testing of materials and methods to establish designs for four specific types of miniature resistors and a single pole, single throw switch. Resistor designs developed include the 1/2 inch diameter bushing mount resistor with attached single pole, single throw switch, the 1/2 inch diameter flat mount resistor, the 3/8 inch diameter bushing mount resistor, and the 5/16 inch diameter multiturn resistor.

HIGH TEMPERATURE PRINTED CIRCUITRY, by G. H. Young, C. H. T. Wilkins and others. Quarterly rept. no. 11, third series, 1 Apr-30 June 59, on Computer Components Fellowship no. 346, Contract AF 19(604)1959. 4 Apr 60, 31p. 29 refs. AFCRC-TN-60-361.
Order from LC mi$3.00, ph$6.30 PB 149 143

Continuation of investigations on printed circuitry has shown that non-glaze-containing, screen-printed conducting patterns comprised of silver-platinum alloys are feasible for use as two-dimensional electrodes. Tables of physical properties of refractory materials, including borides, nitrides, carbides, and silicides, considered pertinent to past and present investigations are given. Bulk alloy ultimate tensile values for the Ag-Pt alloy system at firing temperatures from 1000 to 1500°C on two substrates are given and acceptable combinations of variables are indicated. Bonding of silver-glaze enamels to alumina is discussed and illustrated photomicrographically. In addition, a number of effects encountered in firing screen-printed conducting films are shown and correlation of the Ag-Pt films with the binary phase diagram is discussed. The utilization of rhodium as a barrier layer between evaporated-film capacitor electrodes and dielectric has produced capacitors of acceptable electrical characteristics. (Author) (See also PB 144 545)

Mellon Inst., Pittsburgh, Pa.
HIGH TEMPERATURE PRINTED CIRCUITRY, by G. H. Young, C. J. Owen and others. Quarterly rept. no. 12, third series, 1 July-30 Sep 59, on Computer Components Fellowship no. 347, Contract AF 19(604)1959. 13 Apr 60, 33p. 12 refs. AFCRC-TN-60-577.
Order from LC mi$3.00, ph$6.30 PB 149 144

Screen-printed electrode films of alloyed silver and platinum powders and containing no glaze constituent are shown to have exceptionally good adhesion to refractory substrates and acceptable conductivity. These fired, electrically-conducting films should prove adaptable to high temperature circuitry. Extensive physical and electrical property data pertinent to these films are presented in tabular summaries. The physical variations in geometry of the Ag-Pt screen-printed electrodes of 5 to 60% Ag content are presented for illustrative purposes. The utilization of evaporation-annealing, or vacuum deposition on a hot substrate, as a substitute for cycle-annealing of Au-Pd thin film resistors is discussed. Resistance versus temperature sample curves for resistors annealed by both methods and monitored simultaneously are presented. The effect of electron bombardment on the electrical properties of high temperature resistors and capacitors fabricated in the laboratory is discussed. Radiation damage varied from none for the screen-printed enamel resistors to a permanent effect for film capacitors. (Author) (See also PB 149 143)

Mellon Inst., Pittsburgh, Pa.
HIGH TEMPERATURE PRINTED CIRCUITRY, by G. H. Young, C. J. Owen and others. Quraterly rept. no. 13, third series, 1 Oct-31 Dec 59, on Computer Components Fellowship no. 347, Contract AF 19(604)1959. 13 Apr 60, 40p. 10 refs. AFCRC-TN-60-578.
Order from LC mi$3.00, ph$6.30 PB 149 145

Continued investigations on essentially two-dimensional electronic components showed that laboratory-fabricated thin film capacitors were relatively temperature-insensitive up to about 300°C. A test circuit diagram for a more automated method for the elevated temperature testing of capacitors is described. As a preliminary step in the investigation of a newly-assigned research area, inorganic wire coatings and encapsulating compounds, a literature survey of the mechanism and rate of formation of oxides in general and of litanium and zirconium oxides is presented. Radiation tests on screen-printed and vacuum-evaporated resistors showed that, at the highest level of electron bombardment utilized, the resistors were unaffected during irradiation. Tensile and electrical resistance data are presented for screen-printed metallized alloy conducting films containing a glassy phase, with and without a molten silver phase, to show the degree of effect of silver on bond strength and electrical resistance. Photomicrographs of scraped capacitor dielectric films show that, in the absence of a barrier layer over the gold electrode, the gold diffuses or migrates laterally into and through the dielectric. (Author) (See also PB 149 144)

Mellon Inst., Pittsburgh, Pa.
HIGH TEMPERATURE PRINTED CIRCUITRY, by G. H. Young, C. J. Owen and others. Quarterly rept. no. 14, third series, 1 Jan-31 Mar 60, on Computer Components Fellowship no. 347, Contract AF 19(604)1959. 13 Apr 60, 53p. 16 refs. AFCRC-TN-60-579.
Order from LC mi$3.60, ph$9.30 PB 149 146

Continued investigations on high temperature, passive, 2 D components have included a literature survey of the mechanism and rate of formation of oxides, the second section being presented in this report. An apparatus for determining the gross effect at temperature of differential expansion between thin film (0.001" thick) enamels, screen-printed and fired on ceramic substrates, is described and illustrated. The useful operating temperature of the laboratory-developed, screen-printed $MoSi_2$ resistor has been raised from 500 to about 650°C. A systematic investigation of such related parameters as type and amount of glaze constituent, wetting agent, firing time and temperature, and type of substrate is presented in tabular form. The probable nature of the high-resistance film formed between a printed and fired Ag:Pt electrode and one end of an $MoSi_2$ resistor is discussed. The high temperature testing of miniature, single crystal dielectric capacitors by manual methods indicates tentatively that only a dielectric approaching single crystal properties will suffice in developing an adequate component. Initial studies on the effect of temperature on contact angle of compressed glaze pellets on silver, as a preliminary step in the development of dielectric coatings for silver wire, are discussed and illustrated. The temperature coefficient of resistance of evaporated Au:Pd alloy resistor films of controlled but widely varying thickness was found to remain essentially constant. (Author) (See also PB 149 145)

MODE-JUMPING CAVITY FOR FLOATING-DRIFT-TUBE KLYSTRONS, by J. J. Shaw and D. K. Winslow. Technical rept. on Contract DA 36-039-sc-73178. Oct 59, 37p. M. L. rept. no. 659; SEL Technical rept. no. 352-1; AD-232 383.
Order from LC mi$3.00, ph$6.30 PB 148 333

A new method is described for increasing the frequency-tuning band of high-power, CW microwave oscillators of the floating-drift-tube type. An important advantage of the system is that it would require a voltage tuning ratio on the tube of only 1.5, which is the same as required for $f_2/f_1 = 1.22$ in a single mode system. It is shown experimentally that a tube cavity can be designed so that both the parallel and series modes will have the proper RF voltage ratios between output and input gaps required for efficient operation. It is further shown to be experimentally possible to satisfy a simultaneous condition on the frequency separation between the series and parallel modes so that they will be mutually noninterfering. A cold test cavity was built, and measurements of voltage ratios and mode separation showed reasonable values over the entire 3/2 frequency turning range.

Microwave Lab., Stanford U., Calif.
SOLID-STATE, TWO-LEVEL, HIGH-POWER MASER, by H. John Shaw. Quarterly progress rept. no. 1, 1 Dec 59-29 Feb 60, on Contract DA 36-039-sc-85263, continuation of Contract DA 36-039-sc-72785. Apr 60, 14p. ML rept. no. 707; AD-236 801.
Order from LC mi$2.40, ph$3.30 PB 149 382

Several aspects of pulsed microwave generation using ferrites are currently being investigated. Cold test measurements have been made on the original S-Band generator. Full scale K-band components have been constructed for the K-band generator. Significant advances have been made in pulsed magnetic field production, which now make available pulsed fields suitable for a millimeter wave generation. Various millimeter wave generation schemes to utilize these pulsed fields have been considered, and components have been fabricated for one of these schemes. (Author)

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
X-BAND BEACON FERRITE DUPLEXER, by G. J. Wheeler. Quarterly progress rept. no. 1, 1 Apr-30 June 59, on Contract DA 36-039-sc-78802. 8 July 59, 8p. AD-227 266.
Order from LC mi$1.80, ph$1.80 PB 149 412

Research concerns the development of an X-band beacon ferrite duplexer. The duplexer consists of a tee circulator and a limiter. Tee circulators meeting the requirements of phase 1, i.e., covering 9.3 to 9.5 kmc, had been constructed before the contract was received. A design for a phase 2 model, covering 8.5 to 9.6 kmc, was developed and preliminary tests indicate there will be no difficulty in meeting the specifications. A ferrimagnetic limiter is being developed experimentally. Insertion loss and threshold are too high, but were reduced substantially from earlier models. Several geometries and materials are being tested. Thus far, the results are satisfactory only over a narrow band. (Author)

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
X-BAND BEACON FERRITE DUPLEXER, by G. J. Wheeler. Quarterly progress rept. no. 3, 1 Oct-31 Dec 59, on Contract DA 36-039-sc-78802. 12 Jan 60, 13p. AD-232 107.
Order from LC mi$2.40, ph$3.30 PB 149 413

A broad band Tee requiring less critical tolerances in fabrication was developed. A tunable ferrimagnetic limiter was also developed using a shunt cavity in a constant magnetic field. Low insertion loss and low threshold are still mutually exclusive. (Author) (See also PB 149 412)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
ON STUDY OF MICROWAVE FERRITE DUPLEXER, by Laurence Levey. Quarterly rept. no. 1, 1 Apr-30 June 58, on Contract DA 36-039-sc-78000. 12 Sep 58, 32p. 4 refs. Rept. R-682.3-58; PIB-610.3.
Order from LC mi$3.00, ph$6.30 PB 149 111

Techniques employed to fabricate toroidal ferrite elements for rectangular waveguide have been detailed. The remanent magnetism of toroidal structures has been utilized to obtain a differential phase shift of 23 degrees per inch in rectangular waveguide. The feasibility of constructing switching devices using ferrite toroids has been demonstrated. Ferrite compositions in preparation to produce new square loop materials for switching applications have been described. The theoretical differential phase shifts obtained with a number of composite ferrite-dielectric geometries in coaxial lines and rectangular waveguide have been computed. (Author)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
ON STUDY OF MICROWAVE FERRITE DUPLEXER, by L. Levey. Quarterly rept. no. 2, 1 July-30 Sep 58, on Contract DA 36-039-sc-78000. 28 Oct 58, 9p. 1 ref. Rept. R-682.6-58; PIB-610.6.
Order from LC mi$1.80, ph$1.80 PB 149 112

Ultrasonic techniques of fabricating ferrite toroids, for use in waveguide switches, have been explored. After some development, proper tools have been fabricated and the technique has been proven to be feasible. The differential phase shift, due to ferrite toroids in a rectangular waveguide, has been measured with the toroids centralized in the waveguide and with the toroids laterally displaced. Surprisingly enough, the laterally displaced toroids gave up to 50% more differential phase shift per unit length than the centralized ones. Ferrite materials are being sought which have a combination of good square loop and switching properties and also have good microwave properties. Exploration

of some Magnesium Manganese ferrite is promising in that some measurements showed various compositions had excellent microwave properties. (Author) (See also PB 149 112)

STUDY OF MICROWAVE FERRITE DUPLEXER, by L. Levey. Quarterly rept. no. 5, 1 Apr-30 June 59, on Contract DA 36-039-sc-78000. 1 Sep 59, 12p. Rept. R-682-15-59; PIB-610.15.
Order from LC mi$2.40, ph$3.30 PB 146 451

The examination of methods of reducing the volume of ferrite material per degree of differential phase shift was continued. Computations of differential phase shift were made for a waveguide configuration consisting of permanently magnetized ferrite slabs separated by a dielectric material. (See also PB 146 453)

Mohawk Business Machines Corp., Brooklyn, N. Y.
DEVELOPMENT OF A DUAL SPEED, DUAL CHANNEL-DUAL TRACK MAGNETIC TAPE RECORDER-REPRODUCER AN/UNH-1 ( ), by W. F. Heine and S. Duckstein. Final engineering rept. on Contract DA 36-039-sc-52600. May 57, 85p. AD-148 233.
Order from LC mi$4.80, ph$13.80 PB 149 397

The results of this development indicate that the requirements of studio equipment quality and complexity field type ruggedness, and low weight in equipment of this kind cannot be realized simultaneously. It is entirely feasible to combine any two of these objectives and obtain a finished item at reasonable cost, but not all three. The primary instance of this conflict is the drive mechanism, wherein the requirements for studio type tape speed accuracy, and ruggedness could have been achieved with no particular difficulty, had it not been complicated by the weight factor. What is especially troublesome in this respect is that weight begets weight, not linearly, but with some higher order relationship.

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
DATA TRANSMISSION IN THE PRESENCE OF INTERFERENCE, by R. M. Showers, R. S. Berkowitz and others. Final rept. for 1 May 58-30 June 59 on Project ADAR, Task C, Contract DA 36-039-sc-75047. 31 July 59, 135p. 4 refs. AD59URI, v. 3; AD-235 997.
Order from LC mi$6.90, ph$21.30 PB 149 393

Studies involve (1) the effects of interference in producing baud errors in a digital data transmission system and (2) the relative efficiency of various error detecting schemes in reducing the number of undetected errors in a transmitted message. The performance of AM and PM systems using standard teletype transmission in the presence of noise recorded from an actual transmission circuit was investigated. A baud error probability considerably less than one error in 10^5 can be expected with such circuits. From theoretical calculations of the performance of AM, FM, and PM systems in the presence of this type of interference it was concluded that the binary PM system is about 3 db better than AM or FM transmission. A procedure for predicting the performance of such systems is suggested. Of the five detection codes studied in the presence of random, grouped, and periodic errors, the transverse-longitudinal parity check proved to be quite superior to the others. (Author)

National Aviation Facilities Experimental Center, Atlantic City, N. J.
CHARACTERISTICS OF A VOR ON A 200-FOOT TOWER, by Sterling R. Anderson and Robert B. Flint. Final rept. Apr 60, 37p. 2 refs.
Order from OTS $1.00 PB 161 949

A mobile VOR station located in a cleared area 200 feet square at one corner of a heavily wooded site was flight tested. A maximum course scalloping of plus or minus 11.5^o was recorded at a radius of 20 miles and an altitude of 1,000 feet. Later, a VOR antenna was erected on a 200-foot tower with a 60-foot-diameter counterpoise. Similar flight tests indicated a scalloping maximum of plus or minus 0.5^o. A 20-mile-radius orbital flight in the first null (1.2^o) produced scalloping of plus or minus 6^o maximum. The distance range, for a receiver input signal of 5 microvolts, varied from 63 miles at 300 feet altitude to 175 miles at 9,000 feet altitude. It is shown that with an antenna 200 feet above ground, while there still are objectionable course bends in the nulls of the vertical plane radiation pattern, the detrimental effect of the site on VOR performance was reduced at low elevation angles, and the low-altitude coverage was extended. This type of installation should be useful in heavily wooded terrain where a suitable site cannot be obtained for the installation of a more conventional station.

National Bureau of Standards, Washington, D. C.
OXIDE COATED CATHODE SUBLIMATION STUDIES, by Glenn F. Rouse. Scientific rept. no. 3, 1 Feb 57-31 Dec 58. 4 Feb 59, 21p. 2 refs. NBS rept. 6286; AFCRC-TN-59-158; AD-211 448.
Order from LC mi$2.70, ph$4.80 PB 147 399

A sensitive vacuum microbalance has been used to study the sublimation characteristics of some samples of uncoated cathode nickel. The results of this study are presented. A study of the coated cathode has been started. As an initial step the changes in mass which occur during the thermal conversion of the carbonates have been determined. The data obtained are discussed. (Author)

A BINARY COUNTER AND ACCUMULATOR USING TRANSISTORS AND MAGNETIC CORES, by H. R. Irons. 23 Oct 58, 30p. NAVORD rept. 6184; AD-210 060.
Order from LC mi$2.70, ph$4.80 PB 147 565

Binary devices are described which employ a transistor-magnetic core combination as a fundamental building block for digital circuits. These devices are capable of high operating speeds and yet require very little power at low operating speeds. For example, a five stage binary counter has a total power consumption of 40 micro watts when operated at a counting rate of 100 pulses per second. The same counter is capable of operation at rates as high as 2×10^6 pulses per second. Good reliability is indicated by the fact that a counter has been operated successfully over a temperature range of -65°F to 160°F with a supply voltage of -2.0 volts to -4.5 volts. (Author)

Naval Ordnance Lab., White Oak, Md.
A NARROW BAND LOCK-IN ANALYZER AND SLAVE ANALYZER, by A. Zed Robinson. Rept. for Dec 47-Sep 51 on Improved Noise Analyzers. 15 Jan 58, 15 Jan 58, 65p. 7 refs. NAVORD rept. 4420; AD-158 517.
Order from LC mi$3.90, ph$10.80 PB 147 570

This report describes a novel method for obtaining narrow band frequency analysis using RC circuits as the filtering elements. Normal ambiguities due to frequency and amplitude modulation of discrete components are eliminated by providing the analyzer with two quadrature phase channels. A lock-in circuit allows considerable more information to be obtained on discrete components. The use of this analyzer in conjunction with a slave analyzer is also described. This allows positive identification of discrete signals at different parts of a vibrating system. (Author)

Naval Research Lab., Washington, D. C.
AN IMPROVED DC CURRENT-INTERRUPTER UNIT, by C. H. Presbrey, Jr., and S. Schuldiner. 14 July 60, 22p. 2 refs. NRL rept. 5472.
Order from OTS $0.75 PB 161 437

An improved design for a dc current interrupter has been developed at this Laboratory. This improvement was made in an effort to remedy certain operational difficulties encountered in the use of an existing model and also to provide for further studies at higher cell-current levels. In its present application to electrochemical studies, the current interrupter is part of an overall system consisting of the interrupter, a cell-current dc meter, a cell (with probe), an external power supply for the cell and for gating-stage bias, a peak-to-peak ac voltmeter, and an oscilloscope for visual or photographic analysis of the interrupted waveform. The specifications of the improved interrupter include the following features: current range from 10 μamp to 400 ma, pulse repetition rate from 1 cycle to 10 kc, pulse length from 1 μsec to 0.1 sec, pulse rise-and-fall time of 0.25 μsec. This unit has been used in the study of the time vs potential characteristics of electrochemical solution IR drops and of the cleanliness of the associated electrode metals. (Author)

Naval Research Lab., Washington, D. C.
INSTRUMENTATION FOR THE CLASSIFICATION OF SPACE SIGNALS, by F. T. Powles. Interim rept. 21 July 60, 19p. 4 refs. NRL rept. 5488.
Order from OTS $0.50 PB 161 515

The detection and identification of nonradiating satellites require a system designed to provide a phase difference of two incoming signals from a common source which can be translated to an angular position for the source, and a record from which input intensities over the duration of the signal may be derived, both related to an accurate time scale. The Navy's Space Surveillance System, based on the interferometer principle, was designed to satisfy these needs. The classification of signals from this system requires a knowledge of as many as possible of the characteristics by which the identity can be established. In the measurement of the characteristics of the signals obtained from the SPASUR system, it has been found that equipment available for the processing and analysis of the data in general does not have the accuracy or high speed required for a precise determination of short-duration signal characteristics. Improvement of existing instruments and development of new equipment to meet these performance requirements is being investigated. (Author)

Naval Research Lab., Washington, D. C.
REGULATED LINEAR TRANSFORMER-RECTIFIER POWER SUPPLIES, by D. S. Toffolo. Interim rept. 27 July 60, 19p. NRL rept. no. 5494.
Order from LC mi$2.40, ph$3.30 PB 146 392

The NRL unit described in this report, without using any filtering components, has an essentially linear input impedance per phase, is lighter for the same rating than present operational units procured from commercial sources, utilizes the more economical standard grades of transformer steels, and has equal if not superior regulation characteristics, particularly under transient conditions. The regulation control scheme is relatively simple, rugged, and reliable. As a further reliability feature, the unit is capable of delivering power at the same regulation as the ac primary input power even when the control components fail. The NRL unit incorporates several new features in a conversion unit of this type. They are a multiwinding synthetic secondary, series compensation, flux switching to obtain regulation, and tertiary windings to suppress harmonics, particularly those due to the rectifiers. Additional control features can be added, depending upon the degree of regulation desired.

New York U. Coll. of Engineering, N. Y.
CONTROL SYSTEM WITH MINIMUM SPECTRAL BANDWIDTH PF PLANT INPUT, by James C. Hung. Rept. on Contract AF 49(638)586. May 60, 21p. 2 refs. Technical rept. 400-9; AFOSR-TN-60-493.
Order from LC mi$2.70, ph$4.80 PB 148 943

A design method for control systems that minimizes the spectral bandwidth of the plant input signal is discussed. The plant input signal is minimized subject to the constraint that the integral square error for deterministic inputs or the mean square error for random inputs be limited to a known desired value. The control system transfer function that satisfies these requirements is derived, and the functions used in bandwidth shaping are discussed. An example of a system design using this technique is given. (Author)

MICROWAVE TUBE RESEARCH ON BARKHAUSEN-KURZ CAVITY-TYPE OSCILLATORS AND A TRANSVERSE-FIELD TRAVELING-WAVE TUBE, by Dean T. Davis, Fang-Shang Chen, and E. M. Boone. Final rept. on Contract AF 18(600)982. Dec 59, 61p. 15 refs. AFOSR-TN-60-134.
Order from LC mi$3.90, ph$10.80 PB 149 261

An electron tube employing a magnetically focused electron stream moving in an electric field resulting from a parabolic potential distribution can be operated as a Barkhausen-Kurz oscillator. Electrons traveling in such a potential distribution execute simple harmonic motion, and insofar as an accurate parabolic potential distribution is achieved, the frequency of the electron oscillations will be independent of the amplitude of the motion. If the interaction gap of a cavity resonator is located at the center of such a potential distribution and the resonator is tuned to an odd integral multiple of the frequency of simple harmonic electron motion, the electrons can then remain in proper phase to deliver energy to the high-frequency field of the resonator on successive transits. Oscillators of this type have been investigated at wavelengths of 3 cm, 1 cm, and 6 mm. Two types of geometries have been utilized, one having symmetry about the plane of a flat electron beam, and the other being symmetrical about the axis of a cylindrical electron beam. These tubes have exhibited low starting currents, wide electronic tuning ranges, and efficiencies of 12 to 14 percent in the 3 cm and 1 cm wavelength range. A detailed theoretical analysis has been completed, and is well correlated by experiment.

Ohio State U. Research Foundation, Columbus.
PARAMETRIC AMPLIFICATION, by Marlin O. Thurston. Final rept. on Contract AF 19(604)4060. May 60, 53p. 21 refs. AFCRC-TR-60-145.
Order from LC mi$3.60, ph$9.30 PB 149 166

This research was concerned with the capabilities and limitations of parametric amplifiers of the non-linear capacitance type. The dependence of junction capacitance on bias voltage for various special impurity distributions near the junction was calculated theoretically It was found possible to obtain a moderately large rate of change of capacitance with voltage at a reverse bias voltage large enough to make the capacitance itself small. The implications of this design for high-frequency, high-sensitivity amplifiers were considered. Diodes embodying this idea were constructed and initial tests were made. In support of the work on diode characteristics it was necessary to extend the theory of parametric amplifiers. The results obtained permit the performance of a parametric amplifier to be related to the capacitance characteristic of the diode, even at moderately high-signal level. Experimental frequency multipliers and parametric amplifiers were constructed and tested at various frequencies from audio to 23 kMc. The main purpose of this part of the work was to provide systems for use in making comparative operating tests of experimental diodes. (Author) (See also PB 143 192)

Philco Corp., Philadelphia Pa.
INVESTIGATION OF PHYSICAL LIMITATIONS ON CURRENT GAIN (BETA) AND RESEARCH ON IMPROVED SILICON CONTACTS, by Leon L. Maissel and James P. Spratt. Final rept. for 1 Apr 58-31 Mar 59 on Contract AF 19(604)3894. 30 Apr 59, 22p. 10 refs. H-2162-F; AFCRC-TR-59-157; AD-216 765.
Order from LC mi$2.70, ph$4.80 PB 148 553

This report comprises two principal studies: an investigation of the factors limiting the grounded emitter current gain (β) of a transistor, and research on improved contacts for silicon. Theoretical analysis of β limitations suggested a technique for evaluating the relative importance of the factors known to affect current gain. Attempts to apply this technique experimentally yielded anomalous results. These discrepancies, as yet unexplained, indicate that it is not possible to produce high-gain and/or high-frequency devices by biasing transistors near punch-through voltage. The first step in the study of improved silicon contacts was to determine the possibility of developing a micro-alloy structure for silicon. When experiments showed that such a device, while possible, would not be adaptable to large-scale production, this work was discontinued. Attention was then turned toward a silver-antimony contact. A method of jet-plating silver onto silicon was developed. The effect of silver alloying on lifetime was investigated; no adverse effect was noted. A study was made of diffusion from a plated contact as a method of producing a good injecting contact of small area. It was concluded that this method does not yield usable contacts.

Radiation Research Corp., New York.
NUCLEAR BATTERIES, by John H. Coleman and Arthur P. Pinkerton. Final progress rept., 15 Aug-15 Nov 57, on Contract DA 36-039-sc-73115, continuation of Contract DA 36-039-sc-71132. [1957] 35p. 10 refs. AD-160 419.
Order from LC mi$3.00, ph$6.30 PB 149 104

The battery components (source, collector and enclosure) were tested separately to obtain general design data and batteries constructed to test these principles. In regard to components, first, tritium-

titanium sources were prepared and tested for helium 3 and tritium evolution. Tests using a mass spectrograph indicate no measurable evolution after 67 days. Tests using an ion chamber indicate model R life is 32,000 days at room temperature and 2,000 days at 75°C and R2 life is 930,000 days at room temperature and 5,200 days at 75°C. Secondly, a new electrophoresis process was developed to deposit the carbon collector with a minimum of impurities. Thirdly, enclosures for Models R and R2 types were designed and drawn from flat CRS with copper plating. In regard to battery models, two types (RS and R2S) were designed for 1000°C processing. Also electrical data was taken which indicated Model R and R2 output current as a function of internal gas pressure. (Author)

Radiation Research Corp., New York.
VACUUM TRITIUM NUCLEAR BATTERY, by Joseph Thomas-Hazel, Bernard Caras and others. Final rept., 15 June-14 Dec 58, on Contract DA 36-039-sc-78047. [1958] 64p. 9 refs. AD-218 856.
Order from LC mi$3.90, ph$10.80 PB 149 113

A new battery design was evolved which incorporates a ceramic terminal and a complete processing schedule was developed for constructing these batteries on a special large-bore double-pumping vacuum system. Batteries were fabricated and subjected to life tests. (Author)

Radio Corp. of America, Harrison, N. J.
RUGGEDIZATION OF TWO TYPES OF S-BAND PULSED PENCIL-TUBE-AND-CAVITY TRANSMITTER UNITS. VOLUME I. RESEARCH AND DEVELOPMENT PROGRAM, by R. K. Reusch, D. W. Power, and R. E. Brooks. Final rept. for 17 May 57-10 July 59 on Contract DA 36-039-sc-74808. [1959] 182p. 5 refs. AD-236 221.
Order from LC mi$8.40, ph$28.80 PB 149 607

The development and the ruggedization are described of two types of S-band, pulsed, pencil-tube-and-cavity transmitter units. Volume 1 contains a description of the work done, test procedures and results, conclusions, and recommendations concerning RCA Developmental Type Nos. A-15134 grid-pulsed and A-15135 plate-pulsed units. The work has produced transmitter units with increased reliability and the following major features: good stability in frequency and power output when subjected to linear acceleration forces of at least 10,000 g's, forces of shock, vibration, and rotation, changes in temperature, and mismatched loads. In addition, the units possess increased life, low rf power leakage, and uniform drive requirements. The report contains two studies by R. K. Reusch: "A Theoretical Analysis of Rieke Diagram Interpretation," and "A Theoretical Analysis of Starting-Time Delay." (Author)

Raytheon Co., Waltham, Mass.
INVESTIGATION OF THE CORRELATION OF STANDARD DIODE EMISSION STUDY CONTRACT FINDINGS WITH PRODUCTION TYPE TUBES USING STANDARD PRODUCTION EQUIPMENT, by F. Hill, C. Bardsley and others. Final Scientific rept., 15 Dec 58-15 Jan 60, on Contract AF 19(604)4095. 4 Apr 60, 50p. AFCRC-TR-60-133.
Order from LC mi$3.30, ph$7.80 PB 149 574

Controlled laboratory exhaust tests have shown that the three variables affecting the emissive qualities of a vacuum tube are: time (length of exhaust cycle), cathode temperature during the exhaust cycle, and vacuum pressure conditions during the exhaust cycle. A program was initiated to study two exhaust machines: one with poor pumping speed, and one with vastly improved pumping speed. It has been demonstrated that the main variable affecting the pumping speed of the two exhaust units is the conductance of the plumbing connections between the vacuum tube exhaust stem and the pump. The conductance of the plumbing connections was improved by increasing the diameter of the piping. The first series of tests was run to study the effect of machine speed variations, with the same exhaust lighting and induction heating schedule on both units, upon the emissive qualities of the 6AH6 vacuum tube. It was concluded from these tests that machine speed variations from 500 to 1200 tubes per hour do not affect the life burning characteristics of the 6AH6 vacuum tubes regardless of the exhaust unit. (See also PB 148 123)

RCA Defense Electronics Products, Camden, N. J.
MICRO-MODULE PRODUCTION PROGRAM. Quarterly rept. no. 7, 1 Oct 59-1 Jan 60, on Contract DA 36-039-sc-75968. [1960] 212p. AD-234 690.
Order from LC mi$9.60, ph$33.30 PB 149 375

Production and testing of nearly all final-grade elements was accomplished. The process of molybdenum-manganese metallizing combined with ultrasonically assisted soldering was adopted as a method for producing reliable hermetic seals of semiconductor and quartz crystal units. All required digital modules of prototype-grade were completed and are undergoing tests. Forty-eight prototype-grade modules of sixteen different types have accumulated 62,000 module-hours of 85°C operating life-tests. (Author) (See also PB 146 042)

RCA Labs., Princeton, N. J.
BRIGHTNESS INTENSIFIER STUDY, by G. A. Morton, J. E. Ruedy and others. Rept. for 15 Sep 54-30 Nov 56 on Light Amplification, Contract AF 33(616)2631. May 60, declassified. 54p. 6 refs. ARL Technical rept. 60-284.
Order from OTS $1.50 PB 161 945

The basic limits of vision and image detection are discussed. Experimental results with the direct view intensifier are reported. A general discussion of pickup tube limitations concludes that the image intensifier orthicon is a very suitable pickup tube for a brightness intensifier amplifying a low light scene. Other intensifications methods and storage operation of intensifier orthicons are also investigated and discussed. The use of the image intensifier orthicon for optical pulse ranging is suggested. (Author)

RCA Defense Electronics Products, Camden, N. J.
MICRO-MODULE PRODUCTION PROGRAM. Quarterly rept. no. 6, 1 July-1 Oct 59, on Contract DA 36-039-sc-75968. [1959] 157p. 3 refs.
Order from OTS $3.00 PB 161 911

Electrical testing of prototype micro-elements was substantially completed during this quarter and environmental and life tests were initiated. Fifty prototype modules were assembled and encapsulated, and given electrical tests. Further evaluation is underway. The final printed wiring layouts for the micro-modular AN/PRC-36 Receiver and for three required subassemblies were completed. The design is compatible with the Program packing density objective of a quarter million parts per cubic feet. (Author)

MATHEMATICAL CIRCUIT ANALYSIS AND DESIGN. Scientific rept. no. 1 on Contract AF 19(604)5189. 29 Feb 60, 40p. AFCRC-TN-60-358.
Order from LC mi$3.00, ph$6.30 PB 148 222

This report describes the attempt to develop a mechanized routine for the design and fault diagnosis of electronic circuits, summarizes the progress to date, and suggests areas for future study. Fault diagnosis has been considered initially, since (1) it seems to be the more tractable of the two, and (2) circuit design is considered to be a direct extension of fault diagnosis, requiring the incorporation of the worst case criterion and a method of optimization. A unique method has been devised for translating any schematic diagram into computer language so that each component and its location is specifically described. A method has been established and programmed for the Univac computer to generate the complete set of irredundant nodal and branch equations which will handle both linear and nonlinear characteristics of the circuit parameters. Finally, the set of equations has been reduced by eliminating all variables not required for solution of the component parameters. A sample circuit is given and a copy computer printout accompanies the description of each stage of the analysis. (Author)

STUDY OF SEALED NICKEL-CADMIUM BATTERIES, by Paul Ritterman. Final rept. for 1 Dec 58-31 Jan 60 on Research Investigations to Develop and Evaluate a Nickel-Cadmium Battery Having a Hermetically Sealed Construction, and to Study Its Reaction Mechanisms, Contract DA 36-039-sc-78249. [1960] 76p. 13 refs.
Order from LC mi$4.50, ph$12.30 PB 149 026

The life cycling program, using size "D" hermetically sealed cells filled with varying concentrations and amounts of electrolyte, was concluded after 608 cycles. Results of periodic capacity tests made during the entire cycling program are shown. Sealed cells were constructed for the experiment to test the effects of cobalt addition to the positive plates, lithia addition to the electrolyte and variation of negative/positive capacity ratios. The rate of reaction with oxygen of cadmium plates was investigated, within a sealed chamber, under varying conditions of oxygen pressure, mole fraction of oxygen and electrolyte concentration. Hermetically sealed cells were constructed with a special side opening so that it was possible to measure pressure build-up on charge and discharge by connection to a gauge. An experiment was designed to test the effect of temperature and initial cell atmosphere on the charge and discharge characteristics of the sealed cell. The effects on pressure build-up during charge and discharge were also studied. A relatively low recombination pressure (average = 12.4 psig) was found for the three cells tested when they were charged at the 3 hour rate (1.8 amperes).

Sperry Gyroscope Co., Great Neck, N. Y.
INVESTIGATION OF MICROWAVE WINDOW FAILURE MECHANISMS AND THEIR ELIMINATION, by D. Churchill and E. Cheatham. Quarterly progress rept. no. 2, 1 Sep-1 Dec 59, on Contract DA 36-039-sc-78314. Jan 60, 45p. 12 refs. Sperry rept. no. NA-8240-8182-2; AD-235 611.
Order from LC mi$3.30, ph$7.80 PB 149 027

The trajectories of electrons in an evacuated cylindrical waveguide under the fields of propagating rf energy were calculated. The results indicate an axial drift in the direction of propagation; this may be contributory mechanism in the charging of dielectric windows. The ghost-mode resonant frequencies of a thick, self-resonant structure were calculated using Forrer's equations. The solutions are presented as universal curves for various dielectric constants. These solutions were then compared with experimental values; the results were favorable. A survey of literature pertaining to radiation effects in inorganic solids was assessed. Radiation damage, such as color centers in the alkali halides, is primarily the result of ionization and excitation caused by electrons and X rays. A number of structures were selected for transmission measurements and bandwidth studies. The disc window with a short cylindrical section has produced the most promising results. A double-disc assembly was constructed for breakdown tests. Two material samples were subjected to 100-kv electron bombardment. The alumina sample was apparently undamaged; the Vycor sample showed indications of minor radiation damage. (Author) (See also PB 147 972)

Sperry Gyroscope Co., Great Neck, N. Y.
TRANSISTORIZED GYRO MAGNETIC COMPASS SET. Final engineering rept. for Aug 57-Feb 59 on Contract DA 36-039-sc-74871. Aug 59, 47p. 2 refs. Rept. no. LA-3254-0028; AD-227 162.
Order from LC mi$3.30, ph$7.80 PB 149 023

Design plans for four Gyro Magnetic Compass Sets were completed and submitted. Sperry was requested to redesign and convert the two sets with rotating pointer indicators to rotating dial indicators. This design incorporates integral lighting in both the rotating dial indicators and the rotating dial repeaters. Redesign of the two compass sets was accomplished and accepted. Fabrication of all four sets was completed. Testing of the compass sets to establish compliance with Procurement Specification SCL-1802 was completed. Evaluation of test data indicated that over-all performance of the compass sets is satisfactory.

Stanford Electronics Labs., Stanford U., Calif.
CORRUGATED WAVEGUIDE FILTERS WITH SPECIFIED STOP-BAND CHARACTERISTICS, by M. Crane and D. J. Grace. Rept. on Contract DA 36-039-sc-73151. 31 Jan 58, 62p. 8 refs. Technical rept. no. no. 152-4; AD-160 471.
Order from LC mi$3.90, ph$10.80 PB 149 407

This report treats the design of corrugated filters for which both pass-band and stop-band characteristics have been specified. Following a review of the general corrugated-waveguide matrix and a summary of image-parameter techniques, it is shown that considerable simplification results when the guide wavelengths in both the transmission waveguide and the slots are the same. A procedure is described for designing a filter in sections, with each section composed of a cascade of identical filter elements which accomplishes one of the design objectives. This technique is illustrated by the design of a filter with a pass band from 8.0 to 15.0 kMc and a stop band from 15.0 to 21.0 kMc. The attenuation was required to rise at least 10 db per 100 Mc above the 15.0 kMc lower cutoff and remain 40 db or more throughout the stop band. The sequence of construction and measurement for this filter is discussed, and the experimental results are presented. Of the many important filter constructions for which the general corrugated-waveguide matrix must be used, ridge waveguide and dielectric or paramagnetic loading are perhaps the most common. The results of some preliminary work using changes in the permeability of ferrite to shift the cutoff frequencies of a corrugated filter are discussed briefly. (Author)

A CROSSED-FIELD MULTI-SEGMENT DEPRESSED COLLECTOR FOR BEAM-TYPE TUBES, by D. A. Dunn, R. P. Borghi, and G. Wada. Rept. on Contract AF 33(616)6207. 21 Sep 59, 22p. 8 refs. Technical rept. no. 102-1; AD-227 051.
Order from LC mi$2.70, ph$4.80 PB 147 615

The velocity-dependent action of crossed electric and magnetic fields can be used to sort the electrons of the spent beam of a klystron or traveling-wave tube into two or more velocity classes and to collect each class of electrons at a potential appropriate to its velocity. Secondary electrons produced at the collection surfaces do not return to the interaction space of the tube because of the nonreciprocal action of the crossed fields. An experimental tube permitted two-segment operation with 20 per cent of the beam power dissipated in the collector at small signals. Velocity sorting was observed that permitted operation near this percentage of beam power over a considerable range of r-f signal levels. (Author)

A HELICAL MICROWAVE ANTENNA FEED, by W. H. Huntley, Jr. Rept. on Contract DA 36-039-sc-73151. 30 Sep 57, 17p. 10 refs. Technical rept. no. 461-3; AD-144 454.
Order from LC mi$2.40, ph$3.30 PB 149 406

Design and construction of an S band beam mode helix for feeding an offset section of a paraboloid are described. Some measurement data taken with a test helix are given and evaluated for this application. The characteristics described include: beam shape and width; axial ratio; impedance; and location of the phase center. (Author)

AN INVESTIGATION OF THE SENSITIVITY OF SOME RECEIVERS HAVING LARGE R-F BANDWIDTH, by J. L. Grigsby. Rept. on Contract DA 36-039-sc-73151. 4 Nov 58, 172p. 18 refs. Technical rept. no. 553-1.
Order from LC mi$8.10, ph$27.30 PB 149 402

An investigation is made of the sensitivity of two types of receivers that have large r-f bandwidth. The receiver types considered are the superheterodyne with distributed-frequency local oscillator, and the crystal-video receiver employing r-f preamplification. The intent of the work is to determine the limiting values of the sensitivity of the receivers when the r-f bandwidth is at least several per cent of the band-center frequency.

TRANSMITTING AND RECEIVING EQUIPMENT FOR S-BAND PROPAGATION STUDIES. PART A. RECEIVER, by R. E. Miller, D. B. Coates, and C. S. Liston. Rept. on Contract DA 36-039-sc-73151. 3 Feb 59, 15p. 2 refs. Technical rept. no. 461-6A.
Order from LC mi$2.40, ph$3.30 PB 149 403

A high-sensitivity S-band receiver is described. Principal design factors of the system leading to a suitable receiver design for beyond-the-horizon propagation experiments are included as well as special circuit features of the receiver.

Stanford Research Inst., Menlo Park, Calif.
APPLIED RESEARCH IN MICROMINIATURE FIELD EMISSION TUBES, by W. W. Hansen. Quarterly progress rept. no. 2, 1 Oct 59-1 Jan 60, on Contract DA 36-039-sc-84526. [1960] 23p. 2 refs. AD-235 643.
Order from LC mi$2.70, ph$4.80 PB 149 380

Characteristics of simulated, microminiature, field emission tubes were studied in apparatus now nearing completion. Important parts of the apparatus are a demountable, ultra-vacuum chamber and a micromanipulator for adjustment of the spacing of tube elements without breaking the vacuum seal. Theoretical studies of a particular triode configuration indicate that power gains of 10 to 20 are realizable if plate loads of several megohms are used. The possibility of significant power gain at frequencies as high as 100 megacycles is implied by inter-electrode capacitances of the order of 10^{-15} farads. Tube dimensions determine whether tube operation is plate-power or emission limited. Maximum plate power becomes the dominant limiting factor as the dimensions of the tube studied are increased. (Author) (See also PB 146 797)

INVESTIGATION OF METHODS OF SCANNING THE BEAM OF LARGE ANTENNAS, by M. Gilden and J. S. Honda. Scientific rept. 10, 1 Sep-30 Nov 59, on Contract AF 19(604)2240. Feb 60, 58p. 23 refs. AFCRC-TN-60-394.
Order from LC mi$3.60, ph$9.30 PB 148 758

Gas discharge phase shifters are discussed with a view to determining their applicability to electronic scanning antenna arrays. A description of a gas-discharge plasma is given, and several modes of wave propagation are analyzed. Criteria for evaluation of phase shifters are then specified and applied to the various types of gas-discharge phase shifters described in the literature. It is concluded that a low-power, electronically controlled, gas-discharge phase shifter of small size is feasible at UHF. The second half of the report discusses a 360-degree-azimuth, line-source scanner employing a toroidal bend. (See also PB 144 310)

Stanford Research Inst., Menlo Park, Calif.
INVESTIGATION OF METHODS OF SCANNING THE BEAM OF LARGE ANTENNAS, by L. A. Robinson and E. M. T. Jones. Scientific rept. no. 11, 1 Dec 59-29 Feb 60, on Contract AF 19(604)2240. Apr 60, 29p. 16 refs. SRI Proj. 2184; AFCRC-TN-60-560.
Order from LC mi$2.70, ph$4.80 PB 149 543

The discussion is devoted to line-source feeds for the mechanical scanning of large spherical reflectors. With present-day large reflectors required for radars and for radio astronomy, the line source which is needed is many wavelengths long, so that leaky-wave type radiators become feasible. Radiation from leaky-wave atennnas can be very accurately controlled in amplitude and phase along the length of the antenna, and it should therefore be possible to approximate very closely the theoretical line source feed requirements. A particular leaky-wave feed design, consisting of a circular waveguide section perforated by narrow, transverse slots, is discussed. The slots are operated below resonance so that the amount of power coupled through each slot can be controlled by means of the slot length, and the phase velocity along the line source can be controlled by means of the waveguide diameter. MULTIWAVE TRANSMISSION LINE, by James D. Kellett. Rept. on Contract AF 19(604)5474. 1 Apr 60, 81p. 11 refs. Scientific rept. no. SR424-1; ERD-TN-60-599.
Order from LC mi$4.80, ph$13.80 PB 149 813

This paper describes an investigation of the electrical properties of a multiwave transmission line. The structure consists of two unbalanced TEM transmission lines whose outer conductors are modified to form either a rectangular or a ridged waveguide. The attenuation, mode cross-coupling, TEM characteristic impedance, and cut-off wavelength properties of this multiwave structure are analyzed both theoretically and experimentally. TEM attenuation of less than 1.5 times the attenuation of a coaxial structure of the same physical dimensions, decoupling between the TEM modes of greater than 50 decibels, and changes in cut-off frequency of less than 8 percent can be realized in the multiwave structure. (Author)

DIAGNOSIS OF EQUIPMENT FAILURES, by Richard A. Johnson, Earl Kletsky, and John Brule. Technical rept. no. 1 on Contract AF 30(602)1833. Apr 59, 75p. 6 refs. SURI rept. no. EE577-594T1; RADC-TR-59-47; AD-213 876.
Order from LC mi$4.50, ph$12.30 PB 147 540

Recent advances in the design of electronic systems have results in an ever-increasing complexity in such systems. While such complexity is necessary to permit the systems to perform tasks of ever-increasing scope, the problem of keeping the systems in "working" order tends to increase at least as fast as the basic complexity. The present report is concerned with one particular phase of the problem of maintenance - namely the problem of determining which part of an equipment is in need of repair when the equipment as a whole does not function properly. While this is only one aspect of the whole problem of maintaining equipment in working order, any improvement in general diagnostic procedures would result in significant economies. Some of the other factors which contribute to maintainability are the reliability of the basic component parts, proper preventive maintenance procedures, and proper mechanical and electrical design so as to make component parts easily accessible for replacement.

Technical Operations Inc., [Burlington] Mass.
DEVELOPMENT OF POWER TRANSISTOR CIRCUITRY, by R. R. Smyth. Final rept. on Contract DA 36-039-sc-63072. 14 May 56, 77p. 2 refs. Rept. no. TOI 56-13; AD-104 650.
Order from LC mi$4.50, ph$12.30 PB 149 014

The use of a simple transistor push-pull oscillator circuit as a d-c to d-c power converter has been investigated. The transistors act essentially as switches alternately connecting the supply battery across each half of a transformer primary. As a result the transistor dissipation is very low and the circuit efficiency high. Because of the importance of transistor dissipation in determining the maximum power output, considerable attention is given to the problem of determining optimum conditions. The problem of regulating the output voltages has received considerable attention. Three practical circuits have been developed. Satisfactory regulation of a single output for both supply voltage and load current changes has been obtained with a circuit employing saturable reactors in the output circuit. (See also PB 140 106)

RESEARCH ON MOLECULAR AND ATOMIC RESONANCE DEVICES, by J. C. Helmer and H. E. Weaver. Quarterly rept. no. 7, 1 Jan-31 Mar 59, on Contract DA 36-039-sc-73266. [1959] 41p. 5 refs. Engineering rept. no. 218-7Q.
Order from LC mi$3.30, ph$7.80 PB 146 462

The EPR spectrum of $SrTiO_3$ has been examined over a wide temperature range and the results correlated with earlier measurements on the dielectric properties of this crystal. In thin plate crystals the EPR spectrum reveals an anomalous frozen-in-tetragonal splitting which is independent of temperature. This effect is large enough that it masks the temperature dependent splitting predicted on the basis of dielectric measurements. The frozen-in splitting is probably due to strain-release brought about by cutting the thin plates. This hypothesis is supported by measurements at room temperature on a cubic-shaped sample. Additional measurements of the EPR spectrum at low magnetic fields reveal the presence of two unexplained lines of twofold symmetry. (See also PB 145 234)

R-THETA TRANSPONDER. Westinghouse Instruction Book. Rept. on Contract NOa(s)-12186. 18 Oct 51, 65p.
Order from LC mi$3.90, ph$10.80 PB 147 949

The R-Theta Transponder is an airborne radio transmitting-receiving equipment used as a radar beacon and as an aid in the identification of aircraft. It is designed primarily to be used in conjunction with ground radars, ASR and PAR. The R-Theta Transponder will permit extending the reliable range of the S-Band Surveillance radars to 100 miles, and the X-Band Precision Approach radars to 15 miles. In addition, the use of the Transponder codes provides positive aircraft identification without maneuvering the aircraft.

Westinghouse Electric Corp., Baltimore, Md.
RHO THETA TRANSPONDER MOD II. Westinghouse Instruction Book. Rept. on Contract NOa(s)-12186. 15 Aug 52, 81p.
Order from LC mi$4.80, ph$13.80 PB 147 950

The Rho Theta Transponder Mod II is an airborne radio transmitting-receiving equipment used as a radar beacon and as an aid in the identification of aircraft. It is designed primarily to be used in conjunction with ground control approach radars, ASR and PAR. The Rho Theta Transponder Mod II will permit the reliable range of the S-Band Surveillance radars to be extended to 100 miles, and the X-Band Precision Approach radars to 15 miles. In addition, the use of the Transponder codes provides positive aircraft identification without maneuvering the aircraft. (See also PB 147 949)

RESEARCH AND REPORTS ON AN OPTICAL AMPLIFIER, by Joseph Lempert. Rept. on Light Amplification, Contract AF 33(616)2611. May 60, declassified, 82p. ARL Technical rept. 60-283.
Order from OTS $2.25 PB 161 944

The purpose of this contract has been twofold. During Phase A, the object was to find through research new solutions which lead to new and improved types of pickup transducers which are potentially suitable for future development in the military field, especially under low light level conditions. Definite improvement has been accomplished in the threshold by extra dynode multiplication and by image preamplification. Phase B called for investigating the feasibility of producing an imaging pickup tube which would be capable of operating under the vibration encountered in an aircraft in flight. The feasibility of constructing image orthicons with considerably reduced microphonics, and suitable for use in aircraft, was established. (Author)

SOLUTIONS OF THE PROBLEM OF ARTIFICIAL SATELLITE THEORY WITHOUT DRAG, by Dirk Brouwer (Yale U. Observatory). Rept. on Project Space Track. Oct 59, 48p. 3 refs. GRDST-10; AFCRC-TN-59-638.
Order from LC mi$3.30, ph$7.80 PB 149 177

Sections 1 - 6 give the solution of the main problem for a spheroidal earth with the potential limited to the principal term and the second harmonic which contains the small factor k_2. The solution is developed in powers of k_2 in canonical variables by a method which is basically the same as that used in a different problem by von Zeipel (1916). The periodic terms are divided in two classes: The short-period terms contain the mean anomaly in their arguments: the arguments of the long-period terms are multiples of the mean argument of the perigee. The periodic terms, both of short and long period, are developed to $O(k_2)$; the secular motions are obtained to $O(k_2^2)$. The results are obtained in closed form; no series developments in eccentricity or inclination arise. The solution does not apply to orbits near the critical inclination, 63.4^o, but is otherwise valid for any eccentricity < 1 and any inclination. Section 7 gives the long-period terms and the additions to the secular motions caused by the fourth harmonic in the potential; section 8 gives the contributions by the third and fifth harmonics; section 9 contains formulas for computation. Air U., Maxwell AFB, Ala.
AEROSPACE GLOSSARY, by Woodford Agee Heflin. Sep 59, 118p. Documentary Research Study AU-282-58-RSL
Order from LC mi$6.00, ph$18.30 PB 149 447

The work list has been arrived at by noting words and phrases spoken by people engaged in aerospace research, development, and operations, also by noting terms found in the current periodical and book literature of missiles, astronautics and related fields. A large number of quotations have been extracted from aerospace literature, each quotation illustrating a manner in which a particular term is used. As a result, the definitions are based upon an analysis of both spoken and written usage, fortified by consultations with knowledgeable persons in residence at Air University, in missile industry, and at AF research and development and test centers. This glossary attempts only to describe and explain usage not to prescribe it.

Allied Research Associates, Inc., Boston, Mass.
LAUNCHING OF AIRBORNE MISSILES UNDERWATER. PART IV. OPTIMUM LAUNCHER HEADING IN A CONFUSED SEA, by Theodore R. Gordon and Irving Frank. Rept. on Contract Nonr-2343(00). 30 Oct 59, 49p. 5 refs. Document no. ARA-701; AD-229 080.
Order from LC mi$3.30, ph$7.80 PB 149 510

When a missile is launched underwater in a confused sea, mean-square trajectory responses (e. g. angle of attack, pitch angle, etc.) can be calculated. These variances, in turn, define a bivariate Gaussian probability density function. It is assumed here that a particular launch is successful if, at a certain time, a particular response falls within the confines of a square region whose sides are fixed with respect to the launcher. By changing the launcher heading the square is rotated with respect to the directional properties of the sea, and the probability of successful launch is thereby altered. It is the objective of this report to discover that particular launcher heading which gives maximum probability of success. The results are applied both to sea-type and swell-type disturbances, and some numerical illustrations are included. It is concluded that significant improvement in the probability of successful launch is obtained by optimizing launcher heading under virtually all sea conditions likely to be encountered. (Author)

HIGH POWER PULSE STEEPENING BY MEANS OF EXPLODING WIRES, by G. S. Janes and H. Koritz. Apr 59, 20p. 3 refs. Research rept. 50.
Order from LC mi$2.40, ph$3.30 PB 147 201

A circuit technique is described which reduces the rise times of high power pulses by means of exploding wires. Using this technique, a mangetic field of 10,000 gauss is built up in .15 microseconds throughout a volume 4 cm in length and 10 cm in diameter. The best results are obtained with high conductivity fuse materials such as copper or aluminum.

Ballistic Research Labs., Aberdeen Proving Ground, Md.
ELECTRONIC MISSILE ACQUISITION SYSTEM BY MEANS OF FM/FM TELEMETRY INSTRUMENTATION, by K. H. Patterson. Aug 53, declassified [15 Dec 53]. 14p. Technical note no. 817; AD-91 098.
Order from LC mi$2.40, ph$3.30 PB 148 646

A method of obtaining trajectory data from the FM-FM telemetry carrier by means of highly specialized receivers is proposed. These receivers would provide

a means of comparing the phase of the signal received by two antennas spaced a known distance apart. Problems involved and inherent limitations are discussed. While accurate predictions are impossible present considerations indicate that such a system should prove to be a valuable asset in the field of electronic instrumentation. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
MACRO-PELLET PROJECTION WITH AN AIR CAVITY HIGH EXPLOSIVE CHARGE FOR IMPACT STUDIES, by John H. Kineke, Jr., and Lee S. Holloway. Apr 60, 12p. 5 refs. Memo. rept. no. 1264; AD-237 944.
Order from LC mi$2.40, ph$3.30 PB 148 905

A series of high explosive charges has been developed for projecting steel pellets at velocities sufficiently high for terminal ballistic investigations of hypervelocity crater formation. The air cavity charge suggested by Deas and Zimmerman has been the basis for designing a number of charges projecting pellets whose masses and velocities are statistically reproducible within 3%. Pellet masses range from 0.15 to 8.86 grams and velocities from 1.99 to 5.43 km/sec. Mass determination and velocity measurement techniques are described. These charges are currently being used for extensive, and economical hypervelocity crater studies. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
THE ORBIT OF A SATELLITE OF AN OBLATE PLANET, by Boris Garfinkel. Dec 59, 39p. 7 refs. Rept. no. 1089.
Order from LC mi$3.00, ph$6.30 PB 149 237

The report gives a solution of the problem of motion of a particle in the potential field

$$V = -1/r + J_2P_2(\sin\theta)/r^3 + J_4P_4(\sin\theta)/r^5,$$

where J_2 and J_4 are small parameters. The first approximation is furnished by a V_o that incorporates the major effect of the second spherical harmonic and leads to a closed solution with no secular variations of order J_2. The perturbations of this non-Keplerian intermediary orbit are derived here by the von-Zeipel modification of the method of Delaunay. The secular variations are carried up to orders J_2^2 and J_4, and the periodic variations to orders J_2 and J_4/J_2. A computational summary is included, and the effect of the third spherical harmonic is appended. (Author)

Ballistic Research Lab., Aberdeen Proving Ground, Md.
RESEARCH AND DEVELOPMENT OF OPTICAL TRACKING METHODS AND INSTRUMENTATION AT THE BALLISTIC RESEARCH LABORATORIES, by Dirk Reuyl and Walter Carrion. May 60, 60p. 23 refs. Rept. no. 1103.
Order from LC mi$3.60, ph$9.30 PB 148 903

Problem areas discussed include determination of missile trajectories, measurement of missile attitude and recording of special events in flight, determination of target intercept by guided missiles, observation of small missiles at great distances, evaluation of missile performance in the terminal phase of flight, especially that pertaining to the functioning of the warhead, as well as atmospheric optics research and studies of detection, acquisition and tracking. Instrumentation systems described include cinetheodolites, tracking telescopes T-1 to T-5 of various types, the IGOR intercept system, the large aperture SMT instrument for small missiles, the TET, WAF and IMP telescopes for terminal trajectory, warhead functioning and impact proximity problems, respectively, and the RT-1 and RT-2 research telescopes. PITCH AXIS CONTROL SYSTEM, FC-110, by L. Rupel. Rept. on Contract AF 33(038)19589. 10 Feb 56, 67p. Document no. D-16954 A; AD-88 517.
Order from LC mi$3.90, ph$10.80 PB 150 296

This report released for sale to the public 19 Sep 60.

The purpose of the pitch control system is to control the model 624-7 missile in the pitch plane during all phases of flight. It is composed of the pitch rocket control system and the elevator control system. The circuitry involved in the pitch control system electronics is explained. Packaging considerations are enumerated. Unit requirements and hydraulic and mechanical component requirements are tabulated. Appendixes describe the ring-type instrument amplifier-demodulators, the series demodulator, and the operational magnetic amplifiers.

Centro di Studio per la Fisica Delle Microonde (Italy).
ON THE DETERMINATION OF THE PATH OF THE ARTIFICIAL SATELLITES, by N. Carrara, P. F. Checcacci and L. Ronchi. Technical note no. 1 on Contract AF 61(052)182. Oct 59, 19p. 8 refs. AFCRC-TN-60-151.
Order from LC mi$2.40, ph$3.30 PB 148 779

A method based on the Doppler effect is described for determining some parameters of the path of an artificial satellite and the available approximation discussed. Another system is described which does not require any special hypothesis on the path to be determined. A possible arrangement of the ground equipment is described in detail. This system is very similar to the SPHERODOP system. However, the SPHERODOP system is in general used for tracking the missiles from the starting point. Four stations are required, because the frequency emitted from the missile cannot be considered known. This system is substantially the application of the SPHERODOP to the determination of the orbit of the satellites, in the general case, when the stations do not receive the signals from the starting point.

Centro di Studio per la Fisica delle Microonde (Italy).
TECHNIQUES AND EQUIPMENTS FOR DOPPLER OBSERVATIONS, by P. F. Checcacci. Technical note no. 2 on Contract AF 61(052)182. Oct 59, 43p. 2 refs. AFCRC-TN-60-370.
Order from LC mi$3.30, ph$7.80 PB 148 780

This report describes the apparatuses used for carrying out the measurements on the satellites planning

according to the Space Track Program. The measurements concern the determination of the Doppler effect curves and of the plots of the intensity of the received signal versus the time. The complete apparatus is basically composed of an antenna, a receiver, a recorder, a frequency meter and other auxiliary equipments. Everyone of these elements might be chosen between some different types, with slightly different performances. The apparatus used has been chosen after a number of tests of several types, which are described and discussed.

Department of the Air Force, Washington, D. C.
INTERIM AEROSPACE TERMINOLOGY REFERENCE. 30 Oct 59, 79p. Administrative Practices Pamphlet AFP 11-1-4.
Order from OTS $2.00 PB 161 913

This pamphlet is an interim consolidation of the numerous aerospace terms and definitions that have appeared in various Air Force publications. It is intended to offset the confusion resulting from the inconsistencies of many of those definitions. Here, to the most practical extent, a singular definition has been ascribed to each term, to replace previous multi-definitions. Thus, mutual understanding is promoted. Additionally, this pamphlet provides a meaningful reference-guide, and focuses the attention of Air Force members on the terminology of the aerospace age.

Diamond Ordnance Fuze Labs., Washington, D. C.
FUZE, ROCKET, PDSQ, T2058, by Peter B. Ferrara. Final rept. 29 July 60, 12p. Technical rept. TR-850.
Order from LC mi$2.40, ph$3.30 PB 150 012

The fuze, now in the Engineering and User Test Phases, is a point detonating, superquick, mechanical design for use with the T238, 115-mm Area Toxic Rocket—a high velocity, fin-stabilized, ground-to-ground projectile. The rocket is designed for use with the T145 Multiple Rocket Launcher System. The T2058 fuze employs a modified Mk 181 S&A mechanism. The final laboratory and R&D field test results, drawings, and pertinent photographs are included. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
SPECIFICATION OF ZIRCONIUM FOR USE IN GASLESS MIXTURES, by R. E. McIntyre and M. L. Couch. 9 Mar 60, 36p. 13 refs. TR-821; AD-234 317.
Order from LC mi$3.00, ph$6.30 PB 147 795

Relationship between the properties of zirconium powder and the properties of heat powders or delay compositions, to arrive at a suitable specification. The data show the important points to be specified are the total zirconium content, the ignition gain, the hydrogen content, the particle-size distribution and the surface area. The data show that the burning rate of barium chromate-zirconium delay compositions depends primarily upon the calorific value and secondarily upon the composition.

Frankford Arsenal, Philadelphia, Pa.
THE DETECTION OF FLAWS IN 20mm HEI SHELL, by A. J. Wysoczanski. Dec 58, 39p. 1 ref. Technical rept. no. R-1484.
Order from LC mi$3.00, ph$6.30 PB 150 304

This report released for sale to the public 19 Sep 60.

A detailed description is given of the various electromagnetic techniques that were developed and evaluated in an attempt to detect the presence of surface and sub-surface defects in 20mm HEI shell. Details are given concerning a reluctance technique and two eddy current techniques, and the instrumentaion developed during these studies.

BIBLIOGRAPHY AND INDEX OF PROJECT HERMES REPORTS, 1945-1950, by W. D. Robusto. Rept. on Proj. Hermes, Contract [DA 30-115-ORD-23]. May 51, declassified 13 May 58. 82p. 804 refs. Technical Information Series rept. no. R51A0515.
Order from LC mi$4.80, ph$13.80 PB 149 208

The material is listed according to a subject, number, and author index. German documents translated by Project Hermes are also included. A listing of the Hermes Bimonthly Surveys is not included in this report. (Author)

General Electric Co., Schenectady, N. Y.
AN EXPERIMENTAL INVESTIGATION OF SUBSONIC DIFFUSER CONFIGURATIONS FOR THE HERMES B-1 RAMJET, by R. E. Geiger. Rept. on Project Hermes [Contract DA 30-115-ORD-23]. Dec 50, declassified 17 Mar 58, 28p. 6 refs. Technical Information Series TR-55274.
Order from LC mi$2.70, ph$4.80 PB 149 468

This report presents the results of an experimental investigation of some of the important parameters affecting the design and performance of subsonic diffusers. The subsonic diffusers tested were of the annular divergent area type common to the after-part of ramjet diffusers. Each configuration was tested with two types of flows: supersonic flow with an internal shock and, completely subsonic flow. (Author)

MEASUREMENT OF ROCKET EXHAUST GAS VELOCITY BY SPECTROSCOPIC DOPPLER SHIFT METHOD, by F. P. Bundy and H. M. Strong. Rept. on Project Hermes. 6 Oct 48, declassified 17 Mar 58, 42p. 6 refs. Rept. no. 55269.
Order from LC mi$3.30, ph$7.80 PB 149 467

Considerable effort has been directed toward developing ways of measuring the velocity, temperature and pressure directly from the flame by optical means which do not produce any mechanical disturbance of the flame. This paper presents the method which has been developed for measuring the flame gas velocity.

General Electric Co., Schenectady, N. Y.
A PROPOSED GUIDANCE SYSTEM FOR THE HERMES A3 MISSILE, by A. P. Adamson and R. F. Drenick. Rept. on Project Hermes. [Contract DA 30-115-ORD-23]. 23 Sep 48, declassified 17 Nov 58, 22p. 1 ref. Rept. 55200.
Order from LC mi$2.70, ph$4.80 PB 149 465

A class of guidance systems is desired which eliminates all random first order range errors from short range surface-to-surface trajectories. It is shown that guidance systems of this type can be realized by one properly mounted integrating accelerometer matching its output against that of computer which generates an arbitrary function of the time of flight. Two special systems are discussed in some detail and a combination of the two is recommended for the range control of the Hermes A-3 missile. It is shown that considerable accuracy of hitting can be achieved with existing control equipment. (Author)

Naval Ordnance Lab., White Oak, Md.
THE ACTUATOR, EXPLOSIVE WOX-23A, AN ACTUATOR TO REPLACE ACTUATOR MK 3 MOD 0 IN THE EXPLOSIVE SWITCH MK 46 MOD 0, by E. Eugene Kilmer. 4 May 60, 33p. 1 ref. NAVORD rept. 6761.
Order from OTS $1.00 PB 161 933

In view of Explosive Switch Mk 46 Mod 0 failures, a program was initiated to find a suitable replacement for the Actuator Mk 3 Mod 0. An investigation indicated that the inability of the Olin-Mathieson Ball Powder (W2920.3 Type II class 4) to sustain burning under the leakage condition existing in the Mk 46 Mod 0 Switch to be the cause of the explosive switch failures. Various propellants were investigated both in a variable volume pressure bomb and in the Explosive Switch Mk 46 Mod 0. Of the powders tested, SR4990, a Dupont smokeless powder, gave the desired boundary condition of a fast rise pressure front unaffected by the change of volume in the switch. Consequently, a direct substitution replacing the Olin Mathieson Ball Powder (W2920.3 Type II class 4) by SR4990 (DuPont) will be made in the actuator for the switch Mk 46 Mod 0. The new actuator has been designated Actuator, Explosive, WOX-23A. (Author)

Naval Ordnance Lab., White Oak, Md.
CHARACTERIZATION OF THE MK 1 MOD 0 SQUIB: IMPEDANCE MEASUREMENTS IN THE FREQUENCY RANGE 50-1500 MEGACYCLES, by R. M. H. Wyatt. 31 May 60, 35p. 2 refs. NAVORD rept. 6826.
Order from OTS $1.00 PB 161 934

The impedance characteristics of the Mk 1 Mod 0 Squib were determined by the use of an admittance meter for the frequency range of 50 to 1500 megacycles. In general the reactance values obtained were very close to what could be expected if the squib were considered to be a symmetrical two-conductor parallel transmission line terminated with a 1-ohm resistor (the bridge wire). Under limited conditions of frequency and lead length the investigation showed that the squib could be considered to consist of lumped parameters: pure inductances for the leads within and without the bakelite portion of the plug and a pure resistance for the bridge wire. (Author)

Naval Ordnance Lab., White Oak, Md.
A DESIGN FOR SPHERICALLY DETONATING EXPLOSIVE CHARGES, by C. Randall and R. Clairmont. 5 Apr 60, 30p. 1 ref. NAVORD rept. 6292.
Order from LC mi$2.70, ph$4.80 PB 149 227

A design and technique of fabrication for spherical detonators or detonator-booster combinations are discussed. The detonators are either 0.312 or 0.495 inch in diameter with the outer, secondary explosive initiated from a central sphere of silver azide 0.150 inch in diameter. The primary charge in turn is initiated from a hot spot located on a bridge extending through the detonator. The detonator-booster combinations consist of 0.312-inch diameter detonators imbedded in the initiating 0.750-inch diameter spheres. Examples of the early expansions to be expected from these charges are presented which show that variation in simultaneity of detonation breakout on the charge surface = ±0.15 to 0.20 microseconds, deviation of gas

cloud and early shock contour from the true sphere ± 2 to 5 per cent of contour radius, and deviation of contour center from charge center 1/8 to 1/4 charge radius. (Author)

Naval Ordnance Lab., White Oak, Md.
DEVELOPMENT OF WOX-73A AND WOX-74A PRIMERS, by E. Eugene Kilmer. 30 June 60, 18p. 8 refs. NAVORD rept. 6883.
Order from OTS $0.50 PB 161 935

An instantaneous primer, the WOX-73A, and a delay primer, the WOX-74A, have been developed for use in a picket-boat depth-charge pistol. The delay primer has a mean delay time of 18 seconds and operates reliably over the temperature range -65° to 160°F. This primer contains a double cup and a water tight seal which enables it to pass MIL-STD-304 (temperature and humidity cycling). The design of the delay primer is such that at the time of firing the inner cup is ruptured, allowing the gases evolved by the ignition element and the delay powder to be vented. Both primers have identical bridge wire circuits. The energy for 0.50 probability of firing (mean energy), determined by a Bruceton Sensitivity Test, is 4200 ergs. The energy for 0.999 probability of firing was calculated to be 5650 ergs. The WOX-73A and WOX-74A primers have been subjected to the standard environmental tests and have functioned properly following these tests. (Author)

Naval Ordnance Lab., White Oak, Md.
DISCRIMINATING COPPER-BALL ACCELEROMETERS, by V. F, DeVost and G. Stathopoulos. 10 Apr 59, 38p. 5 refs. NAVORD rept. 6204; AD-219 368.
Order from LC mi$3.00, ph$6.30 PB 147 604

Several inertia-actuated discriminator mechanisms were incorporated into the NOL copper-ball accelerometer design. The discriminators are used where several shock pulses occur in close time sequence and where it is desired to measure the maximum acceleration of one pulse or a portion of a pulse while discriminating against shocks incidentally present. This report describes briefly the NOL copper-ball accelerometers and presents information and drawings on the discriminator modifications. (Author)

Naval Ordnance Lab., White Oak, Md.
THE EFFECT OF DIFFERENT AMINES ON THE MECHANISMS OF CURE OF EPOXY RESINS AND EXPLOSIVE COMPATIBILITY, by Hugh C. Anderson. 16 Dec 57, 22p. 9 refs. NAVORD rept. 6023; AD-158 532.
Order from LC mi$2.70, ph$4.80 PB 146 470

The causes of the generally adverse effects of amine cured epoxy resins on explosives were investigated. The effects of four structurally different amines on percentage epoxy conversion, degree of crosslinking and compatibility of the cured products with HBX-1 were studied.

Naval Ordnance Lab., White Oak, Md.
GRAVITY-SENSITIVE COMPONENT SHOCK TESTER, by V. F. DeVost and G. Stathopoulos. 27 Aug 58, 23p. 5 refs. NAVORD rept. 5779; AD-206 792.
Order from LC mi$3.00, ph$6.30 PB 147 568

This report describes a shock tester developed at the NOL for evaluating gravity-sensitive, inertia-operated devices. The machine is designed to accelerate light test components at any desired angle while mounted in their normal orientation with respect to the earth's gravitational field. The tester essentially consists of a seismically suspended carriage to which the test component is mounted and an air driven hammer which strikes the carriage. Accelerations of 2 to 50 g and velocity changes of 0.25 to 15 fps can be obtained by varying the air pressure. Shock durations of 2 to 50 milliseconds can be obtained by varying the material and shape of the hammer impacting surface. The report also discusses the machine's advantages, limitations, and applications, includes machine drawings, and presents information on inertia sensitivity concepts. (Author)

Naval Ordnance Lab., White Oak, Md.
NOL COPPER-BALL ACCELEROMETERS, by G. Stathopoulos and V. F. DeVost. 6 May 59, 13p. 4 refs. NAVORD rept. 6638; AD-216 096.
Order from LC mi$2.40, ph$3.30 PB 147 605

This report describes the copper-ball accelerometers currently in use at the Naval Ordnance Laboratory. The principle of operation of this instrument as a peak reading accelerometer is discussed as well as its use as a velocity pickup. Discriminator modifications that permit programing the recording period of the gage to preclude recording multiple impacts are presented. (Author) (See also PB 147 660)

Naval Ordnance Test Station, China Lake, Calif.
AN EVALUATION OF LEAK-DETECTION METHODS, by Robert H, Martin and Wm. C. Shaw. 15 Oct 58, 36p. 12 refs. NOTS 1993; NAVORD rept. 5868; AD-206 622.
Order from LC mi$3.00, ph$6.30 PB 149 821

This report released for sale to the public 25 Aug 60.

The following industrial techniques for finding and measuring small leaks are described: bubble methods, volume-sharing method, and halogen, radioactive, and helium tracers. The use of the helium leak detector is discussed in detail as it was found to be the most suitable for working with small, sealed items of ordnance. (Author)

Naval Ordnance Test Station, China Lake, Calif.
PROPOSAL FOR A SIMPLE SYSTEM FOR ACHIEVING SOFT LANDING OF A ROCKET VEHICLE, by Charles E. Hendrix. 8 June 60, 17p. 4 refs. NOTS TP-2495; NAVWEPS rept. 7084.
Order from LC mi$2.40, ph$3.30 PB 148 964

A simple optical system has been proposed for terminal guidance of a soft-landing rocket vehicle. Working on the apparent motion of objects on the ground through the field of view, the system requires no specific targets, but only natural surface contrast. The system can be used to provide information on both deceleration and attitude stabilization. Deceleration is to be achieved with a NOTS-developed variable-thrust rocket motor, the use of which greatly simplifies the control problem. The system is not limited to vacuum conditions, but can work on any planetary surface, whether or not there is an atmosphere. (Author)

Naval Postgraduate School [Monterey, Calif.]
THE EFFECT OF EXPLOSIVE MIXTURES UPON IMPACT SENSITIVITY, by James Edward Sinclair. Mar 57, 32p. 6 refs. Technical rept. no. 16.
Order from LC mi$3.00, ph$6.30 PB 150 151

This report released for sale to the public 12 Sep 60.

The measurement of the impact sensitivity of two explosive systems TNB-TNB and TNT-PETN has been studied along with relevant factors affecting this sensitivity. The effects of sample size, dilution with inert material, and active mixtures have been explored and a "rule-of-thumb" formula suggested as an index of the reliability of a particular explosive or explosive mixture. (Author)

Naval Research Lab., Washington, D. C.
SATELLITE LAUNCHING TRAJECTORY CALCULATIONS: A MULTISTAGE, TWO-DIMENSIONAL, ZERO-LIFT PROGRAM FOR NAREC, by J. L. Hammersmith. Interim rept. 20 June 60, 6p. NRL rept. 5512.
Order from LC mi$1.80, ph$1.80 PB 147 834

Because all programs were done in basic NAREC coding, which allows only fixed point arithmetic, the formulas for apogee calculations were rescaled to permit greater distances and higher velocities. The procedure used to select suitable trajectories in some of the programs frequently collapsed when they were used for vehicles radically different from Vanguard, resulting in considerable loss of time. The program described in this report was constructed with many features which render it more efficient in such cases.

Naval School of Aviation Medicine, Pensacola, Fla.
A NOTE ON THE GRAVITY-FREE STATE ON A SPACE PLATFORM, by Hermann J. Schaefer. 29 Jan 59, 31p. 1 ref. Proj. NM 17 01 11, R-48; AD-213 439.
Order from LC mi$3.00, ph$6.30 PB 146 680

Through the use of a concrete example of intersatellite transportation, the dynamics and kinetics of such motions are analyzed in a simplified way. If the satellite is assumed to maintain attitude in space and if the free motions are described in a coordinate system at rest to the satellite, it is found that these motions are rectilinear and of constant speed during an initial period which, for an earth circling vehicle at 500 kilometers altitude, equals five minutes. Thereafter, the apparent motion follows a complicated circular or spiral pattern depending on the direction of the initial speed. Two limiting cases, the "forward" and the "upward" throw of an object from the satellite, are analyzed in more detail. A consequence of more general interest of these relationships is the known fact that it is not possible to put a loose assembly of parts or objects in orbit so that they maintain their original array. As their respective centers of gravity will have slightly different distances from the center of the earth, they will start spreading as soon as they are set free. On the other side, only very small conservative forces are required to keep even very "heavy" objects aligned.

Naval Weapons Lab., Dahlgren, Va.
EXTERIOR BALLISTIC DATA FOR THE 56-LB PRACTICE BOMB MK 89 MOD O WITHOUT SUSPENSION LUGS EJECTED FROM THE AERO 8A PRACTICE BOMB CONTAINER IN THE A3D-1 AIRPLANE IN HORIZONTAL FLIGHT, by J. D. Kunlo. 17 June 60, 22p. 4 refs. NWL rept. no. 1708.
Order from LC mi$2.70, ph$4.80 PB 149 160

From an analysis of the test results it is concluded that (1) the observed dispersions of the Mk 89 Mod O without suspension lugs are acceptable, and (2) the ballistic table OP 2787 is applicable to the subject bomb when ejected from the Aero 8A practice bomb container in the bomb bay of A3D aircraft in horizontal release maneuvers up to 10,000 feet altitude and 510 knots true airspeed. Moreover, it is believed that, in view of the satisfactory flight characteristics, OP 2787 will be applicable to the Mk 89 bomb when released at altitudes up to 70,000 feet and at subsonic airspeeds. (Author)

Oklahoma State U. Research Foundation, Stillwater.
AEROBEE RANGE SAFETY EQUIPMENT, by Oscar L Cooper. Scientific rept. no. 1 on Contract AF 19(604)2029. 1 Mar 60, 44p. AFCRC TN-60-280; AD-234 050.
Order from LC mi$3.30, ph$7.80 PB 146 465

The equipment, usually called a Range Safety Package, is built to be contained in a standard 10-inch Aerobee extension. It will accommodate an AN/DRW-3, AN/DRW-11 or an AN/DRW-13 command receiver for rocket fuel-cut-off. It also carries an S-Band radar beacon transponder such as the AN/DPN-19 or the AN/DPN-41 with their power supplies. A pair of S-Band Quadraloop antennas is mounted diametrically on the surface of the 10-inch extension. A removable battery access door is mounted on the side of the extension to facilitate battery changes without rocket disassembly.

[Pacific] Missile [Range] Port Mugu, Calif.
KAN-2 (LITTLE JOE) by Ken Mattson. Rept. on TED Proj. PAU 1804. 25 Mar 47, declassified 12 June 56, 45p. Technical rept. no. 10.
Order from LC mi$3.30, ph$7.80 PB 148 623

The test program has succeeded in testing the telemetering system under development as well as providing training of personnel in the testing of pilotless aircraft of this type. LITTLE JOE has been used to advantage in testing internal components of pilotless aircraft and, with a modified aerodynamic design, this missile could be a cheap, simple solution to a test vehicle for development of Pilotness Aircraft components.

Picatinny Research Center, Picatinny Arsenal, Dover, N. J.
THE USE OF CARBON-14 AS A TRACER TO STUDY THE ORIGIN OF TETRANITROMETHANE IN TNT MANUFACTURE, by Frederick S. Holahan, Thomas C. Castorina and others. July 60, 25p. 28 refs. Technical rept. 2695.
Order from LC mi$2.70, ph$4.80 PB 148 304

During the production of TNT, a small amount of tetranitromethane (TNM) forms as a by-product. The purpose of this study was to determine the origin of TNM in this reaction, using carbon-14 as a tracer. TNM is known to form during the trinitration step. It was found that most of the TNM originates from the aromatic ring carbons, with over 50% being contributed by the ring carbon attached to the methyl group of DNT. It was also found that over 80% of all the TNM can be traced to the DNT isomers derived from m-nitrotoluene. From the extent to which each of these compounds contributed to TNM formation, their relative rates of nitration were postulated. The ultimate formation of TNM is attributed to the DNT oxidation reaction in competition with that of nitration. (Author)

Rock Island Arsenal Lab., Ill.
FINGERPRINT NEUTRALIZING COMPOUNDS. V. PREPARATION OF A FORMULATION WITH MAXIMUM SPEED OF FINGERPRINT REMOVAL, by F. Blessin. 4 May 50, 41p. Rept. no. 50-750.
Order from LC mi$3.30, ph$7.80 PB 149 770

This report released for sale to the public 25 Aug 60.

Results of tests previously conducted are presented to illustrate the effect of increased water content in improving the removal efficiency of certain fingerprint removers. Two different methods of systematically determining the optimum composition as regards water content of triethanolamine oleate solubilized fingerprint remover formulations are presented and the results obtained by the two methods are compared. The various base formulations and the optimum solutions derived therefrom were prepared with amounts of water near the maximum tolerance and used for testing the speed of removal of fingerprint residues. (Engineering--Ordnance, 18 Nov 60)

Rome Air Development Center, Griffiss AFB, N. Y.
ON THE POSSIBILITY OF SPACE SURVEILLANCE VIA A 24-HOUR SATELLITE, by Joel S. Greenberg. Mar 60, 21p. 10 refs. RADC TN-60-9; AD-234 381.
Order from LC mi$2.70, ph$4.80 PB 147 805

A brief discussion is given of the possibility of utilizing a 24-hour satellite in a space surveillance system. The power requirements of a typical system configuration are investigated and discussed in terms of integration time (coherent versus noncoherent integration), transmitter beamwidth, frequency, and echo area. (Author)

CREEP BUCKLING OF CYLINDRICAL SHELLS IN AXIAL COMPRESSION, by J. M. Bozajian and C. H. Tsao. Rept. on Contracts AF 33(038)28634 and AF 33(600)28438. 24 Jan 58, 35p. 5 refs. SRSM7-196; AD-158 651.
Order from LC mi$3.00, ph$6.30 PB 150 287

This report released for sale to the public 19 Sep 60.

Tests have been made of 56 QQ-M-44H magnesium alloy circular cylinders in axial compression. The test temperatures ranged from 75° F to 600° F and the loading program included stresses increasing linearly with time in addition to constant stresses. A semiempirical formula was obtained which correlates, through the use of basic elastic and creep properties, the buckling stress and time as influenced by temperature and the stress history in the ranges tested. The statistical variation of the data as correlated has been used to establish allowable buckling stresses of the material used in GAR-3/GAR-4 Falcon missile fuselages as a function of desired probability of failure. The buckling correlation equation has been expressed in terms of the elastic and generalized scant moduli of the cylinder material and has been used to predict creep buckling stresses for other materials. Methods of applying these results to creep buckling under transient stress and temperature conditions have been analyzed. (Author)

Watertown Arsenal Labs., Mass.
INFLUENCE OF CRACK WIDTH AND DEPTH ON MAGNETIC FLUX LEAKAGE FIELDS, by Patrick C. McEleney. Aug 60, 17p. 3 refs. Technical rept. no. WAL TR 148.1/2.
Order from LC mi$2.40, ph$3.30 PB 148 920

The depth of a crack is shown to be the major factor contributing to the amplitude of an induced signal in a pickup coil scanning a magnetized specimen. However, the magnitude of the contribution due to width variations is large enough to cause spread in data in voltage versus crack depth graphs. More refined techniques of signal analysis and a more accurate determination of the distribution of magnetic flux about discontinuities are required to improve the precision of measurement of crack depth by the magneto-inductive method. (Author)

Sanitation and Safety Engineering

Naval Civil Engineering Lab., Port Heuneme, Calif.
FOG FOR MOBILE FIRE APPARATUS, by John J. Bayles and Robert E. Jochums. 9 Mar 60, 53p. Technical Compilation C-002; AD-234 877.
Order from LC mi$3.60, ph$9.30 PB 147 811

A literature survey was conducted by the Laboratory to determine the optimum desired characteristics of water fog in fire fighting and to establish requirements for fog nozzles and fog guns. This study revealed that: (1) fog is now considered a basic tool in fire fighting, essential in efficiently fighting structural and brushgrass fires with mobile fire apparatus; (2) there is also a definite need for the availability of solid streams of water for specific situations encountered in fire fighting; (3) there is a need for both high-pressure and low-pressure pumping systems; and (4) there is a need for a variety of fog patterns for fire fighting.

Naval Civil Engineering Lab., Port Hueneme, Calif.
A PACKAGED FIRE SPRINKLER SYSTEM FOR ADVANCED BASE BUILDINGS, by R. J. Zablodil, C. R. Hoffman, and R. S. Chapler. Interim rept. 18 Feb 60, 38p. 2 refs. Technical rept. 067; AD-234 878.
Order from LC mi$3.00, ph$6.30 PB 146 970

The fire sprinkler system was developed to protect the standard 20 ft x 48 ft advanced base building. It has a 370 gal storage tank, a rectangular, 12-headed sprinkler loop, and associated valves and fittings. The system is dry and starts automatically when supervisory pressure maintained in the loop is lost. Pressure loss opens the pilot operated main nitrogen valve to pressurize the storage tank from two high pressure nitrogen cylinders. Five tests, one each with 1, 3, 6, 9, and 12 heads open, were made at 70 F, using water as the extinguishant, and all five were satisfactory. Flow rates varied from 12 gpm with one head open to 70 gpm with all 12 heads open, and operating time varied from a minimum of 5 min to a maximum of 30 minutes. Three tests were made at -65F on the nitrogen pressurization portion alone. Satisfactory performance was obtained with regulated pressure approximately twice that of the 70 F tests. The nitrogen pressurization components should be improved for low temperature application, and a prototype sprinkler system should be fabricated and field tested in the arctic. (Author)

COMPOSTING OF ORGANIC WASTES: AN ANNOTATED BIBLIOGRAPHY, by John S. Wiley. Feb 58, 126p. 145 refs.
Order from LC mi$6.30, ph$19.80 PB 147 219

This bibliography, with abstracts and occasional editorial remarks, may serve as a source of information for those interested in the subject. The subject matter is limited to composting which may be defined as a process in which microorganisms break down organic matter to a relatively stable humus-like material. Most of the references deal with actual or attempted aerobic thermophilic decomposition. They also deal largely with the composting of municipal refuse or garbage, sometimes with additional materials such as sewage sludge, night soil, or manure. Studies at Michigan State University and the CDC Technical Development Laboratories indicate that de-watered garbage or refuse can be composted through one cycle of decomposition in mechanical units in an appreciably shorter time, perhaps a week or less. A few cities, notably San Diego and Tacoma, have studied composting in pilot plants. The pilot plant at Chandler, Arizona, operated by the CDC Phoenix Field Station is now supplying "know-how" and cost data on the preliminary materials handling of refuse and on outdoor composting. Engineers and municipal officials should know reasonably soon if that type of composting is an approved, competitive method for the treatment of community solid wastes in that area. The composting studies conducted at the CDC Technical Development Laboratories should lead to design and operational improvements in high-rate mechanical composters for treating community solid wastes in the United States.

Technical Development Labs., Dept. of Health, Education, and Welfare, Savannah, Ga.

ANALYSIS, PERFORMANCE TESTS AND COMPUTER SIMULATION OF A 100 KW ENGINE-GENERATOR SET. Rept. on Contract DA 44-009-ENG-3214. July 58, 121p. 22 refs. AD-215 473.
Order from LC mi$6.30, ph$19.80 PB 149 254

Dynamic equations for a 100 KW engine-generator set supplying an isolated, balanced load are derived. The performance of the set composed of diesel engine, load-sensing governor, synchronous generator, and magnetic amplifier exciter was studied in the laboratory and test results are presented. Analog computer simulations for the speed governor loop and voltage regulation loop are given together with a computer representation of the complete engine-generator system. Performance tests and computer results are compared and discussed. (Author)

PULSED PLASMA PROPULSION. AN ADVANCED REACTION SPACE PROPULSION SYSTEM. SUMMARY OF LITERATURE SURVEY, by Thomas L. Thourson. Rept. on Contract AF 33(616)6036. Apr 59, 132p. 276 refs. WADC Technical rept. 59-194; AD-213 838.
Order from LC mi$6.90, ph$21.30 PB 150 150

This report released for sale to the public 12 Sep 60.

A summary is presented of a literature survey on pulsed plasma propulsion, an advanced space propulsion system. Included is a discussion of experimental and analytical investigations of various pulsed plasma propulsion schemes. Other topics included are: (a) competitive propulsion systems, (b) studies in plasma physics, (c) studies in electric breakdown phenomena, and (d) experimental and diagnostic techniques applicable to the study of plasma physics. A bibliography is appended. (Author)

A NUCLEAR GROUND SUPPORT EXPERIMENT WITH QUICK DISCONNECT DEVICES, by P. L. Marjon. Rept. on Contract AF 33(600)32054. 29 June 59, 25p. 3 refs. NARF-59-24T; MR-N-247; AD-219 379.
Order from LC mi$2.70, ph$4.80 PB 149 992

This report released for sale to the public 31 Aug 60.

An experiment in remote handling was conducted to provide information on equipment needs for ground support of nuclear aircraft. Representative, commercially available components with quick-operation features were used in remote handling tests. An evaluation was made of the caused of difficulties encountered in remote operations. Recommendations are made to guide the design of handling equipment for nuclear airplane maintenance applications. (Author)

THE THERMODYNAMIC PROPERTIES OF HYDROGEN AND WATER AS POSSIBLE WORKING FLUIDS FOR NUCLEAR ROCKETS, by I. Sänger-Bredt. Rept. on Contract AF 61(514)910. May 58, 52p. 22 refs. AFOSR-TR-58-87; AD-162 108.
Order from LC mi$3.60, ph$9.30 PB 150 159

Th s report released for sale to the public 1 Sep 60.

Contents:
Notion and function of a working fluid in rocket power planes
The heating of hydrogen, respectively water, at constant pressure and under equilibrium conditions, as well as attainable flow velocities in the end of the expansion nozzle
First comparative analysis of other possible working fluids, particular of hydrogen compounds of light elements
Heat transfers of hydrogen, water, and helium, to the interior walls of the combustion chamber under equilibrium conditions
The influence of nonequilibrium processes on the values of exhaust velocities and heat transfer, as well as on the qualification of the different working fluids

Jet Propulsion Center, Purdue U., Lafayette, Ind.
ON THE IMPORTANCE OF COMBUSTION CHAMBER GEOMETRY IN HIGH FREQUENCY OSCILLATIONS IN ROCKET MOTORS, by J. R. Osborn and J. M. Bonnell. Rept. on Contract AF 49(638)756. May 60, 18p. 7 refs. AFOSR-TN-60-393. AD-237 692.
Order from LC mi$2.40, ph$3.30 PB 148 235

The experiments reported herein were concerned with the determination of some of the underlying factors which contribute to the occurrence of transverse modes of combustion pressure oscillation in rocket motors. Two rocket motors having different diameters and several different lengths were employed in the experiments using a gaseous hydrocarbon fuel and air as propellants. The investigation indicated that changes in the aspect ratio and volume of the rocket motor combustion chamber has a profound effect on the incidence and amplitude of the transverse modes. These effects were modified by interactions of the transverse modes with the longitudinal mode. The transverse modes present in the experiments were determined to be the "spinning" and the radial modes. (Author)

FUNDAMENTALS OF SOLID ROCKET PROPULSION, by Henry Tao-Sze Hsi. Technical memo. Jan 60, 49p. 6 refs. LMSD-288134.
Order from OTS $1.25 PB 161 907

The subjects treated are the basic theories and equations in dynamics and thermodynamics of rocket propulsion; rocket missiles in flight, and velocity and trajectory problems; and background theory and operation of solid-propellant rocket units. A glossary of terms commonly used in solid-propellant rocketry can be found in the appendix. (Author)

Naval Ordnance Test Station, China Lake, Calif.
A METHOD FOR DETERMINING VELOCITY BY COMBINING POSITION AND ACCELERATION DATA TAKEN ON THE SNORT TRACK, by Prescott D. Crout. 28 Mar 60, 59p. 2 refs. NOTS TP 2474; NAVWEPS rept. 7069.
Order from LC mi$3.60, ph$9.30 PB 149 153

A method of combining accelerometer and track-coil data to obtain velocity data using Lagrange polynomials is described. An error analysis shows that under most conditions an RMS of less than 0.1 fps over a velocity range of 200 to 2,000 fps is possible. (Author)

Reaction Motors Div., Thiokol Chemical Corp., Denville, N. J.
HEAVY PARTICLE PROPULSION RESEARCH, by Douglas M. Jamba. Rept. for 1 Jan-30 Apr 60 on Contract AF 49(638)657 and ARPA Order 6-58, Task 8. [1960] 38p. 3 refs. Rept. RMD-1155-S3; AFOSR-TR-60-[79].
Order from LC mi$3.00, ph$6.30 PB 149 903

The work is concerned with the generation, charging and acceleration of multi-atom particles to determine the characteristics of particle beams as they may apply to advanced electric propulsion systems. Major efforts have been concerned with the handling of previously prepared fine powders. Many types of mechanisms were tested to charge, hold and feed these solid metal particles with the end purpose of obtaining a continuous beam of charged particles having an average specific charge in the range of 1 to 100 coulombs per kilogram. Several measurement systems and techniques were investigated to determine their advantages and limitations. No one system was found that could be used for general comparison and evaluation of charged particle beam properties. (See also PB 147 519)

Rosemount Aeronautical Labs., U. of Minnesota, Minneapolis.
PRESSURE RECOVERY OF A FREE JET SUPERSONIC WIND TUNNEL WITH SHROUD DIFFUSER FOR TESTING AIR BREATHING ENGINES, by W. L. Melnick and R. Hermann. Rept. on Contract AF 49(600)713. July 59, 47p. 17 refs. AEDC-TN-59-71; AD-218 184.
Order from LC mi$3.30, ph$7.80 PB 147 574

The flow process in a shroud diffuser is investigated by means of a one-dimensional analysis that treats the flow between nozzle exit and diffuser entrance as a free jet. The effects of cowl drag and control of the test chamber pressure by means of mass inbleed or suction are included in the analysis. An exact solution of the equations of conservation of mass, momentum and energy for steady, inviscid, one-dimensional flow indicates the existence of two possible states after recapture of the flow in the shroud. In general, the flow will be subsonic after recapture; for suitable operating conditions, the flow can be supersonic. A phenomonological model of the flow process is formulated for the supersonic state. The operating conditions for optimum pressure recovery are reviewed for both cases. (Author)

Wiancko Engineering Co., Pasadena, Calif.
ACOUSTIC IMPEDANCE MEASUREMENTS FOR PROPULSION SYSTEM COMPONENTS, by C. L. Dailey, A. C. Brown, and J. W. Headley. Rept. on Contract NOas-58-565-c. July 59, 88p. 4 refs. Rept. no. W2328-F; AD-225 648.
Order from LC mi$4.80, ep$15.30 PB 150 156

This report released for sale to the public 12 Sep 60.

The concept of acoustic impedance is reviewed which is employed by acousticians in describing the boundary conditions relating pressure and velocity disturbance at some station in a distributed acoustic region. The concept is applied in formulating an analytical discription of a complete propulsion system in which experimentally determined functions are used. The acoustic impedances of a diffuser and engine from a specific airplane were measured, and the response of the duct system to a rapid transient in flight was computed. The airplane was flown, and the predicted data were compared with the experimental results. The tests showed that direct measurement of acoustic impedance is practical and that the acoustic system is linear over the range of amplitudes required for the measurement, i. e. the determined impedances do not depend on amplitude of the disturbance signal.

STUDY OF THE WELDABILITY OF A MODIFIED HOT WORK DIE STEEL, by W. A. Sipes and E. J. Fogarty. Rept. on Proj. TED NAM AE 4426, Pt. 4. 9 Apr 59, 28p. Rept. no. NAMC-AML-AE-1083; AD-228 996.
Order from LC mi$2.70, ph$4.80 PB 149 316

A limited study of the weldability of a typical modified hot work die steel of the AISI H-11 type was made. Satisfactory joints were produced utilizing an experimental coated, low hydrogen electrode. The strength levels of the welded joints approached 300,000 psi after suitable heat treatment. Joint efficiencies approximating 100% were readily obtained. (Author)

FUNDAMENTALS OF ULTRASONIC WELDING. Bimonthly rept. no. 2, Dec 57-Jan 58, on Contract NOas-58-108-c. Feb 58, 35p. 9 refs. AD-161 344.
Order from LC mi$3.00, ep$7.80 PB 150 085

This report released for sale to the public 31 Aug 60.

Stress distribution in the weld zone: Three types of photoelastic models are discussed; (1) plank models,

(2) frozen-stress models, and (3) direct-observation triaxially restrained models. Energy delivered to the weld zone: A physics experiment was devised and instrumentation is being assembled to correlate oscillograph patterns with the standing-wave ratio associated with essentially zero power delivery by, and with about 100% power delivery through, an acoustical conductor. Energy transmitted through the weld zone: An experiment was devised to correlated weld strength with the signal produced during welding by a reflector anvil equipped with barium titanate microphonic elements. Temperature developed in the weld zone: Two techniques were used to determine temperatures: (1) by recording thermal emfs obtained from a junction consisting of the weldment and a single wire previously inserted or potted into the zone of the intended welds, and (2) by metallographic studies. Properties of materials being welded: A preliminary experiment is being statistically designed to investigate the relation of certain material properties to vibratory weldability. Initial consideration is being given to hardness, thermal properties, and recrystallization.

Aeroprojects, Inc., West Chester, Pa.
FUNDAMENTALS OF ULTRASONIC WELDING. Bimonthly rept. no. 3, Feb-Mar 58, on Contract NOas-58-108-c. Apr 58, 24p. 14 refs. AD-205 394.
Order from LC mi$2.70, ep$6.30 PB 150 080

This report released for sale to the public 31 Aug 60.

Stress distribution in the weld zone: the direct-observation triaxially restrained model (DOTRM), supplemented by the simple plank model, shows promise as a preliminary means of observing stress distributions. Energy delivered to the weld zone: Instrumentation is being developed for SWR measurement in a primary component of the elastic vibration coupling system which would provide means for determining the net power delivered to the weld zone. Energy transmitted through the weld zone: High response oscillography was used to obtain data from microphone elements attached to the reflector sonotrode during the formation of ultrasonic welds. The reflector-sonotrode system was intimately connected with the materials welded (2024-T3 Alclad, 1100-H4 Al, C. P. Cu, and Armco ingot iron), the operating variable of force and power, and the energy delivered to the weld zone. Temperature developed in the weld zone: The single-wire-thermocouple technique was utilized at 4 clamping force levels and 4 power levels to explore the temperature rise associated with ultrasonically welding (1) half-hard commercial purity Cu (0.032-in. thick) to itself, (2) 1100-H4 Al (0.032-in. thick) to itself, and (3) Armco ingot iron (0.028-in. thick) to itself. Properties of materials being welded: The effects of temperature rise, material thickness, and difficulties of energy measurement associated with ultrasonic welding are discussed. (See also PB 150 085)

Aeroprojects, Inc., West Chester, Pa.
ULTRASONIC WELDING OF STRUCTURAL ALUMINUM ALLOYS. Bimonthly rept. no. 4, 21 July-20 Sep 57, on Contract NOas-57-480-c. Sep 57, 11p. AD-161 151.
Order from LC mi$2.50, ep$4.80 PB 150 083

This report released for sale to the public 31 Aug 60.

Control of weld quality: A more sensitive quality control test (AD-142 657) was initiated, but with 0.040-in. 2024-T3 bare Al alloy welded at 2400 effective w, 700-lb clamping force, and 1.5 sec welding time. Influence of vibratory direction on weld strength: Shear tests were devised for symmetric loading of single-lap specimen. Test results indicated that no preferential orientation exists. Validity of data for structural applications: No consistent trend for tab or panel weldments was developed. Extending capability of spot-type welding equipment: The use of an interleaf of 0.001-in. 1100-0 Al between 0.050-in. sheets of 2024-T3 bare Al alloy nearly doubled the strength of the welds in this material. Ultrasonic roller welding equipment: The brush-slip system design was revised and new parts are being fabricated and installed. (See also PB 150 080)

Aeroprojects, Inc., West Chester, Pa.
FUNDAMENTALS OF ULTRASONIC WELDING. Bimonthly rept. no. 6, Aug-Sep 58 on Contract NOas-58-108-c. Oct 58, 17p. 9 refs. AD-209 993.
Order from LC mi$2.40, ep$4.80 PB 150 078

This report released for sale to the public 31 Aug 60.

Temperature developed in the weld zone: Interface temperatures in 0.032-in. Armco iron were measured by means of the single-wire-thermocouple and meltable-wire-insert techniques. Properties of materials being welded: Acoustic power vs sheet thickness data were obtained for several foil gages of half-hard Cu and AISI 302 stainless steel to establish the minimum electric power required to accomplish a weld. Weld interface distrubance: Autoradiographs displayed high densities ad acent to the surface of radioactive foil insert in several areas of the weld. This darkening of the photographic emulsion was attributed to subsurface radiation. (See also PB 150 084)

Aeroprojects, Inc., West Chester, Pa.
ULTRASONIC WELDING OF STRUCTURAL ALUMINUM. Bimonthly rept. no. 5, 21 Sep-20 Nov 57, on Contract NOas-57-480-c. Nov 57, 13p. 4 refs. AD-161 343.
Order from LC mi$2.40, ep$4.80 PB 150 084

This report released for sale to the public 31 Aug 60.

Control of weld quality: Weld strength test data are presented for 0.040-in. 2024-T3 bare Al alloy which indicate that ultrasonic welds are reproducible and that quality control is not difficult to obtain. Extending capability of spot-type welding equipment: A brief theoretical analysis was made to determine the stresses to which a transducer-coupler may be exposed. The results indicate the need for determining the standing-wave ratio in such systems if the power-handling capacity prediction is to be reasonable accurate. An experiment with foil interleaves of 1100-0 and 1100-H19 Al in various gages indicated that 0.001-in. foil generally produced stronger welds than the heavier gages. Preliminary fatigue studies: The results of studies on the preparation of fatigue test specimens indicate that at high loads ultrasonic welds are equal to and possibly better than resistance spotwelds in the same material. (See also PB 150 083)

California U., Los Angeles.
RESEARCH IN PRODUCTION SEQUENCING, by James R. Jackson. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 9 Oct 58, 14p. 17 refs. Research rept. no. 57.
Order from LC mi$2.40, ph$3.30 PB 148 834

An important class of industrial problems is concerned with the sequencing of production activities, as differentiated from the distribution of workloads among blocks of productive time. The relation of sequencing to workload distribution is parallel to that of job dispatching to master production scheduling. This paper provides a limited survey of analytic research in production sequencing, and a brief indication of the directions taken by some current computational studies. (Author)

DEPARTMENT OF DEFENSE TITANIUM SHEET-ROLLING PROGRAM, by H. R. Ogden. Status rept. no. 5, 1 Jan-31 Dec 59, on Contract AF 18(600)1375. 1 June 60, 80p. 1 ref. DMIC rept. 46H.
Order from OTS $2.00 PB 151 087

Production of the heat-treatable alloys has been completed by one producer and is nearing completion by the other two producers. Three new alloys have been added to the program, Ti-7Al-12Zr, Ti-8Al-1Mo-1V, and Ti-8Al-8Zr-1(Cb+Ta). These are designed to be weldable alpha alloys with high creep strength. Phase II, the development of design data, has been started, with testing well under way. This work is being done on production-aged material by Lockheed Aircraft Corporation, Marietta, Georgia. Two of the seven Phase III contractors have completed their programs, and evaluation is well along for the other five contractors. The two companies who conducted preliminary evaluations of three alloys chose Ti-4Al-3Mo-1V as the most promising alloy for fabrication of parts. All of the Phase III programs are scheduled for completion in 1960. (Author) (See also PB 151 065)

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
NEW DEVELOPMENTS IN THE WELDING OF METALS, by P. J. Rieppel. Rept. on Contract AF 18(600)1375. 24 June 60, 50p. 73 refs. DMIC rept. 131.
Order from OTS $1.25 PB 151 089

Progress being made with new methods of welding metals is described. The applications and limitations of each process are discussed, along with brief descriptions of how the process works and what has been done with it. The developments included are: (1) Fusion welding: (a) electroslag, (b) short-arc and dip-arc, (c) electron beam, (d) arc spot; (2) Resistance welding: (a) high frequency, (b) foil seam, (c) magnetic force, (d) process controls; (3) Brazing; (4) Solid-state bonding: (a) ultrasonic, (b) friction, (c) diffusion, (d) explosive; (5) Cutting and coating (plasma jet). TITANIUM SHEET ROLLING PROGRAM FOR Ti-6Al-4V AND Ti-4Al-3Mo-1V, by W. M. Parris and H. D. Kessler. Bimonthly rept. no. 11, 1 Jan-28 Feb 58, on Contract Noas-56-993-c. 28 Feb 58, 25p. AD-160 076.
Order from LC mi$2.70, ep$6.30 PB 150 082

This report released for sale to the public 31 Aug 60.

Solution treatment of the required twenty full-size Ti-6Al-4V sheets was completed. Uniformity tests on one 0.020" gage sheet showed yield strength variations from 118,000 to 132,000 psi as-solution treated and 149,000 to 160,000 psi after aging. Three additional sheets, one from each of the remaining gages, will be sectioned for uniformity studies later in the program. An additional 57 sheets of the Ti-4Al-3Mo-1V alloy were solution treated making a total of 115 sheets to data. A tentative classification system for solution treated sheets based upon transverse properties only is described. (Author)

Titanium Metals Corp. of America, Toronto, Ohio.
TITANIUM SHEET ROLLING PROGRAM FOR Ti-6Al-4V AND Ti-4Al-3Mo-1V, by W. M. Parris and H. D. Kessler. Bimonthly rept. no. 12, 1 Mar-30 Apr 58, on Contract NOas-56-993-c. 30 Apr 58, 22p. AD-201 485.
Order from LC mi$2.70, ep$6.30 PB 150 079

This report released for sale to the public 31 Aug 60.

Production of Ti-4Al-3Mo-1V sheets from the 3000-pound ingots is well along and should be virtually completed during the next report period. The transfer of the resistance heating - spray quench apparatus to the TMCA, Toronto mill facility was completed and one

sheet each of 0.125, 0.063, and 0.025" gage sheet was solution treated and sectioned for uniformity studies. Results indicated that good uniformity can be expected in 0.063" and heavier gages but that some problem may exist in lighter gages. Further studies on light gage material are in progress. An additional 32 heat treated sheets were shipped to various customers. Properties of these sheets taken from transverse and end strips are presented. (Author) (See also PB 150 082)

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
EXTENSION OF THE CONDUCTING SHEET ANALOGY TO EXTERNALLY PRESSURIZED GAS BEARINGS, by Lazar Licht. Rept. on Contract Nonr-2342(00). Oct 59, 15p. 3 refs. Interim rept. I-A2049-9; AD-228 300.
Order from LC mi$2.40, ph$3.30 PB 149 490

Incompressible, viscous flow in narrow passages bounded by parallel surfaces yields the 2-dimensional Laplace equation, $\nabla^2 P = 0$. The pressure field, load capacity and lubricant flow of hydrostatic oil bearings can be readily determined by means of the electric analogy of the conducting sheet. The equation $\frac{\partial}{\partial x}\left(P\frac{P}{x}\right) + \frac{\partial}{\partial y}\left(P\frac{\partial P}{\partial y}\right) = 0$ characterizes laminar, isothermal flow of gas lubricants in otherwise geometrically identical bearings. It is shown that by means of suitable change of the dependent variable the above equation can be reduced to the Laplacian form. The ensuing advantage is the extension of the conducing sheet analogy to externally pressurized thrust and journal guide bearings when the lubricant is a gas. (Author)

Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
INVESTIGATION OF THE UNNOTCHED AND NOTCHED FATIGUE BEHAVIOR OF SEVERAL HEAT RESISTANT MATERIALS FOR ENGINE BOLTS, by Donald M. Forney, Jr. and Douglas Y. Wang. Rept. for Jan 58-Dec 59 on Materials Analysis and Evaluation Techniques. Feb 60, 59p. 4 refs. WADD Technical rept. 59-25; AD-236 684.
Order from OTS $1.50 PB 161 930

An investigation of the fatigue behavior of 3/8 inch engine bolts at various temperatures is described for the heat resistant alloys AMS 5735(A-286), Udimet 500, Inconel 700 and Incoloy 901. Tests were also performed under axial stress on unnotched fatigue specimens and fatigue specimens with a theoretical stress concentration factor of 3.4. The data are presented as S-N diagrams to show the effect on fatigue strength of temperature, stress concentration, stress magnitude and bolt thread rolling. The results of this investigation suggest the possibility of using fatigue test data obtained with single notched specimens to evaluate other heat resistant alloys for possible engine bolt applications thereby reducing the significant expense of fabrication of experimental lots of bolts for test. DIGITAL COMPUTER PROGRAM FOR ACCELERATION PERFORMANCE, WHEELED VEHICLES, by Robert Arno. Rept. on Contract DA 20-089-ORD-39246. 9 Feb 60, 45p. Rept. no. RR-9.
Order from LC mi$3.30, ph$7.80 PB 148 391

A general computer program was written for the Electrodata 204 "Datatron" digital computer to calculate acceleration performance and related characteristics for wheeled vehicles. Vehicle performance is determined at prescribed time intervals during acceleration from standstill to maximum velocity. Other additional performance data supplied by this program are vehicle speed, distance traveled, time of travel, wheel torque, tractive effort, rolling resistance, drawbar pull, and acceleration. WHEELED VEHICLES (M135), LEAN AND FAT CLAY, 1957, by A. B. Thompson and Mary E. Smith. Rept. no. 2 on Stresses under Moving Vehicles. May 60, 71p. 2 refs. Technical rept. no. 3-545.
Order from LC mi$4.50, ph$12.30 PB 149 199

A study was conducted to determine the distribution of stresses imparted to soil by a moving, pneumatic-tired vehicle and to compare the suitability of three different types of pressure-sensing devices for measuring these stresses. The effects on stresses of such variables as soil strength, tire inflation pressure, vehicle speed, acceleration, deceleration, and towing of the vehicle were investigated with the cells installed at varying depths and offsets from the line of traffic. The large (6-in. diameter), earth pressure cell was found to be the most reliable measuring device of the three used in these tests. Inaccuracy of traffic alignment, variations in wheel load, variations in soil consistency, and cell movement were concluded to have been major causes of the discrepancies in stresses recorded by the cells. Recommendations for future tests, in which these detrimental conditions would be avoided, are included. (Author)

MEASURING FIELD HANDLING AND TRANSPORTATION CONDITIONS, by Kenneth W. Bull and Carl F. Kossack (Purdue U.). Rept. for July 56-July 59 on Finishes and Materials Preservation. Feb 60, 39p. 1 ref. WADD Technical rept. 60-4, suppl. to WADC TR-56-464.
Order from OTS $1.00 PB 161 918

This study involves concealing shock recording instruments inside ordinary shipping containers and shipping the instrumented packages through normal supply channels to determine the actual heights from which packages are dropped. Based on the data given in this report, a test drop height of 21 inches is considered adequate for specifications. Further clarification is given in the report. The recorders, calibration procedure, collected data, analysis, accuracy and associated problems are discussed. Recommendations for future studies of this sort are also given. STUDY OF CREEP IN CONCRETE, by John R. Keeton. 11 May 60, 65p. Technical rept. 082.
Order from LC mi$3.90, ph$10.80 PB 148 397

Various size cylindrical concrete specimens from controlled environments (20%, 50%, and 100% R. H., 73F) received sustained compressive stresses of 38% (2000 psi) and 57% (3000 psi) of ultimate compressive strength at loading time. In the size range investigated, after 175 days of loading and regardless of specimen size, creep is 5% to 10% greater in 20% R. H. than in 50% R. H. Creep in 100% R. H. is about two-thirds of that in 50% R. H. An extensive study will be undertaken to disclose mechanics of shrinkage (Author)

RESIDUAL AND THERMAL STRESSES IN POTTING RESINS, AND THE DEVELOPMENT OF STRAIN GAGE INSTRUMENTATION FOR THEIR DETERMINATION, by R. E. Heise, Jr. 29 Aug 58, 30p. 2 refs. NAVORD rept. 5767; AD-206 317.
Order from LC mi$2.70, ph$4.80 PB 147 569

A transducer was designed to measure strains during and after potting in thermosetting casting resin. Post-cure axial strain indicated residual compressive stress 2800 psi. Bending strains indicated little radial stress. The potted transducer was heated to 160°F and stress was relieved but recovered on cooling; then cooled to 0°F resulting in axial compressive stress 8600 psi. Thermal shock -65°F produced axial compressive stress 12,600 psi. Production of stress was direct result of thermal gradient across resin in early stage and later of different expansion coefficients for resin and transducer. (Author)

Office of Defense Research and Engineering, Washington, D. C.
SUMMARY OF RECOMMENDATIONS FOR RESEARCH AND DEVELOPMENT IN MATERIALS. 1 July 60, 56p.
Order from OTS $1.50 PB 161 865

This document constitutes a review of the many recommendations in the following areas: Materials: iron and steel; heavy nonferrous metals (refractory metals); graphite; ceramic materials; rare earths; plastics, elastomers, and fabrics; semiconductors and thermoelectric materials; intermetallic compounds. Materials Systems: ultrapure materials; composite materials; particle-hardening systems; sandwich construction; coatings. Qualities of Materials: brittleness; heat-engineered structures; lightness; high-temperature physical properties of materials; plasma phenomena. Fabrication of Materials: general; forming of metals; casting of metals; metal stock removal; welding and brazing of metals or of metals with ceramics; adhesive bonding; heat treatment of metals; fasteners. General Recommendations: deterioration of materials and structures; engineering guidance and guidance studies; miscellaneous recommendations; materials research policies.

Adhesives and Sealants

Naval Civil Engineering Lab., Port Hueneme, Calif.
PARAFFIN AS A CONDUIT SEAL AGAINST BLAST PRESSURE, by H. G. Aggas. Final rept. 18 Feb 60, 12p. Technical rept. 074; AD-234 940.
Order from LC mi$2.40, ph$3.30 PB 147 813

The blast resistance of paraffin as a sealing compound in Crouse-Hinds explosion-proof sealoffs was investigated. These sealoffs, which had approximately one-half of their cross-sectional area filled with standard electrical wire, were sealed with paraffin and tested in the blast simulator. Paraffin is an effective seal for resisting dynamic and static pressures to at least 150 psi at an average temperature of 68°F. The sealoffs were subjected to dynamic pressures up to 170 psi with no damage to the wax seal. (Author)

SYNTHESIS OF RESORCINOL-EPOXY ADHESIVE AND EVALUATION OF ITS MECHANICAL PROPERTIES, by Hsueh T. Lee, Eileen R. Swick, and Michael J. Bodnar. July 60, 10p. 2 refs. Technical Notes no. 51.
Order from OTS $0.50 PB 161 785

A resorcinol-epoxy resin was synthesized which when used as an adhesive gave shear strengths of approximately 1570 psi at 73°F and 2110 psi at 160°F. An average impact strength of 16.8 ft-lb/0.75 sq in. of bonded area was obtained at both 73° and 160°F, and 16.4 ft-lb/0.75 sq in. at -65°F when bonding steel to steel. Although a room-temperature cure can be accomplished using 8.2 parts diethylene triamine curing agent per hundred parts resin, the rise in shear strength at 160°F indicates that an elevated-temperature cure would be more effective in achieving the maximum adhesive properties of this material. FABRICATION OF INFRARED TRANSMITTING MATERIALS BY HOT PRESSED TECHNIQUES, by Norbert J. Kriedl, Harold C. Hafner and others. Rept. for 1 Apr 57-31 Mar 58 on Ceramic and Cermet Materials, Contract AF 33(616)5123. Oct 58, 171p. 14 refs. WADC Technical rept. 58-275; Part 1; AD-202 844.
Order from LC mi$8.10, ph$27.30 PB 150 149

This report released for sale to the public 13 Sep 60.

The fabrication of infrared transmitting materials by hot pressing techniques has been studied. BaF_2 was used as a model material. The temperatures studied ranged from 600 to 1225°C and the pressures from 1500 to 8000 psi. The equipment used to obtain these conditions is described. The effects of various hot pressing atmospheres including nitrogen, helium, argon and carbon dioxide, were investigated. A study was carried out to identify the impurities present and to study their effects. (Author)

DEVELOPMENT AND EVALUATION OF INSULATING TYPE CERAMIC COATINGS, by E. W. Blocker, C. A. Hauck and others. Rept. for 1 Mar 58-28 Feb 59 on Ceramic and Cermet Materials, Contract AF 33(616)5441. Nov 59, 74p. WADC Technical rept. 59-102; AD-231 732.
Order from LC mi$4.50, ph$12.30 PB 149 888

This report released for sale to the public 29 Aug 60.

A metal reinforced ceramic coating system has been developed that will successfully withstand temperatures of 3500°F while providing insulative values for the supporting structure. This ceramic coating system utilizes a corrugated strip of stainless steel as the reinforcement media and phosphate bonded alumina as the refractory medium. The great advantages of a coating system of this nature, aside from high temperature resistance and thermal insulation, is the wide variety of applications wherein it can be utilized. Attempts have been made to use zirconia as the refractory grain in phosphate bounded reinforced coatings. These attempts have not been wholly successful, due mainly to the poor thermal shock resistance of zirconia. It is anticipated that this drawback can be eliminated. Several items of research equipment have been designed and built to facilitate study of the various ceramic materials used in this program. These include a differential thermal analysis setup, a high temperature modulus of rupture furnace, and a modification of the existing thermal drop apparatus. (Author)

RESULTS OF A LABORATORY STUDY TO DETERMINE THE CORROSIVE PROPERTIES OF DRY FILM LUBRICANTS, by J. P. Cerini. 17 Aug 59, 12p. Rept. no. NAMC-AML-AE 42173, Pt. I.
Order from LC mi$2.40, ph$3.30 PB 149 320

The pH of MoS_2 powder used in the preparation of dry film lubricants can affect the corrosion characteristics of the film, when the film is in contact with a nonlubricated aluminum surface. Coating both mating surfaces with dry film lubricant provides maximum corrosion protection. The corrosion test method devised to simulate reported field conditions yielded results equivalent to those obtained in service for the one material for which service data was available. (Author)

MEASUREMENT OF THE GAS VELOCITY OF SPHERICAL COMBUSTION WAVES BY THE BALLISTIC PARTICLE TRACK METHOD, by S. D. Raezer and H. L. Olsen. Rept. on Contract NOrd-7386. June 59, 25p. 6 refs. CM-952; AD AD-220 790.
Order from LC mi$2.70, ph$4.80 PB 149 190

When the temperature and density of the gas do not change and the velocity is in the Stoke's law regions, the gas velocity in a transient or wave disturbance can be calculated from its effect upon a heavy particle falling in its path. This method is used to obtain the cold gas velocity ahead of a spherical combustion wave in an effort to determine the flame speed. (Author)

Army Rocket and Guided Missile Agency, Redstone Arsenal, Ala.
TEMPERATURE GRADIENT TESTS OF INERT PROPELLANT GRAINS; DATES TESTED: 2 THRU 23 APRIL 1958, by James F. Wiedman. 29 Aug 58, 35p. Rept. no. 3M78N10; AD-202 536.
Order from LC mi$3.00, ph$6.30 PB 149 182

Six inert propellant grains having the same configuration were temperature cycled to obtain data on the temperature gradients present. The grains were placed in a temperature conditioning chamber at 0°F and kept there until all thermocouples registered approximately that temperature. The grains were then transferred as quickly as possible to a chamber at 100°F where they remained for 10 hr. The readings of the thermocouples within a given group were not always alike, especially those located nearest the surface of the grain. This discrepancy is probably caused by the air flow and resulting temperature gradients set up in the test chamber itself. Another cause of error is the specimen; its consistency may not be homogeneous, causing the heat conductivity to vary.

STANDARD METHODS AND PROCEDURES FOR THE STRAND BURNING-RATE EVALUATION OF ROCKET PROPELLANT POWDER, by M. F. Schoeffel. 29 May 53, 13p. 8 refs. NAVORD OD 9376.
Order from LC mi$2.40, ph$3.30 PB 149 995

This report released for sale to the public 31 Aug 60

This report describes standard methods and procedures as well as special equipment and materials needed for the strand burning-rate evaluation of rocket propellant powder. This publication specifically applies to the strand-burning rate determination of double-base sheet propellant, types N-4 and N-5. It will also apply to other rocket propellant powder when specifically designated in applicable specifications.

Coating and Chemical Lab., Aberdeen Proving Ground, Md.
STORAGE OF BRAKE WHEEL CYLINDERS WITH MINERAL OIL, by C. B. Jordan. 20 Apr 60, 14p. 6 refs. Rept. no. CCL-92.
Order from OTS $0.50 PB 161 662

The object of this study was to evaluate the storage properties of mineral oils with hydraulic brake system components. Synthetic rubber brake cups compatible with mineral oils and having improved operational characteristics were used in the study. Brake cylinders were packaged with two types of mineral oil and placed in warehouse storage and simulated vehicle storage. Cylinders were inspected at one year intervals. All aluminum, tin, steel, and brass parts were in excellent condition after 3 years storage. Cast iron cylinder walls were excessively pitted. Synthetic rubber brake cups were in satisfactory condition. Natural rubber boots were cracked and deteriorated. (Author)

SOLUTION AND EVOLUTION OF GASES AND VAPORS IN AIRCRAFT FUELS. Rept. for 22 Mar 57-1 Jan 59 on Atlantic Research Corp., Subcontract to AF 33(616)3735. Apr 59, 165p. 11 refs. WADC Technical rept. 59-193; AD-233 936.
Order from OTS $3.00 PB 161 900

A program was undertaken to study solution and evolution rates of gases and vapors in aircraft fuels. The purpose was to establish parameters and develop theories to predict the operation of the fuel tanks of high-powered, high-altitude aircraft. The work done, which is reported herein, was largely experimental. Laboratory tanks were tested under simulated dynamic aircraft conditions. Aircraft fuels were pressurized under various gases in shaking tanks for

various fuel levels, temperatures, pressures, contaminants, shaking frequency, and shaking direction. Shaking frequency proved to be the most important variable in controlling the rate constants of solution and evolution. Not only did the rates tend to increase with increased frequency, but when the shaking frequency was in phase with the natural oscillation of the fuel, the rates increased one hundred to a thousand times. Contaminants such as fine dust which held and disbursed minute air bubbles did not affect solution but markedly increased the evolution rate. However, this effect occurred during the first evolution cycle only, corresponding to the first initial climb to high altitude. Fuel level affected the rates by affecting wave action in the tank. The rates increased with increasing amplitude and generally decreased with increase in tank size. Vertical and horizontal shaking operated similarly to increase the rates of solution and evolution. Phillips Petroleum Co., Bartlesville, Okla.
RADIATION FROM LABORATORY SCALE JET COMBUSTOR FLAMES, by E. C. Miller, A. E. Blake and others. Special rept. on Contract NOas-52-132-c. Oct 56, 70p. 10 refs. Research Div. rept. 1526-56R; AD-138 244.
Order from LC mi$3.90, ph$10.80 PB 146 545

Characteristics of the energy radiated from aircraft gas turbine type combustion processes were investigated. Two paraffinic test fuels, normal heptane and isooctane, and two aromatic test fuels, benzene and toluene, were selected to obtain a wide range in hydrocarbon structure. Infrared flame emission and absorption spectra, from 1 to 15 microns in wavelength, were obtained at five different locations around the combustor. This was also done without combustion, and without fuel; to obtain fuel, and air, absorption spectra. Non-luminous flames were characterized by discontinuous radiation of molecular origin. Luminous flames were characterized by a predominance of continuous, black body type, radiation. At intermediate values of luminosity the discontinuous molecular radiation was evident, superimposed on the continuous radiation. The average transverse emissivity of the infrared spectral region for non-luminous flames was approximately 0.03; but it increased, with increasing flame luminosity, to nearly one. The transverse emissivity of the flames increased with increasing combustor pressure, but the rate varied with fuel type.

Rock Island Arsenal Lab., Ill.
A METHOD FOR ACCELERATING THE FEDERAL TEST METHOD PROCEDURE FOR DETERMINING THE MEAN HERTZ LOAD, by George P. Murphy. 8 July 60, 14p. 4 refs. Rept. no. 60-2156.
Order from LC mi$2.40, ph$3.30 PB 149 053

The test procedure is a combination of Girelli's "Compensation Line" and Nason's modification of the Mean Hertz Load procedure. The new test procedure gives Mean Hertz Load values that are on the average within 2% of the values obtained by Federal Test Method 6503. The advantage of the new procedure is that it reduces the number of runs necessary to determine the Mean Hertz Load from 20 to between 2 and 6 depending on the material tested. This is equivalent to a time savings of about 140 to 180 minutes in addition to the savings in cost of the test specimens. The procedure is applicable to both E.P. and non-E.P. oils and greases with the exception of those containing silicones. (Author)

Rock Island Arsenal Lab., Ill.
A STUDY OF THE SHELL FOUR BALL WEAR TEST VARIABLES, by G. P. Murphy. 8 July 60, 16p. 2 refs. Rept. no. 60-2154.
Order from LC mi$2.40, ph$3.30 PB 149 054

Four MIL-G-10924A "General Purpose" greases were tested under various conditions of load, time, and temperature. The results were mathematically treated and the relationship between the variables and the scar diameter determined. These relationships, which hold for tests on MIL-G-10924A greases over the following variable ranges, 2 to 50 kg. load, 27° to 150° C, 10 to 180 minutes and 600 RPM, are as follows: the scar diameter varies directly with the 0.25 power of the load, the 0.12 power of time and the 0.10 power of temperature. The exponential powers of load, time and temperature are also determined for mineral, diester, polyglycol, organic phosphate oils, and several different grease types. The general equation for conversion of data is given. This equation is applicable only to scar diameters in the nonseizure portion of the Shell Four Ball Wear Test wear curve. (Author)

Leather and Textiles

Army Engineer Research and Development Labs., Fort Belvoir, Va.
DESIGN AND RELIABILITY OF SOIL BURIAL TESTS FOR TEXTILES, by J. M. Ashcroft. 28 Aug 58, 28p. 2 refs. Rept. 1541-TR; AD-204 278.
Order from LC mi$2.70, ph$4.80 PB 147 224

The investigation was to determine the extent to which the reliability of the soil burial method as a means of evaluating rot-inhibiting treatments of textiles might be increased by an experimental design more sophisticated than the random pattern frequently employed, and to ascertain whether varying the technique used in applying a given treatment would alter significantly its effectiveness as a rot inhibitor.

Fabric Research Labs., Inc. [Dedham, Mass.]
A SURVEY OF 18 OZ. BLENDED SERGE FABRICS: STABILITY OF FABRICS TO MOISTURE AND R. H. MOVEMENT, by Normal J. Abbott, Leo Barish, and Milton M. Platt. Rept. on USAF Uniform Clothing Assemblies, Contracts DA 19-129-qm-1312; AF 33(616)54-172; AF 33(616)55-82; and AF 33(616)57-20. Oct 59, 43p. WADC Technical rept. 59-242; AD-230 982.
Order from OTS $1.25 PB 161 901

The effect of blending a number of fiber types with wool on the behavior of 18-oz. serges under extremes of humidity was studied. The blended fibers included viscose, nylon, Dacron, Orlon Acrilan, and Dynel, in amounts up to 30%. The results have shown that some differences exist between the effects of changes in humidity on the nine fabrics examined. With one exception, however, the differences were small, and it would require some practical experience with the fabrics to assess their importance. The properties studied included dimensional change, fabric deformation, seam puckering, stiffness, moisture regain, and bagging tendency. The only relatively large change in any of these properties which was brought about by changes in humidity was the rather large increase in stiffness which took place in high humidity. This has been attributed to a jamming of the structure due to the swelling of the fibers, and was apparently not related to the type of fiber which was blended with the wool. In other characteristics the differences which existed between the fabrics are sufficient to differentiate between the fibers, but in general are not considered to be of major practical importance. Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
AIR PERMEABILITY OF PARACHUTE CLOTHS, by H. W. S. LaVier and W. C. Boteler. Rept. on Contract AF 33(038)15624. Apr 55, 75p. 5 refs. WADC Technical rept. 52-283, Part V.
Order from LC mi$4.50, ph$12.30 PB 149 990

This report released for sale to the public 31 Aug 60.

The air permeability evaluations of various nylon cloths produced by different manufacturers to the same MIL specifications are presented here. The effect on air permeability due to various weaving defects was investigated and it was concluded that such normal defects had little or no effect on the cloth air permeability evaluations. Variation of the magnitude of the calendering load was studied regarding its effect on air permeability of a cloth. It was found that loads up to fifty tons per inch caused considerable change in the cloth permeability. However, loads above fifty tons per inch caused very little additional change in air permeability over that caused by a load of 50 tons per inch. Discharge coefficients for various kinds of parachute cloths are also included in this report. These values may prove useful in designing new parachute textiles. (Author)

Massachusetts Inst. of Tech., Cambridge.
AIR FLOW CHARACTERISTICS OF PARACHUTE FABRICS AT SIMULATED HIGH ALTITUDES, by C. V. Seshadri, G. A. Brown and others. Rept. for 1 July 58-30 June 59 on Contract AF 33(616)5864. Mar 60, 165p. 16 refs. WADC Technical rept. 59-374.
Order from OTS $3.00 PB 161 902

The air flow characteristics of parachute canopy cloth have been measured over an unusually wide range of test conditions. High altitude simulated tests (up to 150,000 feet) have shown the cloth to have markedly low flow rates, as may be predicted from a nozzle flow analogy. A method of predicting high altitude behavior has been proposed. Permeabilities of four cloths have been shown to be significantly dependent on their state of stress at the time of air flow measurement. The magnitude of this relationship is observed to be determined by the biaxial stress-strain behavior of each fabric. The air stream deflection tendency of thick canopy material has been verified and its cause investigated. The role of pore geometry in influencing cloth permeability has been explored. (Author)

Materials Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
RESULTS OF STUDY OF NYLON AND DACRON AT HIGH TEMPERATURES, by J. W. Muse, Jr. Apr 53, 13p. Technical note WCRT 53-44.
Order from LC mi$2.40, ph$3.30 PB 149 989

This report released for sale to the public 31 Aug 60.

Results of this study show that nylon is degradated primarily by oxygen at temperatures of 212°F to 284°F. The degree of degradation is influenced by the amount of oxygen present at a specific temperature, i.e., nylon loses 21.8% of its strength after exposure for 8 hours in pure oxygen at 212°F compared to a loss of 5.45% of its strength under the same conditions in compressed air. In comparison dacron is not appreciably affected by the presence of oxygen under identical conditions. From 375°F to 425°F, dacron is degradated primarily by heat. The degree of degradation in nylon by oxygen is very severe at the conditions for which the successful application of parachute material is critical. At maximum test conditions in oxygen, nylon lost 96% in strength in contrast to dacron's 9%. This is conclusive evidence that the principal cause of degradation in nylon is oxygen, which when subjected to higher temperature, increases the rate of oxidation.

COMPARISON OF SENSITIZED MATERIALS FOR AERIAL RECONNAISSANCE, by William Mallios. Rept. on Color Photography. Sep 52, declassified 28 Aug 59. 21p. WADC Technical rept. 52-500; ATI-173 049.
Order from LC mi$2.70, ph$4.80, PB 150 098

This report released for sale to the public 30 Aug 60.

With the exception of hydrographic, geological, and forestry studies, black-and-white film is the overwhelming choice of photo interpreters as a source of aerial photographic intelligence. For certain specific purposes, however, color film and camouflage detection film are superior sources of information. Unfamiliarity of the interpreters with color and camouflage detection films exerts more influence on the film choices than the actual values and qualities of the films themselves. Lack of proper viewing equipment, with special regard to stereo, was an equally strong influencing factor on these choices. Recommendations are made that more instruction be made available through the photo interpretation schools and that more and better equipment be made available for their use, all of which should be specifically aimed at special-purpose films. THE LIMITING TRACE SPACING ON FILM RELATED TO EXPOSURE AND CONTRAST RATIO, by E. Henry and M. Harrison. Memo. on Project Michigan, Contracts DA 36-039-sc-78801 and AF 33(600)38019. July 60, 19p. 5 refs. 2900-84-R.
Order from LC mi$2.40, ph$3.30 PB 149 455

Photographic film is one of the best materials known for storing maximum information in the smallest amount of medium. Data may be inserted in independent channels; it is therefore necessary to know the limiting channel spacing so that the uniqueness of each channel can be preserved. This memorandum describes a procedure to determine the limiting channel spacing. The method consists of contact-printing on a test film the image from a mirror-surfaced, optically flat glass block. In the mirror surface, lines 42 μ wide are engraved with a variable spacing from 8.5 lines/mm to 62.5 lines/mm. The image is then scanned with a specular densitometer and the light transmission recorded. The scanning aperture is 5 μ. From the recording, the contrast ratio at any resolution, i.e., the ratio of contrast at a given resolution to that at a low resolution (8.5 lines/mm) may be determined. This procedure is carried out with different amounts of exposure, all film being developed under constant conditions. A relationship is then expressed between light transmission through the image and the limiting resolution for a given contrast ratio (e.g., 0.707). Data for several commercially available films are given. (Author)

HIGH TEMPERATURE BEHAVIOR OF TEFLON, by Tunis Wentink, Jr. Rept. on Contract AF 04(647)278. July 59, 15p. 18 refs. Research rept. 55; AFBMD-TN-59-15; AD-227 521.
Order from LC mi$2.40, ph$3.30 PB 146 650

The properties of tetrafluorpethylene polymer in the temperature range from 300 to 800°K are reviewed. The pyrolysis of the plastic is treated, with emphasis on behavior under ablating conditions. An effective heat of vaporization at 760°K is calculated. New data on thermal conductivity and emissivity in the infrared are presented. (Author)

INVESTIGATION OF THE EFFECTS OF SEA WATER IMMERSION ON THE PROPERTIES OF GLASS REINFORCED POLYESTER LAMINATES, by P. M. Goldfarb. Final rept. on Lab. Project 4860-J-4. 21 Dec 59, 42p.
Order from OTS $1.25 PB 161 912

A five-year sea water immersion program on glass reinforced polyester laminates has been conducted. Five representative materials were fabricated with polyester resins and various types and constructions of glass reinforcement including glass cloth, glass mat, a combination of glass cloth and glass mat, and woven roving. The materials were immersed in the ocean at a Kure Beach, N. C., exposure station. Samples were removed from the test site yearly and sent, under water, to the Laboratory for mechanical property evaluations. It was found that a material fabricated with Garan finished Style 181 glass cloth had the best overall resistance to extended sea water immersion. A material fabricated with Volan finished Style 1000 glass cloth and a material made with Garan finished glass mat demonstrated fair resistance to sea water immersion. Two materials exhibited poor water resistance; these were a glass mat laminate with surface plies of 114 finished Style 1000 glass cloth and a Garan finished woven roving laminate. (Author)

RADIATION-INDUCED CURRENTS IN SOLID ORGANIC INSULATORS, by J. W. Winslow and R. S. Alger. 21 May 59, 50p. 11 refs. Research and development technical rept. USNRDL-TR-325; AD-225 297.
Order from LC mi$3.30, ph$7.80 PB 150 302

This report released for sale to the public 19 Sep 60.

The general behavior of currents induced by high energy radiation in polyethylene is described. Certain considerations regarding design of circuits for operation in large radiation fluxes are discussed. The dose-rate dependence of x-ray induced photocurrents found by previous investigators at lower dose-rates appears to be extended to dose-rates as high as 15,000 r/min. The theoretical implications of this extension are discussed briefly. Calculations suggest that electrons freed from polyethylene molecules by ionizing radiation succeed in escaping permanently from their parent molecules. Attempts to measure ultraviolet-induced photocurrents in certain solidified organic solvents at near-liquid-nitrogen temperatures place an upper limit of 2×10^{-15} mho/cm on their photoconductivities at the ultraviolet intensities used. Some question is raised concerning the mechanism of color-center formation in Wurster's Blue under ultraviolet irradiation. A property of polyethylene which may be useful in detecting high-energy radiation in regions of low temperature, such as interplanetary space, is reported. (Author)

MARINE BORER ACTIVITY IN TEST BOARDS OPERATED DURING 1958, by Dorothy Brown Wallour Progress rept. no. 12 on Contract NBy-17810. 15 Mar 59, 161p. Rept. no. 11044; AD-220 191.
Order from LC mi$7.80, ph$25.80 PB 149 766

This report released for sale to the public 25 Aug 60.

The compilation of the data obtained from the study of hundreds of test boards submerged in harbors, rivers, estuaries and on lightships throughout the world over a period of years show the extent and type of marine borer destruction taking place in the test boards at various locations. All marine boring organisms are commonly referred to as marine borers. There are three general categories of these organisms: Limnoria, Teredinidae and Pholadidae, all differing in their requirements and degree of destructiveness. Attention has been called to the presence of the different groups in the descriptive section of activity evaluations in this report. Photographs of the test boards showing the degree of attack are included in this report in order to give a more accurate presentation of the evaluation of the activity by Limnoria and Teredinidae. The activities of these two organisms are graphed separately. It is difficult to estimate the amount of damage caused by marine borers at any particular area due to the fact that its activity varies greatly from year to year. However, some general trends are discernible. The activity by both the marine borers Limnoria and Teredinidae continues to show a slight upward trend along the New England seacoast. A slight upward trend is also noted in marine borer activity in the New York area. (Author)

MARINE BORER CONTROL. PART X. EVALUATION OF CREOSOTE-RESIN SOLUTIONS AND CREOSOTE DISTILLATION FRACTIONS, by T. R. Price and T. R. Sweeney. Interim rept. 27 July 60, 11p. 7 refs. NRL rept. 5505.
Order from OTS $0.50 PB 161 695

Three resins were combined with creosote, using several curing agents, in order to determine their ability to increase the resistance of creosoted wood to marine borer attack by reducing the leaching rate. Distillation fractions of creosote were studied to determine the relationship of boiling point to effectiveness as marine wood preservatives. Nitrated and hydrogenated creosotes were also studied for their preservative effect. It was determined that several of the resin-creosote solutions were significantly better than creosote alone in providing protection to wood against Limnoria attack when pre-leached. No improvement with respect to Teredinidae attack would be detected and some evidence of decreased effectiveness was determined. The effectiveness of the creosote distillation fractions was determined to be proportional to their boiling point. Hydrogenated creosote was found to be a very poor wood preservative, and nitrated creosote, though a very good wood preservative, was not very useful because of extremely high viscosity. (Author) (See also PB 151 807)

INVESTIGATIONS ON THE VALIDITY OF THE ARC-SINE LAW, by Erik Sparre Andersen. Technical summary rept. no. 2 on Contract AF 61(052)52. 29 Feb 60, 7p. 3 refs. AFOSR-TN-60-674.
Order from LC mi$1.80, ph$1.80 PB 149 584

For a sequence of r.v.'s $X_1, X_2, \ldots$ the r.v. N_n is defined as the number of positive sums among $S_1, \ldots, S_n$, where $S_k = X_1 + \ldots + X_k$. Under rather general assumptions on $X_1, X_2, \ldots$ the limit distribution of N_n/n is known to be the arc-sine law:

$$F(x) = \frac{2}{\pi} \arcsin x^{1/2} \quad 0 \leqq x \leqq 1.$$

New sufficient conditions for the validity of the arc-sine law for N_n have been obtained. Furthermore the limit distribution of N_n/n has been found in some special cases, where the arc-sine law does not hold. (Author)

APPROXIMATIONS TO OPTIMAL POLICIES IN A DYNAMIC INVENTORY MODEL, by Donald M. Roberts. Technical rept. no. 12 on Contract Nonr-225(28). 29 July 59, 54p. 17 refs. AD-219 880.
Order from LC mi$3.60, ph$9.30 PB 147 798

An investigation is presented of the 2-bin policy which is characterized by 2 critical numbers, s and S, such that whenever the stock level falls below s, an order is placed to bring the level up to S, and otherwise no ordering is done. In approximating the critical numbers by numerical means, an attempt is made to give analytical formulas for determining the asymptotic reorder quantity under the following conditions; (1) all costs are linear, and the costs during any period are composed of a holding cost and a shortage cost, both payable at the end of a period, while the ordering cost is composed of a set-up cost and a unit cost payable whenever an order is placed; (2) demand in each period is an independent observation from a known distribution function; (3) the program lasts an infinite number of periods; and (4) the stock level can be negative (the backlog case). Cases are considered corresponding to instantaneous delivery of order items as well as fixed time lags in delivery. The supposition is made that the decision maker seeks to minimize the total expected costs, discounting future costs to the present.

ONE-SIDED INEQUALITIES OF THE CHEBYSHEV TYPE, by Albert W. Marshall and Ingram Olkin. Technical rept. no. 48 on Contract N6onr-25140. 6 Aug 59, 24p. 2 refs. AD-220 545.
Order from LC mi$2.70, ph$4.80 PB 148 159

A one-sided inequality of the Chebyshev type: Let $x = (x_1, \ldots, x_k)$ be a random vector with $Ex_i = 0$. Either (1) $Ex_i^2 = \sigma^2$, $Ex_ix_j = \sigma^2\rho$ $(i \neq j)$, $i, j = 1, \ldots, k$; or (2) $Ex_i^2 = \sigma_i^2$, $i = 1, \ldots, k$. In each case, a sharp upper bound (only involving the specified moments) for $P\{x_1 \geq 1 \text{ or } \ldots \text{ or } x_k \geq 1\}$ is obtained.

A formulation for more general one-sided bounds is also discussed. A one-sided analog of Kolmogorov's inequality: For every positive ε and every square integrable random variable X with zero expectation, $P\{X \geq \varepsilon\} \leq E(X^2)/[\varepsilon^2 + E(X^2)]$. An inequality is obtained that generalizes this in the same way that Kolmogorov's inequality generalizes Chebyshev's inequality. The inequality is proved and an example is given to show that inequality is achieved. The possibility of obtaining greater generality is also discussed. An extension to continuous parameter martingales is obtained, and a condition under which equality is achieved is given.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
OPTIMAL POLICY FOR DYNAMIC INVENTORY PROCESS WITH STOCHASTIC DEMANDS SUBJECT TO SEASONAL VARIATIONS, by Samuel Karlin. Technical rept. no. 13 on Contract Nonr-225(28). 31 July 59, 44p. 10 refs. AD-220 501
Order from LC mi$3.30, ph$7.80 PB 147 797

A study is made of a dynamic stochastic inventory problem in which the demand distribution may vary over successive periods in a cyclical fashion. This may reflect a situation where the demand undergoes seasonal variations. Subject to some conditions on the cost functions, an optimal policy for this model is characterized. A computational procedure is provided for determining explicitly the critical numbers which characterize the optimal policy. The inventory model considered is the standard one involving discrete time periods. A sequence of ordering decisions is to be made at the beginning of each of a number of periods of equal duration. The demand in each period is assumed to be a random variable with known probability distribution which may vary from period to period. Various costs are incurred during successive periods. The three main costs which influence the ordering decision are: (1) the purchasing cost, (2) a holding cost associated with the stock of inventories on hand, and (3) the shortage or penalty cost. The objective is to determine ordering policy which minimizes the cumulative expected costs. The problem is treated under instantaneous delivery assumption, and in the situation where a significant time lag in delivery is present.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
POLYA TYPE DISTRIBUTIONS OF CONVOLUTIONS, by Samuel Karlin and Frank Proschan. Technical rept. no. 14 on Contract Nonr-225(28). 24 Aug 59, 35p. 16 refs. AD-225 464.
Order from LC mi$3.00, ph$6.30 PB 148 162

New classes of totally positive kernels are characterized that arise from summing independent random variables and forming related first passage time distributions. A general theorem is obtained which asserts that for Pólya frequency densities of a given order, the probability that first passage into the set $[X, \infty]$ for the stochastic process of successive partial sums occurs at the n^{th} transition, is a totally positive function in the variables n, x of the same order. A different kind of characterization is given which shows that g(n, x), the n-fold convolution of a Pólya frequency density of order k extending over the whole real line, does not possess a restricted variation limiting property. Various applications of these results are noted. A number of totally positive functions are constructed by forming successive convolutions of Pólya frequency densities and then applying the general theorem. Several smoothening properties possessed by the kernel $f^{(n)}(x)$, the n-fold convolution of f, is established when it defines a linear transformation.

DISCRETE LINEAR PROGRAMMING, by Raoul J. Freeman and John G. Hocking. Sep 55, 11p. Memo. rept. no. 924.
Order from LC mi$2.40, ph$3.30 PB 149 994

This report released for sale to the public 31 Aug 60.

The question of obtaining discrete or integer solutions to linear programming problems is attacked. Starting from the continuous solution, a procedure is developed, whereby the best integral solution "near" the continuous solution is found, and then a method is indicated as to how to obtain the optimal discrete solution from that point. A numerical example is included to illustrate the technique. (Author)

A POSTERIORI PROBABILITIES, by Wayne E. Smith. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 3 Sep 58, 9p. 5 refs. Research rept. no. 54.
Order from LC mi$1.80, ph$1.80 PB 148 831

Each time a person carries out any action, he is forced to to make at least an implicit estimate of probabilities connected with plausible outcomes of his action. As he carries out experiments or makes observations, his original probability estimates change, and as they change he may vary his strategy. The explicit purpose here is to examine the nature of these changes (if they are rational) and to examine the computational implications of making the changes quantitatively.

California U., Los Angeles.
AN A POSTERIORI PROBABILITY METHOD FOR THE DETERMINATION OF THE FUNDAMENTAL CONSTANTS OF ATOMIC PHYSICS, by Wayne E. Smith. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 10 Sep 58, 25p. 3 refs. Research rept. no. 55.
Order from LC mi$2.70, ph$4.80 PB 148 832

A description is given of the methods of a posteriori probability (as outlined in PB 148 831) as applied to the determination of some physical constants. A hypothesis is formulated concerning the errors in measurement and a test of this hypothesis is demonstrated. After rejecting the original hypothesis a new hypothesis is formulated involving various possible distributions of the errors in measurement each with an a priori probability. The method of obtaining a posteriori probabilities is discussed, the procedure followed is outlined, and the a posteriori probabilities are tested for sensitivity to the assumed values of various parameters.

California U., Los Angeles.
APPLICATION OF A POSTERIORI PROBABILITY TO THE ANALYSIS OF THE FREQUENCY OF DEMAND AND TO THE EFFICIENT MINIMIZATION OF A FUNCTION, by Wayne E. Smith. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 19 Sep 58, 17p. 10 refs. Research rept. no. 56.
Order from LC mi$2.40, ph$3.30 PB 148 833

The philosophy and method of a posteriori probability is outlined. The analysis of the frequency of demand is considered and a method of efficient computational minimization of a function is described which depends on the cost of the computation involved in evaluating the function.

California U., Los Angeles.
A STABILITY CRITERION AND ITS APPLICATION TO THE COMPUTATION OF THE ZEROS OF A POLYNOMIAL, by E. L. Aparo. Technical rept. on ONR Contract. 11 Sep 58, 8p.
Order from LC mi$1.80, ph$1.80 PB 148 839

A finite-iterative procedure is described for the computation of real and complex roots of a polynomial with real coefficients. It is valid also in the case of multiple roots, giving each root repeated as many times as its order of multiplicity.

Carnegie Inst. of Tech., Pittsburgh, Pa.
NOTES ON THE USE OF F IN THE ANALYSIS OF VARIANCE OF ATTRIBUTES DATA AND ON THE TRANSFORMATION OF MEASUREMENTS DATA TO ATTRIBUTES DATA, by Edwin G. Olds and John S. Lewis. Rept. on Research on Transformations on the Analysis of Variance, Contract AF 33(616)3878. May 60, 46p. 11 refs. ARL Technical note 60-118.
Order from OTS $1.25 PB 161 943

The distributions of test statistics, corresponding to F and χ^2/df, for single-factor experiments when replications are Bernonilli trials, are derived for small-sample cases. The relative advantages of the two statistics are considered when nominal percentage points are to be used. The problem of finding the best method of transforming measurements data from a two-factor experiment to attributes data is discussed and exemplified. (Author)

Carnegie Inst. of Tech. Graduate School of Industrial Administration, Pittsburgh, Pa.
RATIONAL EXPECTATIONS AND THE THEORY OF PRICE MOVEMENTS, by John F. Muth. ONR Research memo. no. 65 on Planning and Control of Industrial Operations, Contract Nonr-760(01). Aug 59, 44p. 40 refs. AD-225 471.
Order from LC mi$3.30, ph$7.80 PB 148 170

A simple explanation is presented of the formation of informed predictions of future events (expectations). The general assumption called the rational expectations hypothesis, is that the expectations are essentially the same as the prediction of the relevant economic theory. To show that the hypothesis is not unreasonable it is applied to the theory of short-run commodity price movements as an alternative to the cobweb theorem. The theory is shown to have a superior predictive ability and to imply the cobweb effect. The theory also explains the behavior and economic effects of commodity carryover, which is not possible with the cobweb theory in its original form. The rational expectations hypothesis is stated in the following way: The expectations of firms or households (or the subjective probability distribution of outcomes) tend to be distributed, for the same information set, about the prediction of the theory (or the objective probability distribution of outcomes). The various forms of the cobweb theorem are summarized. The hypothesis is used to explain the price movements in a market affected by current production and consumption. The model is then extended to allow for inventory speculation. The empirical implications of the alternative models are then compared.

ABELIAN EXTENSIONS OF DIFFERENTIAL FIELDS, by E. R. Kolchin. Technical rept. no. 2 on Contract Nonr-266(57). Oct 59, 21p. 5 refs. AD-227 745.
Order from LC mi$2.70, ph$4.80 PB 149 853

The Galois theory of differential field is concerned with strongly normal extensions of a differential field F with algebraically closed field of constants C of characteristic 0. A strongly normal extension of F with Galois group birationally isomorphic to the subgroup G_K of an algebraic group G defined over C, or to an algebraic subgroup of G_K, is called a G-extension of F. The strongly normal extensions are characterized which are A-extensions for some abelian variety A. Such an extension is called an abelian extension. The characterization found is in terms of solutions of certain kinds of differential equations, and generalizes the result previously discussed for the case in which the extension is of transcendence degree 1, i, e., A is of dimension 1.

MARKOV RENEWAL PROCESSES: DEFINITIONS AND PRELIMINARY PROPERTIES, by Ronald Pyke. Rept. on Contract Nonr-266(59). 3 Oct 59, 31p. 12 refs. CU-10-59-NONR-266(59) MS; AD-227 271.
Order from LC mi$3.00, ph$6.30 PB 149 852

The definition of and some preliminary results are presented on Markov renewal processes and semi-Markov processes. The close relationship between these 2 types of processes is described. The concept of regularity is introduced and characterized. A classification of the states of a Markov Renewal process is described and studied. (Author)

Columbia U., New York.
A STORAGE MODEL FOR CONTINUOUS INFINITELY DIVISIBLE INPUTS OF "POISSON" TYPE, by J. Gani and N. U. Prabhu (Karanatak U.). Rept. on Contract Nonr-266(59). [1959] 26p. 13 refs. CU-4-59-Nonr-266(59)MS, AD-216 578.
Order from LC mi$2.70, ph$4.80 PB 146 413

This work considers a dam subject to steady release, and with continuous inputs having infinitely divisible distributions of the 'Poisson' type. The properties of such inputs are specified, and an integro-differential equation for the distribution function F(z, t) of the dam content Z(t) at time t is derived. Using Laplace-Stieltjes transforms, a general equation is obtained for F(z, t) in terms of the input distribution, and the probability of emptiness F(O, t) of the dam. The probability distribution for the 'wet period' T is also found, and its relation to F(O, t) established; the first passage problem for Z(t) is then examined.

ON CERTAIN CONVERGENCE PROPERTIES FOR SEQUENCES OF INDICATORS, by O. Barndorff-Nielsen. Technical scientific note no. 2 on Contract AF 61(052)42. 19 Dec 59, 14p. 2 refs. AFOSR-TN-60-235.
Order from LC mi$2.40, ph$3.30 PB 149 580

This note contains some investigations of the connection between convergence properties for sequence of indicators $I_1, I_2, \ldots, I_n, \ldots$ and certain of their subsequences. An indicator is a random variable assuming only the values 0 and 1. The main result is Theorem 1, from which it follows that the random variable

$$\frac{I_1 + I_2 + \ldots + I_n}{n}$$

converges weakly (or in distribution) if and only if

$$\frac{I_{k_1} + I_{k_2} + \ldots + I_{k_n}}{n}$$

converges weakly, where $I_{k_1}, I_{k_2}, \ldots, I_{k_n}, \ldots$ is a "not too thin" subsequence of $I_1, I_2, \ldots, I_n, \ldots$. The results are applied to the question of the asymptotic behavior of the number of positive sums of random variables. (Author)

A GEOMETRICAL APPROACH TO THE SECOND-ORDER LINEAR DIFFERENTIAL EQUATION, by C. M. Petty. Technical rept. on Mathematics. June 60, 56p. 10 refs. LMSD-288250.
Order from LC mi$3.60, ph$9.30 PB 149 892

The strength of various assumptions on the properties of the solutions of the linear differential equation $\ddot{u} + R(t)\, u = 0$ are studied. A close relationship is established with a partial differential system, in the context of which is found a convenient setting for the theorems and proofs of the studies. Non-oscillatory equations are discussed separately. The major analytic relations are derived, and the major geometrical tools are developed. A surprisingly close relationship is established connecting the differential equation introduced with the geometry of the Minkowski plane. The major results in a possible classification theory are derived, with proofs drawing heavily on the analytic and geometrical tools previously discussed. (Author)

NONPARAMETRIC TESTS FOR LOCATION AND SCALE PARAMETERS IN A MIXED MODEL OF DISCRETE AND CONTINUOUS VARIABLES. I, by Shashikala Sukhatme. Interim technical rept. no. 16 on Research in Multivariate Analysis, Contract DA 20-018-ORD-14735. 8 Mar 60, 34p. 18 refs. OOR rept. 1840.14-M; AD-235 464.
Order from LC mi$3.00, ph$6.30 PB 148 509

Let $Z_1, \ldots, Z_N$, where $Z_1 = (X_1, Y_1)$, be N independent observations from a bivariate distribution. Assume that the random variable X takes only two values, 1 and 0, with $P(X=1) = p$ and $P(X=0) = 1-p = q$. Let the conditional distribution of Y, given $X = j$ $(j = 0, 1)$, be $P(Y \leq y \mid X = j) = F_j(y)$. The hypothesis H: $F_1 = F_0$ is tested against the alternative A: $F_1 \neq F_0$.

Michigan State U. [East Lansing]
NONPARAMETRIC TESTS FOR LOCATION AND SCALE PARAMETERS ON A MIXED MODEL OF DISCRETE AND CONTINUOUS VARIABLES, II, by Shashikala Sukhatme. Interim technical rept. no. 17 on Research in Multivariate Analysis, Contract DA 20-018-ORD-14735. 16 Mar 60, 11p. 3 refs. OOR-rept. 1840.15-M; AD-235 503.
Order from LC mi$2.40, ph$3.30 PB 148 510

A rank test for dispersion and a two-sample run test are discussed in connection with the nonparametric tests for location and scale parameters in a mixed model of discrete and continuous variables. (Author)

ABSOLUTELY CONVERGENT POWER SERIES, by F. Bagemihl and G. Piranian. Technical note on Contract AF 49(638)633. June 60, 12p. 6 refs. 2913-2-T; AFOSR-TN-60-574; AD-239 274.
Order from LC mi$2.40, ph$3.30 PB 148 799

It has been known for some time that power series exist that map the unit circle C onto a Peano curve and that converge absolutely on C. The present note exhibits a new example which has the additional property that it maps the unit disk D onto a Riemann surface of finite area. The note also shows that it is possible for a power series to converge absolutely on C and to map C onto a Jordan curve that has both rectifiable and nonrectifiable arcs. A number of unsolved problems are stated. (Author)

CONTRIBUTIONS TO THE THEORY OF RANK ORDER STATISTICS: COMPUTATION RULES FOR PROBABILITIES OF RANK ORDERS, by I. Richard Savage. Technical rept. no. 9 on Contract Nonr-2582(00): 1 Sep 59, 4p. 3 refs. AD-220 766.
Order from LC mi$1.80, ph$1.80 PB 148 912

Rules are given for computing the probabilities of rank orders for the 1- and 2-sample problems. For the 1-sample problem, the rule permits the computations for samples of size n from the results with samples of $n-1$. For the 2-sample problem the rule permits the computations for samples of size m and n from the results with samples of $m-1$ and n (m and $n-1$). Most computations, done analytically, are built up from smaller to larger sample sizes and the results have limited value, e.g., in checking numerical work. For Monte Carlo sampling, there is no reason for starting with the smaller samples. (Author) (See also PB 148 911)

Minnesota U., Minneapolis.
CONTRIBUTIONS TO THE THEORY OF RANK ORDER STATISTICS; THE TWO-SAMPLE CENSORED CASE, by U. V. R. Rao (Indiana U.), I. R. Savage, and M. Sobel (Bell Telephone Labs.). Technical rept. no. 8 on Contract Nonr-2582(00). 1 Sep 59, 19p. 4 refs. AD-220 765.
Order from LC mi$2.40, ph$3.30 PB 148 911

Rank order theory is developed for the 2-sample problem in which censoring of the observations has occurred, i.e., not all of the random variables are observed. The rank orders are not all equally likely under the null hypothesis and thus the likelihood ratios of rank orders are considered. In applying the results of this paper, there is a strong analogy to sequential analysis. The censoring scheme procedure corresponds to the stopping rule and in both cases the terminal decision procedure is based on the likelihood ratio. The detailed applications are not given of the present theory to either those procedures or the new ones introduced here. (Author) (See also PB 144 399)

Minnesota U. [Minneapolis].
NOTE ON THE TENSOR PRODUCT OF BANACH ALGEBRAS, by B. R. Gelbaum. Rept. on Contract AF 49(638)526. 18 June 60, 5p. 3 refs. AFOSR-TN-60-673; AD-239 606.
Order from LC mi$1.80, ph$1.80 PB 149 076

The relation between the maximal ideal space of a tensor product of Banach algebras and the Cartesian product of the maxima ideal spaces of the algebras is investigated from the standpoint of the kernal-hull topologies. (Author) (See also PB 135 361)

Minnesota U. School of Business Administration, Minneapolis.
SOME PROPERTIES OF THE SPEARMEN ESTIMATOR IN BIOASSAY, by Byron William Brown, Jr. Technical rept. no. 6 on Contract Nonr-2582(00). 1 June 59, 107p. 31 refs.
Order from LC mi$5.70, ph$16.80 PB 146 965

This paper presents an evaluation of the Spearman estimator, a non parametric estimator of μ.

Naval Ordnance Lab., White Oak, Md.
BOUNDS FOR EIGENVALUES OF THE FREE AND FIXED MEMBRANE BY FINITE DIFFERENCE METHODS, by Bert Hubbard. 31 May 60, 54p. 76 refs. NAVORD rept. 6874.
Order from OTS $1.50 PB 161 940

This paper gives explicit upper and lower bounds for the eigenvalues of both the free and fixed membrane problems in terms of the eigenvalues of analogous finite difference problems. In each case the difference between the upper and lower bounds is of the order of the mesh width. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
APPROXIMATIONS IN VARIATIONAL PROBLEMS, by Lu Ting. Rept. on Contract AF 49(638)445. July 60, 19p. 5 refs. PIBAL rept. no. 610; AFOSR TN-60-789.
Order from LC mi$2.40, ph$3.30 PB 149 899

If there are small terms (of the order $\epsilon \ll 1$) in the functional and/or in the accessory equation, the extreme of the functional taking into account the first order effect of those small terms can be obtained by the following procedure. The Euler equation or equations are approximated by omitting the small terms. The solution of the approximate Euler equation subjected to the exact accessory equations is then obtained. With this solution, the value of the functional evaluated without omitting any term differs from the true extreme by the order of ϵ^2. This statement is applied to the problem of optimum rocket trajectory. It is concluded that the relative simple solution of Dommasch and Barron does yield the correct optimum value taking into account the first order effect of aerodynamic forces and that of the variation of gravitational and centrifugal forces due to elevation. A GENERALIZATION OF THE SAMPLING THEOREM, by D. A. Linden and N. M. Abramson. Rept. on Contract Nonr-225(44). 28 Aug 59, 11p. 6 refs. Technical rept. no. 1551-2; AD-225 884.
Order from LC mi$2.40, ph$3.30 PB 148 188

The sampling theorem for bandlimited functions allows one to reconstruct exactly a function containing no frequencies higher than W cycles per sec, given the values of the function at equispaced sampling points 1/2W sec apart. This theorem is generalized to allow reconstruction, given the values of the function and its first R derivatives at equispaced sampling points, (R+1)/2W sec apart. For large R, the R-derivative expansion approaches a Taylor's series weighted by a Gaussian density about each sample point. (Author)

THE INVERSE FUNCTION THEOREM IN BANACH ALGEBRAS, by Einar Hille. Rept. no. 1 on Contract AF 49(638)224. Apr 59, 11p. 3 refs. AFOSR TN-59-330; AD-213 651.
Order from LC mi$2.40, ph$3.30 PB 146 450

This report contains a proof of the inverse function theorem formulated for Frechet analytic functions with domain and range in a Banach algebra. A complex parameter α is introduced in the function and the inverse function is obtained as a power series in α. The procedure makes it possible to use Cauchy's method of Calcul des limites for the convergence proof. (Author)

METHODS FOR OBTAINING COMPLETE DIGITAL CHAINS, by Bernard Lippel and Irving J. Epstein. 30 June 57, 18p. 8 refs. Technical memo. no. M-1850 AD-143 540.
Order from LC mi$2.40, ph$3.30 PB 149 383

Two methods are described and proved for obtaining complete digital chains (chain coded sequences which contain all the possible permutations of p kinds of symbols taken n at a time). A generalized permutation method for complete chains is also given. Possible engineering applications for chain codes are considered.

Computation Lab., Harvard U., Cambridge, Mass.
DESIGN AND OPERATION OF DIGITAL CALCULATING MACHINERY, by Howard Aiken. Progress rept. no. 38, 10 Feb-10 May 55, on Contract AF 33(038)9461. [1955] 157p. 2 refs. AD-62 231.
Order from LC mi$7.50, ph$24.30 PB 150 300

This report released for sale to the public 19 Sep 60.

This report contains the results of computations completed on the Mark I and Mark IV Calculators. The coordinate determination of ground points on aerial photographs is discussed. A mathematical description of a non-linear eigenvalue problem is presented. The solution of nineteen linear second order differential equations with two point boundary conditions is reported.

Dunlap and Associates, Inc., Stamford, Conn.
HUMAN DECISION MAKING AS RELATED TO AIR SURVEILLANCE SYSTEMS, by Andrew P. Chenzoff, Richard L. Crittenden and others. Technical rept. no. 1 on Contract AF 19(604)6164. 10 June 60, 128p. 471 refs. DA rept. no. 300-1; AFCCDD-TR-60-25.
Order from LC mi$6.30, ph$19.80 PB 149 215

This report presents a review of the literature on decision making. The objectives of this survey were: (1) to describe some of the decision making information now available in the areas of mathematics, experimental psychology, sociology and systems research; (2) to identify areas for further experimentation on human decision making. For many years to come human decision making will remain of great practical importance for many kinds of decisions even in those situations where machines are being used to the fullest extent. These experiments will therefore consider as far as possible those aspects of decision making that humans must undertake in air surveillance. (Author)

Electronics Research Lab., U. of California, Berkeley.
RECENT ADVANCES IN THE FIELD OF SAMPLED DATA AND DIGITAL CONTROL SYSTEM, by E. I. Jury. Rept. on Contract AF 18(600)1521. 20 Oct 59, 39p. 49 refs. Series no. 60, issue no. 256; AFOSR-TN-59-1017; AD-233 272.
Order from LC mi$3.00, ph$6.30 PB 146 738

Theoretical aspects are described of the progress made in the field of Sampled-Data and Digital Control Systems during the last few years. The material is classified into the following major topics: (1) linear theory, (2) statistical theory, (3) nonlinear theory, (4) time-varying theory, and (5) digital control systems. These topics are briefly described and methods of analysis and design with their major purposes and achievements are enumerated. Each category is documented with a brief list of references which might serve as a quick aid to new investigators in this field. A brief survey of digital control systems is discussed, and it is indicated how the above mentioned topics can be extended to these systems. (Author)

MATHEMATICAL NEUROPHYSIOLOGY, by J. D. McKnight, Jr. Technical memo. Oct 59, 8p. LMSD-288038; AD-227 196.
Order from LC mi$1.80, ph$1.80 PB 148 941

The purpose was to abstract the essential mathematical elements of the classical studies made since the mid-thirties by various researchers and to extend and elaborate these elements where possible and expedient.

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
COMMON PROGRAMMING LANGUAGE TASK. PART II. AUTOMATIC CODE TRANSLATION SYSTEM (ACT), by A. W. Holt, W. J. Turanski, and D. L. Meginnity. Final rept. for 1 May 58-30 June 59 on Project ADAR, Task D, Contract DA 36-039-sc-75047. 31 July 59, 143p. AD59URI, v. 4A.
Order from LC mi$7.20, ph$22.80 PB 149 394

The study is divided into four portions, the first three of which are directly concerned with the ACT system, while the fourth (Appendix) is an example of a specialized code- Symbolic Logistico-Administrative Code (SLAC). The sections are concerned, respectively, with a general description of the Automatic Code Translation System (general purpose allocation interpreter and "core library", etc), a description of the allocation interpreter, and a discussion of Canonical Form. The SLAC System, which comprises the Appendix, has a direct relation with the section on Canonical Form. (Author)

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
INFORMATION RETRIEVAL AND THE DESIGN OF MORE INTELLIGENT MACHINES, by Harry J. Gray, Jr., Oliver Aberth and others. Final rept. for 1 May 58-31 June 59, on Project ADAR, Task E, Contract DA 36-039-sc-75047. 31 July 59, 216p. 15 refs. AD59URI, v. 5; AD-235 999.
Order from LC mi$9.60, ph$33.30 PB 149 395

In order to reduce the requirements on the personnel who use data processing systems, the systems should be designed to have more intelligence. From study of human processes, a multiple list structure for information is proposed and studied. When applied to an information retrieval problem, it is found to be up to 30,000 times faster than conventional techniques. Results of investigations into the design of an optimized system are given. It is shown that the multiple list structure can perform with greater efficiency all that the Newell-Simon IPL can. Techniques are explored for the retrieval of information having descriptors which are not the same as those under which the item was filed. Results of a study of the nervous systems are given leading to specification of a parallel-access information bank which may be more efficient than the multiple list structure. Finally, some results of psychological experiments on human beings are successfully predicted from the theory of the multiple list structure. (Author)

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
HUMAN FACTORS AFFECTING CONSOLE DESIGN IN THE FIELDATA SYSTEM, by Charles F. Hoban, R. Omer Lucier, and R. Flood. Final rept. for 1 May 58-30 June 59 on Project ADAR, Task B, Contract DA 36-039-sc-75047. 31 July 59, 41p. 1 ref. AD59UR1, v. 2; AD-235 998.
Order from LC mi$3.30, ph$7.80 PB 149 392

The role of human factors in system development in general, with particular reference to their treatment in the Army FIELDATA system, is studied. The consoles of the computer family being designed for the Signal Corps are then analyzed in detail as man/machine interface. The limited capacity of the Signal Corps for human factors studies, together with their methods of compensating for this lack, are noted and discussed. A critical examination is given of the parallel, rather than sequential development plan that has been adopted in the FIELDATA system. On the basis of observations made during visits to the producers of the FIELDATA equipment, console design in this family is discussed. Some of the problems analyzed include invariances in logic and console topography of different computers, and the complexities of a multifunctional console. Among the specific recommendations for improved console design are arabic numeral keyboards, redundant state-indicators and mechanical guards. (Author)

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
WHAT IS A CODE? by G. W. Patterson, W. I. Landauer, and E. J. Parker. Final rept. for 1 May 58-30 June 59 on Project ADAR, Task F, Contract DA 36-039-sc-75047. 31 July 59, 43p. 12 refs. AD59URI, v. 6. AD-236 000.
Order from LC mi$3.30, ph$7.80 PB 149 396

This study involves the definition of the word "code", and the word's relation to current meanings. It also defines syntactical subbases, syntactical bases, and it explains the formalized mathematical model of rules for forming expressions from these characters, known as a concatenation algebra. A code is a nonsingular transformation from a syntactical base into another syntactical base, and one that is effectively calculable. The process of coding is that of finding the expression in the code language, and decoding is the inverse action - both of which must be capable of being programmed on a computer. (Author)

TRANSISTORIZED BUILDING BLOCKS FOR DATA INSTRUMENTATION, by J. A. Cunningham and R. L. Hill. Sep 60, 74p. 2 refs. Technical note 68.
Order from OTS $2.00 PB 161 569

The National Bureau of Standards has developed a number of modular transistorized digital circuits that have been used in automatizing many data recording and preliminary processing tasks encountered in its scientific operations. These versatile building blocks can be connected together systematically to form digital circuits that accept raw data from experimental equipment and transpose these data into a form suitable for input to a high-speed electronic computer. These blocks can be used where: (1) data are produced in large volumes; (2) data taking is extremely fast, extremely slow, or extremely precise; (3) a need exists to minimize human error, tedium and eyestrain; or (4) computation is extensive. This report describes 5 major packages and 8 special-purpose packages.

Naval Weapons Lab., Dahlgren, Va.
SUBROUTINES FOR THE NORC CRT PRINTER, by A. V. Hershey. 9 Mar 60, 45p. 8 refs. NWL rept. no. 1686; AD-234 557.
Order from LC mi$3.30, ph$7.80 PB 147 814

The computing programs in a curve plotting routine, a stereographic routine, and a character plotting routine are described. Some experimental tests with these routines are believed to be consistent with the following postulates: (1) between the datum points for a curve there is an optimum spacing which will give a distortion-free plotting of the curve for any compression of the scaling and (2) the visual interpretation of abstract stereograms is consistent with a mental impression that a central point in every image is located at the same absolute distance. Brown U. Div. of Applied Mathematics, Providence, R. I.
THE HERTZ PROBLEM FOR A RIGID SPHERICAL INDENTER AND A VISCOELASTIC HALF SPACE, by S. C. Hunter. Technical rept. no. 1 on Contract DA 19-020-ORD-4750. Mar 60, 34p. 8 refs. Rept. no. DA-4750/1; OOR rept. no. 1892. 2-E; AD-236 958.
Order from LC mi$3.00, ph$6.30 PB 148 440

The penetration of a viscoelastic half space by a rigid spherical indenter is investigated in a quasi static approximation. Solutions to the problem are obtained for monotonic contact radius $r_1(t)$ and for the case where $r_1(t)$ possesses a single maximum. The analysis is used to estimate the duration of contact and coefficient of restitution for the Hertzian impact of a spherical indenter on a Maxwell solid. (Author)

Florida U. Engineering and Industrial Experiment Station, Gainesville, Fla.
EFFECT OF MEMBRANE FORCES ON LATERAL VIBRATIONS OF RECTANGULAR PLATES, by Marc Trubert and William A. Nash. Technical note no. 2 on Contract AF 49(638)328. May 60, 60p. 23 refs. AFOSR-TN-60-437.
Order from LC mi$3.60, ph$9.30 PB 148 786

A solution to the problem of finding the natural modes of vibration of a rectangular plate loaded by membrane forces, i.e. tension (or compression), in the middle plane, is sought by the perturbation technique. The eigenvalues and eigenfunctions for the plate subjected to tension are deduced from the known eigenvalues and eigenfunctions for the plate with no tension, for the usual boundary conditions, by the use of series involving powers of the tension. General expressions for the series are formulated using the eigenfunctions of the plate with no tension as normal functions. The exact solution of the problem is given for the case of simple supported edges. A second application is made to a clamped square plate.

ON SOME NEW CONTINUATION FORMULAS AND UNIQUENESS THEOREMS IN THE THEORY OR ELASTICITY, by J. H. Bramble and L. E. Payne. Rept. on Contract AF 49(638)228. July 60, 32p. 8 refs. Technical note BN-213; AFOSR-TN-60-723.
Order from LC mi$3.00, ph$6.30 PB 149 101

New formulas for the continuation of the solution to the equations of elasticity across a spherical boundary are obtained. In addition certain new boundary value problems in elasticity are considered. (Author)

Institute of Mathematical Sciences, New York U., N. Y.
THE BUCKLING OF A THICK CIRCULAR PLATE USING A NON-LINEAR THEORY, by Chester B. Sensenig. Rept. on Contract AF 49(638)161. Dec 59, 20p. 3 refs. IMM-NYU 262; AFOSR-TN-60-41; AD-233 366.
Order from LC mi$2.40, ph$3.30 PB 146 748

The stability of equilibrium for an isotropic circular cylinder when compressed along its curved lateral surface is studied. The compression on the curved part of the boundary is assumed to be such that the generators of the cylinder remain vertical straight lines, and such that no shear stress is developed. The problem is treated by making use of the non-linear 3-dimensional theory of elasticity. The formulation of the theory uses Lagrange coordinates and matrix notation. No restrictive assumptions are made concerning the thickness of the plate, and the displacements and strains are not assumed to be small. When the cylinder is compressed, the uniform plane strain satisfies all the conditions of the exact non-linear theory. A small perturbation is made, and critical pressures are found together with the corresponding modes of buckling. Only buckled modes with symmetry about the axis of the cylinder are considered.

Naval Research Lab., Washington, D. C.
FRACTURE TESTING OF HIGH-STRENGTH SHEET MATERIALS UNDER CONDITIONS APPROPRIATE FOR STRESS ANALYSIS, by G. R. Irwin. 27 July 60, 48p. 5 refs. NRL rept. 5486.
Order from OTS $1.25 PB 161 474

This report describes and justifies a method for evaluating fracture toughness of thin sheet metals. The criteria of toughness is taken as a parameter K which characterizes the intensity of the stress field surrounding the crack tip. At fixed load, this intensity grows with crack length; when it can no longer be counteracted by the fracture toughness, crack growth becomes unstable. The field intensity parameter at this point represents a material property of fracture toughness K_c. To obtain a measure of this property, the procedure provides for tensile testing of a sheet specimen containing sharp notches or initial cracks oriented normal to the applied tensile stress. Observations of load and crack length at onset of fast fracture permits evaluation of the fracture toughness parameter K_c. In order to test specimens of convenient width, the measured crack length must be corrected for the influence of the plastic zone surrounding the crack tip. The theoretical basis for this is given in an appendix. A basis for estimating slow crack growth prior to instability without direct measurement is also appended to the text. (Author)

CREEP BENDING OF ANNULAR PLATES, by Sharad A. Patel and B. Venkatramam. Rept. on Contract AF 49(638)302. May 60, 25p. 8 refs. PIBAL rept. no. 559; AFOSR-TN-60-528.
Order from LC mi$2.70, ph$4.80 PB 148 315

The present report is concerned with the creep bending of annular plates subjected to pure bending moments. Annular plates on simple and fixed supports are considered, and the analyses are carried out on the bases of the elastic analogue and a creep flow law formulated in similar terms to those of the plastic flow laws. Solutions for moments and deflections are presented. (Author)

INTERFERENCE BETWEEN A JET ISSUING LATERALLY FROM A BODY AND THE ENVELOPING SUPERSONIC STREAM, by Carlo Ferrari. Rept. on Contract NOrd-7386. Apr 59, 126p. 13 refs. Bumblebee rept. no. 286; AD-226 477.
Order from LC mi$6.30, ph$21.30 PB 150 157

This report released for sale to the public 13 Sep 60

An analysis is made of the interference forces exerted upon a cylindrical body in hypersonic flow from which a jet is issuing laterally out of a circular orifice. The characteristics of the jet are first examined in order to define its centerline path and its cross-sectional shape. Once the shape of the jet is known in approximation, an approach based on Lighthill's treatment of the hypersonic blunt-body problem is employed to find the shock stand-off distance ahead of the jet spout and to approximate the flow field between the shock and the surface of the jet. It is assumed that viscosity does not alter the total interference forces acting on the body, although it is known from physical observation that separation does occur ahead of the shock, with the result that the induced pressures are reduced in magnitude and spread over a larger region of the adjacent cylinder than is premised in the idealized mathematical model employed here. A comparison is made between the calculated results and what has been measured in wind-tunnel experiments, with good confirmation of the trends and magnitudes, despite the fact that the empirical data on jet interference were obtained at lower Mach numbers (2.84 and 3.90) than those for which this present theory should be most applicable. (Author)

COMPARISON OF LINEARIZED TRANSONIC FLOW THEORY WITH EXPERIMENTAL PRESSURE DISTRIBUTIONS ABOUT A PARABOLIC-ARC BODY OF REVOLUTION, by M. Pindzola. Rept. on ARO, Inc., Contract AF 40(600)800. Aug 59, 27p. 4 refs, AEDC TN-59-89; AD-220 255.
Order from LC mi$2.70, ph$4.80 PB 147 879

The pressure distributions obtained by linearized theory for transonic flow, which is based on a linear variation of the axial perturbation velocity, are compared to those obtained experimentally on a parabolic-arc body of revolution. Distributions obtained by

linearized subsonic and supersonic flow theory are also included for comparison. The subsonic and supersonic theories are shown to agree more favorably with the experimental data than with the transonic theory, except in the forward portion of the body in the Mach number range very near 1.0. (Author)

DETERMINATION OF DAMPING DERIVATIVES FROM FREE-OSCILLATION TESTS OF NON-LINEAR SYSTEMS USING ENERGY RELATIONS, by C. J. Welsh, L. K. Ward, and G. R. Ahsmuhs. Rept. on ARO, Inc., Contract AF 40(600)800. June 60, 26p. 5 refs. AEDC-TN-60-104.
Order from LC mi$2.70, ph$4.80 PB 148 961

An energy analysis of the damping of a linear oscillatory system has been made and extended to non-linear wind-tunnel configurations tested over a large amplitude range. It is shown that the measured amplitude decay of the free-oscillation motion of such configurations can be an invalid measurement of the stability of the system and can induce appreciable errors in the computed damping derivatives. An approximate procedure for handling amplitude traces of non-linear configurations tested in wind tunnels and by which equivalent viscous damping derivatives can be obtained is given. Experimental damping data measured at M = 8 over a Reynolds number range of 0.5×10^6 to 1×10^6 based on body diameter for a flared afterbody re-entry shape indicate that the approximate procedure is quite adequate. (Author)

Arnold Engineering Development Center, Tullahoma, Tenn.
FORCE AND PRESSURE TESTS OF AN AGARD CALIBRATION MODEL B AT A MACH NUMBER OF 8, by L. D. Kayser and C. R. Fitch. Rept. on ARO, Inc., Contract AF 40(600)-800 S/A 11(60-110). July 60, 36p. 10 refs. AEDC TN-60-34.
Order from LC mi$3.00, ph$6.30 PB 149 197

Body-wing and body-only configurations of the AGARD Calibration Model B were tested at a nominal Mach number of 8 and Reynolds numbers from 0.8 to 11.0×10^6 based on model length. Forces and moments for both configurations were obtained from internal, strain-gage balance measurements. Also, force and moment coefficients for the body-only configuration were obtained by numerical integration of pressure distributions. The lift-curve slope and aerodynamic center obtained at Mach 8 compared favorably with data obtained from other tunnels at various Mach numbers. The only significant Reynolds number effect was the higher drag coefficient at the lower Reynolds numbers. (Author)

Avco-[Everett] Research Lab., Mass.
THE DIFFERENCES BETWEEN SATELLITE AND BALLISTIC MISSILE RE-ENTRY PROBLEMS, by F. R. Riddell and J. D. Teare. Sep 58, 31p. 12 refs. Research rept. 31.
Order from LC mi$3.00, ph$6.30 PB 147 197

The purpose of this paper is to point out the significant differences in the critical heating and deceleration problems which are faced in re-entry of the atmosphere from different types of trajectories. To do this we discuss two specific cases which are of current interest, the re-entry of long-range ballistic missiles and the re-entry of satellite vehicles.

Ball Brothers Research Corp., Boulder, Colo.
THE DESIGN AND PERFORMANCE OF THE BENT OGIVE POINTING CONTROL, by O. E. Bartoe, R. E. Hathaway and others. Final technical rept. on Contract AF 19(604)2656. Apr 60, 124p. AFCRC-TR-60-259.
Order from LC mi$6.30, ph$19.80 PB 148 476

An instrument called the Bent Ogive Pointing Control has been designed to facilitate measurements of the solar spectrum on rocket probe experiments. Solar pointing controls have been flown in upper atmospheric experiments since 1951 and in general have been used to orient spectrographic instruments at or relative to the sun. The Bent Ogive Pointing Control as described in this report is unique in its configuration in that the Ogive or nose cone is hinged and bent normal to the major rocket axis to achieve the desired results.

HEAT TRANSFER FROM SURFACES OF NON-UNIFORM TEMPERATURE DISTRIBUTION. PART II. TURBULENT TRANSFER FROM ISOTHERMAL SPANWISE STRIPS ON A FLAT PLATE, by H. H. Sogin and R. J. Goldstein. Rept. on Contract AF 49(638)46. Feb 60, 47p. 22 refs. AFOSR-TN-60-647.
Order from LC mi$3.30, ph$7.80 PB 149 454

Experiments were performed on the mass transfer by forced convection from naphthalene strips on a flat plate to an air stream at ordinary temperature and pressure. Turbulence was induced in the boundary layer by means of a wire trip. In all cases there was a hydrodynamic starting length upstream of the strips. The ratio of this inert length to the total length was varied from about 0.80 to 0.96. The flow was practically incompressible with Reynolds number, based on the total length, varying from 175,000 to 486,000. The Schmidt number was 2.5. The experimental results fall in proximity to the Seban step function factor when they are reduced after the mass-momentum analysis of Deissler and Loeffler for a surface of uniform vapor pressure. When Kármán's formulation of the mass-momentum analogy is assumed, the data fall between the values predicted by the Seban and by the Rubesin expression for the step function factor. The results are well correlated by the Colburn analogy in conjunction with the Rubesin step function factor. (Author)

BEHAVIOR OF SMALL REGIONS OF DIFFERENT GASES CARRIED IN ACCELERATED GAS FLOWS, by George Rudlinger and Lowell M. Somers. Rept. on Project Squid, Contract Nonr-1858(25). Mar 59, 39p. 17 refs. Technical rept. CAL-76-P.
Order from LC mi$3.00, ph$6.30 PB 146 544

Small regions in a flow where the density is different from that of the surrounding gas do not exactly follow accelerated motions of the latter, but move faster or slower depending on whether their density is smaller or larger than that of the main flow. This behavior cannot be quantitatively explained by treating a gas "bubble" as a hypothetical solid particle of the same density because a gas bubble cannot move relative to the surrounding gas without being transformed into a vortex which absorbs part of the energy of the relative motion. To illustrate the acceleration effect, the flow velocity behind known pressure waves in a shock tube is compared with the observed velocity of a bubble produced by a spark discharge. A theory is developed which permits computing the response of such bubbles to accelerations.

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
CHEMICAL NONEQUILIBRIUM EFFECTS ON HYDROGEN ROCKET IMPULSE AT LOW PRESSURES, by J. Gordon Hall, A. Q. Eschenroeder, and J. J. Klein. Rept. on Contract AF 18(603)141. Nov 59, 12p. 7 refs. Rept. no. AD-1118-A-8; AFOSR-TN-59-1192; AD-229 134.
Order from LC mi$2.40, ph$3.30 PB 146 541

Calculations of nonequilibrium hydrogen flows were investigated for a lower range of pressures as well as a wider range of temperatures and nozzle geometry than previously considered. The calculations were made by using an approximate method of analysis for such flows. A comparison with exact numerical solutions show the criterion to give an accurate prediction of the frozen dissociation level. The approximate method is particularly convenient for determining the limiting specific impulse, I_∞, attained by expansion to infinite area and zero pressure.

SPECTROSCOPIC TECHNIQUE FOR TEMPERATURE-DENSITY MEASUREMENTS IN OXYGEN-BEARING FLOWS, by W. H. Wurster and C. E. Treanor. Rept. on Contract AF 18(603)141. Dec 59, 47p. 13 refs. Rept. no. AD-1118-A-10; AFOSR-TN-59-1089.
Order from LC mi$3.30, ph$7.80 PB 148 773

The absorption spectrum of shock-heated molecular oxygen has been measured photoelectrically in the wavelength range 2280 to 2870 Å. Four wavelength bands were used, each about 20 Å wide. The oxygen temperatures ranged from 1500 to 4000°K, and the density from 0.01 to 2.0 atmospheres. The photoelectric results for the 20 Å bands were correlated with previous high-dispersion photographic measurements of transition probabilities and line widths for O_2. This correlation is shown in graphical form, and the use of this absorption technique to determine a temperature-density parameter for oxygen bearing flows is discussed. (Author)

DESIGN PROCEDURES FOR COMPUTING AERODYNAMIC HEATING AT HYPERSONIC SPEEDS, by Wilbur L. Hankey, Jr. Richard D. Neumann, and Evard H. Finn. Rept. on Hypersonic Gas Dynamic Heating. June 60, 171p. 142 refs. WADC Technical rept. 59-610.
Order from OTS $3.00 PB 161 937

The basic concept of lifting and nonlifting re-entry vehicles is discussed and approximate trajectories presented. Analyses of flow properties and the mechanism of molecular excitation and dissociation are based on the available energy of the flow. The principle of radiation cooling of lifting re-entry vehicles is contrasted with the heat sink and ablation techniques for nonlifting re-entry vehicles. Regions of maximum heating are shown for both modes of re-entry with the equations for laminar and turbulent flow. The swept-wing lifting body at angle of attack is analyzed showing the heating equations for both leading edges and wing surfaces and including the influence of internal radiation, wall construction, and transient heating effects. Finally, graphs and charts are presented for the rapid calculation of heating rates for lifting and nonlifting re-entry bodies. (Author)

INCREASE IN LIFT PRODUCED BY INTERACTION BETWEEN A CYLINDRICAL BODY AND WINGS OR TAIL FINS: CORRELATION FOR DESIGN PURPOSES BASED ON THEORY AND LIMITED TEST RESULTS, by John R. Weske. Rept. on Project Hermes [Contract DA 30-115-ORD-23] Aug 47, declassified 17 Nov 58, 28p. 7 refs. Rept. no. 55144.
Order from LC mi$2.70, ph$4.80 PB 149 464

The available wind-tunnel data at supersonic speeds relating to interference effect between wings or fins and slender bodies upon the resultant lift are correlated by means of existing theory. Distinction is made between body-wing and wing-body interaction (effect of body on the wing lift and vice versa, respectively). It is found that for wings or fins not too close to the tip nor to the base the effect of body upon the wing contributes the major portion of the increase of lift due to interference, and that it can be determined with satisfactory approximation by Beskin's method of calculation. Wing-body interaction, -i. e. effect of wing upon the body - is small compared with body-wing interaction, and may, therefore, as a first approximation be disregarded when using the Beskin method of computing body-wing interaction, particularly at angles of attack less than 6°, since the latter appears to give results slightly high for these small angles.

Guggenheim Aeronautical Lab., Calif. Inst. of Tech., Pasadena.
EXPERIMENTAL STUDY OF HELIUM DIFFUSION IN THE WAKE OF A CIRCULAR CYLINDER AT M=5.8, by William Mohlenhoff. Rept. on Hypersonic Research Project, Contract DA 04-495-ORD-1960. 20 May 60, 115p. 23 refs. Memo. no. 54.
Order from LC mi$6.00, ph$18.30 PB 149 362

An experimental study of the diffusion of helium in the wake of a circular cylinder was conducted in the GALCIT hypersonic wind tunnel at a Mach number of 5.8. The cylinder was constructed of material having random porosity and was mounted with its axis perpendicular to the stream. The light gas was injected in small amounts

and the thermal conductivity method was utilized to detect the concentration of helium in the air at points downstream. Problems in the utilization of the thermal conductivity method for low sample densities were overcome by suitable calibration. Flow in the wake of the cylinder was found to display characteristically similar behavior at a few diameters downstream, with respect to decay and spread of the concentration. Reynolds number similarity was established in the laminar case, but turbulent Reynolds number similarity may require reference to momentum thickness, which was not possible with the present data. Profile data was somewhat marred by a tunnel pressure perturbation, but many of the important conclusions were not affected. The profiles appear to follow the theoretical Gaussian distribution in the similar region. The thermal conductivity method is quite promising as a means of tracing the diffusion of one binary gas constituent in another, as applied to hypersonic wind tunnel experiment. It will also serve in the analysis of transition and turbulence, and of the lateral spreading of the turbulent fluid into the rest of the wake region behind the bow shock. (Author)

RESEARCH ON TRANSONIC AND SUPERSONIC FLOW OF A REAL FLUID AT ABRUPT INCREASES IN CROSS SECTION (WITH SPECIAL CONSIDERATION OF BASE DRAG PROBLEMS), by W.H. Korst, W. L. Chow, and G. W. Zumwalt. Final rept. on Technical rept. 392-5; AFOSR-TR-60-74.
Order from LC mi$7.50, ph$24.30 PB 149 174

A general theory for pressures and temperatures in separated transonic and supersonic flows is developed using a physically perceptive model composed of simplified flow components. The principle of interaction between dissipative and free stream flow regions, allows one to distinguish between inviscid flow configurations and superimposed jet mixing regions. Treatment of the latter is based on concepts previously developed and on tabulated results (including theoretical Stanton Numbers and Drag Coefficients) for fully developed isoenergetic and non-isoenergetic constant pressure turbulent (Pr_t=1) compressible two-dimensional mixing regions. A great variety of problems in internal and external flow is analyzed theoretically, ranging from the classical base pressure problem to the performance of supersonic ejectors and the detailed study of the jet-slipstream interaction (afterbody-) problem in jet engine and rocket propulsion. (Author)

FLOW STUDIES IN AN ARC HEATED LOW DENSITY SUPERSONIC WIND TUNNEL, by C. L. Brundin, L. Talbot, and F. S. Sherman. Rept. on Contract AF 49(638)502. 15 Apr 60, 42p. 10 refs. HE-150-181; Series no. 132, issue no. 2; AFOSR-TN-60-592.
Order from LC mi$3.30, ph$7.80 PB 148 009

A series of experiments were carried out to evaluate several methods for determining the properties of the flow produced in a supersonic low density arc-heated wind tunnel, using argon as the test gas. These experiments included stagnation point Langmuir probe and heat transfer measurements, impact pressure surveys, and some qualitative spectroscopic studies. A typical set of operating conditions indicated by the measurements were $M \cong 6$, $P_{static} \cong 1$ mm Hg in the free jet, centerline stagnation temperature $T_t \cong 5000^{\circ}$ K, and approximately 0.2% ionization with an electron temperature of about $2 \times 10^{4\circ}$K. (Author)

AN "UNUSUAL" AERODYNAMIC STAGNATION TEMPERATURE EFFECT, by Irvin Glassman and James E. A. John. Rept. on Project Squid, Contract Nonr-1858(25). Dec 58, 9p. 7 refs. Technical rept. PR-88-P.
Order from LC mi$1.80, ph$1.80 PB 148 821

In a program concerned with the mixing of compressible jets with quiescent air, experimental measurements were obtained in which stagnation temperatures along the centerline of the jet (T_c°) were greater than either the uniform initial stagnation temperature of the jet (T_j°) or the ambient temperature (T_a). This effect was most evident when the initial Mach number was the greatest and when the ratio T_j°/T_a was at a minimum (unity for the actual experimental cases).

TABLES OF COEFFICIENTS FOR COMPRESSIBLE FLUTTER CALCULATIONS, by Yudell L. Luke. Rept. on Contract AF 33(038)6473. Aug 50, 95p. 34 refs. AF Technical rept. no. 6200; ATI-92 221.
Order from LC mi$5.40, ph$15.30 PB 150 299

This report released for sale to the public 19 Sep 60.

The purpose of this report is to facilitate the work of the analyst determining the flutter characteristics of a system in compressible flow. To date, tables of aerodynamic coefficients for both subsonic and supersonic flow are to be found in a number of widely dispersed sources. As a rule, each source employs a different notation and no consistency exists in the choice of reference axes. Here, all of the existing tables are brought together under a convenient notation and referred to a convenient set of axes. In the incompressible case, the tables published by Smilg and Wasserman are widely used and so their notation and system of reference axes are followed here. The report also includes some tables which are useful if further values of aerodynamic coefficients need be computed. To facilitate such calculations, some of the existing tables have been extended to cover a wider range of values. (Author)

A HEAT-FLUX-METER FOR USE WITH THIN FILM SURFACE THERMOMETERS, by R. F. Meyer. 26 Apr 60, 32p. 4 refs. Aeronautical rept. LR-279.
Order from LC mi$3.00, ph$6.30 PB 149 198

Thin film surface thermometers may be used to measure the heat transfer to a body on which they are mounted if the assumption of one-dimensional heat transfer to the body is made. Generally the interpretation of the surface temperature history to determine the heat transfer requires the numerical evaluation of an integral. This report describes a simple resistance-capacity network which, when used with the thin film thermometer, enables the heat transfer to be recorded directly. (Author)

THE LAMINAR DIFFUSION BOUNDARY LAYER WITH EXTERNAL FLOW FIELD PRESSURE GRADIENTS, by Judson R. Baron and Paul B. Scott. Rept. on Contract AF 49(638)245. Dec 59, 73p. 10 refs. Technical rept. 419; AFOSR-TN-[60-830].
Order from LC mi$4.50, ph$12.30 PB 149 342

An analysis and sample solutions are presented for the two-dimensional laminar boundary layer in the presence of foreign gas injection and a non-uniform external flow field. Similarity restrictions are given and numerical results shown for the case of helium injection into an external air flow at vanishing Mach number. The external flow field is described by a natural extension of the Falkner-Skan "wedge" solutions. Pressure gradients prove to have appreciable effects upon skin friction, heat transfer, and boundary layer separation. (Author)

EXPERIMENTAL INVESTIGATION OF THE DOWNSTREAM INFLUENCE OF STAGNATION POINT MASS TRANSFER, by Paul A. Libby and Robert J. Cresci. Final rept. for 1 July 58-Nov 59 on Solid State Research and Properties of Matter, Contract AF 33(616)5994. Apr 60, 53p. 20 refs. [PIBAL rept. 520] WADC Technical note 59-210; AD-230 766.
Order from OTS $1.50 PB 161 919

Results are presented of an experimental investigation of the downstream influence of localized mass transfer in the stagnation region of a blunt body under hypersonic flow conditions. The coolant is injected through a porous plug coaxial with the center line of symmetry of the model. Tests were carried out in a Mach 6 wind tunnel with stagnation temperatures of approximately 1600°R and with a stagnation pressure of approximately 600 psia. Four different gases were injected over a range of mass flows. Heat transfer on the impermeable section was measured under isothermal wall conditions; for the higher rates of mass flow, adiabatic surface temperatures were also determined. Theoretical analysis of the boundary flow is investigated to establish the similarity parameters for

the flow system. These parameters permit the extrapolation of the test results to other flow conditions provided laminar flow prevails. Helium is found to be the most efficacious coolant. (Author)

TURBULENT HEAT TRANSFER ON BLUNT-NOSED BODIES IN TWO-DIMENSIONAL AND GENERAL THREE-DIMENSIONAL HYPERSONIC FLOW, by Roberto Vaglio-Laurin. Rept. on Aerodynamic Research, Contract AF 33(616)3265. Sep 58, 49p. 22 refs. WADC Technical note 58-301; AD-206 050.
Order from LC mi$3.30, ph$7.80 PB 149 283

Recent results obtained for three-dimensional laminar boundary layers are extended to the turbulent case. It is shown that in the presence of highly cooled surfaces and of moderate Mach numbers of the outer stream, the crossflow and the pertaining Reynolds stresses in a general three-dimensional turbulent boundary layer are negligible even for large transversal pressure gradients. The demonstration assumes that Reynolds analogy is satisfied by the flow in the streamline direction; subsequently, the validity of this assumption is established by extending a correlation due to Mager between-two-dimensional compressible and incompressible turbulent boundary layers. From a study of the transformation and of its implications, a rapid method for the analysis of the boundary layer flow under the subject conditions is established. In the absence of general three-dimensional data, a comparison with experiments and with the predictions of other known analyses is presented for several axisymmetric configurations; the results of the method proposed here exhibit good agreement with the data. The equations governing the mean motion in a general compressible three-dimensional turbulent boundary layer are derived in an appendix. (Author)

NUMERICAL SOLUTIONS OF SHOCK-INDUCED UNSTEADY BOUNDARY LAYERS, by S. H. Lam. Rept. on Contract AF 49(638)465. Aug 59, 41p. 1 ref. Rept. 480; AFOSR-TN-59-926.
Order from LC mi$3.30, ph$7.80 PB 147 265

In the present report, numerical solutions for the shear function $\phi(\alpha, \beta)$ and the Reynolds analogy coefficient Ra are presented. The symbols used here will follow those used in Reference I. The calculations were performed on the Wright Field Univac Scientific 1103 digital computor using the Wright Field "CHIP" interpretive system. It was found that the iteration procedure suggested in Reference I was successful in generating solutions of good accuracy for the shear function $\phi(\alpha, \beta)$. However, because of the lack of a suitable "momentum integral correction" procedure, the iteration for the enthalpy function $H(\alpha, \beta)$ was found to be unsatisfactory. (Author)

SOME EXPERIMENTAL STUDIES OF THE SEPARATION OF SUPERSONIC TURBULENT BOUNDARY LAYERS, by Seymour M. Bogdonoff. Rept. on Contract AF 18(600)498. June 55, 22p. 28 refs. Rept. no. 336; OSRTN-56-64; AD-81 056.
Order from LC mi$2.70, ph$4.80 PB 150 294

This report released for sale to the public 19 Sep 60.

An experimental study of shock wave turbulent boundary layer interaction, covering a range of geometries and Mach numbers from 1 to 3.85, has been completed. The present paper summarizes the results of a series of some detailed studies and provides a framework which can be used to predict separation, peak pressure ratios, and the pressure ratio before separation over the entire Mach number range. AN EXPERIMENTAL STUDY OF THE REDUCTION IN DRAG ON A ROTATING CYLINDER WHEN HELD AT MODERATELY LOW PRESSURES FOR EXTENDED PERIODS OF TIME (THE SOAKING EFFECT), by A. R. Kuhlthau. J. H. Bodine, and J. E. May. Rept. on Contract NOrd-18211. Mar 60, 42p. 4 refs. Rept. no. AST-2849-101-60U.
Order from LC mi$3.30, ph$7.80 PB 148 390

The "soaking effect" is an observed reduction in drag which occurs when the concentric cylinder apparatus is allowed to stand for many hours at reduced pressure. The details of the procedure for observing this effect are clarified. The one real conclusion that can be drawn from this series of experiments is that the so-called "soaking effect" is more complicated than earlier experimentation has indicated. No information is yet at hand which can provide a clear explanation of the drag reduction.

SIMILAR SOLUTIONS IN RE-ENTRY LIFTING TRAJECTORIES, by Luigi Broglio. Technical note no. 3 on Contract AF 61(052)198. Dec 59, 35p. 3 refs. SIARgraph no. 54; AFOSR-TN-60-678.
Order from LC mi$3.00, ph$6.30 PB 149 586

This paper deals with the analysis of re-entry trajectories. The two general equations of motion are written down by considering all the external forces, i.e., aerodynamic drag, lift, force of gravity. The equations themselves are then made nondimensional by taking as reference point the one corresponding to the deceleration peak; in this way the ballistic parameter $W/c_D A$ can be eliminated, and the only remaining parameters are the value of deceleration peak, the flight path angle at deceleration peak and the lift/drag ratio. Two important features are to be pointed out: (a) the equations are exact also at high altitudes; (b) the solution, being independent of the body shape, can be considered of an universal character.

INFLUENCE COEFFICIENTS FOR RADIATION IN A CIRCULAR CYLINDER, by E. W. Parkes. Rept. on Contract AF 49(638)223. Mar 60, 13p. SUDAER no. 92; AFOSR-TN-60-415.
Order from LC mi$2.40, ph$3.30 PB 148 508

A table of influence coefficients is calculated from which the distribution of absorbed radiation in a long circular cylinder having any distribution of emitted radiation can readily be determined. Lambert's law of diffuse emission and reflection is assumed, and the coefficient of absorbivity is supposed constant. A table of functions for the distribution of reflected radiation after each reflection up to the tenth is also given, so that the results can be compared with non-Lambertian systems. (Author)

INVESTIGATION OF CIRCULATION CONTROL, by Philip Lamson and Frederick O. Smetana. Final rept. on Contract NOas-55-498-d. 31 Mar 58, declassified 9 June 58. 49p. 13 refs. USCEC rept. 49-101; AD-205 395.
Order from LC mi$3.30, ph$7.80 PB 147 576

A correlation study of data from various sources has been made to aid in determining how available blowing air can best be applied. It is well established that if the available blowing momentum lies in the boundary-layer-control region, then the best use of this momentum is tangential blowing over a deflected flap. A correlation of existing data reveals that blowing over a flap is superior to trailing edge blowing even when the C_μ lies in the supercirculation region. This fact is explained on the basis of the present experimental results which clearly point out the importance of the "sink effect" mechanism.

UNSTEADY SUPERCAVITATING FLOWS, by T. Y. Wu. Rept. on Contract Nonr-220(28). July 59, 30p. 14 refs. Engineering Div. rept. no. 85-11; AD-225 264.
Order from LC mi$2.70, ph$4.80 PB 147 792

This work is confined to the case in which the flow at infinity is source-free, and hence the cavity volume will remain constant. However, the generalization of this argument to the case of separated flow in air would be open to question; for in this case of one-phase flow, the fluid inside the wake may actually consist of fluid particles originally outside due to the turbulent mixing in the unsteady motion.

California Inst. of Tech., Pasadena.
WATER WAVES GENERATED BY THIN SHIPS, by Milton S. Plesset and T. Yao-tsu Wu. Rept. on Contract Nonr-220(28). Oct 59, 37p. 4 refs. Engineering Div. rept. no. 85-14; AD-229 378.
Order from LC mi$3.00, ph$6.30 PB 149 508

The problem of interest is that of the water waves in a body of water of infinite depth generated by a thin ship of given hull form, moving with constant velocity U along a straight course of the otherwise undisturbed water surface. A particular method is evaluated for computing the velocity field at an arbitrary distance (not too near the ship) fixed in the fluid. A new proposal is made that the hull profile be represented by a double Fourier series with its half-periods spanning over the region occupied by the longitudinal mid-section of the ship. The convergence of this series representation is found to be satisfactorily rapid, especially when the tangent plane of the hull is every-

where continuous. In the latter case the longitudinal slope of the hull, which is the only partial derivative appearing in the analysis, is found in a specific case to be well represented by the partial derivative of the series. With this series representation of the hull, the analysis of the velocity field calculation is greatly reduced so that the final result can be expressed in terms of a combination of several single and double Fourier integrals which are susceptible to numerical methods. (Author)

A GENERALIZED THEORY OF THE IMPACT CHARACTERISTICS OF SURFACE-PIERCING, FULLY VENTILATED DIHEDRAL HYDROFOILS, by Peter Ward Brown. Rept. on Contract Nonr-263(20). July 59, 112p. 4 refs. Rept. no. 731; AD-225 740.
Order from LC mi$6.00, ph$18.30 PB 147 801

A theoretical analysis of the fixed-trim impact of a surface-piercing fully ventilated dihedral hydrofoil is presented. A basic differential equation of the motion is obtained based on the assumption that the instantaneous forces are quasi-steady and the same as those on hydrofoil running steadily at the instantaneous values of angle of attack, resultant velocity and draft. Integration of this equation leads to a straightforward method of calculating impact time histories. It is shown that each impact is characterized by an approach parameter, P_o, which depends on the trim and initial glide-path angles only. The chief impact characteristics including the maximum acceleration, elapsed time and draft at maximum acceleration, the maximum draft, and the rebound velocity are obtained as functions of the approach parameter. The analysis is extended to cover partial ventilation impacts as well as a number of special cases, including that of landing at the trim for zero lift in which it is found that the hydrofoil does not rebound after impact. The results of the experimental investigation confirm the theoretical predictions in every particular, both as regards the detailed time histories and the chief impact parameters. (Author)

Institute of Engineering Research, U. of California, Berkeley.
SHIP RESISTANCE IN UNIFORM WAVES AS A FUNCTION OF WAVE STEEPNESS AND BEAM OF THE SHIP, by O. J. Sibul. Rept. on Contract Nonr-222(18). Sep 59, 46p. 8 refs. Series no. 61, issue no. 18; AD-229 496.
Order from LC mi$3.30, ph$7.80 PB 148 617

A 5-foot model of Series 60, block coefficient 0.60, was used as the parent form. Two additional models were similar to the parent except for the beam, which was 0.75 of parent for one model and 1.25 of parent for the other. All of the models were towed in waves 5 feet long at seven different wave steepnesses between 0.0146 and 0.0684. The results indicate that the added resistance coefficient depends upon the beam of the ship, the Froude number, and the steepness of the waves. It has been pointed out that for steeper waves the model has definite speed ranges in which change in thrust would affect very little or not at all the forward speed of the model. The speeds between these particular ranges cannot be achieved in actual tests. An attempt has been made to relate this phenomenon to the discontinuity in damping moment curves as discussed by Havelock (Quarterly Transactions of the Institute of Naval Architecture, London, Vol. 100, no. 2, Apr 58). STATISTICAL EFFECTS RESULTING FROM THE PRESENCE OF MANY PARTICLES IN MOTION IN AN IDEAL FLUID, by Richard L. Peskin. Rept. on Project Squid, Contract Nonr-1858(25). June 59, 23p. 6 refs. Technical rept. PR-92-P.
Order from LC mi$2.70, ph$4.80 PB 146 539

The first approximation to the mutual Bernoulli forces between many particles is calculated for an ideal fluid. A fluctuation analysis on a single particle is performed using a single term approximation to the Bernoulli force. The anti-symmetric effects introduced by the velocity of the particle under consideration and the velocity dependent forces result in a systemic deceleration of the particle unless it has a very small speed in which case a systemic acceleration is observed. (Author)

Princeton U., N. J.
TRANSPORT PROCESSES IN TWO-PHASE TURBULENT FLOW, by Chang-Lin Tien. Doctoral thesis. Rept. on Contract Nonr-1858(25). June 59, 99p. 47 refs. Proj. Squid Technical rept. PR-91-T-R.
Order from LC mi$5.40, ph$15.30 PB 146 572

The basic mechanism of momentum transport in a two-phase flow field, i.e., solid particles in a fluid medium, is further studied as a complement of previous works. A knowledge of the decaying processes of turbulent motion in the solid phase is obtained. Statistical relations are obtained in closed forms such that the correlation, scale and intensity of one phase can be calculated from those of the other phase. The wall interference on the two-phase turbulent motion is discussed.

VIBRATIONS OF THICK SHELLS IN A VACUUM AND IN AN ACOUSTIC MEDIUM. PART I. VIBRATIONS OF THICK SHELLS IN A VACUUM, by Joshua E. Greenspon. Technical rept. no. 1 on Contract Nonr-2733(00). Feb 59, 62p. 18 refs.
Order from LC mi$3.90, ph$10.80 PB 145 249

This report discusses the dynamic behavior of thick cylindrical shells. Wave velocities, frequencies, mode shapes, and stress distributions are given for a wide range of physical parameters. The object of this report is to point out some of the characteristics associated with the vibrations of thick shells and contrast these features with those of the thin shell and solid bar. The three dimensional theory of elasticity is used in the analysis. (Author)

Watertown Arsenal Labs., Mass.
BUCKLING CHARACTERISTICS OF CORRUGATED CYLINDERS. PART II. SUMMARY, by Joseph F. Cheatham. July 60, 34p. 2 refs. Technical rept. no. WAL TR 715/3-Pt. 2.
Order from LC mi$3.00, ph$6.30 PB 149 334

In this investigation approximately fifty tests were conducted upon corrugated cylinders. The parameters, which were varied in the tests, were (1) the configuration of the corrugation, (2) the height of the cylinder, (3) the radius of the cylinder, and (4) the material of which the cylinder was fabricated. The buckling data were satisfactorily correlated to existing theories of buckling. (Author) (See also PB 142 430)

DEVELOPMENT OF NIOBIUM-BASE ALLOYS, by Richard T. Begley and William N. Platte. Rept. for 1 June 58-1 June 59 on Metallic Materials, Contract AF 33(616)5754. May 60, 132p. 26 refs. WADC Technical rept. 57-344, Part IV.
Order from OTS $2.75 PB 161 936

Vacuum tensile data were obtained for pure niobium from room temperature to 1371 C (2500 F). The data for niobium followed the general pattern exhibited by other pure refractory metals. The ductile-brittle transition (in impact) for commercial purity, arc melted niobium was close to room temperature. The effect of binary additions of Ti, Zr, Hf, V, Mo, W, Re, Al, and Y on the hardness and workability of niobium was determined. Nb-Ti and Nb-Y alloys had excellent cold workability. Mechanical property data were obtained at room temperature and 1093 C (2000 F) on niobium containing additions of Ti, Zr, Hf, V, Mo, and W. Of the elements studied, vanadium additions were the most effective strengtheners. Nb-Zr and Nb-Hf alloys having high oxygen contents had very good high temperature properties. It appears that the interaction of oxygen with the alloy addition may be responsible for the high strength. Tensile data were also obtained on alloys having ternary and quaternary additions of Ti, Zr, Hf, and Mo. Nb-Ti-Zr-Hf alloys exhibited yield strengths well in excess of 40,000 psi at 1093 C (2000 F). Welding studies on a number of niobium alloys containing additions of Ti, Zr, Hf, V, and W were carried out. Satisfactory welds were obtained in all the alloys studied. Bend test data were obtained on the weld specimens. (Author)

ELECTRODEPOSITION OF CHROMIUM ALLOYS AND STUDY OF ELEVATED-TEMPERATURE PROPERTIES OF CERTAIN ELECTRODEPOSITED METALS AND ALLOYS, by P. T. Woodbury, W. G. Hespenheide and others. Technical progress rept. no. 4, 1 Dec 54-1 Feb 55, on Contract NOas-54-706-c. 15 Feb 55, 28p. 13 refs.
Order from LC mi$2.70, ph$4.80 PB 148 736

One of the objectives of the work in this report period was to continue the elevated-temperature oxidation studies of electrodeposited metals in liquid- and vapor-phase molybdenum trioxide. Another objective was to determine the effect of changing the composition of chromium-iron alloy on its coefficient of thermal expansion and permanent change in length after heat treatment. Another objective was to determine the expansion and contraction behavior of electrodeposited cobalt-tungsten alloy and of a specimen of stress-free nickel.

Battelle Memorial Inst., Columbus, Ohio.
ELECTRODEPOSITION OF CHROMIUM ALLOYS AND STUDY OF ELEVATED-TEMPERATURE PROPERTIES OF CERTAIN ELECTRODEPOSITED METALS AND ALLOYS, by G. R. Schaer, P. T. Woodberry, and others. Technical progress rept. no. 6, 1 Apr-1 June 55, on Contract NOas-54-706-c. 15 June 55, 21p. 4 refs.
Order from LC mi$2.70, ph$4.80 PB 148 737

One of the objectives of the work during this period was to determine whether alternate layers of nickel and chromium plate could be diffused at 100 or 1150 C to form a nickel-chromium alloy. A second objective was to confirm the superiority of stress-free nickel plate over stressed nickel plate as regards denseness after heat treatment. A third objective was to compare the hot hardness of chromium with chromium-iron alloy plates. (See also PB 148 736)

Battelle Memorial Inst., Columbus, Ohio.
ELECTRODEPOSITION OF CHROMIUM ALLOYS AND STUDY OF ELEVATED-TEMPERATURE PROPERTIES OF CERTAIN ELECTRODEPOSITED METALS AND ALLOYS, by G. R. Schaer, J. A. Gurklis and others. Technical progress rept. no. 7, 1 June-1 Aug 55, on Contract NOas-54-706-c. 15 Aug 55, 38p. 11 refs.
Order from LC mi$3.00, ph$6.30 PB 148 738

The objectives of the work during this report period were as follows: (1) to study the density and structure of the diffusion alloy of nickel-chromium electroplates; (2) to measure the oxidation of this diffusion alloy at 980 C in air and in liquid molybdenum trioxide; (3) to compare the changes in density resulting from heat treating nickel-chromium laminate, nickel plate from an all-chloride bath, watts-type nickel, low-contraction chromium, and Crack Free chromium; (4) to apply the diffusion alloy to molybdenum disilicide-coated molybdenum specimens; and (5) to investigate the adherence of chromium-iron alloy plate on steel. (See also PB 148 737).

DEVELOPMENT OF TUNGSTEN-BASE ALLOYS, by M. Semchyshen and R. Q. Barr. Interim rept. no. 2, 1 Jan-30 Apr 59, on Contract NOas-58-847-c. 1 May 59, 18p. AD-217 783.
Order from LC mi$2.40, ph$3.30 PB 149 991

This report released for sale to the public 31 Aug 60.

W-Zr: Elevated-temperature hardness measurements were made on a W-Zr casting which was prepared by vacuum arc-casting a pressed, sintered, and swaged W bar and adding Zr sponge at a uniformly increasing rate. The elevated-temperature hardness increased with Zr content. Comparing data obtained from X-ray intensity measurements with the hardness values indicated that elevated-temperature hardness does not increase linearly with Zr content, but shows less sensitivity to changes in alloy content at the higher Zr levels. W-Ta: Samples of a W-graded Ta heat were subjected to a 1600°F hardness test. The effects of alloying on hardness were more pronounced at 1600°F than at room temperature. Other samples were tested up to 2400°F. The data showed that the hardness values between about 1200° and 2000°F appeared to be changing about linearly with Ta content. Indications were that the curves will tend to merge at higher temperatures. W-Hf: An ingot of W graded with Hf was cast. Slices of the ingot are being cut for test specimens. W-Co: An ingot was cast with an intended Co range from 0 to 5%.

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
DESIGN INFORMATION OF NICKEL-BASE ALLOYS FOR AIRCRAFT AND MISSILES, by R. J. Favor. D. A. Roberts, and W. P. Achbach. Rept. on Contract AF 18(600)1357. 20 July 60, 153p. 35 refs. DMIC rept. 132.
Order from OTS $3.00 PB 151 090

Tensile, compressive, shear, and bearing properties of some nickel-base alloys for aircraft and missiles have been assembled and evaluated. Tentative design curves showing the effect of temperature on these properties are presented in a format consistent with the design document, MIL-HDBK-5 (superseding ANC-5) Strength of Metal Aircraft Elements. These data will be reviewed in October, 1960, by the ANC-5 Panel before the design curves, or modifications of them, can be included in MIL-HDBK-5. In addition to the mechanical-property data, background information on these alloys is presented to aid in the selection of alloys for given elevated-temperature applications. (Author)

SOME PROPERTIES OF VANADIUM AT SUBATMOSPHERIC TEMPERATURES, by J. A. Hren, C. M. Wayman, and T. A. Read. Rept. on Contract AF 49(638)420, 15 Sep 59, 9p. 8 refs. AFOSR-TN-59-1003; AD-227 357.
Order from LC mi$1.80, ph$1.80 PB 149 278

The nature of the resistivity-temperature relation and the proposed allotropy in V was investigated. Resistivity measurements were made on Ca-reduced V of 99.7% purity. The specimen and thermocouple were immersed in a Dewar vessel containing isopentane. A constant temperature was maintained for more than sufficient time to make the necessary measurements. Resistance measurements were made on specimens in

the annealed, vacuum-degassed, and cold-worked condition. The results showed no indication of any sudden discontinuity; however, a deviation from linearity existed at about 200°K. The measurements on heating and cooling were in agreement. Young's Dynamic modulus was measured as a function of temperature for polycrystalline specimens of 99.7% purity. No discernible deviation from linearity was apparent. X-ray diffraction studies were conducted through the same temperature range. Results indicated that the suggested allotropy in V appears to be doubtful, at least in the temperature range examined.

A RADIOMETRIC METHOD FOR DETERMINING SPECIFIC HEAT AT ELEVATED TEMPERATURES, by C. P. Butler and E. C. Y. Inn. 20 May 58, 27p. 6 refs. Research and development technical rept. USNRDL-TR-235; AD-200 857.
Order from LC mi$2.70, ph$4.80 PB 149 267

The validity of radiometric method for the measurement of specific heat of metals as a function of temperature at elevated temperatures is investigated. The method consists in heating a small specimen of metal by radiation from a carbon arc and then allowing it to cool by radiation to the walls of an evacuated chamber. The specimens are coated with platinum black so that they have an emissivity of 1.0. From the area, mass, and cooling rate, the specific heat at any temperatures below the maximum may be obtained. Six pure metals have been measured and the results compared to the handbook values. (Author)

AN INVESTIGATION OF THE EFFECTS OF SOLUTE ELEMENTS ON MAGNETOELASTIC DAMPING AND COERCIVITY IN VERY PURE IRON, by R. E. Maringer and G. K. Manning. Summary rept. on Contract Nonr-2606(00). 1 Oct 59, 24p. 16 refs. AD-227 776.
Order from LC mi$2.70, ph$4.80 PB 149 865

Data are presented showing the time and temperature dependence of the damping in zone-melted iron containing small amounts of carbon. The differences in the damping of magnetized and unmagnetized specimens are assumed to represent the magnetoelastic contribution to the damping. The magnetoelastic contribution increases with increasing temperature in the vicinity of the Snoek peak, shifting the temperature and distorting the shape of this peak. At lower temperatures, the damping decreases with time after the removal of an a-c field. The kinetics of this damping

decrease are similar to those of the time-dependent decrease in permeability after demagnetization. Relaxation timea calculated for this "magnetoelastic aftereffect" are in excellent agreement with those associated with the interstitial diffusion of carbon in alpha iron. Measurements of the temperature dependence of the induced voltage in a transformer-type apparatus have revealed a sigmoidal increase in the induced voltage with increasing temperature. This increase is apparently related to the temperature-dependent increase in magnetoelastic damping, and calculated relaxation times indicate that the interstitial diffusion of carbon is responsible. TURNING OF HIGH-STRENGTH STEELS IN THE HARDNESS RANGE OF 330 TO 560 BRINELL, by C. T. Olofson. [Rept. on Contract AF 18(600)1375]. 15 July 60, 44p. 34 refs. DMIC memo. 58.
Order from OTS $0.50 PB 161 208

This report contains information and data on the turning of steels of hardness levels up to 560 Brinell. The problems of machining these steels are minimized if rigidity of machine, tool, and workpiece, and adequate power to maintain cutting speed exist throughout cutting. The proper selection of feeds, speeds, and depths of cut appropriate to recommended tool materials and designs are important for adequate tool life and metal removal rates.

Naval [Weapons Lab.] Dahlgren, Va.
METHOD FOR DETERMINING CRACK EXTENSION FORCE Gc/IN HIGH STRENGTH STEEL SHEETS AND PLATES: TESTS OF HOMOGENEOUS AIRCRAFT ARMOR PLATE 1/8 INCH THICK, by H. E. Romine. July 58, 10p. 3 refs. NPG Technical memo. no. T-22/58.
Order from LC mi$1.80, ph$1.80 PB 150 144

This report released for sale to the public 12 Sep 60.

The primary objective was the development of a test for determining Gc of steel sheets about 7/64 inch thick and having a hardness of about 45 R_C. This is a progress report on procedures for testing flat sheet or plate material (tests on curved specimens may require more complex loading).

Rodman Lab., Watertown Arsenal, Mass.
THEORETICAL AND PRACTICAL ASPECTS OF VACUUM INDUCTION MELTING OF HIGH-STRENGTH STEELS, by Philip S. Schaffer. Rept. on Industrial Preparedness Measure. Mar 60, 74p. 13 refs. Rept. no. RPL 10/17.
Order from OTS $2.00 PB 161 928

Optimum vacuum induction melting, refining, casting and solidification procedures are employed to develop methods of improving general quality and, in particular, obtaining mechanical properties heretofore unattainable in high-strength 4340 steel castings. Theoretical considerations of crucible-melt reactions, deoxidation, desulfurization, degassification, dissociation and volatilization are applied to the conduct of vacuum heats. It is seen herein that utilizing vacuum induction technology to reduce residual gas content and decrease nonmetallic inclusions, ductility and toughness, especially at the ultra high-strength levels, are substantially improved in vacuum melted steels over conventional air melting procedures. A STUDY OF THE STRAIN-HARDENING AND CUMULATIVE DAMAGE BEHAVIOR OF 2024-T4 ALUMINUM ALLOY IN THE LOW-CYCLE FATIGUE RANGE, by Richard D'Amato. Rept. for 1 Jan-31 Dec 59 on Mechanics of Flight, Contract AF 33(616)3310. Apr 60, 108p. 19 refs. WADD Technical rept. 60-175.
Order from OTS $2.50 PB 161 905

An experimental fatigue investigation in the range of life between 1 and 10000 cycles to failure was conducted with a series of round tapered specimens of 2024-T4 aluminum alloy. The specimens had a minimum diameter of 0.356 inch and a maximum diameter of 3/4 inch with taper radii of 1 1/2, 0.6 and 0.3 inch. Cycling tests were carried out between limits of local strain based upon the change in diameter at the minimum section or strain across the specimen based upon the change in length of the tapered section. Fatigue data for each of the three specimen types can be represented by two straight line segments when range of strain was plotted against cycles to failure on log-log scales. One line segment covered the life range 4 to 1000 cycles and the other above 1000 cycles. When the data for each of the configurations was normalized with respect to its local strain at failure in a static tensile test, all of the data was represented by the same two straight line segments. Using data from the literature for the endurance range above 10000 cycles to failure, the entire fatigue range from 1 to 10^7 cycles to failure was discussed. The fatigue behavior at zero mean strain of the 0.6 inch radius specimens in terms of range of local strain is directly related to that determined by cycling the specimens between fully reversed limits of strain across the specimen. The strain-hardening behavior of the three configurations were compared and effects of mean strain and rate of straining were considered. The relationship between the appearance of the fracture surfaces and the endurance of the specimens was discussed. (Author)

INVESTIGATION OF BEARING CREEP OF TWO FORGED ALUMINUM ALLOYS, by Leonard Mordfin, Nixon Halsey, and Philip J. Granum. Aug 60, 22p. 8 refs. Technical note 55.
Order from OTS $1.00 PB 161 556

Fourteen bearing specimens of 7075-T6 and 2014-T6 forged aluminum alloys were tested in creep at 400°F. The 2014-T6 specimens had greater creep resistance and less ductility than the 7075-T6 specimens. For each material the bearing creep resistance varied directly with edge distance and bolt tightness. Prior exposure of the 2014-T6 alloy to elevated temperature reduced its bearing creep resistance. The validity of a previously proposed theory of creep in bolted joints was examined using the test data together with results from an earlier study. The theory was found to hold for 7075-T6 but not for 2014-T6. (Author)

MECHANICAL PROPERTIES OF TITANIUM ALLOYS AS A FUNCTION OF HEAT TREATMENT AND SECTION SIZE, by Charles F. Hickey, Jr. July 60, 61p. 1 ref. WAL TR 405.2/7.
Order from OTS $1.75 PB 161 799

The mechanical properties of 6Al-4V, 6.5Al-3Mo-1V, and 6Mo-3Al titanium alloys were obtained as a function of section size and heat treatment. Sections of 2-, 3-, 4-, and 6-inch diameter rounds were studied, with each alloy being subjected to two solution temperatures, followed by three aging temperatures. Tensile and impact data were obtained in all cases. As a result of the findings, optimum heat treatment for the investigated conditions were established for each alloy. Other factors, such as specimen location, directionality, and microstructure, are discussed. (Author)

THE PROPERTIES OF GRAIN BOUNDARIES. Annual technical rept. no. 1 to 30 Apr 60 on Contract DA 91-591-EUC-944. May 60, 21p. 10 refs.
Order from LC mi$2.70, ph$4.80 PB 149 431

An investigation is being carried out on the effect of such variables as alloy content, applied stress and temperature on the time dependent sliding of two grains at a common plane grain boundary in bicrystal specimens and also on the creep of crystalline material in single crystals, of copper and dilute copper based alloys.

Crucible Steel Co. of America, Syracuse, N. Y.
DEVELOPMENT OF A DUCTILE, OXIDATION-RESISTANT AND HIGH STRENGTH SINGLE-PHASE (AUSTENITIC) ALLOY BASED ON Fe-Al-Mn-C SYSTEM, by R. C. Gibson. Bimonthly progress rept. no. 3, 15 Feb-15 Mar 60, on Contract NOas 60-6025-c. May 60, 11p.
Order from LC mi$2.40, ph$3.30 PB 148 785

Studies performed on an Fe-Al-C-Mo-W-V base alloy containing additions of nickel and copper indicated that copper lowered stress-rupture properties and improved oxidation resistance. Nickel additions increased stress rupture and room temperature tensile properties of the base alloy but had little effect on oxidation resistance. (Author) (See also PB 148 003)

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
STRESS-CORROSION CRACKING OF Ti-5Al-2.5 Sn, by Hiram Brown. [Rept. on Contract AF 18(600)1375] 4 Aug 60, 14p. DMIC memo. 60.
Order from OTS $0.50 PB 161 210

A large number of unexplained cracks were encountered in the fabrication of complex assemblies of Ti-5Al-2.5Sn. These were not the usual stress cracks, but, instead, consisted of regular families of cracks in certain areas. Laboratory investigation and a survey of technical literature indicated that the cracking was similar to stress-corrosion cracking due to chlorides. In order to see whether stress-corrosion cracking as a result of residual trichloroethylene could take place during heat treating, a series of tests was performed.

Manufacturing Labs., Inc., Cambridge, Mass.
RESEARCH AND DEVELOPMENT ON THE EFFECTS OF HIGH PRESSURE AND TEMPERATURE ON VARIOUS ELEMENTS AND BINARY ALLOYS, by J. S. Harvey, L. Kaufman and others. Rept. for 1 July 58-30 Sep 59 on Metallic Materials, Contract AF 33(616)5996. Apr 60, 99p. 17 refs. WADC Technical rept. 59-655.
Order from OTS $2.25 PB 161 920

High-pressure high-temperature apparatus capable of subjecting test specimens to 100,000 atmospheres at temperatures above 1500°C was designed and constructed. High hydrostatic pressure lowers the temperature of martensitic transformations in Fe-Ni alloys and expands the temperature range of the gamma loop in the Fe-Ni system. The precipitation hardening process in both Al-Cu and Cu-Be alloys is inhibited and modified when carried out at high hydrostatic pressure. The use of pressure during heat treatment of various steels results in transformation products different in structure from those normally obtained, and also retards the temperature reactions. High-pressure high-temperature processing of the Pt-C, Pd-C, and Ni-C systems results in the formation of a new phase. Preliminary experiments indicate that the Ti-N phase diagram is significantly modified by pressure. (Author)

THE EFFECTS OF STRAIN ON THE INTERFACIAL ENERGIES OF SOLIDS, by S. Floreen, E. E. Hucke and D. V. Ragone. Rept. on [Contract AF 49(638)422] 9 Nov 59, 17p. 25 refs. AFOSR-TN-59-1253; AD-233 780.
Order from LC mi$2.40, ph$3.30 PB 146 740

Surface energy and the grain boundary energy of a solid changes with the elastic strain in the following manner;

$$f^S = f^S_o + k\epsilon^2$$

$$f^G = f^G_o + j\epsilon^2.$$

Paint Lab., Mare Island Naval Shipyard, Vallejo, Calif.
EVALUATION OF TEFLON (TETRAFLUOROETHYLENE RESIN) AS A PROTECTIVE COATING AND DRY LUBRICANT FOR SHIPS' SURFACES, by John R. Saroyan. Rept. on Protective Coatings for Ships. 26 Aug 55, 37p. 5 refs. Mare Island Test no. 346.
Order from LC mi$3.00, ph$6.30 PB 148 857

This report released for sale to the public 29 Aug 60.

Several hundred bearing and friction surfaces of various submarine parts were successfully coated with Teflon (tetrafluoroethylene resin). Preliminary results for short period use has indicated excellent performances. Such Teflon coated parts operate freely and show no evidence of salt deposition when subject to seawater. (Author)

Rock Island Arsenal Lab., Ill.
THE EVALUATION OF PETROLEUM BASE RUST PREVENTIVES BY LONG TERM EXPOSURE AND ACCELERATED LABORATORY TESTS. ADDENDUM I. RESULTS AFTER TEN YEARS OF EXPOSURE, by Van Y. S. Hong. 5 Feb 60, 42p. 23 refs. Technical rept. 60-325.
Order from LC mi$3.00, ph$6.30 PB 146 993

Machine gun bolts with specially prepared surfaces were coated with eleven materials including three noninhibited and eight inhibited petroleum base rust preventives and were exposed to three types of simulated field service conditions. At specifiec time intervals covering a period of ten years, the coated bolts were removed, decoated, and evaluated. At the end of ten year test period, analysis of the results indicated that suitable rust preventive materials may be selected for specific time and type of exposures. (Author)

PHOTONEUTRON CROSS SECTIONS OF COBALT AND MANGANESE, by P. A. Flournoy, R. S. Tickle, and W. D. Whitehead. Technical note on Contract AF 49(638)176. June 60, 22p. 21 refs. AFOSR TN-60-658; AD-238 123.
Order from LC mi$2.70, ph$4.80 PB 148 343

The total photoneutron yields of Mn^{55} and Co^{59} have been carefully measured from threshold to approximately 30 Mev. Analysis of these data using the Leiss-Penfold matrix indicates that the cross sections for both elements show a splitting in the giant resonance region in accord with the predictions of the classical hydrodynamic model. The Mn^{55} peaks occur at energies of $16.8 \pm .25$ Mev and $19.75 \pm .25$ Mev corresponding to cross sections of 90 mb and 77 mb respectively. Co^{59} maxima occur at $16.75 \pm .25$ Mev and $18.75 \pm .25$ Mev with cross sections of 109 mb and 92 mb. The cross sections $\sigma(\gamma,n) + \sigma(\gamma,2n) + \sigma(\gamma,np) + \ldots$ integrated to 25 Mev are 627 Mev-mb for Mn^{55} and 709 Mev-mb for Co^{59}. Breit-Wigner resonance lines were fitted to both cross sections and the intrinsic quadrupole moments determined from these fits are $+.78 \pm .10$ barns for manganese and $+.76 \pm .11$ barns for cobalt. SINGLE PARTICLE SINGULARITIES IN SCATTERING AND PRODUCTION AMPLITUDES, by J. Gunson and J. G. Taylor. Technical scientific rept. no. 5 on Contract AF 61(052)233. Jan 60, 20p. 12 refs. AFOSR-TN-60-278; AD-234 216.
Order from LC mi$2.40, ph$3.30 PB 147 619

A proof of analyticity properties in momentum transfer of the amplitude for certain physical processes is given here. In particular we justify the use of extrapolation in the scattering angle, at a fixed energy, to obtain the pion- nucleon coupling constant from photoproduction data, for photon laboratory energies up to 1BeV. This extrapolation procedure to obtain strange particle parities and coupling constants is also justified for certain strange particle production and scattering processes. (Author)

Cambridge U. (Gt. Brit.)
UNSTABLE PARTICLES IN A GENERAL FIELD THEORY, by J. Gunson and J. G. Taylor. Technical scientific note no. 6 on Contract AF 61(052)233. Feb 60, 12p. 6 refs. AFOSR-TN-60-679.
Order from LC mi$2.40, ph$3.30 PB 149 587

The problem of unstable particles in quantum field theory is treated as one of the interpretation of complex singularities appearing in the analytic continuation of scattering amplitudes into unphysical sheets of their Lorentz invariant variables. Suitable continuations are shown to hold under certain restrictive assumptions in a general field theory, making use of unitarity and causality of the S-matrix. The extra singularities appearing in the continuation are fixed isolated poles, in accordance with a conjecture of Peierls. (Author)

Institute of Theoretical Physics, Stanford U., Calif.
QUENCHING OF MAGNETIC MOMENTS IN NUCLEI, by S. D. Drell and J. D. Walecka. Technical note no. 19 on Contract AF 49(638)388. June 60, 42p. 15 refs. Technical note 388-19; AFOSR-TN-60-714.
Order from LC mi$3.30, ph$7.80 PB 149 575

Starting from the premise that with modern dispersion-theoretical techniques one has a reliable method for calculating the anomalous magnetic moment of a nucleon, the modification or "quenching" of this moment has been calculated for a nucleon in nuclear metter. The effect considered here is due to the fact that nucleons are not allowed by the exclusion principle

to recoil into states already occupied by other nucleons in the nucleus. The actual technique used in the calculation is to sum all the Feynman diagrams that are included in the dispersion theory calculation of the single nucleon moment. The nucleon propagator is then written as a sum over states and those states are removed in which the nucleon is inside the Fermi sea. The result is that the anomalous moment is reduced by by $\simeq 7\%$. (Author)

AUGER RATE IN μ MESIC ATOMS, by A. Pevsner, R. Strand and others. Rept. on Contract AF 18(603)143. May 60, 10p. 24 refs. AFOSR-TN-60-463.
Order from LC mi$1.80, ph$1.80 PB 148 957

A study has been made of the K Auger transitions in the light elements of nuclear emulsions. Of 3382 stopping μ-mesons, 1016 were observed to decay. 5 of these had associate short-range electrons whose energies were consistent with the K transitions of CNO. 2 of these 5 are attributed to the K Auger transitions of CNO, while the remaining 3 are attributed to higher Auger transitions in AgBr.

Johns Hopkins U., Baltimore, Md.
THE MASS OF THE Λ° HYPERON, by J. Lodge, F. Anderson and others. Rept. on Contract AF 18(603)143. May 60, 9p. 9 refs. AFOSR-TN-60-462.
Order from LC mi$1.80, ph$1.80 PB 148 956

The mass of the Λ°-hyperon has been measured using nuclear emulsions: $M_{\Lambda} = 1115.55 \pm 0.15$ Mev. (Author)

Miami U., Coral Gables, Fla.
INTERACTIONS AND DECAY OF HYPERONS PRODUCED IN K^- CAPTURE STARS AT REST, by M. Blau, C. F. Carter, and A. Perlmutter. Rept. on Contract AF 49(638)97. 31 May 60, 46p. 24 refs. AFOSR-TN-60-745.
Order from LC mi$3.30, ph$7.80 PB 149 332

The results of an investigation of hyperon interactions and decays are presented. Several inelastic interactions are described. The mean free path for nuclear interactions of charged Σ hyperons in emulsion is found to be 11 ± 4 cm in the energy range 10 - 200 Mev.

National Bureau of Standards, Washington, D. C.
SINGLE SCATTERED NEUTRONS FROM AN ISOTROPIC POINT SOURCE, by E. R. Mosburg, Jr. and W. M. Murphey. July 60, 11p. 4 refs. Technical note 63.
Order from OTS $0.50 PB 161 564

A calculation was made to determine the number of particles from an isotropic source which will reach a detector after scattering once in the medium surrounding the detector and source. The simple result obtained is applicable when the separation of the detector and the source is much less than the mean free path of the particle in the medium. The particular case of 14.1 Mev neutrons in air was considered. It was found that 44 percent of the single scattered neutrons had scattering angles of less than 30 degrees. (Author)

Battelle Memorial Inst., Columbus, Ohio.
EXPERIMENTAL AND RESEARCH WORK ON NEUTRON DOSIMETRY, by H. C. Gorton, O. J. Mengali and others. Quarterly progress rept. no. 3, 15 Nov 59-14 Feb 60, on Contract DA 36-039-sc-78924. 15 Feb 60, 30p.
Order from LC mi$2.70, ph$4.80 PB 149 378

The effects of dose rate on the sensitivity to fast-neutron radiation of the experimental silicon-rectifier dosimeters were compared by exposing two sets of units to like amounts of radiation from the General Atomic TRIGA Reactor and the Battelle Research Reactor No significant dependence of device characteristics on the rate of irradiation was observed. In addition, valuable information was obtained on radiation-induced changes in lifetime and, consequently, on the current-voltage characteristics of the experimental units. Two types of read-out circuits have been developed, one of which employs the radiation-induced change in forward current at a fixed voltage and the other radiation-induced changes in lifetime. (See also PB 147 981)

CALIBRATION OF STANDARD 50 CC AND 900 CC IONIZATION CHAMBERS, by C. F. Malone and V. M. Davis, Rept. on [Contract AF 33(038)21117]. 8 Mar 54, 31p. MR-N-34; CVAC-255T.
Order from LC mi$3.00, ph$6.30 PB 149 993

This report released for sale to the public 13 Sep 60.

The calibration of eight 50-cc and eight 900-cc ionization chambers and their related electrometers is described. Data charts are included which show electrometer readings as functions of electrode voltage changes, percent collection of ions as a function of field strength, electrometer response--a function of pressure in the ion chamber, directional properties of ionization chambers, and dose rate as a function of source-detector separation distance.

Naval Radiological Defense Lab., San Francisco, Calif.
A SIMPLIFIED FILM DOSIMETER FOR FISSION NEUTRONS, by S. W. Ross and E. Tochilin. 4 Apr 58, 23p. 19 refs. Research and development technical rept. USNRDL-TR-224.
Order from LC mi$2.70, ph$4.80 PB 150 147

This report released for sale to the public 12 Sep 60.

A film dosimeter technique has been developed for fast neutron monitoring of reactor personnel. The method takes advantage of the rapid build-up of ther-

mal neutrons when fast neutrons are allowed to penetrate a hydrogenous moderator. The badge consists of a 3/4-inch thick polyethylene frontpiece that is worn on the belt against the body. A combination of silver and tin filters are matched so as to produce equal film blackening from either x- or gamma-rays. Fast neutron exposure is determined from film blackening under radioactive silver produced by capture of the moderated neutrons. The badge contains a sensitive gamma-ray dosimeter film together with a nuclear track emulsion. The dosimeter film serves as both a fast neutron and gamma-ray dosimeter. The nuclear emulsion is read whenever an overexposure is indicated or under any other conditions were a more accurate evaluation of the fast neutron dose is warranted. (Author)

Naval Radiological Defense Lab., San Francisco, Calif.
THEORETICAL ANALYSIS OF RADIOMETER PERFORMANCE, by H. G. Ferris. 13 Jan 59, 17p. 1 ref. Research and development technical rept. USNRDL-TR-311, AFSWP-1119; AD-216 542.
Order from LC mi$2.40, ph$3.30 PB 148 850

A theoretical analysis of the thermal behavior of water-cooled thin foil radiometers is carried out. The expression for the heat balance in the circular foil of the radiometer is derived. The steady state solution, $T/t = 0$, subject to certain boundary conditions, yields an expression for thermal sensitivity. This relationship when applied to the three radiometers in common use at NRDL indicates that they operate linearly over their entire ranges (0 to 10, 0 to 50, and 0 to 100 Cal/cm^2) with a maximum error of 2 percent when maximum irradiance is incident on the foil. Solving the heat balance equation, subject to the same boundary, conditions, by means of the Laplace Transformation, an expression for reaction time results: $\tau = \frac{0.416R^2}{K}$

Applying this relationship to the three NRDL instruments yields reaction times of 0.016, 0.004, and 0.004 sec, respectively. (Author)

AN ELECTROPLATED NEUTRON THERMOPILE FOR THE 3-Mw GTR, by F. P. Harmon. Rept. on Contract AF 33(600)32054. 20 Feb 59, 27p. 3 refs. NARF-59-20T; MR-N-226.
Order from LC mi$2.70, ph$4.80 PB 150 016

This report released for sale to the public 25 Aug 60.

A neutron-sensitive thermopile which utilizes an electroplating technique for making thermoelectric couples has been developed. This technique offers improved flexibility in design at reduced cost in that it eliminates the usual soldered or welded couples. The thermopile described in this report was constructed for use in the Ground Test Reactor. It consists of a large number of equally spaced junctions extending the length of the reactor core. The signal output is therefore proportional to the integral of the thermal flux distribution along the length of the thermopile. Other features of the thermopile include (1) 100 B^{10}-coated hot junctions and 100 bare cold junctions positioned for ambient-temperature compensation; (2) sensitivity of 10 microvolts per kilowatt reactor power at 2.5 inches from the reactor face; and (3) a time constant of less than one second. Methods used in determining the characteristics of the thermocouple are described in an appendix. (Author)

Nuclear Radiation Lab., U. of Illinois, Urbana.
THE MAGNETIC FIELD PROGRAM FOR THE UNIVERSITY OF ILLINOIS SPIRAL RIDGE CYCLOTRON, by J. O. Ballance, J. L. Friedes and others. Status rept. Technical rept. no. 11 on Contract Nonr-1834(05). Oct 59, 34p. 5 refs. AD-233 131.
Order from LC mi$3.00, ph$6.30 PB 149 476

As soon as the first measurements were analyzed, it was discovered that the magnetic field of the cyclotron was radically different from the expected shape. Efforts were then directed towards the design of a correction coil which would correctly shape the magnetic field. Extensive measurements were made in this connection. This report correlates the data gathered from these measurements and sets forth the techniques developed for the measurements. (Author)

DETERMINATION OF Np^{239}, "TOTAL FISSIONS", Mo^{99}, AND Ce^{141} IN FISSION PRODUCT MIXTURES BY GAMMA-RAY SCINTILLATION SPECTROMETRY, by L. D. McIsaac. 5 Jan 56, 17p. 8 refs. Research and development technical rept. USNRDL-TR-72.
Order from LC mi$2.40, ph$3.30 PB 150 146

This report released for sale to the public 12 Sep 60.

A gamma-ray scintillation spectrometric method, involving no other chemistry than sample dissolution, has been developed for the rapid determination of Np^{239} and "Total Fissions" in fission-product samples. A single channel NaI(Tl) scintillation spectrometer was used, and analysis required about 1 hour. The 140-Kev gamma-rays of Tc^{99m} and Ce^{141} were used while the 105-Kev gamma ray plus conversion X ray accompanying the decay of Np^{239} was employed to measure the Np^{239} concentration. Determination of the disintegration rates of Mo^{99}, Tc^{99m} and Ce^{141} is also possible by this technique. An accuracy of about 10 per cent or better can be obtained. (Author)

THE SIGMA-NEUTRON INTERACTION, by G. Eder. Scientific note no. 2 on Contract AF 61(052)265. 23 Nov 59, 5p. 1 ref. AFOSR-TN-60-25; AD-232 068.
Order from LC mi$1.80, ph$1.80 PB 146 713

The potential between a Σ-particle and a neutron due to exchange of pions is calculated in a static theory. A strangeness and isobaric spin conserving interaction is considered. Second and fourth order terms in the coupling constant are evaluated. It can be shown, that the singlet spin potential is more attractive than the triplet spin potential, in agreement with some experimental evidence. (Author)

SCATTERED GAMMA RADIATION MEASUREMENTS FROM Co^{60} CONTAMINATED FIELD, by Clayton L. Schlemm, Alexander E. Anthony, Jr. and Zolin G. Burson. Jan 59, 126p. 15 refs. AFSWC-TN-59-6; AD-232 439.
Order from LC mi$6.30, ph$19.80 PB 149 987

This report released for sale to the public 31 Aug 60.

A 90° sector of a circle of 604-ft radius was contaminated with cobalt-60 point sources to an approximate level of 1.72 millicuries psf. as a means of simulating an area approaching an infinite contaminated field. Radiation measurements were made in an open hole with a PDR-27A radiac instrument and Dupont 553 film to determine the percentage of the total radiation which is due to scattered radiation (skyshine). It was found to be approximately $10 \pm 4\%$. These measurements were made at selected points from approximately 36 in. above to 25 in. below ground level. Data were obtained in a miniature basement to determine the attenuation of the skyshine by various thicknesses of concrete on the roof. Additional data were obtained to determine the energy of the scattered radiation as a function of the angle above the plane, using a total absorption gamma spectrometer. The unshielded effective energy for dose considerations ranged from 0.90 to 0.12 mev for elevation angles from 10° to 80° above the plane. (Author)

HIGH ALTITUDE SAMPLING PROGRAM (HASP), SPECIAL REPORT, by Albert K. Stebbins, III. 1 June 60, 244p. 29 refs. DASA 532B.
Order from OTS $3.50 PB 161 916

This report outlines the results of the HASP program in its effort to determine the role played by the stratosphere in the world-wide distribution of radioactive fallout from nuclear weapons tests. The sampling network has collected 10^8 standard cubic feet of air from 57°S to 71°N up to 70,000 feet. Stratospheric inventories of Sr-90 have been calculated for the periods November 1957 to December 1958, January to August 1959, and September to November 1959 to be respectively 0.95, 0.81, and 0.7 megacuries. Concentrations have been greater in the Northern Hemisphere by a factor of 2 or 3 over the Southern Hemisphere. The Sr-90 maximum occurs in the equatorial regions around 90,000 feet and slopes down to around 70,000 feet in the polar regions. A semi-empirical application of Gaussian diffusion is described which suggests that hot clouds injected in the equatorial stratosphere spread in the North-South direction with mixing coefficients near 5×10^8 cm^2/sec. An Injection-Depletion model is offered which indicates that as much as 50% of the material produced in a megaton ground surface burst comes down in local fallout. Removal from the stratosphere occurs at different rates depending on altitude and latitude of injection and season of the year. Surface concentrations of Sr-90 are displayed as a function of latitude and time.

PREDICTION, MONITORING AND ESTIMATION OF RADIOLOGICAL FALLOUT PATTERNS FOR CIVIL DEFENSE, by A. Broido, R. R. Read, and R. W. Shephard. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 1 Aug 59, 38p. 20 refs. Series no. 2, issue no. 17.
Order from LC mi$3.00, ph$6.30 PB 150 014

This report released for sale to the public 15 Sep 60.

This report describes, without technical details, the theoretical and computational bases of a probabilistic approach to prediction, monitoring, and estimation of radiological fallout patterns. The approach can lead to the design of a monitoring system for the quantitative assessment of the completed fallout distribution in which the patterns can be obtained to a specified accuracy with fewer monitoring locations than would be required for the purely empirical approach of graphic interpolation between observations.

TECHNIQUE FOR DESIGNING AND EMPLOYING A RADIOLOGICAL MONITORING SYSTEM FOR THE EVENT OF ATTACK, by Robert R. Read. Interim rept. on Civil Defense Research Project, Contract CD-SR-58-40. 10 Apr 59, 30p. 2 refs. Series no. 2, issue no 22.
Order from LC mi$2.70, ph$4.80 PB 150 015

This report released for sale to the public 15 Sep 60.

This report presents a method for estimating fallout iso-intensity contours on the basis of ground monitored radiological measurements and of a probabilistic model describing the behavior of such measurements. This method can be used either for interpolation among several measurements or for the "downwind" prediction of additional hazardous areas where fallout has not yet occurred. Using such an estimation procedure as a basis, the report describes a technique for determin-

ing what radiological measurements are necessary for a ground monitoring system, including the specification of which regions are to be monitored. (Author)

CALIBRATION OF FIVE GAMMA-EMITTING NUCLIDES FOR EMISSION RATE, by J. M. R. Hutchinson. Aug 60, 23p. 14 refs. Technical note. no. 71.
Order from OTS $0.75 PB 161 572

Mercury-203 and niobium-95 were calibrated by a $4\pi\beta$-γ coincidence method for γ-emission rate, zinc-65 by comparison with the 1.12 Mev peak of scandium-46, sodium-22 by a γ-annihilation-quanta coincidence method and by a triple coincidence method, and strontium-85 by x-γ coincidence counting. The accuracy of the calibration in all cases was $\pm$ 2%. The half-life of the isomeric state of rubidium-85 was measured and found to be 0.98 microseconds. (Author)

NOMOGRAM FOR RADIOACTIVITY IN GROSS FISSION PRODUCT ANALYSES, by M. H. Rowell and E. C. Freiling. 22 May 57, 6p. Research and development technical rept. USNRDL-TR-159; AD-139 583.
Order from LC mi$1.80, ph$1.80 PB 149 266

A nomogram is presented which facilitates calculations involving the age and size of fission product samples and the fission yields, half lives, and residual activities of the individual fission product nuclides. Although all important fission products of half-life greater than 1 hr are conveniently indicated, the nomogram is applicable to many more. (Author)

New York U. Coll. of Engineering, N. Y.
DEVELOPMENT OF TECHNIQUES FOR THE EVALUATION OF HIGH ALTITUDE PRESSURE SUITS, by Renato Contini, Rudolfs Drillis, and Lawrence Slote. Rept. on Human Engineering Evaluation for Pressure Suits, Contract AF 33(616)3592. Dec 59, 130p. 115 refs. WADC Technical rept. 58-641.
Order from OTS $2.75 PB 161 899

The principal purpose of this study is to develop objective criteria to facilitate the selection of that pressure suit or component which permits the operator maximum function. A secondary purpose is to make available to the manufacturer of the suit or component objective data from which he may improve the design of the item. The techniques and methodologies associated with biomechanics were studied for their application to pressure-suited personnel. Physiological and psychological techniques were investigated for their usefulness in the over-all evaluation. Only the basic movements of the upper extremities were considered. Nonetheless, the methods can be applied generally to other body segments, and, therefore, an over-all evaluation of a pressure suit or suit component can be accomplished. (Author)

Sierracin Corp., Burbank, Calif.
MA-3 ELECTRICALLY HEATED FACEPIECE. Rept. on Development of Pressure Suit System, Contract AF 33(616)3746. Jan 60, 26p. Engineering rept. ER-59-269; WADD Technical rept. 60-88; AD-235 995.
Order from LC mi$2.70, ph$4.80 PB 146 662

A proprietary, transparent, electrically conductive coating, "Sierracote III," was successfully incorporated into laminated, formed, optically and thermally satisfactory facepieces. Success in the heating of polyester-vinyl laminates was achieved in a shorter than anticipated period. This permitted the addition of surface coated parts of monolithic acrylic structure to the program. (Author)

NONLINEAR SONIC PHENOMENA, by Wesley L. Nyborg. Final rept. on Contract AF 18(603)54. 31 May 60, 63p. 13 refs. AFOSR-TR-60-70; AD-238 441.
Order from LC mi$3.90, ph$10.80 PB 148 558

Theory has been developed for a particular sonic characteristic, acoustic streaming, in terms of the equations of nonlinear acoustics. Detailed experimental investigations have been made of streaming patterns under conditions of interest, and of the effects of streaming on surface processes. Papers included in the report are:
Acoustic streaming near a boundary, AFOSR TN-57-792, pub. in the Jnl. of the Acoustical Society of America 30:329-339, Apr 58
Cavitation microstreaming, pub. in the Jnl. of the Acoustical Society of America 31:54-64, Jan 59
Microscopic eddying near a vibrating ultrasonic tool tip, AFOSR TN-58-991, pub. in Jnl. of Applied Physics 30:949-950, June 59
Sonically-induced microstreaming near a plane boundary. I. The sonic generator and associated acoustic field, AFOSR TN-60-539
Sonically induced microstreaming applied to a surface reaction, AFOSR TN-59-253, pub. in the Jnl. of the Acoustical Society of America 31:706-711, June 59
Effects of acoustic microstreaming at electrodes, AFOSR TN-60-538, pub. in Proceedings of the Third International Congress in Acoustics, Stuttgart, Germany, Sep 59
Imbedded thermistor for boundary layer measurements, AFOSR TN-58-992, pub. in the Jnl. of the Acoustical Society of America 31:249-250, Feb 59.

California U., Los Angeles.
ULTRASONIC ABSORPTION AND DISPERSION IN GASEOUS DIBROMOMETHANE, by Norman J. Meyer. Technical rept. no. 15 on Contract Nonr-233(48). July 59, 74p. 37 refs.
Order from LC mi$4.50, ph$12.30 PB 147 800

Ultrasonic speed of sound and absorption measurements have been made in gaseous dibromomethane at 296°K. and at pressures between 0.5 and 15.0 mm. Hg. A continuous selection of frequencies between 13 and 80 Kcs was used, generated as pulsed sine waves. Independent vibrational relaxation processes were found at 7.0 and 125 Mc/atmos, with corresponding relaxation times of 3.02×10^{-8} and 0.146×10^{-8} secs. A third relaxation process was not within the experimental range of the apparatus. Seven of the nine vibrational modes have sufficient population at 296°K to contribute to the various relaxation processes. Primarily based upon the specific heat contributions of each mode, the assignments of the various modes relaxing at the different relaxation times were made. (Author)

THE CONCEPT OF THE IDEAL OBSERVER IN PSYCHOPHYSICS, by W. P. Tanner, Jr., T. G. Birdsall, and F. R. Clarke. Technical rept. no. 98 on Contract AF 19(604)2277. Apr 60, 45p. 3 refs. 2659-6-T; AFCRC-TR-59-54.
Order from LC mi$3.30, ph$7.80 PB 148 804

This report discusses the manner in which the concept of the ideal observer serves as a tool for the development of a description model of human performance in the detection and recognition of signals. (Author)

Michigan U. Research Inst., Ann Arbor.
DETECTION OF COMPLEX SIGNALS AS A FUNCTION OF SIGNAL BANDWIDTH AND DURATION, by C. D. Creelman. Technical rept. no. 99 on Contracts AF 19(604)2277 and Nonr-1224(22). Jan 60, 20p. 14 refs. 2659-8-T; AFCRC-TR-59-59. Also appears as Rept. no. 6 of Speech Research Lab.
Order from LC mi$2.40, ph$3.30 PB 148 805

An experimental examination of the efficiency of human observers in detecting a stimulus waveform which consists of a train of damped sinusoids is reported. The signal duration and degree of damping (or spectral bandwidth) were varied, with the energy of the signal held constant. Bandwidth is shown to affect human detection more at long than at short durations. (Author)

Naval Research Lab., Washington, D. C.
THEORETICAL ANALYSIS OF MONOSTATIC REFLECTION IN THE FAR FIELD OF RIGID, FINITE OBJECTS, by W. G. Neubauer. Interim rept. 12 July 60, 4 refs. NRL rept. 5467.
Order from LC mi$2.70, ph$4.80 PB 145 244

The solution to the approximate integral form of the reflection in the "far field" has been developed as well as a graphical, or numerical, method for the case of a rigid, finite plane rotated about an edge and for a wedge shape. The reflection may be conveniently presented in diagrams in the complex plane. Extension of the method has been made to the case for the reflection amplitude at any orientation of a reflector. Physically measurable quantities are required in the evaluation of this sum. Although the evaluation is not exact, rapid, or inclusive of all reflection mechanisms, it does make possible the derivation of the reflection from shapes not analytically describable by a means other than the methods which give the reflection in terms of the radii of curvature of the reflecting surface. (Author)

Air Force Cambridge Research Center, Bedford, Mass.
THERMOELECTRIC PHENOMENA, by A. D. Johnson. Dec 59, 48p. 7 refs. AFCRC-TR-59-362.
Order from LC mi$3.30, ph$7.80 PB 148 968

This report is intended to serve as an introduction to thermoelectricity. It consists of three parts: the history, advantages, limitations, and applications of thermoelectricity; a physical picture of thermoelectricity, using energy level diagrams; and an accounting of the type and extent of research effort currently devoted to the subject in this country, including references to materials that appear most promising. (Author)

[Army] Signal [Research and Development Lab.] Fort Monmouth, N. J.
MEASUREMENT OF PERMEABILITY AND Q OF MAGNETIC MATERIALS OVER THE FREQUENCY RANGE OF 50 TO 500 MEGACYCLES, by Isidore Bady and Robert Franklin. 30 Sep 55, 70p. 5 refs. Engineering rept. 1159.
Order from LC mi$3.90, ph$10.80 PB 149 418

Four methods for measuring the complex permeability of magnetic materials are given. These are based on the use of a Q meter, cavity resonator, slotted line, and VHF bridge. Test procedures and formulas are given. All formulas are derived. The advantages and disadvantages of the various methods are discussed and sources of errors noted. Tests performed on several samples show very good agreement among the methods. Where discrepancies do occur, the reasons for these discrepancies are discussed. (Author)

A NOTE ON HARMONIC ANALYSIS OF GEOPHYSICAL DATA WITH SPECIAL REFERENCE TO THE ANALYSIS OF GEOMAGNETIC STORMS, by Masahisa Sugiura. Scientific rept. no. 1 on Contract AF 19(604)2163. 18 Apr 60, 16p. 6 refs. UAG-R108; AFCRC-TN-60-410; AD-238 213.
Order from LC mi$2.40, ph$3.30 PB 149 757

Some geophysical characteristics tend to have a fixed distribution relative to the sun. An example is the distribution of air temperature on an ideal earth that is perfectly symmetrical (e.g., in its pattern of land and water) about its axis of rotation. In such a case the geophysical characteristic at any fixed station on the earth undergoes a daily variation that depends only on local time (and latitude and season). This simple pattern of daily change may be modified by intrinsic changes in the solar influences on the earth. The harmonic components of the daily variation at any station may in this case undergo phase changes, in some respects corresponding to Doppler shifts of frequency in optical or sonic phenomena. Care is then needed if the results of harmonic analysis are to be properly interpreted. Such interpretation is discussed with reference to the parts Dst and DS of the magnetic storm variations. Like caution must be observed in cases where the amplitude of a harmonic variation changes, with fixed phase. (Author)

RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by H. V. Anderson, Joseph S. Mathias and others. Quarterly progress rept. no. 1, 15 July-15 Oct 53, on Contract DA 36-039-sc-42580. 15 Oct 53, 38p. 6 refs.
Order from LC mi$3.00, ph$6.30 PB 149 599

An extension of the investigation of the influence of time of annealing at 675°C on the response to magnetic annealing is reported. X-ray evidence indicates that the amount of ordered structure present does increase with annealing time in a manner similar to the residual induction. Further investigation of the iron-cerium system, though continuing to provide materials with higher inductions than the base of U. S. S. pure iron, failed to provide improvement over pure iron specimens produced by the same technique. Preliminary work on the iron-beryllium system indicated a distinct increase of residual induction and coercive force with aging in a magnetic field. (Author)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by H. V. Anderson, Joseph S. Mathias and others. Quarterly progress rept. no. 2, 15 Oct 53-15 Jan 54, on Contract DA 36-039-sc-42580. 15 Jan 54, 34p. 6 refs.
Order from LC mi$3.00, ph$6.30 PB 149 600

The study of the influence of annealing temperature on response to magnetic annealing of the 50% iron-50% cobalt alloys was extended to include series at 720°C and 740°C. The results indicate that the maximum response obtainable appears to be independent of the annealing temperature, though the annealing time required to achieve the response decreases at the higher temperatures. The coercive force peak obtained on annealing at 675°C becomes almost non-existent at 740°C. The iron-cerium alloy investigations indicate a marked increase in coercive force and little change in induction at 10 to 100 oersteds on increasing the cerium content to 1 and 2%. The variation of B_r/B_s ratio with cerium content appears quite marked. The magnetostriction value of the 1% cerium alloy was fo found to be 1-1.5 microinches per inch ± 0.5 at 40 oersteds. Attempts to add carbon to the MnSb alloy markedly decreased the saturation. (Author) (See also PB 149 599)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by H. V. Anderson, Joseph S. Mathias and others. Quarterly progress rept. no. 3, 15 Jan-15 Apr 54, on Contract DA 36-039-sc-42580. 15 Apr 54, 92p. 55 refs.
Order from LC mi$5.40, ph$15.30 PB 149 601

One phase of the studies of ordering and magnetic annealing of the 50% iron - 50% cobalt alloy has been completed. These studies indicate that for this alloy: (1) The ordering appears to take place by two mechanisms, atomic rearrangement and nucleation and growth; (2) the maximum B_r/B_s ratio, and maximum response to magnetic anneal was obtained for the specimens treated to produce the greatest degree of order; (3) at longer annealing times anneals with the field applied continuously were more effective than anneals with the field on cooling only. A new program has been initiated on the phase of the work directed towards development of soft magnet materials with higher induction at fields of ten and one hundred oersteds. This program involves the determination of the influence of grain size on magnetic properties of alloys of 4% Molybdenum-balance iron. (Author) (See also PB 149 600)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by H. V. Anderson, Joseph S. Mathias and others. Quarterly progress rept. no. 4, 14 Apr-15 July 54, on Contract DA 36-039-sc-42580. 15 July 54, 45p. 21 refs.
Order from LC mi$3.30, ph$7.80 PB 149 602

The iron molybdenum alloy investigations indicate a marked dependence of magnetization characteristics on annealing treatment. The best averaged properties obtained to date in the investigations of these alloys are 18,100 and 15,550 gauss at fields of 100 and 10 oersteds respectively. The work done to date on magnetic alloys of non-ferromagnetic materials is summarized. Magnetic data have been reported for Mn-Sb, Mn-Ge and Mn-B binary alloys as well as some ternary alloys with carbon or boron. The calibration method for the magnetostriction measuring equipment has been improved. (Author) (See also PB 149 601)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by H. V. Anderson, Marvin C. Y. Lee and others. Quarterly progress rept. no. 5, 15 July-15 Oct 54, on Contract DA 36-039-sc-42580. 15 Oct 54, 27p. 6 refs.
Order from LC mi$2.70, ph$4.80 PB 149 603

Further results on the iron molybdenum investigations are reported. Slightly higher values of B_{100} (18100-18400 gauss) and B_{10} (15620-15850 gauss) were obtained for the 5% molybdenum alloy than thos previously reported for the 4% alloy, though tere was a concurrent increase in coercive force from approximately 0.50 oersteds. Preliminary tests on additional alloys of Manganese indicated ferromagnetism in alloys of Mn-Sn, Mn-C-Sn, Mn-Zn, Mn-Cd, Mn-C-Cd, as well as other complex alloys of the Heusler type. Initial test results are reported for alloys of Mn_xSn_y and $(Mn_4Sn)_xC_y$ types. (Author) (See also PB 149 602)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by Marvin C. Y. Lee, Joseph S. Mathias and others. Quarterly progress rept. no. 6, 15 Oct 54-15 Jan 55, on Contract DA 36-039-sc-42580. 15 Jan 55, 59p. 19 refs.
Order from LC mi$3.60, ph$9.30 PB 149 604

Work has been initiated on the iron 6.4% silicon alloy in the hope of determining the relation, if any, between the ordering reaction and the response to annealing in a magnetic field. The first series of rings prepared appear free of defects but show an abnormally low permeability. The studies of the influence of grain size on the magnetic properties of the iron-molybdenum alloy have been completed. The results as reported indicate a decrease of coercive force and an increase of low field permeability with increased grain size. The induction at high fields appears to decrease slightly with increased grain size. Further tests have been made on the Mn-Sn-C system and the Mn-Sb-C system. (Author) (See also PB 149 603)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by Marvin C. Y. Lee, Ernest Costello, and others. Quarterly progress rept. no. 7, 15 Jan-15 Apr 55, on Contract DA 36-039-sc-42580. 15 Apr 55, 36p. 8 refs.
Order from LC mi$3.00, ph$6.30 PB 149 605

The critical temperatures for ordering of the Fe-6.1% Si and the Fe-5.2% Si alloys appear to be approximately 645°C and 630°C respectively. By preannealing the iron powders in hydrogen, rings of 5.2 and 6.4% Si - balance iron have been produced with permeabilities in the annealed condition in the range to be expected from such alloys. Further magnetic results are reported for the systems Mn-Sn-C and Mn-Sb-C. Further standard X-ray patterns were run for several of the phases expected to be present in the Mn-Sn-C investigation. The "d" values are presented in this report though metallographic studies and crystal structure analyses have not been performed. (Author) (See also PB 149 604)

Institute of Research, Lehigh U., Bethlehem, Pa.
RESEARCH STUDY ON THE IMPROVEMENT OF MAGNETIC MATERIALS, by Marvin C. Y. Lee, Joseph S. Mathias and others. Final rept. for 16 July 53-15 July 55 on Contract DA 36-039-sc-42580. 15 July 55, 40p. 26 refs.
Order from LC mi$3.00, ph$6.30 PB 149 606

The studies of the influence of time and temperature on the response of the 50% iron - 50% cobalt alloys to heat treatment in a magnetic field have been completed as have the studies of the influence of grain size on the magnetization curve and coercive force of iron-molybdenum. The results of these investigations are summarized. Magnetic data have been obtained on a number of alloys of manganese including alloys in the binary systems Mn-Ge, Mn-Sb, Mn-B, and Mn-Sn and the ternary system Mn-C-Sn. Some data have also been reported on preliminary studies of the Mn-Sb-C and Mn-Sb-B systems. Preliminary studies have been made of other alloys of manganese and of chromium as well as of the iron-beryllium system. Work has progressed on the construction of equipment for measuring high temperature magnetostriction and magnetocrystalline anisotropy. (Author) (See also PB 149 605)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
A SOLUTION FOR THE MAGNETIC FIELD IN FERROMAGNETIC LAMINATIONS WITH NON-LINEAR B-H CHARACTERISTICS, by K. T. Lian. Rept. on Contract Nonr-839(05). 22 Sep 59, 33p. 7 refs. Research rept. R-766-59; PIB-694; AD-229 995.
Order from LC mi$2.40, ph$3.30 PB 148 897

A technique is described for determining the field distribution inside a ferromagnetic lamination or slab when the material is excited by a step of magnetic field (H) applied to the surface. The functional form of the solution is found to be independent of the shape of the B-H characteristic. (Author)

Scripps Institution of Oceanography, U. of California, La Jolla.
GEOMAGNETIC WESTWARD DRIFT AND IRREGULARITIES IN THE EARTH'S ROTATION, by Michael G. Rochester (U. of Utah). Final rept. on Contract Nonr-2216(03). 15 July 59, 58p. 19 refs. AD-220. 218.
Order from LC mi$3.60, ph$9.30 PB 148 186

Bullard's (1950) rigid-sphere model for the steady westward drift of the Earth's non-dipole magnetic field is extended to include the magnetic coupling provided by the presence of the higher multipole fields at the core-mantle boundary. If the first 6 harmonics of the observed surface field are taken into account, the retarding couple on the mantle is increased by a factor of 1.6. Using this result it would follow from Bullard's specialized model of the core that the geomagnetic dynamo mechanism generates a toroidal field of several hundred gauss in the deep interior of the core. Time-dependent perturbations of the mantle-core coupling are investigated, and it is shown that reasonable fluctuations of the fields at the core-mantle boundary are capable of explaining changes in the length of day at the rate of order 1 msec in 10 yr. The argument provides additional evidence that the mean electrical conductivity in the bottom 2000 km of the mantle is at least 10^{-9} emu. A summary of knowledge of the distribution of electrical conductivity with depth in the Earth is given. (Author)

Electronics

Air Force Cambridge Research Center, Bedford, Mass.
A YEAR'S SAMPLING OF HIGH-FREQUENCY ARCTIC SIGNALS, by H. S. Marsh. Apr 60, 49p. 13 refs. AFCRC-TR-60-125.
Order from LC mi$3.30, ph$7.80 PB 148 967

This report covers a year's intermittent sampling at Scituate, Mass., on various High-frequency Arctic signals, predominantly the Thule 12- and 18-Mcps slant-sounder signals, with particular interest in Arctic blackout occurrences. The limited sampling possible, plus the abnormality of "normal" Arctic ionospheric conditions reduced the information gained on blackout morphology. Several definite trends that emerged are presented. Other ionospheric anomalies observed, including normal relative-frequency diurnal and seasonal variations, contrasted with their expansions during magnetic disturbances and approaching blackout conditions; brief thermal dropouts of interfering signals around sunrise and sunset and validity of Appleton-Beynon 'curved layer, thin earth' geometry when the signal is close to the MUF, are examined in some detail. THE EVALUATION OF INCOMPLETE NORMALIZATION INTEGRALS AND DERIVATIVES WITH RESPECT TO THE ORDER OF ASSOCIATED LEGENDRE POLYNOMIALS, by Raphael Tsu. Rept. on Monostatic and Bistatic Measurement of Scattering Shapes and Synthesis of Scattering Shapes, Contract AF 19(604)6157. 1 Apr 60, 23p. 7 refs. Rept. 1073-3; AFCRC-TN-60-376.
Order from LC mi$2.70, ph$4.80 PB 148 789

Material pertinent to scattering pattern synthesis is presented. The evaluation of the incomplete normalization integrals and derivatives with respect to the order of associated Legendre Polynomials are presented. These integrals arise from the study of a scatterer which has a minimum average scattering cross section in a given cone. The formulas of $(\partial P_\nu/\partial \nu)_{\nu=n}$ for n = 0, 1, 2 are obtained in closed form. Various recurrence relations are derived.

THE VELOCITY DISTRIBUTION IN A MOLECULAR BEAM, by F. O. Vonbun. 15 Mar 60, 13p. 7 refs. USASRDL Technical rept. 2103; AD-236 952.
Order from LC mi$2.40, ph$3.30 PB 149 385

The velocity distribution in a mean of molecules after it has been subjected to an inhomogeneous, cylindrical electric or magnetic field is calculated. The molecules under consideration are under the influence of a force directed toward the axis of the focusing or separating system. The resulting velocity distribution is a simple analytical function in which, p, N, q and x are practical parameters of the focusing system and the molecule itself. Expressions are derived for the average and most probable velocities in a beam leaving the focuser, as well as for the increase in total flux from the end of the focuser due to the applied field. A simple formula is given for the effectiveness of separation of molecules in various quantum states. (Author)

SCATTERING OF A PLANE WAVE ON A FERRITE CYLINDER AT NORMAL INCIDENCE, by W. H. Eggimann. Scientific rept. no. 11 on Contract AF 19(604)3887. 25 Feb 60, 26p. 3 refs. AFCRC-TN-60-380. AD-237 887.
Order from LC mi$2.70, ph$4.80 PB 148 194

The diffraction of a plane wave on a circular ferrite cylinder at normal incidence is investigated. The scattered field is found as a series of cylinder functions. The amplitude and phase of the scattered field have been calculated on a digital computer for various values of cylinder radius and permeability of the ferrite. Approximation formulas for the thin cylinder and the far field have been developed. It is found that the field is asymmetrical with respect to the scattered direction of the incident field. For certain values of the parameters, the scattered field has the form of a spiral wave, due to the precession of the magnetic dipole currents. Application of ferrite rods in scanning antenna systems seem feasible. (Author)

POLARIZATION ANALYSIS AND SYNTHESIS, by Harold L. Newman. Rept. on Contract DA 36-039-sc-75012. 10 Mar 59, 29p. 7 refs. Technical memo. no. EDL-M183; AD-213 825.
Order from LC mi$2.70, ph$4.80 PB 147 441

Problems involved in matching the polarization of a transmitter to that of a particular incoming signal are examined. This includes consideration of the parameters required for the specification of polarization, the effect on power transfer between antennas of errors in matching polarization, various means whereby polarization parameters may be measured and synthesized, and determination of the requirements of the major components of a system which will automatically accomplish polarization detection, analysis, and synthesis. TIME DOMAIN SIDELOBE SUPPRESSION, by H. H. Hougardy. Quarterly rept. no. 3, 1 Oct-31 31 Dec 59, on Contract AF 30(602)2021. [1960] 41p. 4 refs. RADC-TN-60-76; AD-237 680.
Order from LC mi$3.30, ph$7.80 PB 148 087

Analytic studies have been continued in the areas of optimum modulation forms, systems compatibility, and error analysis. A method of synthesizing the modulation for a linear array in terms of a desired sidelobe level is established, and the time domain linear array theory is extended to modulated two-dimensional apertures. Performance of time modulated antennas with regard to gain, tracking sensitivity and utility in Doppler systems is considered. Results of initial efforts on an error analysis of a modulated cosine-on-a-pedestal distribution are presented. In addition, the experimental effort in developing a receiver detection system is discussed. (Author)

A THEORY OF BUNCHING PHENOMENA IN MAGNETICALLY CONFINED BEAMS FOR FAST-WAVE MICROWAVE TUBES, by Michio Nakano. Rept. on Contract AF 19(604)4143. 1 Oct 59, 70p. Research rept. R-772-59; PIB-700; AFCRC TN-60-109; AD-234 016.
Order from LC mi$3.90, ph$10.80 PB 146 328

The possibility of high power generation from the initial gyration energy in magnetically confined electron beam through the fast-wave interaction at the cyclotron resonance is studied. It is shown that this bunching is possible in a gyrating beam interacting with an RF magnetic field. Microwave generation in plasma media is considered, because phenomena in a fully ionized plasma have much in common with those in a high density electron beam. The study of the mechanism of bunching pheomena in magnetically confined media suggests many interesting applications such as new types of amplifiers, oscillators and other relative devices. INTERFERENCE SUPPRESSION FOR AUTOMOTIVE IGNITION SYSTEMS, by A. Mason Brown. Final rept. 18 Feb 60, 23p. 3 refs. Technical rept. 070; AD-234 876.
Order from LC mi$2.70, ph$4.80 PB 147 812

A low-cost radio interference suppression harness for automotive ignition systems is being developed and is based on the following premises: (1) the mild steel sheet-metal stampings could be substituted for bronze castings as suppression shields; and (2) that standardized parts might be designed to fit all engines. Fabrication of the shielding components from sheet metal successfully resulted in providing satisfactory suppression characteristics. Standardization of parts to include 3 different types of engines was partially successful.

ATOMIC SPECTROSCOPIC INVESTIGATION OF NUCLEAR PROPERTIES, by R. H. Hughes. Technical rept. on Contract AF 18(603)26. Feb 60, 21p. 17 refs. AFOSR-TR-60-28; AD-233 294.
Order from LC mi$2.70, ph$4.80 PB 146 753

A study of the isotope shifts in the atomic spectra of the medium-weight elements was undertaken. Experimental data were obtained on the isotope shifts in the spectra of strontium, molybdenum, and ruthenium. An apparent correlation was discovered between the binding energy of the last pair of neutrons, obtained from mass spectroscopic data, and isotope shifts. (Author)

HIGH PRECISION MICROWAVE SPECTROMETER FOR 60 kMc, by Robert W. Zimmerer. Doctoral thesis. Technical rept. no. 3 on Contract Nonr-1147(05). Aug 59, 17p. 5 refs. AD-226 157.
Order from LC mi$2.40, ph$3.30 PB 148 873

A high precision microwave spectrometer incorporating several novel ideas was developed to measure the fine structure of the rotational levels of oxygen. The transitions lie between 50 and 65 kmc. The spectrometer is quite dependable. It was used for many hr of continuous operation with no adjustment. Three 60,000,000 kc oxygen lines were measured to 5 kc. The measurements are made by tuning first to one side of the absorption peak and then the other while counting the frequency against the 100 kc national standard. To record the line shape the 15 mc oscillator is tuned through the absorption line by a motor drive. The Zeeman components can be recorded by increasing the bias current in the Zeeman coil until they are resolved in the quiescent field. A normal line recording superposed on a recording of the Zeeman components is shown. The Zeeman components compare nicely with the theoretical expectation. Any contribution by the π lines was very small.

Gates and Crellin Labs. of Chemistry, Calif. Inst. of Tech., Pasadena.
THE ACTIVATION ENERGY OF INVERSION IN SUBSTITUTED 1-METHYLAZIRIDINES (N-METHYLETHYLENIMINES) MEASURED BY THE NUCLEAR MAGNETIC RESONANCE TECHNIQUE, by A. Lowenstein and John D. Roberts. Technical rept. no. 6 on Contract Nonr-220(26). 1 Sep 59, 15p. 13 refs. AD-225 557.
Order from LC mi$2.40, ph$3.30 PB 148 862

The activation energy ΔE, and frequency factor ν_o, for inversion in 1-methyl-2, 2-dimethylaziridine (I) and 1-methyl-2-methyleneaziridine (II) have been measured using the n-m-r- technique. The results are $\Delta E = 10.0$ Kcal. and $\nu_o = 5 \times 10^7$ sec.$^{-1}$ for I and $\Delta E = 6.4$ Kcal. and $\nu_o = 1 \times 10^9$ sec.$^{-1}$ for II. ΔE and and ν_o have also been measured for solutions of I in methanol and carbon tetrachloride. The results are: $\Delta E = 6.8$ Kcal.; $\nu_o = 2 \times 10^5$ sec.$^{-1}$ and $\Delta E = 7.8$ Kcal.: $\nu_o = 1 \times 10^6$ sec.$^{-1}$, respectively. (Author)

DRIFT TUBE-MASS SPECTROMETER FOR STUDIES OF THERMAL-ENERGY ION-MOLECULE REACTIONS, by E. W. McDaniel and D. W. Martin. Technical rept. no. 3 on Contract AF 18(600)1524. 20 June 60, 34p. 21 refs. AFOSR-TN-60-661; AD-239 337.
Order from LC mi$3.00, ph$6.30 PB 148 965

Apparatus has been developed for the mass spectrographic study of ion-molecule reactions occurring under gas-kinetic conditions at thermal energies. Ions are produced inside a two-foot-long drift space containing gas at a pressure of up to 0.7 mm Hg. A thermionic source utilizing a thoriated iridium filament is used for this purpose. The ions diffuse down the drift tube under the action of a weak electric field and pass through a small aperture at the end into a field-free, two-stage differential pumping chamber. From the second stage of this chamber the ions enter a 60° magnetic deflection mass spectrometer. The number of ion-molecule collisions in the drift tube may be varied over a wide range by changing the source position and the gas pressure, and information concerning the nature and probability of various reactions is revealed by the resulting changes in mass spectra. The apparatus may also be used for surface reaction studies, ionic mobility measurements, and for crude investigations of the lifetimes of unstable ions against spontaneous disintegration. (Author)

EQUILIBRIUM EMISSIVITY CALCULATIONS FOR A HYDROGEN PLASMA AT TEMPERATURES UP TO 10,000°K, by D. Olfe. Technical rept. no. 14 on Contracts AF 18(603)2 and Nonr-220(03). May 60, 69p. 53 refs. AFOSR-TN-60-669; AD-239 405.
Order from LC mi$3.90, ph$10.80 PB 149 142

The important equilibrium emission processes in a hydrogen plasma have been investigated in the temperature range between 300°K and 10,000°K for pressures up to several hundred atmospheres. Representative emissivity calculations have been carried out for a transparent gas at a total pressure of 100 atmos and a mean beam length of 30 cm. Important emissivity contributions were made by the pressure-induced fundamental vibration-rotation band and rotational lines of H_2 at the lower temperatures, i. e., below approximately 4500°K. Above this temperature, the bound-free and free-free transitions of the H^- ion and the continuum and line radiation of the H atom are the most important contributors to the emissivity. The following emission processes were also investigated: the bound-free transitions of the H_2^+ ion, free-free transitions of colliding H atoms and H^- ions, electronic transitions of the H_2 molecule, quadrupole vibration-rotation transitions of the H_2 molecule, and vibration-rotation transitions of the HD molecule. In addition, the effects of the lowering of the ionization potentials by the fields of plasma ions and of the very broad wings of the Lyman α line have been considered. (Author)

Guggenheim Jet Propulsion Center, Calif. Inst. of Tech., Pasadena.
SHOCK-TUBE MEASUREMENTS OF THE f-NUMBER FOR THE (0,0)-BAND OF THE OH $^2\Sigma \longrightarrow {}^2\Pi$ TRANSITIONS, by M. Lapp. Technical note no. 11 on Contract AF 18(603)2. May 60, 45p. 17 refs. AFOSR-TN-60-666; AD-239 582.
Order from LC mi$3.30, ph$7.80 PB 149 139

The f-number for the (0,0)-band of the $^2\Sigma \longrightarrow {}^2\Pi$ transitions of OH has been found to be $(0.9 \pm 0.5) \times 10^{-3}$. A shock tube was used to produce hot gas samples at temperatures from 3300 to 3900°K with equilibrium partial pressures of OH of 0.004 to 0.02 atm. The emission intensities were measured photoelectrically as a function of time behind the reflected shock in a selected spectral interval. These results were then related to the f-number by means of an absolute intensity calibration. (Author)

Guggenheim Jet Propulsion Center, Calif. Inst. of Tech., Pasadena.
SHOCK-TUBE MEASUREMENTS OF THE HOMOGENEOUS RATE OF DECOMPOSITION OF NH_3 IN NH_3-Ar MIXTURES, by T. A. Jacobs. Technical note no. 12 on Contract AF 16(603)2. May 60, 12p. 14 refs. AFOSR-TN-60-667; AD-239 584.
Order from LC mi$2.40, ph$3.30 PB 149 140

The advent of the shock tube and "fast" infrared detectors have now made possible a method for the measurement of the homogeneous decomposition rate. This paper reports the results of preliminary activation energy measurements for the homogeneous decomposition of NH_3. (Author)

Guggenheim Jet Propulsion Center, Calif. Inst. of Tech., Pasadena.
VIBRATIONAL RELAXATION IN CYLINDRICAL CHAMBERS CONTAINING ISOTHERMAL, DILUTE GAS MIXTURES, by S. S. Penner, D. Olfe, and T. A. Jacobs. Technical note no. 13 on Contract AF 18(603)2. May 60, 14p. 9 refs. AFOSR-TN-60-668; AD-239 585.
Order from LC mi$2.40, ph$3.30 PB 149 141

The problem is considered of vibrational excitation in the presence of an external radiation field and deexcitation in the absence of the field for stationary, dilute systems in cylindrical containers in which surface deactivation of excited species is so effective as to reduce the concentration of vibrationally excited molecules to zero at the bounding surfaces. The rate of excitation in an external radiation field is examined and the subsequent rate of deexcitation when the external radiation field is removed.

Laboratory of Astrophysics and Physical Meteorology, Johns Hopkins U., Baltimore, Md.
INTERFEROMETRIC DETERMINATION OF FAR INFRARED LINE WIDTHS, by Ernest V. Loewenstein. Progress rept. on Contract AF 18(600)1307. 1 Jan 60, 122p. 22 refs. AFOSR-TN-60-65.
Order from LC mi$6.30, ph$19.80 PB 149 162

A study has been made of pressure broadening of two pure rotational lines: the line of ammonia at 20 cm^{-1} and that of hydrogen chloride at 40 cm^{-1}. The data have been analyzed by the Ladenburg-Reiche method to obtain the widths of the lines. The experimental uncertainties present in the data made it necessary to use the calculated line strengths in order to arrive at values of the widths. In addition, the transmission spectra of several discs of sapphire have been measured. The channel spectrum arising in the sapphire has been analyzed for index of refraction and extinction coefficient. The channel spectrum shows clearly that sapphire is birefringent. The transmission of sapphire in the far infrared has also been determined.

Massachusetts Inst. of Tech., Cambridge.
INFRARED SPECTRA OF ADSORBED MOLECULES, by Carl W. Garland. Final rept. for 1 Nov 55-30 June 69 on Contract Nonr-1841(01). 30 Oct 59, 18p. 3 refs. AD-228 622.
Order from LC mi$2.40, ph$3.30 PB 149 515

An analysis is given of work on CO chemisorbed on rhodium and on the effect of poisoning with CS_2 on the spectrum of CO adsorbed on nickel. New work on the desorption of CO from nickel samples of varying composition and the reaction of CO with nickel surfaces to form $Ni(CO)_4$ is reported. Brief mention is made of some results for CO on cobalt samples. (Author)

OPTICAL CONSTANTS OF SOME IONIC CRYSTALS IN THE REGION OF THEIR FAR INFRARED EIGENFREQUENCIES, by Ely E. Bell and Raymond L. Brown. Scientific rept. no. 2 on Contract AF 19(604)4119. 17 Nov 59, 72p. 35 refs. AFCRC-TN-60-260; AD-233 492.
Order from LC mi$4.50, ph$12.30 PB 147 807

The percent transmission of LiF, NaCl, NaBr, KCl, KBr, and KI was measured in the far infrared region of strong absorption neighboring the eigenwavelength. This was done for 3 samples of each material. The samples were prepared by evaporating, in a high vacuum, thin films (0.1 to 1μ thick) of material onto collodion substrates. The transmission measurements were made for sample temperatures of about 300°K and about 100°K. From the transmission measurements the values of the eigenwavelength for each material were determined to within ±0.1μ at both temperatures. The classical dispersion formula was assumed to describe correctly the wavelength dependence of n and k in the region of strong absorption. Values for the constants of the dispersion formula were determined which gave good agreement between the measured transmission and the transmission calculated using an approximate transmission formula. These constants were used in the dispersion formula in the calculation of values of n and k for several wavelengths within the region of strong absorption. This was done for each material at both temperatures. Where similar data existed a comparison was made with the results obtained in the present work. In all cases the agreement was within the experimental accuracy of the investigation. (Author)

THE ARC SPECTRUM OF CESIUM, by H. Kleiman and K. W. Meissner. Technical rept. no. 1 on Spectroscopic Research, Contract Nonr-1100(08). Oct 59, 39p. 31 refs. AD-228 375.
Order from LC mi$3.00, ph$6.30 PB 149 501

Precision measurements were made on 63 lines in the arc spectrum of Cs. The first 3 members of the principal series were measured interferometrically for the first time, allowing improvement in the level scheme. Comparison was made of the wavelengths emitted by 2 different light sources, a Geissler tube and an electrodeless discharge lamp, and a relative shift was found in the high members of the fundamental series. The term values found were fitted to extended Ritz type formulas with fair accuracy. The polarization formula was used to fit the fundamental series. (Author)

MASS SPECTROMETRIC STUDY OF THE HEATS OF DIMERIZATION OF THE ALKALI CHLORIDES, by Thomas A. Milne and H. Michael Klein. Technical note no. 6 on Contract AF 49(638)89. June 60, 29p. 46 refs. AFOSR-TN-60-512. AD-239 918.
Order from LC mi$2.70, ph$4.80 PB 149 159

The heats of sublimation of the important species in equilibrium with the five alkali chlorides have been determined using the Bendix time-of-flight mass spectrometer. The mass spectrometrically determined differences between the heats of sublimation of monomer and dimer have been combined with the best available value for the monomer heat of sublimation to calculate the dimerization energies for all five salts. For LiCl a trimerization energy was also determined. These results are compared with the results of previous studies. (Author)

Virginia U., Charlottesville.
ENERGY SPECTRUM OF THE PHOTONEUTRONS FROM GOLD, by R. F. Askew and A. P. Batson. Technical note on Contract AF 49(638)176. July 60, 19p. 7 refs. AFOSR-TN-60-790.
Order from LC mi$2.40, ph$3.30 PB 149 223

The energy spectrum of the neutrons produced at 90° to a gold target bombarded with 55 Mev bremstrahlung has been measured. Nuclear emulsions were used to detect the photoneutrons. The spectrum shows two peaks. The large peak at 1.25 Mev can be interpreted as due to the statistical decay of the compound nucleus. The smaller peak at about 5.5 Mev is assumed to come from a "direct" transition, as described by the Wilkinson model. In the appendix a new method is presented for the calculation of the corrections involved for those proton recoils which leave the emulsion. (Author)

ELECTRIC-FIELD-INDUCED INFRARED SPECTRUM by R. W. Terhune. Rept. on Project Michigan, Contract DA 36-039-sc-78801. May 59, 15p. 14 refs. Rept. no. 2900-1-T.
Order from LC mi$2.40, ph$3.30 PB 147 275

A supplemental technique for molecular spectroscopy has been developed to measure very small percentage absorptions in the infrared at comparatively high resolution. Changes in transmission of 1 part in 10,000 with a resolution of 1 cm^{-1} at 4000 cm^{-1} were readily measured by modulating the absorption. Electric-field-induced absorption was observed for some 8 vibration-rotation transitions of H_2 and 7 of D_2. Also, the Stark effect on an infrared active vibration of NH_3 was observed. (Author)

DETERMINATION OF DESIGN DATA FOR THE TRACKER EVALUATING SYSTEM, by A. Razdow. Quarterly rept. no. 1, 12 Jan-15 Apr 59, on Optical Tracker Evaluation and Accuracy Test System, Contract DA 36-039-sc-78271. [1959] 66p.
Order from LC mi$3.90, ph$10.80 PB 148 337

The subject of this report is the analysis of the basic problems connected with the evaluation of optical target locator systems and the search for simple solutions to these problems. It deals specifically with the compilation of data for the exact calculation of the various dimensions and angles. A detailed analysis is made of the minimum requirements for the dimensional and angular tolerances design data for the determination of baselines and the definition of errors in the test system and system under test. (Author)

Razdow Labs., Inc., Newark, N. J.
DETERMINATION OF DESIGN DATA FOR THE TRACKER EVALUATING SYSTEM, by A. Razdow. Quarterly rept. no. 2, 16 Apr-17 July 59, on Optical Tracker Evaluation and Accuracy Test System, Contract DA 36-039-sc-78271. [1959] 86p.
Order from LC mi$4.80, ph$13.80 PB 148 338

The subject of this report is the analysis of the problem of dynamic evaluation of optical trackers, the analysis of pertinent problems of geodetic measurements, the application of astronomical techniques, the analysis of energy transmission of a light link, the investigation of external error producing factors, and a preliminary design plan for the evaluation system. One version of the evaluation system was breadboarded and tested on an Askania Cine-Theodolite. Formulae are derived for the location of a concealed axis of rotation with respect to an external point and also for the transformation of externally measured angles to the coordinate system of the optical tracker. The problem of the dynamic evaluation of infrared tracking systems is investigated and a solution proposed. (Author) (See also PB 148 337)

Razdow Labs., Newark, N. J.
DETERMINATION OF DESIGN DATA FOR THE TRACKER EVALUATION SYSTEM, by A. Razdow and Elliott F. Cameron. Quarterly rept. no. 3, 18 July-19 Oct 1959, on Optical Tracker Evaluation and Accuracy Test System, Contract DA 36-039-sc 78271. [1959] 33p.
Order from LC mi$3.00, ph$6.30 PB 148 339

The scope of this report includes the design parameters of the search beam, the definition of reference lines and checking of scale accuracy by astronomical means, and a design which includes the sensing of the angular velocity of the tracker and the synchronization of the target flashes with the mid exposure position of the camera shutter. This preliminary design is adaptable to servo driven and manually operated tracking instruments which may be equipped with either single frame cameras or intermittent motion picture cameras. The theory involved in the determination of the time of transit of a particular star at a given meridian is explained and illustrated with a detailed example. The application of this theory to the static and dynamic testing of an optical tracker is further developed. (Author) (See also PB 148 338)

Scripps Institution of Oceanography, U. of California, La Jolla.
ON THE STRUCTURE OF THE LIGHT FIELD AT SHALLOW DEPTHS IN DEEP HOMOGENEOUS HYDROSOLS, by Rudolph W. Preisendorfer. Rept. no. 3-5 on Contract NObs-72039. Mar 59, 50p. 6 refs. AD-216 039.
Order from LC mi$3.30, ph$7.80 PB 148 375

Recent experimental determinations of the up and downwelling irradiances in Lake Pend Oreille are studied with the purpose of explaining certain observed nonlinear trends in the semilog plots of these irradiances at shallow depths. A mathematical model which describes these irradiances is derived from the basic equations of radiative transfer. The model explains the observed phenomena in terms of the inherent optical properties of the medium and its external lighting conditions. On the basis of the cited experimental evidence and supporting theory hypotheses about light fields in all homogeneous natural hydrosols are proposed.

THE CONTRAST TRANSMITTANCE DISTRIBUTION AS A POSSIBLE TOOL IN VISIBILITY CALCULATIONS, by Rudolph W. Preisendorfer and James L. Harris. Rept. on Contract NObs-72092. 1 Oct 58, 15p. 2 refs. SIO Ref. 58-68; AD-212 697.
Order from LC mi$2.40, ph$3 30 PB 148 377

The purpose of this note is to introduce the concept of the contrast transmittance distribution and to point out its potentially useful application to the general visibility problems in natural aerosols and hydrosols. It is shown that the contrast transmittance distribution: (a) can quite generally be assigned the status of an (apparent) optical property of scattering-absorbing media. (b) possesses certain useful analytical properties which are precisely analogous to those of the well-known beam transmittance function T_1. (c) can eliminate the need for the explicit determination of the volume attenuation function ε insofar as ε is required in the customary solution procedures of apparent contrast problems.

EXCESS NOISE IN SEMICONDUCTORS, by James J. Brophy. Rept. for 15 Nov 58-14 Nov 59 on Contract NOnr-1800(00). 22 Oct 59, 82p. 6 refs. ARF 1066, Summary rept. no. 4; AD-228 634.
Order from LC mi$4.80, ph$13.80 PB 149 505

Random electrical noise phenomena in solids was studied to understand the origin of 1/f noise in ZnO and to apply noise measurements to the problem of trapping transitions and neutral energy transport in

cadmium sulfide. A characteristic relaxation time of 500 μsec associated with exciton diffusion or other neutral transport in CdS was established from noise measurements. Under uniform illumination the current noise in single crystal CdS may be interpreted in terms of multiple trapping in shallow levels within 0.5 volts of the conduction band. Discrete levels at 0.36 and 0.43 volts were observed in lightly doped crystals. Noise measurements are particularly suitable for determination of frequency factors of such traps and values ranging from 10^8 to 10^{11} sec^{-1} are derived. It is possible to account semi-quantitatively for the 1/f noise present in some crystals on the basis of the exponential trap distribution determined from photoconductivity experiments and the constant frequency factor of these traps derived from low frequency noise measurements. MEASUREMENT OF THE COMPLEX DIELECTRIC CONSTANT OF VERY HIGH DIELECTRIC CONSTANT MATERIALS AT MICROWAVE FREQUENCIES, by Isidore Bady. 22 Apr 54, 52p. Technical memo. no. M-1569.
Order from LC mi$..60, ph$9.30 PB 149 419

Two methods for the measurement of the complex dielectric constant of very high dielectric constant materials at microwave frequencies are given. The first method is suitable for low loss or moderately lossy samples, and the second method is suitable for very lossy samples. In the first method, the sample is placed in a wave guide with a signal generator and slotted section (or pair of directional couplers) on one side, and a movable short on the other side. Measurement of the maximum and minimum VSWR's obtained when the position of the short is varied, gives sufficient information to calculate the complex dielectric constant of the sample. In the second method, the sample is placed in a wave guide with a signal generator and slotted section on one side, and a slotted section and movable short on the other side. Measurement of the ratio of the field intensities in the two slotted section as the short is adjusted to give resonance in the second slotted section, and measurement of VSWR in the first slotted section, give sufficient information to calculate the complex dielectric constant of the material. The sensitivity of the measurement can be increased by tuning out all or part of the mismatch on the generator side of the sample. (Author)

THE PRESSURE VARIATION OF THE ELASTIC CONSTANTS OF SODIUM, by W. B. Daniels. Technical rept. no. 3 on Contract Nonr-1141(05). June 58, 25p. 22 refs.
Order from LC mi$2.70, ph$4.80 PB 147 262

The pressure variation of the single crystal elastic constants of sodium at room temperature using a modified ultrasonic pulse echo method are: $dC_{44}/dP = 1.63$, $dC'/dP = 0.226$, $dB_S/dP = 3.60$.

Detroit U., Mich.
THE STUDY OF PROPERTIES OF SINGLE CdS AND ZnS CRYSTALS FOR USE AS DETECTORS IN CRYSTAL COUNTERS, by S. J. Czyzak, H. Payne and others. Technical rept. no. 5, 1 Sep 58-31 Aug 59 on Contract Nonr-1511(01). 1 Oct 59, 37p. 27 refs. AD-227 777.
Order from LC mi$3.00, ph$6.30 PB 149 503

Progress is reported on the growing of single CdS and ZnS crystals. A new technique in powder preparation has produced single crystals of greater purity. By heat treating the grown crystals hexagonal ZnS crystals were produced more easily than the cubic ZnS crystals, the reaction in the latter being sluggish. More accurate data was obtained by employing new techniques and more sensitive apparatus in the measurement of the electrical properties of CdS and ZnS. Rechecking of data shows the results to be consistent. Electron polarizabilities of free positive ions were calculated. The work on dislocation studies of Zns single crystals is being continued. (See also PB 143 223)

MICROWAVE PROPERTIES AND APPLICATIONS OF GARNET MATERIALS, by G. P. Rodrigue. Scientific rept. no. 13 on Contract AF 19(604)1084. 15 Aug 57, 26p. 27 refs. AFCRC-TN-57-786; AD-133 740.
Order from LC mi$2.70, ph$4.80 PB 146 562

The known microwave properties of the new garnet materials are summarized briefly and compared to those of the more conventional ferrites. In order to facilitate the explanation of the operation of some new types of microwave devices, recent theories of ferromagnetic resonance developed by Suhl and by Walker are outlined. Possible applications of the yttrium garnet material include low frequency conventional microwave elements, frequency doublers and detectors, a new type of microwave limiter, and the recently announced ferromagnetic amplifier. The advantages that yttrium iron garnet offer in each of these devices are briefly discussed. (Author)

Horizons, Inc., Cleveland, Ohio.
FERROELECTRIC FILMS, by Richard A. Fotland. Final rept. on Contract AF 19(604)5499. Apr 60, 18p. 3 refs. AFCRC-TR-60-141.
Order from LC mi$2.40, ph$3.30 PB 148 817

Procedures have been evolved for preparing uniform 20 micron thick films of ferroelectric sodium niobate and barium-lead titanate ceramic materials. The procedure involves first grinding the materials to colloid size. The fine particles are then dispersed in water using a colloid mill and a deflocculent. Films are then formed on a glass plate, using an organic film as an interlayer, by pouring the suspension on the plate and allowing the water to evaporate. Separation of the film from the glass plate is accomplished by rapidly volatilizing the interlayer at a high temperature. Strict attention to details of cleanliness must be observed in order to prevent the formation of pinholes in the film. Vitrification of the films is performed with the films resting on a fine particle size, partially sintered zirconia layer. (Author)

COLOR CENTER REACTIONS IN THE ALKALI HALIDES, by Jack Kingsley. Technical note no. 2 on Research on the Electronic Properties of Nonmetallic Crystals, Contract AF 49(638)529. June 60, 129p. 40 refs. AFOSR-TN-60-635.
Order from LC mi$6.30, ph$19.80 PB 148 971

A variety of experiments have been performed with the object of understanding certain color center phenomena so as to shed light on the nature of the defects in the alkali halides and the mechanisms of their formation and destruction. More specifically, these experiments were directed toward the photoconductive, bleaching and restoration properties of the V_4 center and toward a study of the details of the processes involving the destruction of V_1 centers. The majority of the experiments were performed on potassium bromide.

MOBILITY OF AN ELECTRON IN THE DONOR IMPURITY BAND OF A COMPENSATED SEMICONDUCTOR, by Alexei A. Maradudin and Barry S. Gourary (Applied Physics Lab., Johns Hopkins U.). Rept. on Contracts AF 18(600)1315 and NOrd-7386. Feb 60, 22p. 7 refs. Technical note. BN-190; AFOSR-TN-60-201; AD-234 103.
Order from LC mi$2.70, ph$4.80 PB 147 617

The motion of an electron is studied in an aperiodic one-dimensional potential consisting of a random linear array of attractive delta-function potentials of equal strength. It is shown that the ground state of this electron is nondegenerate, and that its energy is separated from that of the next higher energy state by a gap. These 2 results imply that mobility in such a system is an activated process. The relevance of the present model to impurity band conduction in nearly compensated semiconductors is pointed out, and its relation to the recent work of N. F. Mott [Can. J. Phys. 34:1356, 1956] is discussed. (Author)

FREQUENCY SPECTRA OF LATTICES WHOSE PARTICLES INTERACT WITH LONG RANGE FORCES, by John A. Davies. Doctoral thesis. Rept. on Contract AF 49(638)399. Apr 60, 195p. 20 refs. Technical rept. no. 174; AFOSR-TN-60-386; AD-237 704.
Order from LC mi$8.90, ph$30.30 PB 149 538

The properties of the normal mode frequency spectra of lattices in which long range interactions exist between the lattice particles are studied for two- and three-dimensional crystal models. The models are (1) two-dimensional square lattices with either transverse vibrations normal to the plane of the lattice, or with longitudinal vibrations in the plane of the lattice; and (2) a three-dimensional simple cubic lattice. The types of interactions assumed to exist between lattice particle are pair potentials varying as inverse powers of the distance between the interacting particles. Long range interactions are found to give rise to types of singularities in the frequency spectrum, and its derivatives, which do not occur when only short range interactions exist in the lattice. The nature of these singularities is studied, and several examples are given. A treatment of lattice models having only short range interactions between constituent particles is given for purposes of comparison with the long range potential models. (Author)

COEFFICIENTS OF CONDENSATION AND EVAPORATION, by J. P. Hirth and G. M. Pound. Technical rept no. 3 on Contract Nonr-760(17). 15 Oct 59, 35p. 50 refs. AD-229 107.
Order from LC mi$3.00, ph$6.30 PB 149 474

Since the relation between the vapor pressure of a substance and the flux of the substance leaving a surface in equilibrium with the vapor was developed, there has been a vast research effort to investigate the quantity α_j ambiguously called the condensation coefficient, the evaporation coefficient, or the accomodation coefficient. In general, α_j in condensation does not equal α_j in evaporation under similar experimental conditions as was assumed by early investigators. Also, there are often several factors affecting α_j which may or may not be mutually independent. This has resulted in doubtful interpretations of α_j in the literature. Accordingly, the following treatment of the various factors affecting J_i is presented in order that the interaction of these factors might be better understood.

Microwave Lab., Stanford U., Calif.
WALKER MODES IN LARGE FERRITE SAMPLES, by B. A. Auld. Scientific rept. no. 20 on Contract AF 19(604)1930. Apr 60, 20p. 6 refs. M. L. rept. no. 709; AFCRC-TN-60-383.
Order from LC mi$2.40, ph$3.30 PB 149 247

The modes of resonance for a ferrite strip and a ferrite post resonator between conducting planes are found by taking appropriate combinations of uniform plane wave solutions. It is shown that magnetostatic resonances (Walker modes) may exist even when the resonator dimensions are arbitrarily large, provided the mode indices satisfy certain restrictions. (Author)

TRANSMISSION LINE FORMULATION FOR SEMICONDUCTORS, by Herbert Kurss. Quarterly rept. no. 12, 1 Apr-30 June 59, on Contract DA 36-039-sc-73052. 28 Sep 59, 26p. Rept. R-523.35-59; PIB-453.35; AD-228 468.
Order from LC mi$2.70, ph$4.80 PB 146 454

A calculation of two points in the band structure of Lithium is tabulated with the aid of the new formulae for structure constants. The problem of determining those crystal planes which possess an orthogonal basis is reduced to a set of diophantine equations and, in a sense, solved. A priori constraints for the network

aspect of a set of coupled transmission lines are analyzed. These constraints are that the network conserve an inner product of terminal quantities where this inner product is (a) bilinear or (b) Hermitian-bilinear. (Author) (See also PB 145 896)

RESEARCH ON PHOTOCONDUCTIVE FILMS OF THE LEAD SALTS, by Richard L. Petritz and James N. Humphrey. 13 Nov 57, 44p. 75 refs. NAVORD rept. 6042; AD-159 799.
Order from LC mi$3.30, ph$7.80 PB 147 227

A review is given of recent research on the photoconductive process in lead salt films. The paper begins with a discussion of the basic models of photoconductivity. The majority carrier model is then analyzed in detail and formulae for the responsivity, noise, and noise-equivalent power are developed. Experimental studies of the sensitization process barrier modulation, noise, quantum efficiency, responsivity, and noise-equivalent power are then discussed in terms of the majority carrier model. (Author)

Northwestern Technological Inst., Evanston, Ill.
TEMPERATURE AND COMPOSITION DEPENDENCE OF THE STRENGTH OF Al BASE Zn ALLOY SINGLE CRYSTALS, by J. Dash and M. E. Fine. Rept. on Contract AF 49(638)524. May 60, 16p. 19 refs. AFOSR-TN-60-524.
Order from LC mi$2.40, ph$3.30 PB 149 537

The critical resolved shear stress, σ_c, of zone-hardened Al base Zn alloys was found to increase with $c_{Zn})^{1/2}$ at room temperature, suggesting that the stress necessary to shear the zones is larger than that necessary to overcome the Mott-Nabarro misfit stresses. On cooling to 4.2°K, σ_c of a particular alloy (e.g. 5.3 at .% Zn) increases considerably more than predicted. This is attributed in part to off-center cutting of zones and in part to cutting of mismatch dislocations presumed to be located in the region between the core of the zone and the depleted shell.

ELECTRON EMISSION FROM A SINGLE CRYSTAL, by E. A. Coomes. Reprint series. Technical rept. on Contract Nonr-1623(01). 12 Oct 59, 26p. 23 refs. AD-229 451.
Order from LC mi$2.70, ph$4.80 PB 149 511

A model for electron emission is presented which parallels volume transport theory and allows the interpretation of a number of perplexing experimental surface effects in a simple consistent manner. Use of the model raises the question of validity of assigning a surface potential barrier to the face of a perfect crystal. (Author)

Ohio State U. Research Foundation, Columbus.
STUDY OF THE MECHANISM OF ENDOTHERMIC REACTIONS PHOTOSENSITIZED ON SOLID SURFACES, by Jack G. Calvert. Final rept. on Contract AF 19(604)4069. Dec 59, 28p. 11 refs. AFCRC-TR-60-222; AD-233 258.
Order from LC mi$2.70, ph$4.80 PB 149 260

Samples of CdS, CdSe, and CdTe were prepared in our laboratory and/or obtained from commercial suppliers. The light-absorbing properties of the solids were determined by reflectance measurements. This work proved that CdS(s) is not suitable for use as a light-to-chemical energy converter in aqueous suspensions containing oxygen. CdSe(s)-O_2-H_2O(1) system also shown to be unsuitable as an energy converter in oxygen-containing aqueous systems. CdTe(s)-O_2-H_2O(1) system appeared to be ideally suited for consideration as a solar-to-chemical energy converter.

Pennsylvania U., Philadelphia.
INVESTIGATION OF PHYSICAL PROPERTIES OF SEMICONDUCTORS, by Max E. Caspari. Rept. on Research on Physical Phenomena Affecting the Characteristics of Electronic Components, Contract AF 33(616)3376. Apr 60, 53p. 9 refs. WADC Technical rept. 59-549.
Order from OTS $1.50 PB 161 903

Part of the research effort described in this report was devoted to the investigation of materials which may have interesting semiconducting properties at high temperatures. In particular solid solutions and compounds of metals and tungsten trioxide have been investigated. It was found that lead forms solid solutions with tungsten trioxide over a wide composition range but has metallic electrical properties. Copper tungstate and a compound containing a small amount of silver in tungsten trioxide were found to have interesting semiconducting properties. Aluminum boride was found to be a semiconductor with a large activation energy. Coupled with the preparation, chemical analysis and determination of electrical properties of these compounds, a crystal structure determination of triclinic copper tungstate was initiated. A study of the Faraday effect at microwave frequencies on n- and p-type germanium and silicon was carried out over a wide temperature range as a function of the static magnetic field, leading to information regarding the effective masses, life-times and mobilities of the charge carriers. Optical investigations of iodine single crystals showed the latter to be a semiconductor with a large activation energy. A large electrostrictive effect was measured in rutile single crystals and surface rather than volume imperfections were shown to have an effect on the breakdown strength in Harshaw KCl crystals. SILICON CRYSTAL PERFECTION STUDY, by H. U. Yearian. Quarterly rept. no. 3, 1 Dec 58-28 Feb 59, on Contract DA 36-039-sc-77991. [1959] 29p. 9 refs.
Order from LC mi$2.70, ph$4.80 PB 149 110

Single crystals of Si have been pulled from a quartz crucible heated by a regulated carbon resistance furnace in either a He or A atmosphere. A small dislocation free seed was used with <111> growth axis. Initially there was no physical separation of the gas flowing over the crucible and the radiation shielded heater. Under these conditions the dislocation density was in the neighborhood of a few tens to a few hundred per cm^2 and twinning not associated with known changes in growing conditions occurred frequently. By isolating

the crucible gas from the heater, reducing gas contamination by hydrocarbon vapors, and by careful preparation of the seed, the dislocation density was reduced to less than $10/cm^2$ in favorable cases of seeding and growth control. The only twins observed were associated with an irregularity in the temperature control which can be eliminated. The factors affecting plastic deformation during crystal growth and the optimum growing conditions were formulated. A regulated RF converter and puller were installed for experiments on extending the small seed technique to pulling from a molten zone supported by surface tension on the end of a silicon rod. Preliminary experiments with unregulated equipment gave some promise of success. (Author) (See also PB 142 703)

Rutgers State U., New Brunswick, N. J.
X-RAY STUDY OF LATTICE DEFECTS IN FATIGUED SINGLE CRYSTALS, by A. Shrier, S. Weissmann, and J. J. Slade, Jr. Technical note no. 2 on Contract AF 49(638)17. July 60, 58p. 37 refs. AFOSR-TN-60-519.
Order from LC mi$3.60, ph$9.30 PB 149 154

Annealed silver single crystals grown from the melt with a (111) orientation were subjected to cyclic bending and were studied below and above the fatigue limit (10^7 cycles). High resolution x-ray methods were employed which included the Schulz reflection topography method, the x-ray reflection microscopy method with continuous speciment rotation, the double-crystal diffractometer method supplemented by x-ray reflection microscopy and the divergent x-ray beam back-reflection method. The x-ray studies were carried out as functions of increased number of cycles and position of specimen areas and were also supplemented by microhardness investigations. It was possible to discern three distinct stages in low-stress fatigue: in high-stress fatigue the effects of all three stages were juxtaposed and the characteristic fatigue phenomena developed at a higher rate.

Stanford Electronics Labs., Stanford U., Calif.
STUDIES OF MICROPLASMAS AND HIGH-FIELD EFFECTS ON SILICON. Final rept. on Contract DA 36-039-sc-78272. 15 Feb 60, 33p; AD-236 849.
Order from LC mi$3.00, ph$6.30 PB 149 411

This study is concerned with producing a p-n junction device for obtaining high internal fields perpendicular to a silicon surface. This device will ultimately be used to study microplasmas and high field effects in silicon. The work has proceeded in three steps. The first step was to achieve a reproducible diffusion process. The next step was the construction of the device itself. Essentially, the device is a guard ring diode with a very shallow junction which under reverse bias will, hopefully, avalanche uniformly over the junction area. In the avalanche condition the device emits light in the region of breakdown, the glow being produced by hot hole-hot, electron recombination in the high fields present. The devices constructed experienced avalanche breakdown in isolated spots rather than uniform breakdown over the junction area. The attempt to correlate these breakdown spots with surface imperfections led to the discovery that surface imperfections introduced during the construction of the device were directly related to the breakdown phenomenon. Attempts to understand the nature of the surface imperfections constitute the present stage of the research. (See also PB 147 933)

DEVELOPMENT OF THE PERIODIC SHOCK WAVE TECHNIQUE AND ITS APPLICATION TO THE PREPARATION OF SEMICONDUCTOR SILICON CARBIDE, by J. Dharma Teja. Final rept. for 15 Aug 57-15 Oct 59 on Contract AF 19(604)2665. Jan 60, 165p. 77 refs. TRG-117-FR; AFCRC-TR-60-105.
Order from LC mi$7.80, ph$25.80 PB 149 789

The periodic shock tube has been investigated as a high temperature device for the pyrolytic decomposition of various organo-silicon compounds, into silicon carbide. Temperatures in the range 1100°F were produced in a periodic shock tube (gas driven jet resonance tube). Results of hundreds of experimental runs show that silicon carbide is obtained in a comparatively impure form in such a shock tube. Gram quantities of silicon carbide were thus prepared. X-ray diffraction analyses indicate that both α- and β-forms of silicon carbide are formed in the pyrolysis showing large temperature gradients in the shock tube. Since times of the order of one minute were employed in each experimental run, adequate time was not available for crystal growth, and hence only micro-crystalline silicon carbide is produced. (Author) (See also PB 138 704)

CRYSTALLOGRAPHIC AND MICROSTRUCTURAL CHANGES OCCURRING DURING THE GRAPHITIZATION OF A PETROLEUM COKE, by Aram Tarpinian. Jan 60, 46p. 25 refs. Technical rept. no. WAL TR 825.5/1; AD-234 186.
Order from LC mi$3.30, ph$7.80 PB 146 997

An analysis is made of the growth kinetics of carbon crystallites in a Gulf Coast crude petroleum coke. In the range of 2000° to 2500°C an activation energy of 90 - 120 K cal/mol was determined for growth parallel to the c-axis; from 2500° to 2800°C a lower activation energy of 20 - 30 K cal/mol was observed. Cathodic etching techniques were utilized to prepare powdered coke specimens for microstructural examination. Significant changes in microstructure were observed at approximately the same temperature range (2400° - 2500°C) in which the activation energy for crystallite growth changed to the lower value. PHENOMENOLOGICAL THEORY OF THE ONE-DIMENSIONAL STATIONARY SHOCK WAVE, by Bruno Manz. July 60, 140p. 15 refs. AFMDC TR-60-12.
Order from LC mi$6.90, ph$21.30 PB 149 306

Known results from the physics of shock waves are combined here with new results. The main features, or results, are: (1) a more refined application of the Second Law of Thermodynamics; (2) a critical review of the concept of a shock thickness as a criterion for the applicability of ordinary thermodynamics: (3) its replacement by a new criterion which is based on a formula of Enskog for the specific entropy of a heat-conducting viscous gas which departs from external equilibrium; (4) a mathematical discussion of the non-linear second-order differential equation for the velocity with respect to the possibility of oscillations occurring inside the shock zone; (5) an iteration method leading to the approximation of the original second-order differential equation by a first-order differential equation which is integrable; (6) the conclusion that the initial Mach number generally cannot exceed a certain limit which depends on the Prandtl number and which is infinite for Prandtl numbers greater than 0.56 ($\gamma = 1.4$); (7) a closed-form solution for the velocity as an implicit function of x which holds for Prandtel numbers in the neighborhood of unity and for not-too-great initial Mach numbers. (Author)

COLLISION FREE MAGNETOHYDRODYNAMIC SHOCK WAVE, by A. Kantrowitz, R. M. Patrick, and H. E. Petschek. Rept. on Contracts AF 49(638)61 and Nonr-2524(00). Aug 59, 15p. 6 refs. Research rept. 63; [AFOSR TN-59-1190] AD-228 384.
Order from LC mi$2.40, ph$3.30 PB 148 187

It is assumed that the dissipation in a collision free shock produces a random distribution to magneto-hydrodynamic waves. These waves are then treated as the fundamental particles of the plasma. A rough kinetic theory is developed which estimates the heat conduction coefficient due to the waves. Using this heat conduction coefficient, the shock thickness is estimated to be about 4 times the characteristic ion Larmour radius. This prediction is in rough agreement with experimental results obtained in a MAST device. (Author)

SUPERSONIC TWO-DIMENSIONAL MAGNETOHYDRODYNAMIC FLOW, by F. Fishman, J. Lothrop and others. Rept. on Contracts AF 04(647)278 and AF 49(638)61. Feb 59, 50p. 7 refs. Research rept. 39; [AFOSR TN-59-290; AD-212 922]
Order from LC mi$3.30, ph$7.80 PB 147 199

The problem treated in this paper is the experimental and theoretical treatment of a two-dimensional supersonic flow problem. In order to emphasize the magnetohydrodynamic effects and minimize ordinary flow effects, a problem has been chosen in which there are virtually no solid bodies in the flow field, but only a magnetic field. This situation can be approximated by using the magnetic field of a loosely wound circular solenoid. A flow perpendicular to the axis of the solenoid will have only a weak interaction with the wire of the solenoid. For reasonable magnetic field strengths the interaction with the magnetic field of the solenoid can be much larger.

ON THE THEORY OF SOME CERENKOVIAN EFFECTS, by Giuliano Toraldo di Francia. Technical note no. 7 on Contract AF 61(052)67. Feb 60, 22p. 17 refs. AFCRC-TN-60-566.
Order from LC mi$2.70, ph$4.80 PB 149 583

The field generated by a charged particle in uniform straight motion is expanded into a set of evanescent waves. The expansion is valid in any half-space with no points in common with the path of the particle. The evanescent waves may impinge on the surface of an optical diffraction grating and be diffracted. Some of the diffracted waves turn out to be ordinary plane waves, which carry energy away from the grating. It is possible in this way to explain the Smith and Purcell effect and to derive some quantitative conclusions. (Author)

ON A POSSIBLE NEW EXPERIMENTAL TEST OF GENERAL RELATIVITY THEORY, by L. I. Schiff. Technical note no. 12 on Contract AF 49(638)388. Feb 60, 10p. 8 refs. AFOSR-TN-60-199; AD-233 744.
Order from LC mi$1.80, ph$1.80 PB 147 616

An experiment is proposed that would provide a genuine test of the general theory of relativity. This consists of observation of the precession of the axis of a torque-free gyroscope that is either fixed in a laboratory (rotating with the earth), or located in a satellite. It is also suggested that a gyroscope made of a superconducting sphere supported by a static magnetic field might be used for this experiment, and possibly also for an experimental investigation of Mach's principle.

EXCITATION OF ALFVEN WAVES, by Roy W. Gould. Rept. on Advanced Propulsion Systems, Contract AF 04(647)309. 24 May 60, 26p. 7 refs. STL/TR-60-0000-09143.
Order from LC mi$2.70, ph$4.80 PB 149 896

This memorandum examines the nature of waves which can propagate in a cold plasma which is immersed in a strong magnetic field and surrounded by a perfectly conducting cylinder.

Physical Research Lab., Space Tech. Labs., Inc., Los Angeles, Calif.
MAGNETIC PLASMA PROPULSION BY MEANS OF A TRAVELLING SINUSOIDAL FIELD, by Rudolf X. Meyer. Rept. on Contract AF 04(647)309. 30 Apr 60, 19p. 8 refs. STL/TR-60-0000-09114.
Order from LC mi$2.40, ph$3.30 PB 148 923

A theoretical model for electrodeless plasma propulsion by means of a time-dependent magnetic field is considered. The plasma is propelled by the peristaltic motion caused by an externally applied travelling magnetic field. The field is sinusoidal and purely transverse in the plane of symmetry. The model is based on the assumption of a fully ionized gas of finite conductivity. The conductivity is assumed to be sufficiently high to permit neglecting the kinetic energy associated with the leakage velocity of the plasma through the magnetic field. The plasma motion is therefore determined by the equilibrium of ponderomotive force and pressure gradient, and is somewhat analogous to the flow of a cold, viscous gas percolating through a porous medium. Temperature and conductivity can be shown to be approximately constant. The quantity of greatest interest is the pressure ratio sustained per half-wavelength of the applied magnetic field. An explicit expression for the case of zero magnetic Reynolds number is given in terms of an integral over the reciprocal of a Legendre elliptic integral. Numerical results are given. (Author)

REACTION RATE DISTRIBUTIONS ON CATALYTIC SURFACES. II. COMPARISON OF EXACT AND APPROXIMATE FLAT PLATE SOLUTIONS FOR ASYMPTOTICALLY SMALL PRANDTL NUMBER, by Daniel E. Rosner. Rept. on Contracts AF 49(638)300 and AF 33(616)6216. Apr 60, 14p. 19 refs. Technical pub. no. 16; AFOSR-TN-60-690.
Order from LC mi$2.40, ph$3.30 PB 148 230

A chemical reaction rate distribution along a catalytic plate immersed in a uniform incompressible fluid stream containing a reactant in dilute amounts is shown to satisfy a familiar integral equation when the Prandtl number for diffusion ($Pr_D \equiv \nu/D$) asymptotically approaches zero. The closed form, exact solution to the catalytic plate problem provides a convenient standard against which two approximate methods, intended to span the entire range of Prandtl numbers, are compared. It is concluded from this comparison that global diffusion corrections η (= actual over-all conversion/chemically controlled conversion) computed assuming a constant (fictitious) reactant concentration along the catalytic surface probably represent exact solutions to the laminar diffusion layer equations (with first order chemical reaction) to within 4.8 percent over the entire range of Prandtl number $Pr_D = \nu/D$. Aeronautical Research Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
A STUDY OF FREE CONVECTION BOUNDARY LAYER OSCILLATIONS AND THEIR EFFECTS ON HEAT TRANSFER, by Jack P. Holman, Harold E. Gartrell, and Erich E. Soehgren. Dec 59, 42p. 7 refs. WADD Technical rept. 59-3.
Order from OTS $1.25 PB 161 941

Wave length, wave speed, and wave amplitudes of artificially induced oscillations in a free convection boundary layer on a vertical, isothermal, flat plate were measured with a Zehnder-Mach interferometer. It was found that, as the oscillations amplify in their movement up the plate, the wave energy increased more rapidly in the outer layers of the boundary layer than in the layers close to the wall. When the wave energy in the outer layers became sufficiently high transition to turbulence began. It was also observed that the time averaged heat transfer coefficient for the oscillating boundary layer was the same as the theoretical steady state value, within the range of the experimental error. LAMINAR HEAT TRANSFER AROUND BLUNT BODIES IN DISSOCIATED AIR, by N. H. Kemp, P. H. Rose, and R. W. Detra. Rept. on Contract AF 04(645)18. May 58, 36p. 12 refs. Research rept. 15.
Order from LC mi$3.00, ph$6.30 PB 147 192

In the present work the local similarity differential equations are solved exactly, with variable external pressure gradient parameter, variable $\rho\mu$, and inclusion of the dissipation term. Lewis number effects are also discussed. This is accomplished numerically by an extension of the method which Fay and Riddel used at the stagnation point. The solutions which depend on the local external flow conditions, vary around the body, in contrast to the constant values used by Lees. Attention is restricted to bodies of revolution at zero angle of incidence. Results for two-dimensional bodies could be obtained by the same method.

Avco-[Everett] Research Lab., Mass.
A QUANTITATIVE RAPID RESPONSE ATOM DETECTOR, by Kurt L. Wray. Rept. on Contract AF 04(645)18. Mar 59, 16p. 5 refs. Research rept. 46.
Order from LC mi$2.40, ph$3.30 PB 146 659

A fine platinum wire resistance thermometer which serves as a rapid response atom detector is described. The platinum wire surface catalyzes the recombination of the atoms striking it and the liberated heat of recombination increases the temperature of the wire. In use, a constant electric current is passed through

the wire and the voltage drop across the wire is monitored as a function of time on an oscilloscope. Equations are developed which quantitatively relate the observed signal to the atom concentration when the detector is simultaneously subjected to atom flux and electrical heating. An electrical calibration technique is given for the detector which is independent of a known atomic concentration. (Author)

A METHOD OF DETERMINING THE HEAT CONDUCTIVITY COEFFICIENT OF A GAS WITH A SINGLE AC HEATED HOT WIRE, by Herbert J. Bomelburg. May 60, 19p. 3 refs. Rept. no. 1107.
Order from LC mi$2.40, ph$3.30 PB 149 238

A method is theoretically derived and experimentally verified for measuring the heat conductivity coefficient of a gas with a single ac heated hot wire. It is based on the determination of the phase lag between the heating current and the resulting temperature fluctuations of the wire. For temperatures up to about 300°C the experimental results were in good agreement with existing textbook data but at temperatures above 300°C systematic deviations are evident. This paper tries to give a possible explanation for this unexpected behavior. (Author)

HEAT TRANSFER FROM SURFACES OF NON-UNIFORM TEMPERATURE DISTRIBUTION, FINAL REPORT. PART I. LOCAL RATES OF MASS TRANSFER FROM CYLINDERS IN CROSS FLOW, by H. H. Sogin, V. S. Subramanian, and R. J. Sogin. Rept. on Contract AF 49(638)46. May 60, 75p. 29 refs. AFOSR-TR-60-78.
Order from LC mi$4.50, ph$12.30 PB 149 597

This is an investigation of the distribution of the local rate of mass transfer from 4.2-in.-diameter naphthalene cylinders to air flowing normal to the axis. The air speeds, ranging from 58 to 166 ft/sec, are in the critical zone. The temperatures range from 73.6 to 84.7°F. The results in the laminar region have been compared with predictions based on the approximate boundary-layer calculations of H. Schuh and of H. J. Merk. Also, the results are compared with the heat transfer measurements of Schmidt and Wenner and of Zapp, and the mass transfer measurements of Winding and Cheney. The effect of changing the turbulence intensity of the main stream from 0.8 to 2.4 per cent by means of a wire grid is also presented. (Author) (See also PB 139 919)

Brown U. Div. of Engineering, Providence, R. I.
HEAT TRANSFER FROM SURFACES OF NON-UNIFORM TEMPERATURE DISTRIBUTION. FINAL REPORT, PART II. LOCAL SUBLIMATION FROM DISKS IN AXISYMMETRIC FLOW, by H. H. Sogin and V. Oskay. Rept. on Contract AF 49(638)46. July 60, 48p. 18 refs. AFOSR-TR-60-78.
Order from LC mi$3.30, ph$7.80 PB 149 598

The radial distribution of the local rate of mass transfer is measured on 4 in. naphthalene disks facing air streams in axisymmetric flow. The air speeds range from 71 to 128 ft/sec, and the temperature from 75 to 90°F. The results are compared with the solution by Merk. The effect of a change in turbulence intensity from 0.8 to 2.4 per cent is included. Experimental results on disks with inert central regions are compared with a wedge-type step function factor. (Author) (See also PB 149 597)

California Inst. of Tech., Pasadena.
GROWTH OF VAPOR BUBBLES IN A RAPIDLY HEATED LIQUID, by S. A. Zwick. Rept. on Contract Nonr-220(28). Sep 59, 21p. 7 refs. Engineering Div. rept. no. 85-13; AD-227 651.
Order from LC mi$2.70, ph$4.80 PB 148 895

The previous theory of the growth of vapor bubbles in superheated liquids is extended to the situation in which the rate of temperature rise of the liquid is large. Numerical solutions are presented for the early stages of bubble growth for various rates of liquid temperature rise. The asymptotic behavior of a bubble is found explicitly for a temperature rise of the liquid which is linear in the time. The asymptotic behavior consists of an early phase in which the radius increases like $t^{1/2}$ and a later phase in which the radius increases like $t^{3/2}$. These 2 phases are joined in a continuous manner. The $t^{3/2}$ solution occurs not only for rapid rates of temperature rise but also for moderate temperature rise rates provided the bubble growth is followed for a sufficiently long time. (Author)

HEAT CONDUCTION IN A MELTING SLAB: AN EXACT SOLUTION, by R. W. Sanders. Technical note on Flight Sciences. July 60, 23p. 2 refs. LMSD-288274.
Order from LC mi$2.70, ph$4.80 PB 149 327

Transient heat conduction in melting finite solids is discussed. Solutions are determined for which the melting rate is inversely proportional to the amount of unmelted material. The solutions obtained demonstrate that a better measure of accuracy for any numerical procedure is its ability to predict the melting rate and not the grosser quantity — the total amount melted. THERMODYNAMIC FUNCTIONS FOR ATOMIC IONS, by Harold W. Woolley. Rept. on Contract SWR-53-1014. Apr 57, 114p. 28 refs. AFSWC-TR-56-34; AD-96 302.
Order from LC mi$6.00, ph$18.30 PB 150 099

This report released for sale to the public 30 Aug 60.

The calculation of equilibrium thermodynamics properties of a chemically reacting mixture of gases at such high temperatures that ionic forms are appreciably present is discussed with special consideration of cluster theory.

Ohio State U. Research Foundation, Columbus.
INFRARED EMISSION SPECTRUM OF GASEOUS HBO_2. THERMAL FUNCTIONS, by D. White, D. E. Mann and others. Technical rept. no. 3 on Contract Nonr-495(12). June 59, 22p. 11 refs. RF Proj. 691; AD-220 495.
Order from LC mi$2.70, ph$4.80 PB 149 259

The system $B_2O_3(l) + H_2O(g)$ at elevated temperatures has been investigated spectroscopically in the infrared region 700 to 4000 cm^{-1}. A vapor species, HBO_2, has been identified at partial pressures of water in the range 1 to 15 mm and three emission bands of this molecule observed, at approximately 3680, 2030 and 1420 cm^{-1}. Approximate B^{-10}-B^{-11} and H-D isotope shifts are given.

Physical Research Lab., Space Tech. Labs., Inc., Los Angeles, Calif.
EXTENDED HYPERVELOCITY GAS DYNAMIC CHARTS FOR EQUILIBRIUM AIR, by Richard W. Ziemer. Rept. on Contract AF 04(647)309. 14 Apr 60, 43p. 3 refs. STL/TR-60-0000-09093.
Order from LC mi$3.30, ph$7.80 PB 149 218

The gas dynamic properties associated with a traveling normal shock, stationary normal shock, stagnation point, and reflected normal shock were computed for incident shock velocities of up to Mach 50. The computation, one of successive approximations and utilizing graphical thermodynamic data, has an estimated accuracy of 1 to 10 percent, with the major portion correct to within 5 percent. The properties of density, pressure, temperature, internal energy and enthalpy are plotted versus shock velocity for initial densities of 10^{-1} to 10^{-5} times atmospheric density and an initial temperature of 273.2°K. A Mollier diagram and an enthalpy-density cross-plot are included. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
ON NEAR-EQUILIBRIUM AND NEAR-FROZEN BEHAVIOR OF ONE-DIMENSIONAL FLOW, by Martin H. Bloom and Lu Ting. Rept. on Contract AF 40(600)732. July 60, 27p. 10 refs. AEDC TN-60-156; PIBAL R-525
Order from LC mi$2.70, ph$4.80 PB 149 747

Near-equilibrium and near-frozen one-dimensional inviscid flows downstream of an initial station at which the flow is in equilibrium have been examined by means of perturbation analyses. The near-equilibrium analysis requires the application of boundary layer techniques. The near-frozen analysis is of standard type. It is demonstrated that both types of flow behave in a frozen manner near the initial station. However the near-equilibrium flow quickly approaches the equilibrium behavior. Examples have been presented for both cases utilizing a dissociating model gas after Lighthill. Representative numerical results are included. (Author)

Princeton U., N. J.
ENTROPY PRODUCTION AND PRESSURE WAVES, by Gerald Rosen. Rept. on Project Squid, Contract Nonr-1858(25). June 59, 13p. 7 refs. Technical rept. PR-90-P.
Order from LC mi$2.40, ph$3.30 PB 146 538

Neglecting thermal conduction and viscous dissipation, the velocity-free equations of one-dimensional flow are derived with the inclusion of general fluid thermodynamics. The strength of finite amplitude pressure waves is introduced into the theory. This quantity is conserved if the entropy of each fluid particle remains constant with time. The growth or decay of the strength is examined for a perfect gas which produces entropy. (Author)

Stanford U., Calif.
THERMAL STRESS DUE TO DISTURBANCE OF UNIFORM HEAT FLOW BY CAVITIES AND INCLUSIONS, by J. N. Goodier and A. L. Florence. Rept. on Contract Nonr-225(29). 15 July 59. 101p. 3 refs. Div. of Engineering Mechanics technical rept. no. 120; AD-225 882.
Order from LC mi$5.70, ph$16.80 PB 147 799

Steady heat flow under a uniform temperature gradient in a linear isotropic homogeneous material does not induce thermal stress, if the body is free to expand. Thermal stress is induced, however, if the heat flow is distrubed by an inclusion of another material, or a cavity. Solutions are obtained of problems of this type concerning inclusions in thin plates, the special cases considered being the circular and elliptic inclusions and the insulated ovaloid hole. It was assumed that the surface of the plate is insulated. The problems are reduced to isothermal boundary load problems, and these are solved by the methods of N. I. Muskhelishvili, the regions of the inclusions being mapped conformally in the unit circle. Solutions are given of the 3-dimensional axi-symmetric problems of the spherical inclusion and the insulated prolate and oblate spheroidal cavities. Computations for the stress distribution around some prolate and oblate cavities are also presented. (Author)

Order from LC mi$2.70, ph$4.80 PB 149 018

The desired frequency behavior of the carcinotron was obtained by means of 3 servo loops. The first loop slaves the carcinotron frequency to the 14th harmonic of a frequency modulator. The linearity sweep period and endpoints of the carcinotron sweep are determined by the properties of this modulator, differing only by errors of the servo loop. A second servo loop fixes the endpoints of the modulator sweep. Crystal filters are used to provide pulses that invert the sweep direction of the modulator. The third servo loop controls the slope of the input applied to the modulator (and to the carcinotron) to ensure that the modulator reaches the inflection points of its frequency sweep in time coincidence with the sync pulses. This is accomplished by varying the gain of the amplifier in accordance with the time difference between the sync pulses and a set of pulses (called frequency pulses) that are coincident with the sweep inflection points. An error in the timing of the inflection points may require several sweep cycles for correction. For the receiver system, a super-heterodyne receiver with a tracking local oscillator was the most suitable. Tests on a local oscillator for the receiver are in progress.

Airborne Instruments Lab., Inc., Mineola, N. Y.
TIME-FREQUENCY VARIATION OF TROPOSPHERIC SCATTER PROPAGATION, by W. E. Landauer. Quarterly rept. no. 3, Nov 57-Jan 58, on Contract DA 36-039-sc-73276. 17 Feb 58, 19p. Rept. no. 4231-1-3; AD-159 114.
Order from LC mi$2.40, ph$3.30 PB 149 019

The design of the transmitter was revised because of difficulties encountered in the servo loop that was utilized to align the frequency inflection pulses with the synchronizing pulses. Instead of fixing the endpoints of the frequency sweep by crystal filters and using the difference in time between the frequency and synchronizing pulses to control the slope of the sweep voltage, the frequency sweep will be inverted at fixed moments of time, as determined by the synchronizing pulses. A voltage-sensing circuit at the discriminator output was used to identify the location of the signal frequency within the IF amplifier pass band. The AFC level sensor permitted data display only when the discriminator output was within limits corresponding to intermediate frequency within about 1 or 2 db of the peak response of the IF pass band. The characteristic of the discriminator is such that the second range of frequencies corresponds to frequencies at which the IF gain is more tha 40 db below its center frequency gain. An oscilloscope type of frequency-time-intensity display was chosen. Preliminary measurements were performed on the integrator that provides the sweep voltage. The IF amplifier, limiter, and discriminator were constructed. (See also PB 149 018)

Airborne Instruments Lab., Mineola, N. Y.
TIME-FREQUENCY VARIATION OF TROPOSPHERIC SCATTER PROPAGATION, by W. E. Landauer and J. C. Greene. Annual rept. (Final) on Contract DA 36-039-sc-73276. Feb 59, 47p. 2 refs. Rept. no. 4231-1. Order from LC mi$3.30, ph$7.80 PB 149 022

A tropospheric scatter link has been established in France using a transmitter with a frequency that is swept in a triangular fashion between 3100 and 3600 Mc at a 10-cps sweep rate. A superheterodyne receiver, with a local-oscillator sweep synchronized with the transmitter sweep, is used to measure the amplitude of received signals as a simultaneous function of frequency and time. Preliminary data from this link show that there are many frequency bands within the swept-frequency range where the received signal level exceeds the median level by about 10 db. These privileged transmission bands are relatively stationary in frequency and time, being generally wider than 4 Mc (ofteh 10 to 20 Mc wide) and persisting for periods of from 5 to 20 seconds. These data suggest the possibility of a scatter link using a frequency-seeking system to exploit the privileged transmission frequencies, and are also of considerable interest in the theory of scatter propagation. THE SPECTRAL DENSITY OF A MULTIPLY SCATTERED ELECTROMAGNETIC FIELD, by Dimitri S. Bugnolo. Doctoral thesis. Final rept. on Contract AF 49(638)350. 31 May 60, 89p. 8 refs. CU-13-60-AF-350-EE; AFOSR-TR-60-10.
Order from LC mi$4.80, ph$13.80 PB 149 783

This dissertation is concerned with the derivation of a transport equation for the spectral distribution of the photon density function in positional velocity space. The general theory is applied in detail to the case of multiple scattering by random dielectric noise and is independent of any particular model. A method of solution is developed for the special case of forward scattering. The results are applied in detail to the earth's troposphere.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
SIGNALS REFLECTED FROM THE MOON, by H. D. Webb. Final rept. for 1 Feb 57-31 Dec 59 on Contract DA 36-039-sc-73163. 29 Feb 60, 75p. 25 refs. AD-236 064.
Order from LC mi$4.50, ph$12.30 PB 149 015

The modifications made in the antenna and receiving equipment, and the development of supplementary equipment are described. The reception of moon reflections at 151.11 mc, 413 mc, and 448 mc are summarized. Other types of signal reception include satellite signals, signals at 151.11 mc by scatter mechanism, and radio noise from the sun and radio stars. A history of refiction of radio waves from the moon is given. A development of an equation for Faraday rotation in mks units is given. Some data were analyzed for Faraday rotation and some for amplitude fading. The Faraday rotation was used to calculate the change in electron content following ionospheric sunrise and shortly before sunset. Changes of about 1.8×10^{15} electrons/sq m/min were

obtained. Fading rates were analyzed by autocorrelograms. Propagation path attenuation is given, but the values are in doubt because of lack of knowledge of transmitter characteristics. (Author)

RADIO REFRACTION IN A COOL EXPONENTIAL ATMOSPHERE, by J. R. Bauer, W. C. Mason, and F. A. Wilson. Rept. on Contract AF 19(122)458. 27 Aug 58, 32p. 9 refs. Technical rept. no. 186; AD-202 331.
Order from LC mi$3.00, ph$6.30 PB 147 347

Equations are derived for computing the height of a radar target or other radio scatterer as a function of observed (or virtual) slant range and elevation angle of arrival for the case of propagation through a spherically symmetric nondispersive atmosphere with an arbitrary refractive index distribution n(h). The method is applied to calculate propagation through the lower atmosphere when the refractive index of the troposphere obeys the exponential law $n(h) = 1 + \alpha \cdot \exp[-\beta h]$. When these results are compared with calculations based on the 4/3 earth's radius principle, serious discrepancies are found in the latter principle at ranges exceeding about 100 n. mi. Interpolated values of height vs range for the exponential model are tabulated in 10-n. mi. intervals of range to a maximum range of 360 n. mi., for elevation angles of 0^{o} to 90^{o}, to a maximum height of 100,000 feet.

RELATION BETWEEN A CLASS OF TWO-DIMENSIONAL AND THREE-DIMENSIONAL DIFFRACTION PROBLEMS, by L. B. Felsen and S. N. Karp. Rept. on Contract AF 19(604)4143. 12 Jan 59, 26p. 7 refs. Scientific rept. no. R-694-58; PIB-622; AFCRC-TN-59-130; AD-210 493.
Order from LC mi$2.70, ph$4.80 PB 146 526

By means of a certain transformation, a relationship is demonstrated between a class of two-dimensional and three-dimensional scalar or electromagnetic diffraction problems. The basic three-dimensional configuration consists of a perfectly reflecting half plane excited by a ring source centered about the edge and having a variation $\exp(\pm i\phi/2)$, where ϕ is the azimuthal variable; in addition, a perfectly reflecting rotationally symmetric obstacle whose surface is defined by $f(\rho, z) = 0$ (ρ, z are cylindrical coordinates), may be superposed about the edge (z-axis). This problem is shown to be simply related to the two-dimensional one for the line source excited configuration $f(y, z) = 0$, where y and z are Cartesian coordinates. Various special obstacle configurations are treated in detail.

ELECTROMAGNETIC PROPAGATION STUDY, by Robert J. Solem and John H. Thess. Semi-annual rept. for period ending 31 Mar 59 on Contract DA 36-039-sc-74841. [1959] 35p. 7 refs. AD-228 363.
Order from LC mi$3.00, ph$6.30 PB 149 371

Ducting (or trapping), a special case of tropospheric refraction, is shown to be a possible model of propagation of energy between two AN/PPN-13 equipments. This phenomena is described in terms of refractive modulus, and the mechanics of duct trapping are briefly presented from a qualitative ray-tracing aspect. Further, a background in meteorology, and those atmospheric conditions which lead to the formation of ducts, is presented. A study of the effects of multi-path propagation on AN/PPN-13 system distance-measuring accuracy is made. An equation for the envelope of the total response to two signals (a typical multi-path situation) is developed on the Appendix and applied to several examples of reflection percentages and time delays. These examples are illustrated and the indicated errors resulting from the various conditions imposed are tabulated. (Author) (See also PB 149 371)

Studies of natural electric and magnetic fields
A proposed experiment to determine ELF propagation characteristics

Electrical resistivity studies on the Athabasca Glacier, Alberta, Canada
Half wave cylindrical antenna in a dissipative medium: current and impedance
A very-low frequency antenna for investigating the ionosphere with horizontally polarized radio waves
Sub-audio frequency (1 to 50 c/s) geomagnetic fluctuations at Denver, Colorado
Dipol radiation in a conducting half-space
Possible application of the system loss concept at ELF
Some ELF phenomena
Field strength measurements in fresh water
Slow tails from intra-cloud lightning discharges
Mode theory and the propagation of E.L.F. radio waves
ELF electric fields from thunderstorms
Useful radiation from an underground antenna

RCA Victor Co., Ltd. (Canada).
ELECTROMAGNETIC WAVE PROPAGATION OVER THE SURFACE OF THE EARTH (ELECTROMAGNETIC WAVE PROPAGATION OVER NATURAL OBSTACLES). Final rept. on Contract AF 19(604)3049. Mar 60, 104p. 30 refs. AFCRC-TR-60-138-1.
Order from LC mi$5.70, ph$16.80 PB 148 790

Scale model laboratory experiments have been utilized to simulate the propagation of electromagnetic waves over the surface of the earth. The major advantage of the scale model techniques has been the ease with which control can be exercised over the pertinent parameters. As a result, the influence of critical factors could be specifically ascertained. Two general aspects of propagation over the earth's surface have been of concern, namely, the effect of the shape of dominant obstacles, such as mountains, on wave propagation and secondly the effect of the location and nature of reflecting ground on the radio energy at the receiving site. This report deals with electromagnetic wave propagation over dominant obstacles.

Stanford Electronics Labs., Stanford U., Calif.
NIGHT-TIME EQUATORIAL PROPAGATION AT 50 Mc/s; FINAL RESULTS FROM AN IGY AMATEUR OBSERVING PROGRAM, by M. P. Southworth. Final rept. on Contract AF 19(604)5235. 31 May 60, 142p. 16 refs. [AFCRC] TR-60-281.
Order from LC mi$7.20, ph$22.80 PB 149 307

Transequatorial scatter or "TE" causes vhf signals to propagate over 5,000-10,000-km transequatorial paths during the evening hours. Diurnal and seasonal plots are presented for typical paths, and it is concluded that there are actually two kinds of evening transequatorial propagation. The first type provides steady signals and is best between 1800 and 1900 local time. The second gives signals a deep flutter fade and maximizes at 2000-2200 local time. Both types occur most often during the equinoxes. The optimum path for both is one symmetrical both geographically and magnetically to the magnetic dip equator, normal to the magnetic equator and about 6000 km long. Amateurs often make contacts over distances of 200-4000 km at the same time TE is present. Amateur work in South America is compared with results from 50- to 50-Mc backscatter soundings made at Puerto Rico. TE is shown to correlate negatively with magnetic activity and positively with spread F and with the height of the F-layer on the equator at 1900 local time. Either magnetic or h'F data for this hour can be used to predict spread F and TE a few hours later, especially at the equinoxes. The early type of TE is believed to involve the "billiard ball" mode in which there are two successive reflections from either side of the equatorial bulge in the ionosphere without any intermediate ground reflection. The type of TE with fluttery signals is believed to be F scatter from turbulence caused by the collapsing equatorial bulge.

Woods Hole Oceanographic Institution, Mass.
RADIATION OF WAVES FROM A POINT SOURCE, by Robert McKelvey. Technical rept. on Contract Nonr-891(00). May 59, 15p. 3 refs. Reference no. 59-23.
Order from LC mi$2.40, ph$3.30 PB 146 570

The object of this note is to obtain an expression for a radiation solution of the wave equation in medium which is in general inhomogeneous and non-isotropic. The form of solution obtained is identical with that found by the method of Hadamard. We give a direct verification which avoids many of the complications of that method but which preserves its spirit. The particular case of an isotropic continuously stratified medium is worked out in detail. (Author)

RESEARCH METHODS, TECHNIQUES AND EQUIPMENT

Naval Ordnance Test Station, China Lake, Calif.
EXPERIMENTAL DESIGN AND USEFUL TECHNIQUES OF ANALYSIS, by R. L. Eidemiller. 2 Apr 59, 60p. 21 refs. NOTS TP 2186; NAVORD rept. 6466; AD-216 636.
Order from LC mi$3.60, ph$9.30 PB 147 608

The planning and conducting of statistically designed experiments and the selection of actual designs are discussed. Several techniques that are useful in the analysis of observed data of an experiment are included: (1) an IBM 704 program for computation and analysis, (2) two methods for estimating missing values, (3) Tukey's method for individual mean comparisons, (4) attribute analysis techniques including Fisher's "Exact Method" and Batson's proposed "Factorial Chi-Square Analysis," and (5) Box's technique for optimizing a response surface including a numerical example. The appendixes contain many fractional factorial designs that are ready for use, and a direct entry table for Fisher's exact method for analyzing a 2 x 2 contingency table. (Author)

Naval Ordnance Lab., Corona, Calif.
FOUNDATIONAL RESEARCH PROJECTS. Quarterly rept. for Jan-Mar 60. June 60, 42p. 17 refs. NAVWEPS rept. 5996; NOLC rept. 503.
Order from LC mi$3.30, ph$7.80 PB 149 084

Contents:
Communication stochastics
Ferromagnetic resonance
High temperature polymer program
Infrared atomic spectra
Semiconductor physics

COMPETITIVE STABILITY UNDER WEAK GROSS SUBSTITUTABILITY: NONLINEAR PRICE ADJUSTMENT AND ADAPTIVE EXPECTATIONS, by Kenneth J. Arrow and Leonid Hurwicz. Technical rept. no. 78 on Contract Nonr-225(50). 12 Oct 59, 33p. 17 refs.
Order from LC mi$3.00, ph$6.30 PB 149 487

McKenzie's dynamic system, which is the most general yet proposed, is considered, and it is demonstrated that if there exists at least one strictly positive equilibrium, then the path defined by the dynamic system from any starting point will converge to a limit which, of course, must be an equilibrium. This theorem is stronger than McKenzie's in the sense that the type of stability proved is somewhat stronger. The method of proof is somewhat novel. (See also PB 147 058)

California U., Los Angeles.
AN ECONOMIC ANALYSIS OF THE SHORT RUN EQUILIBRIUM OF A JOB SHOP--AN EXTENSION OF THE THEORY OF THE FIRM, by Yoshiro Kuratani. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 8 July 58, 11p. 1 ref. Discussion paper no. 71.
Order from LC mi$2.40, ph$3.30 PB 148 837

An economic analysis on the job shop's behavior heretofore unattempted in the traditional economic analysis. Attention has generally been focused on the type of the firm which produces for the market and not to customers' orders. The analysis of the present paper is aimed toward firms producing to fill orders already on hand. The presentation is general and applies to many subcontractor types of firms in whose operation delivery time plays a strategic role. (Author)

California U., Los Angeles.
PRICE-TEMPORAL EQUILIBRIUM -- AN EQUILIBRIUM ANALYSIS OF MARKETS UNDER CONTRACTS, by Yoshiro Kuratani. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 12 May 59, 16p. 4 refs. Discussion paper no. 72.
Order from LC mi$2.40, ph$3.30 PB 148 838

A standard demand and supply analysis seldom goes beyond price and quantity dimensions and even in the case where a third factor, quality variations for example, is considered, the other independent variable namely, price, is treated as a parameter. While this approach has a great merit of simplicity, it is bound to become utterly inadequate when the parametric treatment of one factor grossly distorts the market behavior due to the wilful neglect of the interrelation among the factors. The analysis presented here aiming at the behavior of the market under contracts is the first step towards constructing a more general theory of the firm which considers eventually all the relevant factors simultaneously, including the traditional demand and supply analysis as a special case. (Author)

California U., Los Angeles.
UCLA EXECUTIVE DECISION GAMES, by James R. Jackson. Rept. on Management Sciences Research Proj. [Contract Nonr-223(02)] 9 Dec 58, 7p. Research rept. no. 58.
Order from LC mi$1.80, ph$1.80 PB 148 835

This report consists of a brief description of UCLA Executive Decision Game No. 2, and an even shorter preliminary description of the new Game No. 3.

Minnesota U., Minneapolis.
PORTS AND ECONOMIC DEVELOPMENT IN BORNEO, by Jan O. M. Broek. Final rept. on Contract Nonr-710(09). June 59, 26p.
Order from LC mi$2.70, ph$4.80 PB 146 409

Minnesota U., Minneapolis.
TRADE AND TRADE CENTERS OF SARAWAK, by Jan O. M. Broek. Technical rept. no. 3 on Contract Nonr-710(09). June 59, 41p. 17 refs.
Order from LC mi$3.30, ph$7.80 PB 146 410

MISCELLANEOUS

Naval Research Lab., Washington, D. C.
REPORT OF NRL PROGRESS, Sep 60.
Order from OTS $1.25, $10.00/year PB 161 285

Contents:
Articles:
The development of nuclear propulsion in the Navy
An investigation of the possible variations in the centimeter wave emission from Jupiter, by E. F. McClain, J. H. Nichols, and J. A. Waak
High temperature oxidation of iron-chromium binary alloys in water vapor, by C. T. Fujii and R. A. Meussner
Scientific program:
Applications Research: Relationship of retinal-gain index to system performance
Astronomy and Astrophysics: Observations of enhanced solar radiation at centimeter and millimeter wavelengths
Chemistry: Effect of high temperature on the formation of insolubles in jet fuel. Corrosion of stainless steels exposed to tropical environments over a period of 8 years
Mechanics: Minimum toughness requirements for high-strength sheet steel. Instrumentation for high-speed strain testing. Thermoelectric power measurements on dehydrogenated palladium. Hydrodynamic forces on a vibrating cylinder close to a rigid wall (part 1). Methods for determining natural frequency of piezoelectric accelerometers. Impact damage to materials inflicted by 0.2-gm projectiles fired in excess of 22,000 ft/sec by an improved light-gas gun
Metallurgy and Ceramics: Mold materials for casting titanium-base alloys. Vacuum induction melting--oxygen and carbon in iron. Effect of sintering pressure and time on the oxide bond strength for 99.8% pure nickel specimens. Pile measurements of the Hall coefficient and conductivity of silicon. Special

high-temperature apparatus for studying the radiant energy transmission properties of beryllium oxide. Formation rate of $CbZn_3$ on columbium in zinc vapor. Oxidation study of metals containing zinc in solid solutions. Vacuum-stream degassing of aluminum alloys (analysis control). Stability of protective spinel films on steel under conditions encountered in steam power systems

Nuclear and Atomic Physics: Neutral pion lifetime. On tables of integrals related to the Planck radiation function

Optics: An f/6.6 high-dispersion, time-resolving, grating spectrograph

Radio: Passive transistor-core electronic computer switching circuits. Satellite communication systems (ECHO I and CMR)

Solid State Physics: Dynamic proton spin polarization. Design and instrumentation of a Pound-Watkins nuclear magnetic-resonance spectrometer. On the nature of vibrational modes in ionic crystals. K-series x-ray excitation efficiencies for bulk specimens

Sound: Mechanical self-resistance and mechanical mutual resistance of unbaffled rigid disk (ka 1) radiating sound from a single face into an acoustic medium. Radiation mechanical impedance of multi-zone radiators in a prolate spheroidal baffle

Supporting Techniques:

A Vibration-Free Base

Articles:

Parametric amplifiers in radar astronomy, by F. Wrigley, K. J. Craig, and B. S. Yaplee

Trace analysis and its application at NRL, by S. H. Cress and O. R. Gates

Scientific program:

Astronomy and Astrophysics: Atmospheric scattering of visible and infrared radiation

Chemistry: Effect of chemical structure on the spontaneous ignition of hydrocarbons. Synergistic surface tension effects from mixtures of fluorinated alcohols with conventional wetting agents. Analysis of contaminants in aviators' breathing oxygen

Mechanics: Effect of differential temperatures on the fracture toughness of stretch-oriented MIL-P-8184 acrylic. Absolute thermoelectric power measurements on Pd-Ni specimens at temperatures from that of liquid nitrogen to about 0°C. Probability of an incapacitation as a function of height above ground

Metallurgy and Ceramics: Fracture toughness of high-strength sheet titanium alloys. Crystallographic study of Cb_2Zn_3. Preliminary data on post-irradiation heat treatment for recovery of material properties. Progress report on the protection of refractory metals for high-temperature service. Performance of galvanic anode cathodic protection system for Navy ships

Nuclear and Atomic Physics: Gas chromatographic analysis technique useful in radiation chemistry

Radio: Improved antenna tuning procedure for the AN/FRT-4 communication facility. A semiconductor binary coordinate converter. Wind-induced torques measured on a large antenna

Solid-State Physics: Transparent cathodoluminescent films of zinc and cadmium silicates formed by solution spraying. Pressure effects on the absorption spectra of phosphors (NH_4Br:Pb and CsCl:Pb)

ATOMIC ENERGY COMMISSION REPORTS

Reports may be purchased in accordance with instructions on the inside front cover of the U. S. GOVERNMENT RESEARCH REPORT. As PB numbers are not indicated, order by series and number. These reports may also be consulted at any AEC Depository Library. A list of these libraries may be obtained from the U. S. Department of Commerce, Office of Technical Services, Washington 25, D. C.

Reproduction in whole or part of any report listed herein is encouraged by the U. S. Atomic Energy Commission, subject to the approval of authors or originating sites. General inquiries from the industrial press about AEC-developed information should be directed to the Industrial Information Branch, Atomic Energy Commission, Washington 25, D. C.

Biology and Medicine

Semiannual report to The Atomic Energy Commission, by L. O. Jacobson and M. Doyle. Argonne Cancer Research Hospital, Chicago, Ill. Mar 60. Contract AT-(11-1)-69. 118p. Order from OTS. $2.75. ACRH-13

Metabolism of W^{185} in the rat, by J. E. Ballou. Hanford Atomic Products Operation, Richland, Wash. Mar 60. Contract AT(45-1)-1350. 12p. Order from OTS. 50 cents. HW-64112

Blast biology. Technical progress report, by C. S. White and D. R. Richmond. Lovelace Foundation for Medical Education and Research, Albuquerque, N. Mex. Sep 59. Contract AT (29-1)-1242. 89p. Order from OTS. $1.00. TID-5764

A trapezoidal-wave electromagnetic blood flowmeter, by H. M. Yanof and P. Salz. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 42p. Order from OTS. $1.00. UCRL-9204

Toxicology of beryllium: A bibliography, by E. D. Hutchinson and others. The University of Rochester, Rochester, N. Y. Mar 60. Contract W-7401-eng-49. 74p. Order from OTS. $2.00. UR-570

The accumulation of Po^{210} in the rat during multiple inhalant exposures, by H. L. Berke and A. C. Di Pasqua. The University of Rochester, Rochester, N. Y. July 60. Contract W-7401-eng-49. 35p. Order from OTS. 75 cents. UR-573

Biological effects of nuclear radiation on the monkey (Macaca Mulatta): Two-year evaluation, by J. E. Pickering and others. School of Aviation Medicine, U. S. Air Force, Brooks Air Force Base, Tex. June 59. 51p. Order from OTS. $1.25. WT-1542

Chemistry—General

Kinetics of dissolution of zirconium in molten uranium, by G. H. Golden. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 38p. Order from OTS. $1.00. ANL-6167

Counting individual alpha activities in mixtures, by J. Sadauskis. Argonne National Laboratory, Argonne, Ill. June 60. Contract W-31-109-eng-38. 20p. Order from OTS. 50 cents. ANL-6186

Nuclear magnetic resonance spectra of trialkyl phosphates and related compounds. I. Proton magnetic resonance spectra, by W. E. Shuler and R. C. Axtmann. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. June 60. Contract AT(07-2)-1. 48p. Order from OTS. $1.50. DP-474

Thermodynamic and transport properties of helium, by M. P. Wilson, Jr. General Dynamics Corp., Electric Boat Div., San Diego, Calif. Jan 60. Contract AT(04-3)-187. 144p. Order from OTS. $2.75. GA-1355

Corrosion control of copper and steel by vacuum deaeration, by M. E. Tester. Goodyear Atomic Corp., Technical Div., Process Engineering Dept., Portsmouth, Ohio. May 60. Contract AT-(33-2)-1. 14p. Order from OTS. 50 cents. GAT-296

A versatile autoclave facility for aqueous corrosion research, by V. H. Troutner. Hanford Atomic Products Operation, Richland, Wash. Contract

AT(45-1)-1350. 30p. Order from OTS. 75 cents. HW-64111

Decomposition of nitrous oxide. Final report, by J. H. Zufall and H. S. Miller. Phillips Petroleum Co., Atomic Energy Division, Idaho Operations Office, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 19p. Order from OTS. 50 cents. IDO-14513

Transport numbers in pure fused zinc chloride, by A. Lunden. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. Apr 60. Contract W-7405-eng-82. 34p. Order from OTS. $1.00. IS-114

Improved U^{235} measurements at the Paducah Plant through refinements in the gravimetric oxide dilution procedure, by R. F. Smith, R. E. Eby, and C. W. Turok. Union Carbide Nuclear Co., Union Carbide Corp., Paducah Plant, Paducah, Ky. July 60. Contract W-7405-eng-26. 14p. Order from OTS. 50 cents. KY-349

Tabulated values of thermal diffusion column shape factors for the Lennard-Jones (12-6) potential, by B. B. McInteer and M. J. Reisfeld. The University of California, Los Alamos Scientific Lab., Los Alamos, N. Nex. Oct 59. Contract W-7405-ENG-36. 56p. Order from OTS. $1.75. LAMS-2413

Thermal conductivity and thermal expansion of B_eO at elevated temperatures, by R. E. Taylor. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Cnntract AT(11-1)-GEN-8. 19p. Order from OTS. 75 cents. NAA-SR-4905

P-V-T relationships of BF_3 gas, by C. R. F. Smith. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 31p. Order from OTS. 75 cents. NAA-SR-5286

The cadmium--cadmium halide systems, by L. E. Topol and A. L. Landis. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 15p. Order from OTS. 50 cents. NAA-SR-5310

Liquidus curves for molten alkali metaphosphate-sulfate systems, by S. W. Mayer and others. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 15p. Order from OTS. 50 cents. NAA-SR-5334

The thermostability of thorium tetraiodide, by A. L. Landis and A. J. Darnell. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 15p. Order from OTS. 50 cents. NAA-SR-5394

Green salt Pilot Plant final report, by R. Braddock and others. Mallinckrodt Chemical Works, St. Charles, Mo. Mar 43. Decl. July 12, 1960. 54p. Order from OTS. 50 cents. NYO-5029

Hydrides of metals and metalloids. A literature search. Tufts University, Medford, Mass. July 60. 164p. Order from OTS. $2.75. TID-3902

I. Beta-spectroscopic studies in the promethium region. II. The coriolis interaction in deformed nuclei. Thesis, by T. V. Marshall. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 73p. Order from OTS. $1.75. UCRL-8740

Fission of gold with 112-Mev C^{12} ions: A yield-mass and charge-distribution study. Thesis, by H. M. Blann. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. OTS $1.75. UCRL-9190

Thermal ignition and response of materials, by K. P. Laughlin. Office of Civil and Defense Mobilization, Battle Creek, Mich. July 60. 58p. Order from OTS. $1.25. WT-1198

Preparation of dense, spheroidal UO_2, by R. P. Levey, Jr. Union Carbide Nuclear Co., Division of Union Carbide Corp., Y-12 Plant, Oak Ridge, Tenn. Aug 60. Contract W-7405-eng-26. 25p. Order from OTS. 50 cents. Y-1299

Preparation of uranous oxalate, by L. R. Phillips and others. Union Carbide Nuclear Co., Division of Union Carbide Corp., Y-12 Plant, Oak Ridge, Tenn. Aug 60. Contract W-7405-eng-26. 18p. Order from OTS. 50 cents. Y-1308

Chemistry—Radiation and Radiochemistry

Radiation processing report no. 1: Gamma irradiation experiments in the N_2-O_2 system, by M. Steinberg. Brookhaven National Laboratory, Associated Universities, Inc., Upton, N. Y. June 60. 17p. Order from OTS. 50 cents. BNL-612(T-182)

Radiation processing report no. 2: Irradiation of NH_3-H_2O solutions for formation of hydrazine, by M. Steinberg and others. Brookhaven National Laboratory, Upton, N. Y. June 60. 7p. Order from OTS. 50 cents. BNL-613(T-183)

Precipitation of radioruthenium, by F. E. Butler. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. June 60. Contract AT(07-2)-1. 11p. Order from OTS. 50 cents. DP-494

The mass spectra of deuterated biphenyls: mechanisms of hydrogen and carbon loss processes, by J. C. Burr, J. M. Scarborough and R. H. Shudde. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 29p. Order from OTS. 75 cents. NAA-SR-4960

Some factors correlating the rates of gas formation in the radiolysis of aromatic hydrocarbons, by J. G. Burr and J. D. Strong. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 11p. Order from OTS. 50 cents. NAA-SR-4962

Chemistry—Separation Processes for Plutonium and Uranium

Chemical Engineering Division summary report for January, February, March, 1960, by S. Lawroski and others. Argonne National Laboratory, Argonne, Ill. 1960. Contract W-31-109-eng-38. 192p. Order from OTS. $2.75. ANL-6145

Reactor chemistry, by S. Peterson and R. W. Stoughton. Oak Ridge National Laboratory, Oak Ridge, Tenn. May 54. Decl. July 8, 1960. 53p. Order from OTS. 50 cents. CF-54-4-198(Rev.)

Separation processes, by I. Perlman. Argonne National Laboratory, Argonne, Ill. Sep 46. Decl. Aug 2, 1960. Contract W-31-109-eng-38. 72p. Order from OTS. 55 cents. CN-3627

Shear development for the nonproduction fuel reprocessing program. Interim report, by V. P. Kelly. Hanford Atomic Products Operation, Richland, Wash. July 60. Contract AT(45-1)-1350. 42p. Order from OTS. $1.00. HW-62842

Reprocessing uranium-molybdenum alloy fuels - dissolution in concentrated nitric acid, by W. W. Schulz. Hanford Atomic Products Operation, Richland, Wash. Mar 60. Contract AT(45-1)-1350. 16p. Order from OTS. 75 cents. HW-64432

Idaho Chemical Processing Plant technical progress report for April through June 1956, by C. E. Stevenson. Phillips Petroleum Co., Idaho Falls, Idaho. Jan 57. Decl. July 6, 1960. Contract AT(10-1)-205. 54p. Order from OTS. 50 cents. IDO-14391

Tributyl phosphate extraction of uranium from ammonium nitrate solutions, by K. L. Rohde and R. A. Kent. Phillips Petroleum Co., Idaho Chemical Processing Plant, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 16p. Order from OTS. 50 cents. IDO-14501

Idaho Chemical Processing Plant technical progress report for July through September, 1959, by C. E. Stevenson. Phillips Petroleum Co., Idaho Falls, Idaho. June 60. Contract AT(10-1)-205. 92p. Order from OTS. $2.25. IDO-14509

Idaho Chemical Processing Plant technical progress for October through December 1959, by C. M. Slansky and others. Phillips Petroleum Co., Idaho Falls, Idaho. June 60. Contract AT(10-1)-205. 85p. Order from OTS. $2.00. IDO-14512

Report of the Chemistry and Chemical Engineering Section for February, March, April, 1956, by D. H. Ahmann and others. General Electric Co., Knolls Atomic Power Laboratory, Schenectady, N. Y. July 56. Decl. July 8, 1960. Contract W-31-109-Eng-52. 98p. Order from OTS. 60 cents. KAPL-1536

Report of the Chemistry and Chemical Engineering Section for August, September, October, 1956, by D. H. Ahmann and others. General Electric Co., Knolls Atomic Power Laboratory, Schenectady, N. Y. Jan 57. Decl. July 8, 1960. Contract W-31-109-Eng-52. 105p. Order from OTS. 65 cents. KAPL-1620

Operation of the piqua OMR degasification system prototype, by G. W. Corporales and P. R. Benson. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 36p. Order from OTS. 75 cents. NAA-SR-4894

Corrosion data from the ORNL Purex Pilot Plant acid recovery equipment, by J. W. Landry and J. W. Ullmann. Oak Ridge National Laboratory, Chemical Technology Division, Oak Ridge, Tenn. Mar 52. Decl. June 18, 1960. Contract W-7405-eng-26. 71p. Order from OTS. 55 cents. ORNL-1210

Dissolution of uranium-zirconium fuel elements in fused $NaF-ZrF_4$, by R. G. Wymer and J. F. Land. Oak Ridge National Laboratory, Chemical Technology Division, Oak Ridge, Tenn. Feb 57. Decl. July 6, 1960. Contract W-7405-eng-26. 26p. Order from OTS. 35 cents. ORNL-2183

Controlled Thermonuclear Processes

Development of reliable 20 KV, size a ignitrons for thermonuclear research, by G. P. Boicourt, E. L. Kemp, and F. K. Tallmadge. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 46p. Order from OTS. $1.00. LAMS-2416

Quarterly status report of the LASL Controlled Thermonuclear Research Program for period ending May 20, 1960, by S. Glasstone. The University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 59p. Order from OTS. $1.50. LAMS-2444

A beam inflector, by F. C. Gilbert. University of California, Lawrence Radiation Laboratrry, Livermore, Calif. Nov 59. Contract W-7405-eng-48. 7p. Order from OTS. 50 cents. UCRL-5698

High-energy molecular ion injection into a mirror machine, by F. C. Gilbert and others. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Feb 60. Contract W-7405-eng-48. 26p. Order from OTS. 75 cents. UCRL-5827

Tables of functions involved in linear pinch stability criteria, by J. Killeen, W. A. Newcomb, and J. S. Vandergraft. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Mar 60. Contract W-7405-eng-48. 9p. Order from OTS. 50 cents. UCRL-5885

Controlled Thermonuclear Research quarterly report for December 1958, January, and February 1959. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 59. Decl. February 15, 1960. Contract W-7405-eng-48. 81p. Order from LC. Mi $4.50, ph $12.30. UCRL-8682

Controlled Thermonuclear Research quarterly report for December 1959, January, February 1960. University of California. Lawrence Radiation Laboratory, Berkeley and Livermore, Calif. Mar 60. Contract W-7405-eng-48. 122p. Order from OTS. $2.75. UCRL-9106

Criticality Studies

Plutonium plexiglas assemblies, by C. L. Schuske and others. Dow Chemical Co., Rocky Flats Plant, Denver, Colo. Man 60. Decl. February p6, 1960. Contract AT(29-1)-1106. 20p. Order from LC. Mi $2.40, ph $3.30. RFP-178

Criticality studies of enriched uranium metal in $UO_2(NO_3)_2$ solutions, by A. Goodwin, Jr., G. H. Bidinger, and C. L. Schuske. The Dow Chemical Co., Rocky Flats Plant, Denver, Colo. July 60. Contract AT(29-1)-1106. 19p. Order from OTS. 50 cents. RFP-182

Plutonium plexiglas assemblies. Part II, by G. H. Bidinger, C. L. Schuske, and D. F. Smith. The Dow Chemical Company, Rocke Flats Plant, Denver, Colo. July 60. Contract AT(29-1)-1106. 22p. Order from OTS. 50 cents. RFP-190

Equipment, Methods and Techniques

A bibliography on gas lubricated bearings, revised, E. B Sciulli. Franklin Institute, Laboratories for Research and Development, Philadelphia, Pa. Sep 59. Contract Nonr-2342(00) Task NR 097-343. 104p. Order from OTS. $2.50. AECU-4440

Refinements of the theory of the infinitely-long, self-acting, gas-lubricated journal bearing. Interim report, by H. G. Elrod, Jr. and A. Burgdorfer. Franklin Institute, Laboratories for Research and Development, Philadelphia, Pa. Jan 60. Contract Nonr-2342(00. 48p. Order from LC. Mi $3.30, ph $7.80. AECU-4688

Isotopic method for age determinations of industrial products. Monthly progress letter for January 1960, by T. C. Gregson and L. B. Bangs. Goodyear Tire and Rubber Co., Akron, Ohio. Contract AT(11-1)-729. 5p. Order from LC. Mi $1.80, ph $1.80. AECU-4711

An analysis of several of the variables encountered in low cycle fatigue. Interim Technical report no. 4, by W. W. Gerberich. Syracuse University, Metallurgical Research Laboratories, Syracuse, N. Y. June 59. Contract AT(30-1)-2141. 45p. Order from LC. Mi $3.30, ph $7.80. AECU-4722

Isotopic method for age determination of industrial products. Quarterly progress report for October through December 1959. Goodyear Tire and Rubber Co., Akron, Ohio. 1959. Contract AT(11-1)-719. 52p. Order from LC. Mi $3.60, ph $9.30. AECU-4724

Parallel operation of welding generators, by B. H. Butler. E. I. du Pont de Nemours & Co., Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. June 60. Contract AT(07-2)-1. 11p. Order from OTS. 50 cents. DP-482

Fabrication of the type "E" fluorine cell tank, by B. W. Clark. Union Carbide Nuclear Co., Div. of Union Carbide Corporation, Paducah, Ky. May 60. Contract W-7405-eng-26. 23p. Order from OTS. 75 cents. KY-326

OMR finned fuel plate, by R. R. Hargrove and C. R. Atomics International. Division of North American Aviation, Inc., Canoga Park, Calif. Jan 58. 10p. Order from LC. Mi $2.40, ph $3.30. NAA-SR-Memo-2354

Stresses in contoured nozzles when subjected to external loadings. Period covered October 16, 1958 to September 15, 1959, by D. E. Hardenbergh. Pennsylvania State University, University Park, Pa. Sep 59. Contract AT(30-1)-1874. 85p. Order from LC. Mi $4.80, ph $13.80. NYO-7565

A sampling device for molten-salt systems, by W. B. McDonald and J. L. Crowley. Oak Ridge National Laboratory, Reactor Projects Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 4p. Order from OTS. 50 cents. ORNL-2688

Design, development, and operation of metal-diaphragm reactor-service pumps, by E. C. Hise. Oak Ridge National Laboratory, Reactor Experimental Engineering Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 63p. Order from OTS. $2.00. ORNL-2841

An evaluation of solid moderating materials, by T. S. Lundy and E. E. Gross. Oak Ridge National Laboratory, Metallurgy Division and Reactor Projects Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 10p. Order from OTS. 50 cents. ORNL-2891

Surface temperatures of irradiated ORR fuel elements cooled in stagnant air, by J. F. Wetts, Jr. Oak Ridge National Laboratory, Operations Div., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 13p. Order from OTS. 75 cents. ORNL-2892

Fission product distribution in ORR fuel elements, by A. L. Colomb. Oak Ridge National Laboratory, Operations Division, Oak Ridge, Tenn. [nd]. Contract W-7405-eng-26. 7p. Order from OTS. 50 cents. ORNL-2897

Photoneutrons and the control of a pool-type reactor, by A. L. Colomb. Oak Ridge National Laboratory, Operations Division, Oak Ridge, Tenn. [nd]. Contract W-7405-eng-26. 8p. Order from OTS. 50 cents. ORNL-2898

Development of an electrolytic cell for removal of nickel from HRT fuel solutions, by E. L. Youngblood. Oak Ridge National Laboratory, Chemical Technology Division, Oak Ridge, Tenn. [nd]. Contract W-7405-eng-26. 21p. Order from OTS. 75 cents. ORNL-2923

Tolerances of position and form, including MMC, by Sandia Corporation, Albuquerque, N. Mex. Sep 55. 54p. Order from OTS. $1.25. SC-7016 (SP)

Environmental testing to 2000°F, by J. A. Barber. Sandia Corporation, Albuquerque, N. Mex. June 59. 16p. Order from OTS. 75 cents. SCR-96

How positional tolerancing clarifies design intent and reduces product cost, by E. S. Roth. Sandia Corporation, Albuquerque, N. Mex. Jan 60. 41p. Order from OTS. $1.25. SCR-154

The work ratio system, by C. J. McGarr. Sandia Corporation, Albuquerque, N. Mex. July 60. 14p. Order from OTS. 50 cents. SCT-220

An analysis of general stores investment, by R. M. Allan, and P. H. Arnold. Sandia Corporation, Albquerque, N. Mex. Mar 60. 51p. Order from OTS. $1.50. SCTM-72-60(34)

Crystal accelerometer response to mechanical shock impulses, by A. F. Lawrence. Sandia Corporation, Albuquerque, N. Mex. Aug 56. 10p. Order from OTS. 50 cents. SCTM-168-56-16

Application of thin printed wiring laminate in electronic packaging, by G. Voida. Sandia Corporation, Albuquerque, N. Mex. Jan 57. 38p. Order from LC. Mi $3.00, ph $6.30. SCTM-279-56-14

Geology and Mineralogy

A preliminary study of the potential to kinetic energy conversion process in the stratosphere, by R. M. White and G. F. Nolan. Massachusetts Institute of Technology, Cambridge, Mass. Sep 59. Contract AT(30-1)-2241. 12p. Order from LC. Mi $2.40, ph $3.30. AECU-4556

Operation PRE-gnome. Seismic data from natural phenomena and high-explosive tests near Carlsbad, New Mexico, by D. S. Carder and others. Coast and Geodetic Survey, Washington, D. C. Jan 60. Contract AT(29-2)-746. 45p. Order from LC. Mi $3.30, ph $7.80. AECU-4625

Comparison of seismic shock in salt and tuff, by P. E. Byerly. Geological Survey, Washington, D. C. Oct 59. 10p. Order from LC. Mi $1.80, ph $1.80. TEM-1034

Health and Safety

Sr^{90} Monitoring at the Savannah River Plant, by F. E. Butler. E. I. du Pont de Nemours & Co., Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Plant, Aiken, S. C. May 60. Contract AT(07-2)-1. 37p. Order from OTS. $1.00. DP-473

Surface dosage rate studies of Task III Feed Materials, by F. L. Helgeson. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Apr 54. Decl. March 15, 1960. Contract W-31-109-Eng-52. 25p. Order from LC. Mi $2.70, ph $4.80. HW-31522

Quarterly progress report Research and development activities in the field of radiological sciences October - December 1959, by Members of the Staff. Hanford Atomic Products Operation, Richland, Wash. Jan 60. Contract AT(45-1)-1350. 37p. Order from OTS. $1.25. HW-63643

Evaluation of radiological conditions in the vicinity of Hanford for 1959, by R. L. Junkins and others. Hanford Atomic Products Operation, Richland, Wash. May 60. Contract AT(45-1)-1350. 123p. Order from OTS. $2.50. HW-64371

Evaluation of radiological conditions in the vicinity of Hanford January through March - 1960, by E. C. Watson and others. Hanford Atomic Products Operation, Richland, Wash. May 60. Contract AT(4501)-1350. 45p. Order from OTS. $1.25. HW-65534

Neutron tissue dose survey for the little EVA critical assembly, by M. J. Engelke, B. B. Riebe, and J. A. Sayeg. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Aug 60. Contract W-7405-ENG-36. 14p. Order from OTS. 50 cents. LA-2425

A study of Nevada Test Site wind variability, by J. W. Reed. Sandia Corporation, Albuquerque, N. Mex. Mar 58. 51p. Order from OTS. $1.50. SC-4144(TR)

Comparison of fallout doses from Nevada Tests (Revised), by J. W. Reed. Sandia Corporation, Albuquerque, N. Mex. June 60. 46p. Order from OTS. $1.50. SC-4414(RR)

Factors influencing the biological fate and persistence of radioactive fall-out, by R. C. Lindberg and others. University of California of Los Angeles, School of Medicine, Department of Laboratories of Nuclear Medicine and Radiation Biology, Los Angeles, Calif. Jan 59. 78p. Order from OTS. $1.75. WT-1177

Measuring and monitoring training exercise: Foodstuffs, by H. J. McConnell and others. Food and Drug Administration, Department of Health, Education, and Welfare, Washington, D. C. Dec 59. 28p. Order from OTS. 50 cents. WT-1498

Instruments

Magnetic recorder for nuclear pulse application. Period covered: December 6, 1959 to February 5, 1960, by G. M. Burgwald and R. M. Norton. Illinois Institute of Technology, Armour Research Foundation, Chicago, Ill. Feb 60. Contract AT(11-1)-702. 8p. Order from LC. Mi $1.80, ph $1.80. ARF-1151-4

Development of a fuel-element leak-detection system based on the principle of isotopic exchange, by J. E. Howes, Jr., T. S. Elleman, and D. N. Sunderman. Battelle Memorial Institute, Columbus, Ohio. Aug 60. Contract W-7405-eng-92. 17p. Order from OTS. 50 cents. BMI-1432

Accurate micrometer for corrosion samples, by W. J. Woodward. E. I. du Pont de Nemours & Co., Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. June 60. Contract AT(07-2)-1. 10p. Order from OTS. 50 cents. DP-488

Medium-level continuous alpha air monitor, by M. O. Rankin. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. June 59. Contract W-31-109-Eng-52. 27p. Order from LC. Mi $2.70, ph $4.80. HW-56487(Rev.)

Stainless-inconel metal sorting device, by G. E. Martin. Knolls Atomic Power Laboratory, Schenectady, N. Y. Mar 59. Contract W-31-109-ENG-52. 6p. Order from LC. Mi $1.70, ph $1.80. KAPL-M-GEM-1

Development of temperature protective circuits for the HNPF fuel channel exit, by D. E. Brown. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 18p. Order from OTS. 50 cents. NAA-SR-5313

Interim report on investigation of dynamic characteristics of relays. This report covers the period 1 November to 31 December, 1959. Sandia Corporation, Albuquerque, N. Mex. June 60. 90p. Order from OTS. $2.25. SC-4422(RR)

Theoretical characteristics of several fluid- metering instruments, by M. D. Bennett. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 51p. Order from OTS. $1.50. SC-4446(RR)

Radar return from the vertical for ground and water surfaces, by C. S. Williams, Jr., C. H. Bidwell and D. M. Gragg. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 93p. Order from OTS. $2.25. SCR-107

Metallurgy and Ceramics

Progress letter no. 11 for January 1, 1960 through January 31, 1960, by E. H. Baron. Stevens Institute of Technology, Hoboken, N. J. Feb 60. Contract AT(30-1)-2258. 5p. Order from LC. Mi $1.80, ph $1.80. AECU-4695

Corrosion of plutonium alloys in NaK, by H. H. Hyman and J. J. Katz. Argonne National Laboratory, Lemont, Ill. July 53. Decl. March 15, 1960. Contract W-31-109-eng-38. 10p. Order from LC. Mi $1.80, ph $1.80. ANL-5090

The fabrication of a plutonium helix for a doppler experiment. Work completed September 1956, by R. J. Dunworth, H. V. Rhude and L. R. Kelman. Argonne National Laboratory, Lemont, Ill. Feb 58. Decl March 15, 1960. Contract W-31-109-eng-38. 15p. Order from LC. Mi $2.40, ph $3.30. ANL-5842

The transformation temperatures of high-purity uranium, by B. Blumenthal, J. E. Baumrucker, and L. T. Lloyd. Argonne National Laboratory, Argonne, Ill. June 60. Contract W-31-109-eng-38. 30p. Order from OTS. 75 cents. ANL-5957

Tests of defected thoria-urania fuel specimens in EBWR, by R. F. S. Robertson. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 87p. Order from OTS. $2.00. ANL-6022

Aqueous corrosion of magnesium alloys, by S. Greenberg and W. E. Ruther. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-108-eng-38. 18p. Order from OTS. 50 cents. ANL-6070

Metallography of aluminum and some aluminum-1 w/o nickel alloys, by R. K. Hart and M. J. Heyduk. Argonne National Laboratory, Argonne Ill. June 60. Contract W-31-109-eng-38. 26p. Order from OTS. 50 cents. ANL-6144

Characteristics of anodic and corrosion films on zirconium, by R. D. Misch. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 25p. Order from OTS. 50 cents. ANL-6149

Preparation of magnesium oxide refractories, by R. C. Lied. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 14p. Order from OTS. 50 cents. ANL-6164

Combustibility studies with nicrhome V (80 Ni - 20 Cr), by J. B. Conway and R. D. McLay. General Electric Co. Aircraft Nuclear Propulsinn Dept., Cincinnati, Ohio. Dec 54. Decl. November 20, 1959. 33p. Order from LC. Mi $3.00, ph $6.30. APEX-252

Effects of ternary additions on aluminum-35 w/o uranium alloys, by N. E. Daniel, E. L. Foster and R. F. Dickerson. Battelle Memorial Institute, Columbus, Ohio. Oct 59. Decl. February 3, 1960. Contract W-7405-eng-92. 31p. Order from LC. Mi $3.00, ph $6.30. BMI-1388

Progress relating to civilian applications during May, 1960, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. July 60. 99p. Order from OTS. $2.25. BMI-1442 (Rev.)

Experiments to determine the radiation stability of UN dispersions in stainless steel, by J. E. Gates and others. Battelle Memorial Institute, Columbus, Ohio. June 60. Contract W-7405-eng-92. 29p. Order from OTS. 75 cents. BMI-1446

Progress relating to civiliam applications during June, 1960, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. July 60. Contract W-7405-eng-92. 104p. Order from OTS. $2.50. BMI-1448 (Rev.)

Factors affecting the ductility of iron-chromium-aluminum alloy sheet, by R. W. Endebrock, E. L. Foster, Jr., and R. F. Dickerson. Battelle Memorial Institute, Columbus, Ohio. July 60. 24p. Order from OTS. 75 cents. BMI-1450

The bonding of molybdenum- and niobium-clad fuel elements, by S. J. Paprocki, E. S. Hodge, P. J. Gripshover. Battelle Memorial Institute, Columbus, Ohio. July 60. Contract W-7405-eng-92. 61p. Order from OTS. $1.50. BMI-1451

Irradiation effects on massive uranium monocarbide, by A. W. Hare and F. A. Rough. Battelle Memorial Institute, Columbus, Ohio. July 60. Contract W-7405-eng-92. 28p. Order from OTS. 75 cents. BMI-1452

Apparatus for the study of fission-gas release from fuels during postirradiation heating at temperatures up to 1600 C, by R. H. Barnes and D. N. Sunderman. Battelle Memorial Institute, Columbus, Ohio. July 60. Contract W-7405-eng-92. 12p. Order from OTS. 50 cents. BMI-1453

Preparation and evaluation of aluminum-35 w/o uranium alloys containing up to 3 w/o tin or zirconium, by N. E. Daniel, E. L. Foster, Jr., and R. F. Dickerson. Battelle Memorial Institute, Columbus, Ohio. July 60. Contract W-7405-eng-92. 28p. Order from OTS. 75 cents. BMI-1454

The solution susceptibilities of refractory metals in molten plutonium, by F. W. Schonfeld. Los Alamos Scientific Laboratory, N. Mex. June 52. Decl. March 15, 1960. 9p. Order from LC. Mi $1.80, ph $1.80. CMR-5-1365

A sonic test for preferred orientation in Hanford fuel element cores, by A. A. Ferguson and E. C. Wood. General Electric Co. Hanford Atomic Co., Hanford Atomic Products Operation, Richland, Wash. Jan 55. Decl. December 3, 1959, Contract W-31-109-Eng-52. 22p. Order from LC. Mi $2.70, ph $4.80. HW-33024

Calcium uranium (IV) fluoride: Precipitation and reduction to metal, by W. B. Tolley. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Mar 55. Decl. January 12, 1960. Contract W-31-109-Eng-52. 14p, Order from LC. Mi $2.40, ph $3.30. HW-35815

The effect of oxidation on the compression strength of CS-GBF graphite, by B. Griggs. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Apr 56. Decl. January 8, 1960; 12p. Order from LC. Mi $2.70, ph $4.80. HW-42498(Del.)

The irradiation of thin evaporated films of uranium dioxide. Interim report, by T. K. Bierlein and B. Mastel. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Sep 59. Contract AT(45-1)-1350. 17p. Order from LC. Mi $2.40, pn $3.30. HW-61656

A report of results of tests on impervious graphite and discussions by: L. N. Johanson, R. J. Campbell, and E. E. Mueller. University of Washington, Seattle, Wash. Mar 58. 47p. Order from LC. Mi $3.30, ph $7.80. HW-61820

Some metallographic observations on thorium metal, by D. T. Peterson. Ames Laboratory, Iowa State University of Science and Technology, Ames, Iowa. June 60. Contract W-7405-eng-82. 11p. Order from OTS. 50 cents. IS-155

Improved welding techniques for SER fuel element assembly closures, by S. Elchyshyn. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 30p. Order from OTS. 75 cents. NAA-SR-4909

Direct observation of fast neutron damage in gold films, by A. Grenall. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 18p. Order from OTS. 75 cents. NAA-SR-5062

Fuel element development for Piqua OMR, by M. H. Binstock. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 52p. Order from OTS. $1.25. NAA-SR-5119

Hot pressure bonding of OMR tubular fuel elements, E. E. Garrett, G. V. Alm and M. H. Binstock. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 47p. Order from OTS. $1.00. NAA-SR-5120

A heat transfer control device for irradiation experiments, by W. K. McCarty and R. C. Noyes. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 10p. Order from OTS. 50 cents. NAA-SR-5141

Process development of uranium carbide fuel slugs for HNPF, by D. H. Turner. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 26p. Order from OTS. 50 cents. NAA-SR-5346

Development of pass schedule for rolling narrow uranium strip, by J. F. Schiltz and J. W. Magoun. National Lead Company, Cincinnati, Ohio. June 58. Decl. November 30, 1959. Contract AT(30-1)-1156. 23p. Order from LC. Mi $2.70, ph $4.80. NLCO-756

The development and testing of the UO_2 fuel element system. Progress report for period September 1 through December 31, 1959, by B. E. Murtha. Combustion Engineering, Inc. Nuclear Division, Windsor, Conn. 1959. Contract AT(30-1)-2379. 157p. Order from OTS. $2.75. NYO-9006

High energy storage ceramic capacitor. Final report, by P. H. Klein and others. General Electric Co., Electronics Laboratory, Syracuse, N. Y. and General Electric Co., Missile and Space Vehicle Department, Philadelphia, Pa. Feb 60. Contract AT(30-1)-1963. 96p. Order from OTS. $2.25. NYO-9076

Metallurgy Division semiannual progress report for period ending April 10, 1954, by W. H. Bridges. Oak Ridge National Laboratory, Oak Ridge, Tenn. Aug 54. Decl. with deletions December 1, 1959. Contract W-7405-eng-26. 120p. Order from LC. Mi $6.30, ph $19.80. ORNL-1727(Del. 2)

Relaxation characteristics of inconel at elevated temperatures, by C. R. Kennedy and D. A. Douglas. Oak Ridge National Laboratory, Oak Ridge, Tenn. Feb 60. Contract W-7405-eng-26. 28p. Order from LC. Mi $2.70, ph $4.80. ORNL-2407

Metallurgy Division annual progress report for period ending September 1, 1959. Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 59. Contract W-7405-eng-26. 352p. Order from LC. Mi $11.10, ph $37.80. ORNL-2839

Columbium clad uranium carbide fuel element contract. Monthly letter report for September 1 through September 30, 1959. Union Carbide Metals Co., Niagara Falls, N. Y. Sep 59. Contract AT(40-1)-2559. 2p. Order from LC. Mi $1.80, ph $1.80. ORO-229

Research on piezoelectric materials and phenomena. Final report for February 1, 1959 through January 31, 1960, by D. A. Berlincourt. Sandia Corporation, Albuquerque, N. Mex. July 60. 164p. Order from OTS. $3.00. SC-4443(RR)

Quarterly technical progress report for period ending March 31, 1960, by J. L. Zambrow. Sylvania-Corning Nuclear Corporation, Bayside Long Island, N. Y. May 60. Contract AT-30-1-GEN-366. 42p. Order from OTS. $1.00. SCNC-309

Metallurgy information meeting, Ames Laboratory, Iowa State College, May 2, 3, and 4, 1956. Ames Laboratory, Ames, Iowa. 1956. Decl. October 7, 1959. 18p. Order from LC. Mi $2.40, ph $3.30. TID-7526(Pt. 7)

Corrosion of D loop, by H. K. Lembersky and P. Cohen. Westinghouse Electric Corporation, Atomic Power Division, Pittsburgh, Pa. Oct 55. Decl. with deletions November 20, 1957. 15p. Order from LC. Mi $2.40, ph $3.30. WAPD-CP-715(Del.)

Heat transfer effects on the corrosion of zirconium and some alloys, by L. A. Waldman and P. Cohen. Westinghouse Electric Corporation, Atomic Power Division, Pittsburgh, Pa. May 54. Decl. with deletions March 14, 1957. Contract 11-1-GEN-14. 32p. Order from LC. Mi $3.00. ph $6.30. WAPD-MDM-8(Del.)

Back extrusion of Zircaloy-2 lower extension brackets, by J. G. Seton. Westinghouse Electric Company, Bettis Plant, Pittsburgh, Pa. Dec 55. 19p. Order from LC. Mi $2.40, ph $3.30. WAPD-SFR-Fe-355

A method for hot-pressing large diameter beryllium oxide rings, by L. M. McLaughlin and A. H. Ballard. Union Carbide Nuclear Company, Division of Union Carbide Corporation, Y-12 Plant, Oak Ridge, Tenn. Aug 60. Contract W-7405-eng-26. 15p. Order from OTS. 50 cents. Y-1302

Nuclear Explosions—Peaceful Applications

Blanca--A study of the maximum vertical earth motion of the Mesa slope, by D. Barnes and S. Finos. Edgerton, Germeshausen & Grier, Inc., Las Vegas, Nev. Feb 60. 16p. Order from OTS. 75 cents. AECU-4681

Nuclear explosives and landslide dams, by R. H. Carlson. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 95p. Order from OTS. $2.25. SC-4403(RR)

Geologic studies of underground nuclear explosions Rainier and Neptune. Final report, by T. L. Thompson and J. B. Misz. University ot California, Lawrence Radiation Laboratory, Livermore, Calif. Oct 59. Contract W-7405-eng-48. 58p. Order from OTS. $1.75. UCRL-5757

The Neptune event a nuclear explosive cratering experiment, by A. V. Shelton, M. D. Nordyke, and R. H. Goeckermann. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Apr 60. Contract W-7405-eng-48. 32p. Order from OTS. $1.00. UCRL-5766

Industrial and scientific applications of nuclear explosions, by G. W. Johnson. University of California. Lawrence Radiation Laboratory, Livermore, Calif. Jan 60. Contract W-7405-eng-48. 33p. Order from OTS. $1.00. UCRL-5840

The Soviet program for industrial applications of explosions, by G. W. Johnson. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Mar 60. Contract W-7405-eng-48. 15p. Order from OTS. 50 cents. UCRL-5932

An application of nuclear explosives to block caving mining, by W. G. Flangas and L. E. Shaffer. University of California, Lawrence Radiation Laboratory, Livermore, Calif. June 60. Contract W-7405-eng-48. 23p. Order from OTS. 75 cents. UCRL-5949

Particle Accelerators and High-Voltage Machines

A study of some coherent electromagnetic effects in high-current particle accelerators. Thesis, by V. K. Neil. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 141p. Order from OTS. $2.50. UCRL-9124

Bevatron operation and development. XXIV November, December 1959, and January 1960, by W. D. Hartsough. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 13p. Order from OTS. 50 cents. UCRL-9220

Bevatron operation and development. XXV February, March, and April 1960, by W. D. Hartsough. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 10p. Order from OTS. 50 cents. UCRL-9221

Physics and Mathematics

General reactor analysis computer program for the IBM 704, program George, by T. A. Hoffman and W. B. Henderson. General Electric Co., Atomic Products Division, Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. Oct 59. Contracts AT(11-1)-171 and AF 33(600)-38062. 361p. Order from OTS. $5.00. APEX-543

Liquid metal fuel reactor experiment: Operation and testing of a nonnuclear liquid-metal system, by the Babcock and Wilcox Company, Lynchburg, Va. May 60. Contract AT(30-1)-1940. 145p. Order from OTS. $3.00. BAW-1192

Tilting capsule tests in LMFRE fuel solution. Final report, by E. J. Rozic. The Babcock and Wilcox Company, Lynchburg, Va. Apr 60. Contract AT(30-1)-1940. 75p. Order from OTS. $2.25. BAW-1252

Nuclear physics research quarterly report for October, November, and December 1959, by J. E. Faulkner and others. Hanford Atomic Products Operation, Richland, Wash. Jan 60. Contract AT(45-1)-1350. 76p. Order from OTS. $2.25. HW-63576

Quarterly technical report, SPERT project for April, May, June 1959, by S. G. Forbes and others. Phillips Petroleum Company, Idaho Operations Office, Idaho Falls, Idaho. Apr 60. Contract AT(10-1)-205. 36p. Order from OTS. $1.25. IDO-16584

The SPERT III reactor nuclear startup, by F. Schroeder, and others. Phillips Petroleum Co., Atomic Energy Division, Idaho Falls, Idaho. Mar 60. Contract AT(10-1)-205. 54p. Order from OTS. $1.50. IDO-16586

Distributions of neutron density and neutron flux, by W. B. Lewis and G. D. Marshall. Phillips Petroleum Company, Atomic Energy Division, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 15p. Order from OTS. 50 cents. IDO-16614

UFO: A three-dimensional neutron diffusion code for the IBM 704, by E. H. Auerbach, J. P. Jewett, and M. A. Ketchum. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Mar 59. Contract W-31-109-Eng-52. 59p. Order from OTS. $1.75. KAPL-1999

Reactor technology report no. 12: Metallurgy, by B. H. Caldwell and others. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Mar 60. Contract W-31-109-Eng-52. 94p. Order from OTS. $2.50. KAPL-2000-9

Plasma propulsion studies--summer, 1959, by M. E. Ebel and others. The University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Aug 60. Contract W-7405-ENG-36. 143p. Order from OTS. $2.50. LA-2408

Ideal gas treatment of the equilibrium composition, enthalpy function, and heat capacity of cesium vapor and cesium plasma, by D. G. Clifton. The University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Aug 60. Contract W-7405-ENG-36. 33p. Order from OTS. 75 cents. LA-2419

Field emission of electrons. A bibliography of abstracts, by H. Hanson and G. Riese. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 115p. Order from OTS. $2.25. LAMS-2385

The penetration of radiation with constant driving temperature, by A. G. Petschek and others. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. 43p. Order from LC. $1.00. LAMS-2421

Annihilation radiation counting for neutron activation determination, by J. P. Conner and R. T. Wagner. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 19p. Order from OTS. 50 cents. LAMS-2428

The determination of lattice parameters by means of measurements on a single fuel element, by J. W. Zink and G. W. Roderback. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 33p. Order from OTS. 75 cents. NAA-SR-5392

A method for computing expected damage from a single bomb, by Sandia Corporation, Albuquerque, N. Mex. Jan 53. 37p. Order from OTS. $1.25. SC-2663(TR)

A confidence-limit computer, by J. O. Muench. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 11p. Order from OTS. $1.25. SCR-159

Multiple-source schlieren system (Transonic wind tunnel), by H. R. Spahr and R. E. Kyrlach. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 9p. Order from OTS. 50 cents. SCR-177

A system of standard atmospheres, by B. N. Charles. Sandia Corporation, Albuquerque, N. Mex. May 60. 37p. Order from OTS. $1.00. SCR-183

On the algebra of boundary-value problems, by O. Wyler. Sandia Corporation, Albuquerque, N. Mex. May 60. Contract 51-6543. 27p. Order from OTS. $1.00. SCR-185

IBM problem M curves, by C. D. Broyles. Sandia Corporation, Albuquerque, N. Mex. June 60. 57p. Order from OTS. $1.75. SCTM-268-56-51

Energy-absorbing characteristics of several materials, by V. Parfitt. Jandia Corporation, Albuquerque, N. Mex. Oct 59. Contract AT(29-1)-789. 75p. Order from OTS. $2.00. SCTM-284-57(51)

The production of antinucleons by pions, by O. C. Eldridge, Jr. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 92p. Order from OTS. $2.00. UCRL-9128

Photopion production from deuterium near threshold, Thesis by W. P. Swanson. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 134p. Order from OTS. $2.50. UCRL-9194

Low-energy photopion production from pions and neutral-pion decay. Thesis, by How-sen Wong. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 37p. Order from OTS. $1.00. UCRL-9251

A general least-squares program for the IBM 650 computer, by L. K. Goodwin. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 22p. Order from OTS. 75 cents. UCRL-9263

Double dispersion relations and unitarity as the basis for a dynamical theory of strong interactions, by G. F. Chew. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 103p. Order from OTS. $2.25. UCRL-9289

A P-9 multigroup method for solution of the transport equation in slab geometry, by R. C. Gast. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. May 60. Contract AT-11-1-GEN-14. 39p. Order from OTS. $1.25. WAPD-232

Technical progress report: reactor physics and mathematics for the period March 1 to June 1, 1960, by P. N. Ross. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. 1960. Contract AT-11-1-GEN-14. 122p. Order from OTS. $2.50. WAPD-MRJ-10

STDY-3, a program for the thermal analysis of a pressurized water nuclear reactor during steady state operation, by R. S. Pyle. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. June 60. Contract AT-11-1-GEN-14. 42p. Order from OTS. $1.00. WAPD-TM-213

Radiation Effects on Materials

Irradiation of an aluminum alloy-clad ceramic pellet-fueled plate, by A. P. Gavin. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 44p. Order from OTS. $1.00. ANL-6143

Shearing irradiated uranium plates, by W. Scott and others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Savannah River Laboratory, Aiken, S. C. Nov 56. Contract AT(07-2)-1. Decl. July 27, 1960. 20p. Order from OTS. 30 cents. DP-185

Shearing irradiated uranium plates - Part II, by R. B. Olcott. E. I. du Pont de Nemours & Co., Explosives Department, Atomic Energy Division, Technical Division, Savannah River Laboratory, Aiken, S. C. July 57. Decl. July 27, 1960. Contract AT(07-2)-1. 16p. Order from OTS. 30 cents. DP-224

Flux monitoring for radiation damage studies, by H. H. Yoshikawa. Hanford Atomic Products Operation, Richland, Wash. Mar 60. Contract AT(45-1)-1350. 19p. Order from OTS. 75 cents. HW-64251

Radioactive Waste

Zeolitic extraction of cesium from aqueous solutions, by L. L. Ames, Jr. Hanford Atomic Products Operation, Richland, Wash. Sep 59. Contract AT(45-1)-1350. 23p. Order from OTS. 75 cents. HW-62607

Quarterly progress report research and development activities fixation of radioactive residues, October through December, 1959, by D. W. Pearce. Hanford Atomic Products Operation, Richland, Wash. Jan 60. Contract AT(45-1)-1350. 20p. Order from OTS. 75 cents. HW-63949

Study of real gas and heat transfer effects on the design of hotshot wind tunnels, by J. R. Stalder, M. W. Rubesin, and D. K. Eberly. Sandia Corp., Albuquerque, N. Mex. Mar 60. 77p. Order from OTS. $2.25. SCR-166

Reactors—General

Allis-Chalmers critical facility, Final Safeguards report, by C. B. Graham. Allis-Chalmers Manufacturing Co., Atomic Energy Division, Milwaukee, Wis. May 59. Contract AT(11-1)-589. 146p. Order from LC. Mi $8.40, ph $28.80. ACNP-5910

Burnup calculation method for non-uniform flux and/or for movable fuel, by R. T. Shanstrom. General Atomic Division. General Dynamics Corporation, San Diego, Calif. July 58. 15p. Order from LC. Mi $2.40, ph $3.30. AECU-4489

Studies of reactor containment. Monthly technical progress report no. 29 for September 1, 1959 through September 30, 1959, by T. A. Zaker. Illinois Institute of Technology, Armour Research Foundation, Chicago, Ill. Oct 59. Contract AT(11-1)-528. 4p. Order from LC. Mi $1.80, ph $1.80. AECU-4599

Natural and forced-circulation boiling studies, by J. F. Marchaterre and others. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 47p. Order from OTS. $1.25. ANL-5735

Analog computer study of metal-water reactions initiated by nuclear reactor transients, by R. C. Liimatainen and others. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 195p. Order from OTS. $2.75. ANL-6129

Two-dimensional two-group calculation of the Argonaut one slab loading, by D. P. Moon. Argonne National Laboratory, Argonne, Ill. Apr 60. Contract W-31-109-eng-38. 92p. Order from OTS. $2.00. ANL-6154

Observations on transition boiling heat transfer phenomena, by B. J. Stock. Argonne National Laboratory, Argonne, Ill. June 60. Contract W-31-109-eng-38. 70p. Order from OTS. $2.00. ANL-6175

Lynchburg test reactor--critical experiment hazard evaluation, by T. C. Engelder and P. F. Schutt. Babcock and Wilcox Co. Critical Experiment Laboratory, Lynchburg, Va. Nov 59. 103p. Order from LC. Mi $5.40, ph $15.30. BAW-109

Thorium uranium physics experiments. Final report, by N. L. Snidow and others. Babcock and Wilcox Co., Lynchburg, Va. May 60. Contract AT(11-1)-766. 174p. Order from OTS. $3.50. BAW-1191

Radiation effects on boron-containing compounds, by D. J. Hamman and P. Schall. Battelle Memorial Institute, Columbus, Ohio. Jan 60. Decl. March 4, 1960. Contract W-7405-eng-92. 24p. Order from LC. Mi $2.70, ph $4.80. BMI-1406

Effect of non-thermal capture on Californium production in the HFIR, by H. C. Claiborne. Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 59. 12p. Order from LC. Mi $2.40, ph $3.30. CF-59-12-16

Molten-salt breeder reactors, by H. G. MacPherson. Oak Ridge National Laboratory, Oak Ridge, Tenn. Jan 60. 25p. Order from LC. Mi $2.70, ph $4.80. CF-59-12-64(Rev.)

Quarterly technical report, SPERT project for July, August, September, 1959, by A. H. Spano and others. Phillips Petroleum Company, Atomic Energy Division, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 53p. Order from OTS. $1.50. IDO-16606

Proposal for an advanced engineering test reactor-ETR II, by D. R. deBoisblanc et al. Phillips Petroleum Company, Atomic Energy Division, Idaho Falls, Idaho. Mar 60. Contract AT(10-1)-205. 223p. Order from OTS. $3.50. IDO-16666

Reactor technology report no. 13; Engineering, by B. H. Caldwell and others. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. June 60. Contract W-31-109-Eng-52. 207p. Order from OTS. $3.00. KAPL-2000-10

Vapor - Liquid equilibrium compositions for terphenyls and high boilers, by R. W. Burkhardt and W. N. Bley. Atomics International. A Division of North American Aviation, Inc., Canoga Park Calif. Oc6 59. 16p. Order from LC. Mi $2.40, ph $3.30. NAA-SR-Memo-4493

Reactor safety quarterly progress report for August to October 1954, by N. E. Huston, North American Aviation, Inc, Downey, Calif. Apr 55. Decl. July 20, 1959. Contract AT-11-1-GEN-8. 43p. Order from LC. Mi $3.30, ph $7.80. NAA-SR-1190

Valve stem freeze seal for high-temperature sodium, by J. S. McDonald. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 31p. Order from OTS. $1.00. NAA-SR-4869

Multigroup-multiregion kinetics of the AETR (Formulation), by E. R. Cohen. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Sep 59. 27p. Order from LC. Mi $2.70, ph $4.80. NAA-SR-Memo-4394

Semi-empirical methods for the calculation of D_2O lattices and comparison with experiment, by L. Goldstein and D. Cokinos. Nuclear Development Corporation, of America, White Plains, N. Y. July 59. Contract AT(30-1)2303. 31p. Order from LC. Mi $3.00, ph $6.30. NDA-84-24

Heterogeneous reactor calculation methods. Quarterly progress report no. 2 for July 1 to September 30, 1959, by C. N. Klahr and L. B. Mendelsohn. TRG, Inc., Syosset, N. Y. 1959. Contract AT(30-1)-2375. 54p. Order from LC. Mi $3.60, ph $9.30. NYO-2674

Analytical and experimental studies of the temperature structure within the art core, by H. F. Poppendiek, and others. Oak Ridge, National Lab., Oak Ridge, Tenn. Feb 57. Decl. November 24, 1959. Contract W-7405-eng-26. 106p. Order from LC. Mi $5.70, ph $16.80. ORNL-2198

Metallurgy Division annual progress report for period ending October 10, 1957, Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 57. Decl. with deletions October 29, 1959. Contract W-7405-eng-26. 247p. Order from LC. Mi $11.10, ph $39.60. ORNL-2422

A transistorized reactivity measurement system, by L. Ehrman. Sandia Corporation, Albuquerque, N. Mex. July 60. 28p. Order from OTS. 75 cents. SCTM-190-60(14)

Operation of an in-reactor loop capsule for the determination of "G" values for the production of NO_2-O_2 systems, by Aerojet-General Nucleonics, San Ramon, Calif. Apr 60. 136p. Order from OTS. $2.50. TID-5693

Nuclear materials control system (NMCS). Phase II: Assay capabilities of a reactor fuels measuring facility, by J. A. Vreeland. Westinghouse Electric Corporation, Atomic Power Department, Pittsburgh, Pa. Dec 59. Contract AT(30-1)-2176, Task I. 49p. Order from LC. Mi $3.30, ph $7.80. WCAP-6041

The spherical reactor with A B_4 C layer between core and reflector, by C. B. Mills. Oak Ridge National Laboratory, Y-12 Area, Oak Ridge, Tenn. July 51. Decl. with deletions 1957. Contract W-7405-eng-26. 15p. Order from LC. Mi $2.40, ph $3.30. Y-F10-59(Del.)

Elk River reactor. Quarterly project for June - July- August 1959, by Allis Chalmers Manufacturing Company, Atomic Energy Division, Washington, D. C. 1959. Contract AT(11-1)-654. 13p. Order from LC. Mi $2.40, ph $3.30. ACNP-ERR-5

Solution of kinetic equations of cylindrical liquid fuel reactor, by M. J. Nielsen and J. W. Webster. Oak Ridge National Laboratory, Oak Ridge, Tenn. Sep 51. Decl. with deletions Feb 20, 1957. Contract W-7405-eng-26. 33p. Order from LC. Mi $3.00, ph $6.30. AECD-4249

Reactivity lifetime. Section I. Third performance, 2797-3797 EFPH. Core I. Seed I. Duquesne Light Company, Shippingport, Pa. Nov 59. 42p. Order from LC. Mi $3.30, ph $7.80. AECU-4511

Periodic radiation survey. Section I. EFPH-4182. First performance. Core I. Seed I. Duquesne Light Company, Shippingport, Pa. Nov 59. 7p. Order from LC. Mi $1.80, ph $1.80. AECU-4512

Periodic radiation survey. Section II. 4182 EFPH. Second performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 14p. Order from LC. Mi $2.40, ph $3.30. AECU-4513

Periodic intercalibration of temperature sensing elements. Section I. Second performance. Nov 59. 28p. Order from LC. Mi $2.70, ph $4.80. AECU-4515

Dynamic response of reactor plant to load changes. Section I. First performance. Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 27p. Order from LC. Mi $2.70, ph $4.80. AECU-4516

Loss of level in D/P cell reference chambers. Section I. First performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Oct 59. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4517

Measurements of coefficients of reactivity. Section I. Seventh performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 20p. Order from LC. Mi $2.40, ph $3.30. AECU-4520

Station radiation level survey. Section II. Fifth performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 9p. Order from LC. Mi $1.80, ph $1.80. AECU-4521

Control air conditions at the reactor chamber. Section I. Duquesne Light Co., Shippingport, Pa. Nov 59. 6p. Order from LC. Mi $1.80, ph $1.80. AECU-4522

Condensate system. Section II. Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 11p. Order from LC. Mi $2.40, ph $3.30. AECU-4574

Turbine start-up. Section I. Second performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. 12p. Order from LC. Mi $2.40, ph $3.30. AECU-4575

Periodic radiation survey. Section I. EFPH-5465.2. Second performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. 11p. Order from LC. Mi $2.40, ph $3.30. AECU-4576

1A reactor inlet hydraulic valve position detector temperature. Core I, Seed 1, Section 1. Duquesne Light Co., Shippingport, Pa. Nov 59. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4577

Leveling of extraction tool crane rails. Section I. Second performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 7p. Order from LC. Mi $1.80, ph $1.80. AECU-4578

Determination of possible failed blanket elements using the fedal system. Section I. First performance, Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 28p. Order from LC. Mi $2.70, ph $4.80. AECU-4579

Periodic radiation survey. Section III. First performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 11p. Order from LC. Mi $2.40, ph $3.30. AECU-4580

Examination of components for crud and corrosion. Section I. Second performance. Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 6p. Order from LC. Mi $1.80, ph $1.80. AECU-4581

Charging and discharging of demineralizer resins. Section IV. First performance. Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 6p. Order from LC. Mi $1.80, ph $1.80. AECU-4582

The determination of decontamination factors for radioisotopes through lithium hydroxide resin. Section I. Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 4p. Order from LC. Mi $1.80, ph $1.80. AECU-4583

Nuclear instrumentation operation during plant operation. Section I. First performance, Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 4p. Order from LC. Mi $1.80, ph $1.80. AECU-4584

Main coolant pump performance test. Section I. First performance. Core I, Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 39p. Order from LC. Mi $3.00, ph $6.30. AECU-4585

Control rod position for criticality. Section I. Eight performance. Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Dec 59. 17p. Order from LC. Mi $2.40, ph $3.30. AECU-4586

Core I control rod drive mechanisms periodic tests. Section I. Ninth performance. Duquesne Light Co., Shippingport, Pa. Nov 59. 11p. Order from LC. Mi $2.40, ph $3.30. AECU-4587

Determination of flux levels in neutron detector wells. Section II. First performance, Core I. Seed I. Duquesne Light Co., Shippingport, Pa. Nov 59. 7p. Order from LC. Mi $1.80, ph $1.80. AECU-4603

Monthly operating report for November 1959. Duquesne Light Co., Shippingport, Pa. Contract AT(11-1)-292. 38p. Order from LC. Mi $3.00, ph $6.30. AECU-4601

Technical review of ZPR-I accidental transient--The power excursion, exposures, and clinical data, by R. O. Brittan and others. Argonne National Laboratory, Lemont, Ill. Jan 53. Decl. March 28, 1957. Contract W-31-109-eng-38. 132p. Order from LC. Mi $6.90, ph $21.30. ANL-4971

Design and construction of an inpile test loop. Liquid metal fuel reactor experiment, by R. A. Lee. The Babcock and Wilcox Company, Lynchburg, Va. June 60. Contract AT(30-1)-1940. 55p. Order from OTS. $2.25. BAW-1092

Research and development of remote maintenance. Final report, by W. H. Maynard. The Babcock and Wilcox Company, Lynchburg, Va. Mar 60. Contract AT(30-1)-1940. 31p. Order from OTS. $1.00. BAW-1184

Graphite evaluation program, by A. L. Lowe, Jr. and others. The Babcock and Wilcox Company, Lynchburg, Va. June 60. Contract AT(30-1)-1940. 186p. Order from OTS. $3.00. BAW-1197

Design and construction of a Faraday-type electromagnetic pump, by W. T. Hage. The Babcock and Wilcox Company, Lynchburg, Va. June 60. Contract AT(30-1)-1940. 25p. Order from OTS. $1.25. BAW-1251

Liquid bismuth dynamic corrosion tests, by R. E. Deville and W. R. Foley. The Babcock and Wilcox Company, Lynchburg, Va. June 60. Contract AT(30-1)-1940. 332p. Order from OTS. $5.00. BAW-1253

Basic slurry investigations, by The Chemistry Section, Research Center, Alliance, Ohio. The Babcock and Wilcox Company, Lynchburg, Va. June 60. Contract AT(30-1)-1940. 276p. Order from OTS. $3.50. BAW-1254

Heavy water moderated power reactors. Progress report for January 1960, by D. F. Babcock and others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. Mar 60. Contract AT(07-2)-1. 41p. Order from OTS. $1.25. DP-465

Heavy water moderated power reactors. Progress report for February 1960, by D. F. Babcock and others. E. I. du Pont de Nemours & Co., Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. Apr 60. Contract AT(07-2)-1. 39p. Order from OTS. $1.25. DP-475

Heavy-water-moderated power reactors. A status report, by D. F. Babcock and others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. Mar 60. Contract AT(3-11)-2303(IX). 60p. Order from OTS. $1.75. DP-480

Heavy water moderated power reactors. Progress report for March 1960, by D. F. Babcock and others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. Apr 60. Contract AT(07-2)-1. 35p. Order from OTS. $1.00. DP-485

Heavy water moderated power reactors. Progress report for April 1960, by D. F. Babcock and others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. May 60. Contract AT(07-2)-1. 38p. Order from OTS. $1.00. DP-495

Maritime gas-cooled reactor program: Quarterly progress report for the period ending September 30, 1959, by K. A. Trickett and others. General Dynamics Corporation, General Atomic and Electric Boat Division, San Diego, Calif. 1959. Contract AT(04-3)-187. 187p. Order from OTS. $3.50. GA-1183

Experimental PRTR moderator flow distribution results, by M. R. Kreiter. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Jan 59. 13p. Order from LC. Mi $2.40, ph $3.30. HW-58743

PRTR gas-cooled loop, hazards survey of preliminary scope design, by N. G. Wittenbrock. General Electric Company, Hanford Atomic Products Operation, Richland, Wash. Apr 59. Contract W-31-109-Eng-52. 24p. Order from LC. Mi $2.70, ph $4.80. HW-59638

A calculation of the reactivity worth of plutonium and uranium-235 as enrichment in thermal reactors, by D. P. Granquist. General Electric Company, Hanford Atomic Products Operation, Richland, Wash. Aug 59. Contract AT(45-1)-1350. 34p. Order from LC. Mi $3.00, ph $6.30. HW-59758 (Rev.)

New production reactor thermal shielding studies, by S. J. Friesenhahn. General Electric Company, Hanford Atomic Products Operation, Richland, Wash. Aug 59. Contract AT(45-1)-1350. 9p. Order from LC. Mi $1.80, ph $1.80. HW-61761

Army gas-cooled reactor systems program: Inpile loop tests of GCRE elements (I-1T and I-1'T), by S. Nakazato, P. M. Williams and W. D. Wilson. Aerojet-General Nucleonics, San Ramon, Calif. July 59. Contract AT(10-1)-880. 81p. Order from OTS. $2.25. IDO-28539

Fabrication of modified GCRE fuel plates using spherical UO_2 dispersions, by G. A. Linenberger.and others. Aerojet-General Nucleonics, Military Projects Division, San Ramon, Calif. Mar 60. Contract AT(10-1)-880. 13p. Order from OTS. 35 cents. IDO-28547

The ML-1 design report, by G. A. Linenberger. Aerojet-General Nucleonics, Military Projects Division, San Ramon, Calif. May 60. Contract AT(10-1)-880. 119p. Order from OTS. $2.75. IDO-28550

Appraisal of organic coolant reactor cycle. Knolls Atomic Power Laboratory, Schenectady, N. Y. Dec 56. Decl. June 25, 1959. Contract W-31-109-Eng-52. 22p. Order from LC. Mi $2.70, ph $4.80. KAPL-1738

Quarterly status report on LAMPRE program for period ending May 20, 1960, by S. Glasstone. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 64p. Order from OTS. $1.50. LAMS-2438

Quarterly status report of the LASL plasma thermocouple development program for period ending June 20, 1960, by S. Glasstone and others. The Univessity of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Aug 60. Contract W-7405-ENG-36. 11p. Order from OTS. 50 cents. LAMS-2447

Evaluation of calandria, thimble, and canned-moderator concepts for sodium graphite reactors, by G. L. Reed. Atomics International. A Division of North American Aviation, Inc., Cnnoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 64p. Order from OTS. $1.50. NAA-SR-3573

Fuel burnup studies for a 255 Mwe advanced sodium graphite reactor, by A. L. Aronson. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 69p. Order from OTS. $1.75. NAA-SR-4529

Heating transformer performance, by R. S. Baker and I. Villalva. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 24p. Order from OTS. 50 cents. NAA-SR-4532

Stress analysis of HNPF loading-face shield, by R. D. Chipman, M. D. Lynch and R. M. Peterson. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 50 p. Order from OTS. $1.00. NAA-SR-4535

Piqua OMR waste gas disposal, by H. M. Gilroy and J. H. Wilson. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 67p. Order from OTS. $2.00. NAA-SR-4576

300,000-KWE SGR nuclear power plant of current technology, by J. Renard, C. L. Peckinpaugh and R. E. Aronstein. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 148p. Order from OTS. $2.50. NAA-SR-4873

Advanced OMR coolant screening and boiling test loops, by J. E. Leary and D. A. Huber. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 33p. Order from OTS. 75 cents. NAA-SR-5070

OMR (Piqua) unitized control--safety rod prototype tests, by J. D. Howell and C. C. Weeks. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 55p. Order from OTS. $1.25. NAA-SR-5077

Hydraulic characteristics of HNPF 19-rod fuel element, J. A. Hagel. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. July 60. Contract AT(11-1)-GEN-8. 32p. Order from OTS. $1.00. NAA-SR-5340

Preliminary safety analysis of the sodium-deuterium reactor (SDR), by C. C. Beusman. Nuclear Development Corporation of America, White Plains, New York. May 59. Contract AT(30-3) 256. 127p. Order from OTS. $2.50. NDA-84-14

10 MW_e sodium deuterium reactor design report, by E. Bernsohn and P. J. Davis. Nuclear Development Corporation of America, White Plains, N. Y. Feb 59 and Mar 59. Contract AT(30-3)-256. 340p. Order from OTS. $4.50. NDA-84-16 (Vols. I & II)

Selected reactors of the power reactor demonstration program. A literature search, by J. M. Jacobs. Office of Technical Information Extension, Oak Ridge, Tenn. June 60. 34p. Order from OTS. 75 cents. TID-3556

New production reactor power plant economic feasibility study, by Federal Power Commission, Burequ of Power, San Francisco Regional Office, Calif. Feb 60. 138p. Order from OTS. $2.50. TID-5762(Vol. I)

State regulation and the future of nuclear power, by R. E. Untereiner. Office of Technical Service Information, Oak Ridge, Tenn. June 60. 11p. Order from OTS. 50 cents. TID-8208

Advanced pressurized water reactor study. Phase II-A report, by Stone and Webster Engineering Corporation and Combustion Engineering, Inc., for Divison of Reactor Development, U. S. Atomic Energy Commission. July 60. Contract AT(10-1)-1010. 405p. Order from OTS. $2.50. TID-8502(Pt. 1) (Supplement)

Heavy water moderated power reactor plants. Design study, by Sargent & Lundy, Engineers and Nuclear Development Corporation of America for Division of Reactor Development, U. S. Atomic Energy Commission. June 59. Contract AT(38-1)-193 Mod. 1. 415p. Order from OTS. $4.50. TID-8503(Pt. 3)

Complete results of the preliminary design and hazards study for the Boiling Nuclear Superheater (BONUS) Power Station are reported in four volumes:
Volume 1: Reference Design - 238p.
Volume 2: Technical and Economic Evaluation of Reference Design - 154p.
Volume 3: Alternate Design Studies - 137p.
Volume 4: Preliminary Hazards Summary Report - 361p.
The Puerto Rico Water Resources Authority and General Nuclear Engineering Corporation, Dunedin, Fla. June 60. 4 volumes (bound separately but priced as a unit). Order from OTS. $9.50. TID-8524

Small size pressurized water reactor specifications, by Gibbs and Hill, Inc. Internuclear Company. Nov 59. 72p. Order from OTS. $1.00. TID-8525

Small size pressurized water reactor conceptual design, by Gibbs and Hill, Inc. Internuclear Company. Apr 60. Contract AT(40-1)-2589. 81p. Order from OTS. $1.75. TID-8526

Bettis Technical Review, by B. F. Langer and others. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. Apr 60. Contract AT-11-1-GEN-14. 134p. Order from OTS. $2.75. WAPD-BT-18

Pressurized water reactor (PWR) project. Technical progress report for the period April 24, 1960 to June 23, 1960, by P. N. Ross and others. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. 1960. Contract AT-11-1-GEN-14. 149p. Order from OTS. $2.50. WAPD-MRP-186

PWR hazards summary supplement, by R. Atherson. and others. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. Oct 59. Contract AT-11-1-GEN-14. 11p. Order from OTS. 50 cents. WAPD-PWR(RD-1)-596

Stable Isotope Separation

Possible large-scale uses of separated fission products. Presented at November 1959 meeting of the Atomic Industrial Forum. Technical Information Service Extension, Oak Ridge, Tenn. 5p. Order from OTS. 50 cents. TID-8521

Technology—Feed Materials

New beta heat-treating salt baths for reducing hydrogen pickup by uranium rods, by L. L. Lortscher, K. A. Sense, and R. B. Filbert, Jr. Battelle Memorial Institute, Columbus, Ohio. June 57. Decl. March 27, 1960. Contract W-7405-eng-92. 31p. Order from OTS. 40 cents. BMI-1195

Densification of uranium tetrafluoride by sintering, by R. A. Carter. Union Carbide Nuclear Company, Union Carbide and Carbon Corporation, Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. Mar 57. Decl. June 27, 1960. Contract W-7405-eng-26. 15p. Order from OTS. 30 cents. K-1299

Process developments in the manufacture of uranium hexafluoride for period July 1957 through June 1959. Union Carbide Nuclear Company, Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. July 60. Contract W-7405-eng-26. 41p. Order from OTS. $1.00. K-1437

Process development quarterly report, Part I, by N. E. Berry and others. Mallinckrodt Chemical Works, St. Louis, Mo. Oct 55. Decl. June 27, 1960. Contract W-14-108-eng-8. 142p. Order from OTS. $2.50. MCW-1380

Process development quarterly report. Part I-Laboratory work, by N. Kuhlman and others. Mallindkrodt Chemical Works, St. Louis, Mo. Jan 57. Decl. May 31-60. Contract W-14-108-eng-8. 151p. Order from OTS. $2.75. MCW-1399

Process development quarterly report. Part I. Laboratory work, by N. Kuhlman and others. Mallinckrodt Chemical Works, St. Louis, Mo. Apr 57. Decl. July 15, 1960. 144p. Order from OTS. $2.50. MCW-1401

The utilization of the HF-H_2O azeotrope in the manufacture of uranium tetrafluoride, by L. G. Weber. Mallinckrodt Chemical Works, Uranium Weldon Spring, Mo. July 60. Contract W-14-108-eng-8. 13p. Order from OTS. 50 cents. MCW-1450

Process development quarterly progress report for April through June 1960, by J. H. Yeager and others. Mallinckrodt Chemical Works, Uranium Division, Weldon Spring, Mo. Aug 60. Contract W-14-108-Eng-8. 68p. Order from OYS. $1.75. MCW-1451

Laboratory evaluation of South Australian Radium Hill uranium concentrates, (Ammonium precipitate and Magnesium precipitate), by B. G. Ryle. and others. National Lead Company of Ohio, Technical Division, Cincinnati, Ohio. Jan 57. Decl. June 2, 1960. Contract AT(30-1)-1156. 21p. Order from OTS. 35 cents. NLCO-665

Laboratory and pilot plant evaluation of synthetic carnotite uranium concentrate, by B. G. Ryle and others. National Lead Company of Ohio, Technical Division, Cincinnati, Ohio. Feb 57. Decl. June 6, 1960. Contract AT(30-1)-1156. 27p. Order from OTS. 35 cents. NLCO-669

A summary report of all pilot plant work done in developing a continuous process for the production of UF_4, by E. K. Teter. Mallinckrodt Chemical Works, St. Louis, Mo. Dec 50. Decl. August 5, 1960. 22p. Order from OTS. 35 cents. NYO-1316

Reprocessing of uranium bearing barium sulfate cake produced in the M. C.W. refinery, by A. M. Kirby. Mallinckrodt Chemical Works, Uranium roject lants, St. Louis, Mo. May 53. Decl. July 14, 1960. Contract W-14-108-Eng-8. 31p. Order from OTS. 40 cents. NYO-1351

A study of continuous extraction methods, by S. H. Anonsen. Mallinckrodt Chemical Works, St. Louis, Mo. May 45. July 12, 1960. Contract W-7405-eng-1. 178p. Order from OTS. $1.10. NYO-5077

The use of poro carbon tubes for dust removal, by H. Yeager and K. Eckberg. Mallinckrodt Chemical Works, St. Louis, Mo. May 50. Decl. August 9, 1960. 7p. Order from OTS. 25 cents. NYO-5234

A report on the filtration of TBP slurrex raffinate, by A. M. Kirby and others. Mallinckrodt Chemical Works, St. Louis, Mo. [nd]. Decl. August 10, 1960. 27p. Order from OTS. 35 cents. NYO-5254

Application of the pulse column for uranium recovery from K-25 wastes, by E. Lieberman and A. C. Jealous. Oak Ridge National Laboratory, Oak Ridge, Tenn. Nov 53. Decl. August 8, 1960. Contract W-7405-eng-26. 22p. Order from OTS. 35 cents. ORNL-1543

Fluorox moving-bed process for producing UO_3, UF_4, and UF_6: A bibliography, by J. E. Moore. Oak Ridge National Laboratory, Oak Ridge, Tenn. Aug 56. Decl. July 6, 1960. Contract W-7405-eng-26. 20p. Order from OTS. 35 cents. ORNL-2117

Laboratory development of the fluorox process: II. Thermogravimetric study of the chemical kinetics for the reaction of UF_4 with dry oxygen, by I. M. Ferris and E. G. Carter. Oak Ridge National Laboratory, Oak Ridge, Tenn. May 57. Decl. June 2, 1960. Contract W-7405-eng-26. 26p. Order from OTS. 35 cents. ORNL-2216

Technology—Raw Materials

Energy from uranium and coal reserves, by R. D. Nininger, C. I. Gardner, M. F. Searl and D. W. Kuhn. Office of Operations Analysis and Forecasting and Division of Raw Materials, United States Atomic Energy Commission. May 60. 7p. Order from OTS. 50 cents. TID-8207

U. S. Government

RESEARCH REPORTS

December 16, 1960
Vol. 34, No. 6

. . . A monthly listing of Government research reports available to industry . . .

UNIVERSITY OF MICHIGAN
DEC 30 1960
ENGINEERING LIBRARY

In this issue:

Strain Aging of Refractory Metals (PB 151 092)

Design for Maintainability. Supplement IV: Maintainability Handbook for Electronic Equipment Design (PB 161 025)

Recent Developments in Superalloys (PB 161 214)

Development of Refractory Metal Sheet in the United States (PB 161 217)

Radio Refractometry (PB 161 567)

Ultra-High Resistance Measurements of Plastics (PB 161 784)

Some Comments of Pump Cavitation Research (PB 161 952)

High-Temperature Electrical Insulating Inorganic Coatings on Wire (PB 161 954)

Fuel Cell Systems (PB 161 972)

Radioisotope Tube Heater (PB 171 015)

Water Recovery Systems (Multi-Variable) (PB 171 022)

Complete list of printed reports begins on page iii

The PB Reports . . .

announced in this publication have just been released, usually by agencies of the U. S. Government, for dissemination to the public. In most instances they result from Government or Government-sponsored research.

The Office of Technical Services is responsible, under Public Law 776, 81st Congress, for the collection and distribution of these technical reports in the interest of American science and industry.

The more important reports are reprinted for sale to the public by OTS. Many of the reports are so specialized that the demand for them does not warrant reproduction of printed copies; originals of these documents are deposited at the Library of Congress. There they may be inspected in the Annex Reading Room, or copies may be ordered from the Library in either photocopy or microfilm.

PB reports of special interest to smaller businesses are abstracted in OTS's monthly *Technical Reports Newsletter*, available from the Superintendent of Documents, Washington 25, D. C., at $1 a year domestic, $1.50 foreign.

Since 1945 thousands of business firms have used PB reports in their research programs. These reports now constitute one of the world's largest collections of non-confidential technical information, numbering over 250,000 items. OTS has published catalogs of related reports in more than 300 areas of industrial interest. For further information relative to any of its activities, you are invited to write OTS, U. S. Department of Commerce, Washington 25, D. C.

Except to the extent indicated by acknowledgment of authorship, OTS does not edit PB reports, nor does it accept responsibility for the information and conclusions contained in them. If copyrighted material appears, permission for its use should be requested from the copyright owners. Any national security restrictions that may have applied to these reports have been removed. Patents may cover the subject matter of any report, and the reader is advised to make patent searches before developing applications based on the reports.

How To Order

ALWAYS USE COMPLETE TITLE AND PB NUMBER of each report ordered. The letter "s" accompanying some PB numbers means "supplement," "t" means "translation," and "r" means a partial or complete revision. These letters should be included as part of the PB number. Prepayment is required.

TO ORDER FROM LC • Address your order to Library of Congress, Photoduplication Service, Publications Board Project, Washington 25, D. C. Make check or money order payable to Chief, Photoduplication Service, Library of Congress. State whether report is desired in microfilm or photocopy. Microfilm copies are in 35 millimeter film and require special reading equipment; if you do not have such a machine you may be able to use one at a library in your area.

TO ORDER FROM OTS • Address your order to Office of Technical Services, U. S. Department of Commerce, Washington 25, D. C. Make check or money order payable to OTS, Department of Commerce. Reports available from OTS may also be ordered through Department of Commerce field offices.

TO ORDER FROM OTHER SOURCES • When an agency other than OTS or LC is the source, use the full address included in the abstract of the report. Make check or money order payable to that agency.

U.S. GOVERNMENT RESEARCH REPORTS

U.S. DEPARTMENT OF COMMERCE
Frederick H. Mueller, *Secretary*

BUSINESS AND DEFENSE SERVICES ADMINISTRATION
William A. White, Sr., *Administrator*

Office of Technical Services
John C. Green, *Director*

Issued monthly. Annual subscription $9 ($2.50 additional for foreign mailing). Single copy $1. Make remittance payable to Superintendent of Documents and mail either to a Department of Commerce field office or to Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C. Address changes should be sent to Superintendent of Documents.

Contents may be reprinted freely. Mention of source will be appreciated

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, July 18, 1958

Printed Reports Available From OTS Announced in This Issue

BIBLIOGRAPHY — Page

Magnetostriction. Aug 60. 6p. (OTS SB-427) 10 cents 774

ASTRONOMY

Limitations for nighttime detection of celestial bodies employing the image orthicon and the intensifier image orthicon. June 60. 46p. (PB 161 951) $1.25 673

BEHAVIORAL SCIENCES

Device and tests for measuring intellectual functions during acceleration. May 60. 39p. (PB 171 019) $1.25 680
Human performance as a function of the work-rest cycle. Mar 60. 21p. (PB 161 958) 75 cents 680

BIOLOGICAL SCIENCES

Closed circuit respiratory systems symposium. Aug 60. 470p. (PB 161 988) $6.00 683
Design parameters for the engineering of closed respiratory systems. Dec 59. 18p. (PB 161 963) 50 cents 681
Determination of internally deposited radioactive isotopes in the Marshallese people by excretion analysis. 1960. 19p. (PB 161 950) 50 cents 688
Radiological health data. Volume I, No. 6. Sep 60. 61p. (PB 161 371-6) 50 cents, $3.00/6 mos 687
Studies in pulmonary physiology: Chemistry, mechanics, and circulation of the lung. Apr 60. 162p. (PB 161 984) $3.00 682
Variations in absolute visual thresholds during acceleration stress. Apr 60. 18p. (PB 171 009) 50 cents 681

CHEMISTRY

Fuel cell systems. July 60. 20p. (PB 161 972) 50 cents 692

EARTH SCIENCES

Geodetic distance and azimuth computations for lines over 500 miles. Dec 59. 90p. (PB 161 994) $2.25 698
Photochemical process for preparation of master terrain models. Aug 60. 13p. (PB 161 993) 50 cents 698
Upper wind statistics charts of the northern hemisphere (850, 700 and 500 mb levels). Aug 59. 94p. (PB 161 995-1) $35.00 695

THE LIMITATIONS FOR NIGHTTIME DETECTION OF CELESTIAL BODIES EMPLOYING THE IMAGE ORTHICON AND THE INTENSIFIER IMAGE ORTHICON, by Radames K. H. Gebel. Rept. on Research on the Quantum Nature of Light. June 60, 46p. 9 refs. WADC Technical note 59-131.
Order from OTS $1.25 PB 161 951

This paper concludes that it is theoretically possible, by using the intensifier image orthicon, to exceed by ten magnitudes the faintest star ever recorded. Generally, the final limit of detectability of faint stars is determined by the randomness in the radiation of the sky background. Further limitations are imposed by the statistical fluctuations in the conversion of photons into electrons at the photocathode and the statistical fluctuations of the photocathode dark current emission. When using the image orthicon without intensifiers, these fluctuations become small with respect to the scanning beam fluctuations. Part I deals with the conventional image orthicon, with the scanning beam fluctuations usually being the prime factor in limiting detectability. An equation is derived which permits calculation of the apparent star magnitude which can be recorded under the made assumption with the image orthicon without intensifier stages. Part II deals mainly with the intensifier image orthicon. Formulas are derived for the intensifier image orthicon for threshold star magnitude number, as determined by the fluctuations in the emission due to sky radiation and photocathode dark current emission. Brandeis U., Waltham, Mass.
ELECTRON SCREENING IN DENSE DEGENERATE GASES, by Jack S. Goldstein. Final rept. on Contract AF 19(604)5563. 30 May 60, 24p. 12 refs. AFCRC-TR-60-275.
Order from LC mi$2.70, ph$4.80 PB 149 596

An investigation is made of the screening properties of a degenerate electron gas, with principal attention placed on the physical conditions to be found in white dwarf stars. In particular, the effect on nuclear reaction rates is considered. We find that although the method of approach differs, the result is not significantly different from that obtained by previous authors except in a very narrow range of densities. (Author)

THE "ASTRONOMICAL UNIT" AND THE SOLAR PARALLAX, by Samuel Herrick, George Westrom, and Maud W. Makemson. Rept. on Contract AF 49(638)498. 30 Sep 59, 26p. 24 refs. Astrodynamical rept. no. 5; AFOSR-TN-59-1044; AD-234 711.
Order from LC mi$2.70, ph$4.80 PB 148 266

A plan for the exploration of the world of planets has developed divergencies of usage on the navigation of interplanetary vehicles, of which one of the most significant and interesting concerns the unit of distance and associated trajectory constants. On the one hand there are those, steeped in laboratory concepts and units and in thrust and drag, who prefer to bring the planets into line by expressing their coordinates in laboratory units. On the other hand there are those who point out that the positions of the planets and the gravitational constant have accuracies up to 8 or 9 significant figures when the unit of distance is the astronomical unit (approximately the mean distance of the earth from the sun) and only to 3 or 4 in any laboratory unit. The pros and cons of these 2 schools of thought, and the 2 ways of handling the trajectory calculations, are explored in connection with specific orbit problems. (Author)

Free U. of Berlin (Germany).
REMARKS ON THE VALIDITY OF A TEST FOR EVOLUTION, by K. Just and R. Wielen. Technical note no. 1 on Contract AF 61(052)335. 3 May 60, 9p. 4 refs. AFOSR-TN-60-916.
Order from LC mi$1.80, ph$1.80 PB 150 348

The former test against a steady state of the universe (Just: Ap. J. 129 (1959) 268-270) holds even when the used clusters of galaxies are catalogued (Abell: Ap. J. Suppl. 3 (1958) 211 - 288) with certain systematic errors. (Author)

Harvard Coll. Observatory, Cambridge, Mass.
EVAPOROGRAPHY WITH SPECIAL APPLICATION TO THE MOON, by Hector C. Ingrao and Donald H. Menzel. Scientific rept. no. 4 on Contract AF 19(604)3074. 15 June 60, 44p. 31 refs. AFCRC-TN-60-469.
Order from LC mi$3.30, ph$7.80 PB 149 806

The methods of evaporography and condensography are discussed with special application to the Moon. Measurements of the droplets, resolving power and detectivity are given. On July 30, 1958, a condensograph of the Moon was obtained with integrated radiation and an evaporograph through a germanium filter; both photographs were made with a reflector of 8-inch aperature and effective focal ratio F/1.85. The feasibility of this technique for a study of some properties of the surface of the Moon is discussed. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
EXTRATERRESTRIAL RADIATION OF NONTHERMAL ORIGIN, by S. Kownacki. Technical note on Physical Electronics. June 60, 31p. 27 refs. LMSD-703032.
Order from LC mi$3.00, ph$6.30 PB 149 594

A type of radiation where spectral energy distribution does not conform with Planck's radiation law is discussed. Various possible mechanisms of its generation are considered with particular emphasis on the "synchrotron mechanism," radiation of electromagnetic waves from fast, charged particles subjected to the centripetal acceleration by magnetic fields. An analysis of the more convincing aspects of the theory as well as its inadequacies is given with description of relevant experimental evidence. The need for further experimental and theoretical work in connection with both the synchrotron mechanism and other alternatives is presented. In particular, additional work is discussed in some detail as related to the investigation of the spectral distribution of radiation, polarization, evaluation of magnetic fields, and to the number and energies of radiating particles. Finally, possible fields of inquiry are mentioned as well as methods of approach to the problems of developing models of alternative mechanisms. (Author)

Maryland U., College Park.
DISTRIBUTION OF DENSITY IN A PLANETARY EXOSPHERE, PART II, by E. J. Opik and S. F. Singer. Rept. on Contract AF 19(604)3861. 20 June 60, 28p. 6 refs. GRD-TN-60-606.
Order from LC mi$2.70, ph$4.80 PB 149 952

In an isolated neutral exosphere three components are distinguished: (1) elliptic-ballistic; (2) hyperbolic-ballistic; (3) bound-elliptic. Component (2) forms the escape flux which cannot be defined simply. Numerical results are given for neutral hydrogen and oxygen, applicable to the terrestrial exosphere. (See also PB 142 711)

Maryland U., College Park.
SOME CONSIDERATIONS OF EXPECTED RADIATION BELTS OF PLANETS MARS AND VENUS, by S. F. Singer. Scientific rept. no. 4 on Contract AF 19(604)5575. Jan 60, 23p. 50 refs. ERD-TN-60-573.
Order from LC mi$2.70, ph$4.80 PB 149 887

The historical development of the ideas which led to the prediction of geomagnetically trapped radiation are briefly traced out. Direct observations are then summarized, and various theories concerning the origin of the radiation belts are discussed. The neutron albedo-plus-solar injection theory (which predicts existence of two belts) is then applied to calculate the expected distribution of trapped particles near Mars and Venus. The "sweeping" effect of the Martian satellite Phobos is calculated; it should provide a radiation-free base near Mars. (Author)

Maryland U., College Park.
STRUCTURE OF THE EARTH'S EXOSPHERE, by S. F. Singer. Rept. on Contract AF 19(604)3861. 27 June 60, 10p. 10 refs. GRD-TN-60-607.
Order from LC mi$1.80, ph$1.80 PB 149 953

The main components of the earth's exosphere are neutral oxygen, neutral hydrogen atoms, ionized oxygen. The position of the base of the exosphere is established at an altitude of 530 km from an analysis of density data obtained from satellite drag observations. The relative distribution of both neutral oxygen and neutral hydrogen is derived from a theory of the exosphere. The normalization of oxygen is accomplished by means of satellite drag data. The normalization of hydrogen is accomplished by the use of the Lyman-alpha technique of Johnson, Friedman and Tousey. The distribution of ionized oxygen can be established jointly from the rocket measurements of Berning and from an analysis of radiation belt data obtained from satellites. They give a consistent picture of ionized oxygen becoming the most important constituent of the atmosphere at about 1500 km. The distribution of ionized hydrogen is only imperfectly known at the present time. (Author).

Oklahoma State U. Research Foundation, Stillwater.
AN ANALYSIS OF ROCKET AND EARTH SATELLITE MEASUREMENTS OF MICROMETEORIC INFLUX, by Curtis W. McCracken. Master's thesis. Final rept. vol. II, appendix B on Acoustic Detection of Meteoric Particles, Contract AF 19(604)1908. 14 Apr 60, 128p. 52 refs. AFCRC TR-60-272, vol. 2, app. B; AD-240 260.
Order from LC mi$6.30, ph$19.80 PB 150 381

The micrometeor data and some of the other available data on meteoric influx are plotted together as particle influx versus particle momentum to get a tentatively revised mass distribution curve. An equation is fitted to the tentatively revised mass distribution curve in order to obtain the corresponding tentatively revised mass distribution function. The new mass distribution function allows a significant extension of the known mass distribution function for meteoric particles. Some of the implications of the tentatively revised mass distribution function are discussed in a quite qualitative manner. (Author) (See also PB 149 099)

Palomar Observatory, San Diego, Calif.
A THEORY OF THE ROLE OF MAGNETIC ACTIVITY DURING STAR FORMATION, by Evry Schatzman. Special technical rept. no. 3 (Pre-print) on Contract AF 49(638)21. 14 Jan 60, 27p. 14 refs. AFOSR-TN-60-214; AD-234 150.
Order from LC mi$2.40, ph$3.30 PB 147 618

EXPERIMENTAL DESIGN FOR HUMAN ENGINEERING EVALUATION OF DV-10/A2F DISPLAYS, by William A. Bradley. Rept. on Proj. TED ADC AV-73011. 30 June 59, 21p. Rept. no. NADC-AI-5958.
Order from LC mi$2.70, ph$4.80 PB 149 526

The purpose of this experiment is to determine the optimum scale factors of certain variables in an electronic contact analog display on the basis of minimum errors obtained in this experiment. These optimum scale factors will then be utilized in the experimental cockpit of the R4Y in real flight and the results compared with those obtained in the simulator.

California U., Los Angeles.
STUDIES OF EFFECTIVENESS OF ELIMINATION OF DISPLAYED INFORMATION WITH OBSERVER PRACTICE INCREASE. Annual summary rept. for Nov 58-Sep 59 on Contract Nonr-233(49). Oct 59, 28p. Dept. of Engineering rept. 58-62; AD-229 418.
Order from LC mi$2.70, ph$4.80 PB 149 507

A review of research accomplishments during the year 1958-1959 is presented. Activities fell into broad categories as follows: (1) development and check-out of an electronically controlled display and control panel and necessary recording apparatus for the study of specified display variables in a perceptual-motor task; (2) development of methodology and actual construction of a versatile paper-and-pencil test for the evaluation of redundancy in dial reading tasks; and (3) initial experimental investigations and subsequent statistical analyses for the evaluation of probability distribution and the performance effects of additional signal cues on the apparatus task, and the evaluation of performance effects as a function of both type and amount of redundancy on a simulated dial reading task. (Author)

HUMAN PERFORMANCE IN INFORMATION TRANSMISSION. PART VI. EVIDENCES OF PERIODICITY IN INFORMATION PROCESSING, by L. G. Augenstine. Rept. on Contract DA 36-039-sc-56695. Dec 58, 38p. 7 refs. Rept. R-75; AD-209 278.
Order from LC mi$3.00, ph$6.30 PB 149 398

In the present study an attempt has been made to specify some of the properties associated with data processing.

Aviation Medical Acceleration Lab., Naval Air Development Center, Johnsville, Pa.
TRANSFER OF TRAINING AMONG COMPONENTS OF A COMPLEX VELOCITY CONTROL TASK, by Randall M. Chambers. Rept. no. 3 on BuMed Proj. MR 005.15-1003.1. 28 Dec 59, 24p. 12 refs. NADC-MA-5920; AD-233 756.
Order from LC mi$2.70, ph$4.80 PB 148 273

The principle of transfer of training among task components states that practice on one part within a total task will result in increments in performance proficiency on the other parts as well as in the total task, provided that the parts are similar to one another. Results of tests conducted on 9 groups of airmen who were given specific practice on parts of a complex multidimensional compensatory rate control task showed that skill proficiency on certain unpracticed components within the total-skill complex was changed as a function of practice on certain components. Practice on the originally difficult component singly, and practice on this component simultaneously with other components, resulted in major reorganization of the skill complex, and in significant increments in total task performance over that of controls, whereas practice on the originally easiest component or combinations involving the easiest component, were generally less effective, even though marked transfer of training occurred. More transfer of training to the total-task occurred following practice on the originally difficult component and/or combinations involving it than following practice on the originally easy component and/or its combinations. Within the task, transfer of training was more effective than the practice itself for raising the proficiency level of originally easy components. However, in situations involving originally difficult components, transfer of training was slightly less effective than practice itself for raising the proficiency level of that component. (Author)

Educational Research Corp., Cambridge, Mass.
A TRAINING ANALYSIS OF THE PILOT'S TASK IN TRANSITIONING TO JET VTOL AIRCRAFT, by Phillip J. Rulon and Milton W. Horowitz. Rept. on Contract N61339-74. Sep 59, 57p. 6 refs. Technical rept. NAVTRADEVCEN 74-1; AD-231 477.
Order from LC mi$3.60, ph$9.30 PB 148 271

An analysis of Vertical Take-off and Landing (VTOL) flight training problems was undertaken. The study consisted primarily of discussions with technical and pilot personnel, examination of test flight reports, and observation of VTOL aircraft from the human engineering viewpoint. Since VTOL aircraft were still in the development stage, the study was necessarily anticipatory and opportunistic. However, an attempt was made to provide data most relevant to horizontal attitude VTOL. A number of factors were found to make the task of flying VTOL aircraft exceptionally difficult. The more important of these were: (1) need for great precision in controlling aircraft, especially during transition from the hovering to the aerodynamic mode; (2) poor visibility from the cockpit during certain flight modes; (3) variations in display-control relationships and instrument responsiveness and sensitivity as a function of flight mode; and (4) inadequate instrumentation for determining whether aircraft is sustained by thrust or aerodynamic control. Solutions of these problems are considered in terms of better instrumented and human engineering VTOL aircraft; previous helicopter training; the use of 2-place VTOL training aircraft; and selected training devices. (Author)

Human Resources Research Office, George Washington U., Washington, D. C.
LEADERSHIP IN ARMY INFANTRY PLATOONS: STUDY II, by Carl J. Lange and T. O. Jacobs. Rept. on Contract DA 49-106-qm-1. July 60, 42p. 4 refs. Research rept. 5.
Order from LC mi$3.30, ph$7.80 PB 149 966

A Leader Activities Questionnaire (LAQ) was developed to measure leader behavior variables found in an earlier study to be associated with judgments of leader effectiveness. The LAQ was planned for use as a measure of the effectiveness of experimental platoon leader training based on the leader behavior variables identified earlier. Results of the tryout indicated that most of the LAQ scoring categories were satisfactory as to internal consistencies and the extent to which platoon members agreed in describing behavior of their platoon leaders. Validities of parallel variables from the earlier and the present study were in substantial agreement. This was interpreted as evidence that the LAQ measured acceptably well those variables it was designed to measure. The close agreement between the two sets of results increases the confidence with which the findings of the earlier study can be used as a basis for training platoon leaders. PART- VERSUS WHOLE-TASK LEARNING OF A FLIGHT MANEUVER, by Jack A. Adams, Lyle E. Hufford, and James M. Dunlop. Rept. on Contract N61339-297. 21 June 60, 58p. 13 refs. Technical rept. NAVTRADEVCEN-297-1.
Order from LC mi$3.60, ph$9.30 PB 150 180

Two matched groups of pilots were trained in a hypothetical toss-bomb maneuver to be performed in the SNJ Operational Flight Trainer. One group had separate training in flight control and procedural tasks; the contrasted group had concurrent training in the two classes of tasks. After equal amounts of training, both groups were asked to perform the maneuver in the whole-task version (i.e. criterion task). Analysis of the whole-task performance of the two contrasted groups revealed that only on the first trial was the part-task group less proficient than the group that learned the two types of tasks concurrently. And even then, this inferiority was shown only on the procedural aspects of the whole task. As for the flight control tasks, they were performed equally well by both groups on the very first whole-task trial.

COMPARISON OF PERFORMANCE AND UTILIZATION OF FTs WITH DIFFERENT TRAINING AND ASSIGNMENT BACKGROUNDS, by Norman Labbe and Bert T. King. Mar 60, 27p. 3 refs. Technical Bulletin 60-2.
Order from LC mi$2.70, ph$4.80 PB 150 007

Data were collected aboard ships of the Atlantic Fleet dealing with the reenlistment intentions, professional and technical performance, and shipboard training and utilization of 265 Fire Control Technicians (FT). It was found that: (1) The incidence of reenlistment intentions was not associated with pay-grade level, GCT+ARI score, "A"-School attendance, or size of FT complement. (2) Better professional and military performance were associated with "A"-School attendance, petty-officer status, and higher GCT+ARI scores. (3) Speed of advancement was related to "A"-School attendance but not to GCT+ARI or size of FT complement. (4) Assignment to more difficult equipments was more frequent for men in larger complements. However, assignment to more difficult tasks characterized men in smaller complements, petty officers, and graduates of Class "A" FT School. (5) About one-half of these technicians were considered by their supervisors to have critical training needs.

Naval Personnel Research Field Activity, Washington, D. C.
SPEED FACTORS IN OFFICER SELECTION MEASURES, by Leonard Wollack and Isaiah Guttman. Feb 60, 31p. 18 refs. Technical Bulletin 60-5.
Order from LC mi$3.00, ph$6.30 PB 150 191

This research sought to find out if certain speed factors could account for the improvement that had been obtained in the prediction of success at Officer Candidate School when the experimental Verbal-Numerical Test (VNT) was used along with the operational Officer Qualification Test (OQT). The analyses offered no support to the hypothesis that "speed" accounted for the unique covariance in question. Rather, it appeared that quantitative reasoning components of the VNT best explained the improvement in prediction. Consequently, in the development of new forms (7, 8, and 9) of the OQT a greater number and variety of mathematics items are being included. (Author)

AUTOMATED TEACHING: A REVIEW OF THEORY AND RESEARCH, by Robert E. Silverman. Rept. on Contract N61339-507. 8 June 60, 49p. 56 refs. Technical rept. NAVTRADEVCEN-507-2.
Order from LC mi$3.30, ph$7.80 PB 150 179

The present state of research in the area of automated teaching and the application of automated teaching devices were reviewed in terms of issues relating to programming, to machine variables, and to studies comparing conventional instruction with automated instruction. Some basic issues were singled out for consideration. Such problems as prompting, confirmation, reinforcement, size-of-step, and branching were considered. The design and construction of machines were judged to be a secondary issue; the question of programming takes precedence. The problem of measuring the effects of automated teaching was considered to be crucial, since it is bound to the question of what is to be learned. It was also pointed out that job analyses of learning tasks must be done and measurement problems solved before valid comparisons between automated and conventional instruction can be made. (Author) (See also PB 148 755)

Pennsylvania State U., University Park.
THE EFFECTIVENESS, ACCEPTABILITY, AND FEASIBILITY OF TECHNICAL TRAINING COURSES RECORDED ON SOUND MOTION PICTURES AND SLIDES PLUS TAPES, by D. P. Duvall, L. P. Greenhill and others. Rept. on Contract N61339-364. June 60, 26p. Technical rept. NAVTRADEVCEN-364-1.
Order from LC mi$2.70, ph$4.80 PB 150 178

The purpose of this study was to develop and evaluate economical and effective means for recording existing courses of instruction in technical areas for subsequent use on shore or in the fleet. The techniques for attempting to do this included the use of minimum cost sound motion pictures, and 2" x 2" slides with audio tape. Specifically, comparisons were to be made between: (a) instruction recorded on 16mm sound motion pictures and face-to-face instruction, and (b) instruction recorded on 2" x 2" slides plus audio tape and face-to-face instruction. The comparisons were to be in terms of (1) the relative effectiveness of the methods as measured by the performance of trainees following the courses, (2) the acceptability of the methods, and (3) the feasibility of the methods. A REGRESSION ANALYSIS OF ONE SET OF AIRMAN PROFICIENCY TEST SCORES, by Chester J. Judy. June 60, 14p. 7 refs. WADD-TN-60-139.
Order from LC mi$2.40, ph$3.30 PB 150 076

One criterion for airman skill upgrading in the Air Force is met by attaining a qualifying score on an applicable Airman Proficiency Test (APT). This note reports an analysis which shows the proportion of variance one such test has in common with selected measures of training, experience, education, aptitude, supervisory opinion, and airman attitudes for a sample of 384 aircraft mechanics tested in 1956 and 1957. Each of these categories of information, excepting airman attitudes, could be used to predict the APT criterion at some level of effectiveness; but only the training variables and the aptitude variables added significantly to the prediction attainable by using all other available information. Other research was cited in which various APT correlates are reported. Results show the utility of APT scores in defining one important aspect of airman proficiency. (Author)

CHARACTERISTICS OF OFFICERS GRADUATING IN 1954 FROM AIR FORCE INSTITUTE OF TECHNOLOGY PROGRAMS, by David K. Trites and Robert N. Cyzmoure. Apr 60, 40p. WADD TN-60-46; AD-237 212.
Order from LC mi$3.00, ph$6.30 PB 148 246

The results of a survey of 360 officers who remained in the Air Force and of 151 officers who left the Air Force subsequent to graduation from training programs sponsored by the Air Force Institute of Technology are reported. Background information was collected and questionnaires were mailed to each group of officers. It was found that officers remaining on active duty are generally older, have more rank, have spent more time in service, and more frequently are rated than were officers leaving service. A number of possible methods of improving retainability are identified and discussed. The most important of these are: (1) require a period of active duty service prior to assignment to AFIT programs; (2) increase the length of obligated service following AFIT graduation; (3) following AFIT graduation, insure that officers have sufficient time and opportunity to meet requirements for continued flying status; (4) in no way jeopardize an officer's promotion list status as a result of AFIT training; (5) continue to offer Distinguished Military Graduates of AFROTC regular commissions upon entering active duty in the Air Force; (6) increase the length of assignments following AFIT graduation; and (7) provide proficiency pay to reduce the gap between Air Force and civilian salaries for the same jobs. CONSTRUCTION AND VALIDATION OF THE INSTRUCTOR APTITUDE TEST, by Cecil J. Mullins and John A. Cox. Dec 59, 9p. 2 refs. WADC TN-59-203; AD-230 968.
Order from LC mi$1.80, ph$1.80 PB 150 590

This report released for sale to the public 11 Oct 60.

A test was constructed for predicting success in Technical Instructor Schools, using items previously proved valid for General Instructor School success and for Pilot Instructor School success. It consists of four parts: a verbal section, an arithmetic reasoning section, a social insight section, and an interest section. The test was normed for instructors now performing on the job. Validation coefficients were obtained between test scores and course grades in Technical Instructor Schools at six Air Force bases. Validities ranged from .06 to .63, with five of the six highly significant. These compare favorably with validities of the General Aptitude Index of the Airman Classification Battery for the final school grade criterion. Test scores identified eliminees from Technical Instructor Schools with considerable accuracy.

Personnel Lab., Wright Air Development Div., Lackland AFB, Tex.
CONVERSION OF APTITUDE INDEXES BETWEEN FORMS AC-1B AND AC-2A OF THE AIRMAN CLASSIFICATION BATTERY, by Bart B. Cobb. Feb 60, 9p. 4 refs. WADD TN-60-39; AD-237 210.
Order from LC mi$1.80, ph$1.80 PB 148 245

This study represents an empirical approach by which scales have been developed to facilitate conversion of aptitude indexes derived from the Airman Classification Battery AC-1B to equivalents of corresponding aptitude indexes for the Airman Classification Battery AC-2A. There has been a continuing need, both in test development and in operational situations, for a reliable means of converting the stanine-type aptitude indexes to the modified percentile-type indexes of Battery AC-2A. The Armed Forces Qualification Test score was used as a reference variable to select and equate an AC-1B sample. Frequency distributions were obtained for each of four sets of corresponding indexes and conversion tables were derived by the equipercentile technique. These tables are appropriate for use when comparing qualifications of individuals tested by different forms of the Airman Classification Battery. (Author)

Personnel Lab., Wright Air Development Div., Lackland AFB, Tex.
IMPACT OF A NEGATIVELY WEIGHTED VARIABLE ON THE VALIDITY OF AN APTITUDE INDEX, by Leland D. Brokaw and Helen Tomlinson. Jan 60, 8p. 4 refs. WADD TN-60-38; AD-237 209.
Order from LC mi$1.80, ph$1.80 PB 148 244

Evaluation of the impact of a negatively weighted variable as a part of a composite score is made by comparison between the characteristics of such composites and the characteristics of the composites with that variable removed. The validity of the aptitude indexes was increased, but not significantly, by eliminating the negatively weighted element; the correlation between the aptitude indexes was strongly affected. The aptitude indexes, containing the negatively weighted elements, were not appreciable correlated with each other; but the composites, within the negatively weighted elements, were positively intercorrelated. The results strongly support the use of negatively weighted elements in the aptitude indexes of differential classification batteries; they indicate that other purposes are best served by batteries involving only positively weighted elements. This conclusion is pertinent only to aptitude composite whose components all have positive validity. (Author)

Personnel Research and Development Corp., Cleveland, Ohio.
SPATIAL TESTS AS PREDICTORS OF SUCCESS IN AIR FORCE TRAINING, by Erwin W. Taylor and James W. Parker. Rept. on Contract AF 41(657)125. Dec 59, 43p. 2 refs. WADC TR 59-361.
Order from LC mi$3.30, ph$7.80 PB 149 625

The Airman Classification Battery includes two measures of spatial ability. In a search for possible improvement of coverage, 20 spatial tests were investigated to determine their validity for predicting success in Air Force training courses in five career fields representing the five aptitude indexes used in airman classification and assignment. Factor analysis indicated that a heterogeneous test was a better measure of spatial ability than were tests composed of homogeneous items. Of the final school grades as criteria, those for Aircraft Mechanic were most predictable both from Airman Classification Battery tests and from the spatial tests. Those for Organizational Supply Specialist were least predictable. Of the spatial battery tests, the most promising for a place in a differential classification battery is the heterogeneous subtest, Space Survey I. This had high individual validity for mechanical training but generally lower validity for other training. The authors suggest, as a general predictor of success in technical school, a composite which would include measures of academic ability, verbal facility, and ability to handle abstractions. TALK ABOUT SELE: THE RESULTS OF A PILOT SERIES OF INTERVIEWS IN RELATION TO GINZBERG'S THEORY OF OCCUPATIONAL CHOICE, by Robert P. O'Hara (Boston Coll.) Rept. no. 14 on Harvard Studies in Career Development, and Technical rept. no. 10 on Contract Nonr-1866(31). Oct 59, 17p. 2 refs. AD-227 532.
Order from LC mi$2.40, ph$3.30 PB 149 854

The nature of evolving conceptions of self was explored. Fifteen boys in the first, third, fifth, seventh, and ninth grades were interviewed. A boy of high, average, and relatively low intelligence was chosen for each level. The interview covered the following areas: (1) what sort of boy are you; (2) things you like to do; (3) present occupational choice and reasons for it; (4) past choices and reasons for changing them; and (5) role models. Results indicated a predominance of relatives as role models. The boys considered themselves as objective entities and began to evaluate themselves as early as the first grade. Reality testing, objective appraisal, entered the career development earlier than Ginzberg and his associates (An Approach to a General Theory, Columbia University Press, N. Y. 1951) suggested. Evidence of the need for compromise appeared to occur by the age of 12 and 13. A rational connection was indicated between the choices and the bases for choice during the fantasy period. Rejection of the former choices also appeared reasonable. The basis for choice appeared to be largely interest, but values and aptitude appeared as bases 4 to 6 grade-levels below those suggested by Ginzberg.

ANNUAL TECHNICAL REPORT. Rept. for 1 Nov 58-31 Oct 59 on Contract Nonr-855(04). [1959] 10p. 1 ref.
Order from LC mi$1.80, ph$1.80 PB 149 516

The various studies summarized are grouped under the following headings: Studies of Social Perception, Studies Related to the recent book by Thibaut and Kelley, Other Experimental Studies, and A Field Study. (See also PB 143 471)

[Institute for Social Research, U. of Michigan, Ann Arbor]
REFERENCE GROUP PROCESSES IN A FORMAL ORGANIZATION, by Jay M. Jackson. (U. of Kansas). Doctoral thesis. Rept. on Contract N6onr-232(02). [1959] 33p. 31 refs. AD-218 325.
Order from LC mi$3.00, ph$6.30 PB 147 897

Research is reported which was directed toward increasing understanding of some of the reference group processes. The following hypothesis were formulated and tested: (1) in any group or organization, a person's attraction to membership will be directly related to the magnitude of his social worth; (2) the magnitude of the positive relationship hypothesized above will vary directly with the volume of interaction the person has with other members of the group or organization under consideration; (3) where alternative group orientations are possible for a person, his relative attraction to membership in one or another group will be directly related to his relative social worth in the group considered; and (4) the magnitude of the positive relationship hypothesized in (3) will vary directly with the volume of interaction the person has with the members of the groups under consideration. Questionnaire data were obtained from 72 staff members of a child welfare agency. The sample consisted of 46 professional and 26 nonprofessional men and women. Hypotheses were tested by computing Pearson product-moment correlations between measures of attraction and social worth. Results indicated that the hypotheses and the assumptions from which they were drawn are supported. The findings point more specifically to the populations, conditions, and context in which the generalizations may hold true. Correlations were computed for high and low contact groups, for professionals and nonprofessionals, supervisory and nonsupervisory personnel, and for work-groups relative to the rest of the organization. None of the relationships approached statistical significance.

Institute of Psychiatry, Maudsley Hospital, London (Gt. Brit.)
RATE OF TEMPORAL AND SPATIAL INHIBITION IN HYSTERIA AND BRAIN DAMAGE IN NORMAL, NEUROTIC, AND BRAIN-DAMAGE SUBJECTS. Final technical rept. for 1 May 59-30 Apr 60 on Contract DA 91-591-EUC-1136. [1960[69p. 33 refs.
Order from LC mi$3.90, ph$10.80 PB 149 422

This report has three sections. In the first of these the experimental investigation has been completed. A battery of tests was administered to 16 hysterics, 16 dysthymics, 16 schizophrenics and 16 normal subjects. The second part is made up of three experiments on reminiscence. The third part consists of a report on sedation threshold as a measure of extraversion and inhibition. This report gives findings on hysterics and dysthymics. (See also PB 143 837).

Link Div., General Precision, Inc., Binghamton, N. Y.
A DEVICE AND TESTS FOR MEASURING INTELLECTUAL FUNCTIONS DURING ACCELERATION, by Irwin Miller, George B. Simon, and Edwin Cohen. Rept on Biophysics of Flight, Contract AF 33(616)6467. May 60, 39p. 28 refs. WADD Technical rept. 60-366.
Order from OTS $1.25 PB 171 019

In manned space flights, a vehicle operator will be expected to perform control functions or act as a systems monitor under high levels of acceleration. To determine the extent to which man's intellectual functions might be impaired under high G, a device was designed for use with the WADD human centrifuge. This device, the Link Intellectual Functions Tester (LIFT), can be operated up to 14 G, and features automatic scoring, tabulation of responses, and automatic pacing of stimulus presentation. Three test batteries of 14 one-minute tests were used to evaluate verbal, reasoning, mathematical, and perceptual abilities under the limitations of high G on the centrifuge. The median reliability of the one-minute tests was 0.27; the estimated reliability of the 14-test battery was 0.83. Until new data actually gathered during acceleration are made available, the reliability of all the tests remains undetermined for any values above 1 G. (Author)

Lockheed Aircraft Corp., Marietta, Ga.
HUMAN PERFORMANCE AS A FUNCTION OF THE WORK-REST CYCLE, by Oscar S. Adams and W. Dean Chiles (Aerospace Medical Div.). Rept. on Human Performance in Advanced Systems, Contract AF 33(616)6050. Mar 60, 21p. 11 refs. WADD Technical rept. 60-248.
Order from OTS $0.75 PB 161 958

This study was designed to investigate the effect on performance of four different work-rest period schedules (2 on and 2 off, 4 on and 4 off, 6 on and 6 off, 8 on and 8 off) followed over a period of 96 hours. The subject sample consisted of 16 male college students with 4 subjects being assigned to each of the four work-rest period schedules. Performance was measured by means of a battery of psychomotor tasks involving arithmetic computation, pattern discrimination, monitoring, and vigilance. Additional data were obtained from information recorded in an experimenter's logbook and from responses to a subject questionnaire administered at the end of the testing. Although the performance tasks failed to differentiate among the four experimental groups, the observational evidence suggested that the subjects in the 2-hour and 4-hour groups achieved a more favorable adjustment than those in the other two groups. (Author)

Maryland U., College Park.
A TEST OF UNDERWOOD'S LAW WITH CONNECTED MEANINGFUL MATERIALS, by Charles N. Cofer and Jean C. Holroyd. Technical rept. no. 22 on Learning, Retention and Recovery of Meaningful Material, Contract Nonr-595(04). Apr 59, 6p. 6 refs. AD-220 228.
Order from LC mi$1.80, ph$1.80 PB 148 272

The data offer no support for Underwood's law which, for the recall of discrete syllables, words or pairs, suggests that recall will be inversely related to the number of previous lists which have been learned.

Psychophysical Research Unit, Mount Holyoke Coll., South Hadley, Mass.
EXPERIMENTS ON VISUAL RESEARCH 1956-57, by H. Corbin, J. Carter and others. Final rept. Tasks I and II, on Contract AF 19(604)1713. July 58, 26p. 3 refs. AFCRC-TR-57-59.
Order from LC mi$2.70, ph$4.80 PB 149 541

About six experiments are summarized relating to two research programs: (1) the discrimination of groups of objects (targets) in searching cluttered visual displays; the research emphasized the use of visual aids to increase the efficiency of the discrimination of groups; (2) the speed and accuracy of search and discrimination of near-threshold and above-threshold visual targets in a horizontal array.

Utah U., Salt Lake City.
VARIABLES RELATED TO ACCURACY IN INTERPERSONAL PERCEPTION, by Victor B. Cline and James M. Richards, Jr. Annual rept. no. 1 on Contract [Nonr-1288(04)]. 15 Nov 58, 27p. 23 refs.
Order from LC mi$2.70, ph$4.80 PB 148 793

This project is concerned with the problem of generality of judging ability, to be followed by the study of the personality characteristics, life history experiences, etc., of judges who appear to excell in a general or specific manner in evaluating, assessing and predicting the behavior of fellow human beings. A preliminary study of these external correlates of judging ability is reported.

Washington U., Seattle. Div. of Counseling and Testing Services.
TWO IBM TYPE 650 PROGRAMS TO CORRECT CORRELATION MATRICES FOR ATTENUATION, by Calvin E. Wright. Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C4). June 59, 7p. 4 refs. AD-227 961.
Order from LC mi$1.80, ph$1.80 PB 147 891

Two IBM Type 650 programs are reported which were found to be useful in multivariate psychological analyses. The first of these corrects symmetric correlation matrix elements for attenuation. For 1 to 50 variables, the program performs its function when the row and column identifications of the correlation coefficients refer to the variables of a symmetric correlation matrix. The second program is useful for up to a 50 by 50 non-symmetric correlation matrix where the row and column identifications of the correlations refer to 2 distinct sets of 50 variables. The input cards for both programs can be the output cards of the correlation matrix programs reported by Dvorak and Wright, where 4 decimal values are obtained. The output cards of the correction for attenuation programs are also of the correlation matrix programs output form. The location of the decimal can be controlled if desired. (Author)

Yale U., New Haven, Conn.
AUTOTELIC FOLK-MODELS, by Alan Ross Anderson and Omar Khayyam Moore. Technical rept. no. 8 on Contract Nonr-609(16). Nov 59, 19p. 32 refs.
Order from LC mi$2.40, ph$3.30 PB 148 962

This paper is concerned with cultural products which we call autotelic, i.e., cultural products such as puzzles, games of chance, games of strategy, and aesthetic objects, all of which contain their own goals and sources of motivation. Such activities are "cut off" in a sense, from serious and immediate problems of survival and welfare, and are protected by autotelic norms which dictate that participation must not impinge on serious problems. As a heuristic principle for the application of formal methods in sociology, it is suggested that autotelic cultural products may be viewed as folk-models, i.e., models in the prescientific culture, with the help of which members of a society learn about and "play at" the workings of their society.

NERVOUS CONTROL OF SHIVERING. IX. A REVIEW, by Allan Hemingway. Rept. on Contract AF 18(600)358. July 57, 12p. 9 refs. Technical note AAL-TN-57-40.
Order from LC mi$2.40, ph$3.30 PB 146 618

The research has endeavored to investigate details of nervous control. According to current concepts the nervous control of thermoregulation is under "dual control". One is a "reflex" control resulting from stimulation of thermoreceptors in the skin, i.e. the cold and warmth temperature receptors. The other is a "central" control operated by a rising or falling brain temperature. These experiments, and others not mentioned here, support the dual control theory of temperature regulation. The location of the controlling center in the brain is believed to be in the hypothalamus, the exact position in the hypothalamus with any ramifications and interrelations being unknown.

Naval Research Lab., Washington, D. C.
ELECTROPHORETIC STUDIES ON BACTERIA. PART I. DESIGN AND PERFORMANCE OF AN IMPROVED APPARATUS FOR ELECTROPHORESIS BY THE MICROSCOPE METHOD, by R. A. Neihof. Interim rept. 15 Aug 60, 11p. 16 refs. NRL rept. 5495.
Order from LC mi$2.40, ph$3.30 PB 146 393

An improved apparatus for studying the electrophoresis of bacteria or other particulate matter by the microscope method is described. A simplified and convenient design is permitted by the use of electrodes consisting of palladium foil charged with atomic hydrogen. In contrast to electrodes previously used, this system permits high current densities to be passed without danger of gassing or the use of convection barriers to prevent contamination of the experimental material with heavy metal ions. Temperature control and heat dissipation are facilitated by immersing the apparatus in a water thermostat. The performance of the apparatus is evaluated with gelatin-coated glass particles, bacteria, and human erythrocytes. Mobility measurements which are sufficiently precise and accurate for the intended studies can be readily obtained. (Author)

THE PHYSIOLOGY OF TEMPERATURE REGULATION, by James D. Hardy. Rept. no. 22 on Task MR005.15-2002.1. 9 June 60, 299p. 851 refs. NADC-MA-6015.
Order from LC mi$11.10, ph$45.60 PB 150 139

The present report is restricted to the narrower considerations of the temperature responses of the homoiotherms and, more particularly, of the usual laboratory animals and of man. Even within this limited field there is an enormous current literature and more than three thousand references were reviewed in preparation of the material presented below. The attempt has been to give principal attention to the literature since 1952 although reference is made to much of the older work for purposes of continuity and clarity. It is not believed practical to separate temperature regulation from the physiological responses to heat and to cold and for this reason the present review is divided into: (a) physiological responses to cold, (b) physiological responses to heat, and (c) the physiology of temperature regulation.

Buffalo U., School of Medicine, N. Y.
STUDIES IN PULMONARY PHYSIOLOGY: CHEMISTRY, MECHANICS, AND CIRCULATION OF THE LUNG, by Hermann Rahn. Rept. on High-Altitude Physiology, Contracts AF 33(616)3834 and AF 33(616)5606. Apr 60, 162p. 5 refs. WADD Technical rept. 60-1.
Order from OTS $3.00 PB 161 984

The scientific papers compiled in this report on various aspects of pulmonary gas exchange have been divided into the following groups: Cardiovascular-Pulmonary Reactions to Pressure Breathing, Carbon-Dioxide Stores of the Body, Gas Tension in Tissues and Biological Fluids, Alveolar-Arterial Oxygen Difference and Theoretical Considerations of Pulmonary Ventilation, Perfusion and Diffusion. (Author).

California U., Los Angeles.
REPETITION AND CONFIRMATION OF MESSAGES RECEIVED BY EAR AND BY EYE, by Edward C. Carterette and Michael Cole. Technical rept. no. 3 on Contract Nonr-233(58). 29 June 59, 29p. 14 refs. AD-220 404.
Order from LC mi$2.70, ph$4.80 PB 147 888

An attempt was made to determine how the auditory and visual modes of reception compare over successive repetitions of a message. The rating method was used to obtain operating characteristics for 60 heterogeneous words, and to make specific comparisons of the visual and auditory modes of reception. The comparisons made showed that over successive repetitions, accuracy of reception is a direct function of the confidence rating and is relatively independent of the intelligibility level. Neither do the accuracy of reception or the distributions of rating categories change markedly over trials. Both visual and auditory data are fitted reasonably well by predictions made from a simple stochastic model based on the assumptions that (1) intelligibility, (2) probability of a correct acceptance, and (3) probability of an incorrect acceptance remain constant over successive repetitions. Results showed that the concept of operating characteristic as used in the reception of messages in noise may be extended to include vision.

Eye Research Foundation, Bethesda, Md.
RETINAL SENSITIVITY DURING PHOTOPIC ADAPTATION, by R. H. Peckham and W. M. Hart. Technical rept. no. 1 on Contract Nonr-2750(00). 12 Oct 59, 20p. 8 refs. AD-228 069.
Order from LC mi$2.40, ph$3.30 PB 149 859

Retinal responses to measured levels of luminance are reported. The stimulus was that of repetitive short alternations of equal duration, above and below a constant background luminance. The use of this stimulus permitted an estimate of retinal sensitivity by recording the frequency of the perception of scintillation in the stimulus area.

Florida U. Coll. of Medicine, Gainesville.
INTERACTION OF ADRENAL AND THYROID HORMONES IN MAINTENANCE OF BODY TEMPERATURE OF RATS EXPOSED TO COLD, by Melvin J. Fregly. May 60, 16p. 33 refs. AFSAM rept. 60-47; AD-239 977.
Order from LC mi$2.40, ph$3.30 PB 149 245

The effects of cortisone acetate and thyroxine, administered separately or in combination, on colonic cooling rate (CCR) were studied in restrained, adrenalectomized rats subjected to cold air (5°C.). Thyroxine alone at 5.0 μg./day reduced the rapid CCR of adrenalectomized rats but failed to return it to that of sham-operated rats. Cortisone acetate alone at 1.0 mg./day also reduced CCR but failed to return it to that of sham-operated rats. Administration of 5.0 μg. thyroxine per day simultaneously with 2.0 to 2.5 mg. cortisone acetate returned CCR to that of sham-operated rats. However, CCR of rats given 2.5 μg. thyroxine and cortisone daily failed to return to that of sham-operated rats. Simultaneous administration of cortisone acetate with graded doses of thyroid-stimulating hormone (TSH) resulted in a greater reduction of CCR than with either treatment alone. With respect to CCR, cortisone acetate did not appear to interfere either with thyroid gland response to TSH administration or to tissue utilization of thyroxine. (Author).

Jefferson Medical Coll., Philadelphia, Pa.
HORMONAL AND NERVOUS FACTORS IN THE RAT'S TOLERANCE TO REDUCED BAROMETRIC PRESSURE, by D. A. DeBias and K. E. Paschkis. May 60, 11p. 11 refs. AFSAM Rept. no. 60-58.
Order from LC mi$2.40, ph$3.30 PB 150 206

The effects of neuropharmacologic agents on the tolerance of adrenalectomized rats to a barometric pressure of 249 mm. Hg (equivalent to an altitude of 27,800 feet) for a period of 6 hours were studied. Dibenamine, antrenyl, pendiomide ditartrate, thorazine, and amphetamine did not improve the animals' tolerance. The survival time of adrenalectomized-thyroidectomized rats was significantly increased (from 2.7 hours to 5.7 hours) by a dose of cortisol sodium succinate which fails to prolong survival of the adrenalectomized animal. Some of the neuropharmacologic agents used have previously been found effective in other forms of stress. (Author)

Life Support Systems Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
CLOSED CIRCUIT RESPIRATORY SYSTEMS SYMPOSIUM. Rept. on Equipment for Life Support on Astronautical Operation. Aug 60, 470p. 164 refs. WADD Technical rept. 60-574.
Order from OTS $6.00 PB 161 988

This report presents various papers concerning Closed Circuit Respiratory Systems. Papers include those presented or submitted by various contractors, and Governmental Agencies. The specific areas which are presented include (a) concentration of expired carbon dioxide gas (b) concentration of expired water vapor (c) decomposition of carbon dioxide recovering all useful fractions, especially all useable oxygen for breathing purposes (d) decomposition of water yielding breathing oxygen and useful hydrogen (e) complete and continuous miniaturized instrumentation for a closed circuit breathing system. The papers represent the most advanced state of the art which is known to this Division in the related fields as determined by the representation and participation of such a universal group of representatives in the field of closed circuit breathing system. Navy Experimental Diving Unit, Naval Weapons Plant, Washington, D. C.
AN EVALUATION OF THE EQUIVALENT AIR DEPTH THEORY, by J. A. Logan. 28 July 60, 16p. 9 refs. Research rept. 1-61.
Order from LC mi$2.40, ph$3.30 PB 150 274

U. S. Navy divers performed working dives on air and on nitrogen-oxygen mixtures other than air with equivalent partial pressures of nitrogen. Results of these dives were then scored in three manners. Inspection of the data revealed a difference in the scores, the dives on the nitrogen-oxygen mixtures appearing to produce higher scores than those on air. Statistical analysis, however, failed to demonstrate any significant differences between the scores of the various comparable dives. It was concluded that the mixed gas decompression system now in use is adequate for decompression. This experiment supports the view that oxygen does have some effect on the decompression problem, however, it is slight and statistical significance could not be demonstrated. (Author).

Navy Experimental Diving Unit, Naval Weapons Plant, Washington, D C.
PERFORMANCE IMPAIRMENT AS A FUNCTION OF NITROGEN NARCOSIS, by R. J. Kiessling and C. H. Maag. 1 June 60, 25p. 25 refs. Research rept. 3-30.
Order from LC mi$2.70, ph$4.80 PB 150 273

Navy divers individually performed air dives in a high pressure chamber for 40 minutes at a simulated depth of 100 feet. Each experimental session consisted of three phases: a measure of performance on choice reaction time, motor coordination, and conceptual reasoning at sea level in the chamber; three 12 minute periods at a pressure equivalent of 100 feet of sea water, during which equal time was allocated to each of the three tests; and a final measure during the decompression stop at 10 feet. All subjects had been trained to plateau level of performance before the experiment proper had begun. Statistically significant decreases in performance for all subjects on all tests were found, with the greatest decrement occurring on the reasoning test, least on motor coordination. Decreased performance occurred as the pressure increased and remained relatively constant with duration of exposure. (Author).

School of Aviation Medicine, Brooks AFB, Tex.
EXTENDING THE RANGE OF THE CARTESIAN DIVER, by Harold L. Bitter, W. O. Baentsch, and Bruce E. Jacobson. Aug 60, 5p. 3 refs. Rept. no. 60-67.
Order from LC mi$1.80, ph$1.80 PB 150 203

A modified Cartesian diver was designed and fabricated in an effort to obtain accurate tissue respiration results in an area not previously covered by the Cartesian diver technic. The resulting apparatus allows greater range in biologic sample size, is easier to load, and requires less accessory equipment — resulting in less chance for sample contamination. (Author)

Biochemistry

Arctic Aeromedical Lab., Ladd AFB, Alaska.
OBSERVATIONS ON THE BIOCHEMICAL BASIS OF CHEMICAL THERMOGENESIS IN THE COLD-ACCLIMATED RAT, by Robert E. Beyer (Tufts U School of Medicine). Apr 60, 10p. 26 refs. AAL-TN-60-6.
Order from LC mi$1.80, ph$1.80 PB 150 026

Several mechanisms concerning the increased thermogenesis resulting from exposure of the laboratory rat to a cold environment are discussed. It is postulated that adrenal medullary hormones mediate an increase in the efficiency of mitochondrial oxidative phosphorylation, and thus provide adequate adenosine triphosphate for accelerated muscular activity during the initial stage of cold acclimation. The second, or chemical, phase of increased thermogenesis may be accounted for by a lowering of mitochondrial respiratory control in the electron transport chain. The possible meditation thyroid hormone is also discussed. (Author)

Army Medical Research Lab., Fort Knox, Ky.
CARBOHYDRATES OF HUMAN AND BOVINE PLATELETS, by E. E. Woodside and W. Kocholaty. Rept. on Biological and Medical Aspects of Ionizing Radiation. 1 Sep 59, 19p. 39 refs. Rept. no. 395; AD-228 935.
Order from LC mi$2.40, ph$3.30 PB 149 767

Average values for the total carbohydrate content of human and bovine platelets were 8.4% and 8.77% of the dry weight, respectively. On a dry weight basis, human platelets were calculated to be approximately one-third larger than bovine platelets. By chemical and chromatographic analysis, glucose, galactose, mannose, fucose, ribose, glucosamine, galactosamine, glucuronic acid, and sialic acid were detected in both human and bovine platelets. Glucose and ribose were found to be the only monomers present in the 5% trichloroacetic acid (TCA) soluble fractions of both human and bovine platelets. The TCA insoluble residue contained glucose, galactose, mannose, fucose, ribose, glucuronic acid, glucosamine, galactosamine, and sialic acid. The acid mucopolysaccharide fraction of both human and bovine platelets contained galactosamine and glucuronic acid monomers as well as galactose, glucose and ribose. Glycogen was found in both human and bovine platelets. Total glycogen was extracted by 5% TCA from sonorated human and bovine platelets; however, subsequent ethanol precipitation of the glycogen was incomplete. In contrast, 30% potassium hydroxide extraction followed by ethanol precipitation resulted in complete recoveries of the glycogen. Variations in both total hexose and glycogen contents existed in both human and bovine platelets. These variations were partially dependent on the length of storage of the platelets in whole blood or in 0.85% sodium chloride after separation from whole blood. (Author)

Liege U. (Belgium).
ISOTOPE STUDIES ON BONE SALTS, by Marcel J. Dallemagne and Leon Richelle. June 60, 18p. 54 refs. Aeromedical Reviews 1-60.
Order from LC mi$2.40, ph$3.30 PB 150 204

The principal purpose of this study is to define bone and tooth salts. The main conclusions drawn are as follows: Bone and dentin mineral isolated from the organic matrix and studied by means of isotope method behave just as hydrated synthetic phosphates. Synthetically, compounds closely approximating bone, dentin, or cementum may be precipitated under well-defined conditions. However, the chemical composition of the biologic and the synthetic compounds is not absolutely the same, since these phosphates do not arise in a liquid phase with the same composition as fluids circulating in bone.

Naval Radiological Defense Lab., San Francisco, Calif.
INHIBITION OF DNA SYNTHESIS BY SODIUM IONS, by E. R. Walwick and R. K. Main. 12 May 59, 8p. 12 refs. Research and development technical rept. USNRDL-TR-319; AD-218 929.
Order from LC mi$1.80, ph$1.80 PB 147 613

Studies concerning the synthesis of DNA in a readily available and controllable in vitro system were initiated. A reliable method of measuring tritiated thymidine incorporation into DNA, as detected by a liquid scintillation counting technique, was devised and tested. It was found that sodium ions at concentrations within physiological limits and in the presence of optimal amounts of Mg^{++} ions markedly inhibit DNA synthesis.

University of Southern California. School of Medicine, Los Angeles.
STORAGE AND METABOLISM OF FED CARBOHYDRATE, by Douglas R. Drury. Rept. on Contract AF 18(600)567. Nov 57, 32p. 6 refs. Technical note AAL-TN-57-46.
Order from LC mi$3.00, ph$6.30 PB 150 023

The 24-hour-fed rats had, on the average, the equivalent of 2.5 grams glucose deposited as body fat. However, each gram of glucose converted to fat requires the expenditure of an additional 0.27 grams glucose to effect the conversion. In other words the fat that contains the amount of carbon that is in one gram of glucose is isocaloric with 1.27 grams glucose. The 2.5 grams of glucose deposited as body fat represents the amount of energy contained in 3.1 grams glucose. This is equivalent to 12.8 calories. The expected caloric requirement for these rats would be about 21 calories per day. Carcass fat therefore accounts for about 60% of stored carbohydrate. (Author).

Uppsala U. (Sweden).
INVESTIGATION OF THE METHODS FOR SEPARATING BIOLOGICALLY AND MEDICALLY IMPORTANT SUBSTANCES OF LARGE MOLECULAR WEIGHT, by A. Tiselius. Final technical rept. no. 2 on Contract DA 91-591-EUC-1025. 30 May 60, 61p. 21 refs.
Order from LC mi$3.90, ph$10.80 PB 149 428

Contents:
Development of zone electrophoresis
Zone electrophoresis in packed vertical columns and in gels
Zone electrophoresis in gel suspensions
Free zone electrophoresis in a revolving tube
Fractionation of particles and macromolecules of biological origin using liquid two-phase systems
Fractionation of particles utilizing stratification by density in packed semi-solid centrifugal sediments
Methodological studies of protein chromatography

Botany

California Forest and Range Experiment Station, Berkeley.
CROWN CHARACTERISTICS OF SEVERAL CONIFEROUS TREE SPECIES: RELATIONS BETWEEN WEIGHT OF CROWN, BRANCHWOOD AND FOLIAGE, AND STEM DIAMETER, by Theordore G. Storey, W. L. Fons, and F. M. Sauer. Interim technical rept. Aug 55, 91p. 26 refs. AFSWP-416.
Order from LC mi$5.40, ph$15.30 PB 150 675

This report released for sale to the public 11 Oct 60.

Prediction of wind breakage and uprooting in tree stands requires information on weight of dry crown, branchwood, and foliage. An experimental program started in 1951 has led to a number of generalized relations by which these crown characteristics can be determined with good accuracy over a wide range of tree diameters, species, and species groups.

University Coll., Galway (Eire).
THE STRUCTURE OF THE PHYCOBILINS. Final rept. for 1 Mar 59-29 Feb 60 on Contract DA 91-591-EUC-1071. [1960] 16p.
Order from LC mi$2.40, ph$3.30 PB 149 434

A chemical study of the algal chromoproteins, phycoerythrins and phycocyanins was undertaken. Representatives of the various types of chromoproteins were isolated from red algae, blue-green algae and cryptomonads. The water-soluble chromoproteins were purified by ammonium sulphate fractionation and/or by column chromatography. Paper chromatographic analyses of hydrolysed chromoproteins revealed the presence of all the common amino acids. A feature of all the proteins examined was the preponderance of dicarboxylic over basic amino acids and their high alanine and leucine contents. N- and C-terminal groups of the chromoproteins were determined quantitatively, using a variety of methods. Approximately 20 terminal groups of both types per molecular weight unit of phycoerythrins and phycocyanins were found. The chromophores (phycobilins) of these chromoproteins are related to the bile pigments. The chromophore-protein attachment was investigated in a number of cases. Previous evidence indicated that a peptide linkage joined the chromophore to the protein, but that a second labile bond was also involved. The ϵ-amino group of lysine does not appear to participate in peptide-bond formation in R-phycoerythrin, as all those groups were found to be free.

Medical Specialties and Equipment

Arctic Aeromedical Lab., Ladd AFB, Alaska.
DROPPABLE, AUSTERE MEDICAL FACILITY, by Norman C. Van Tassel. July 57, 36p. Technical note AAL-TN-57-22.
Order from LC mi$3.00, ph$6.30 PB 150 021

This report describes an Austere Medical Facility developed to furnish paramedical personnel with air-droppable supplies and equipment to care for and maintain 10 casualties for 10 days under Arctic and subarctic field conditions. In the severe environment of these regions, it is usually not feasible to render definitive medical treatment in the field, and the facility is intended only to aid in maintaining life and to minimize suffering until evacuation can be accomplished. Most of the supplies and equipment used are standard Air Force items. The facility is packaged to allow air-drop from cargo type aircraft and designed so that it can be operational within approximately 1 hour after arrival over the drop zone. It has been tested and found to be satisfactory for use on snow covered terrain and on sea ice. (Author)

Arctic Aeromedical Lab., Ladd AFB, Alaska.
PACKAGING FREEZABLE EMERGENCY KIT ITEMS, by John D. Fulton and Jack D. Douglas. Mar 60, 15p. 2 refs. Technical note AAL-TN-60-2.
Order from LC mi$2.40, ph$3.30 PB 150 025

It is considered that the most practical approach for providing suitable insulated containers would be to procure molded styrene foam shells, with a suitable inside volume, which would fit into a standard, medical kit chest. Proper containers could be provided at minimum cost by this method. Based upon lists of the various emergency kit items provided by representative hospitals within the AAC, the required number and size of the containers recommended for each type of kit are shown.

Pathology

Army Chemical Corps., Fort Detrick, Md.
GRAPHIC SUMMARY OF SELECTED INFECTIOUS DISEASES, by Phebe W. Summers. Second edition, 1960, 65p. [Pub. 132]
Order from LC mi$3.90, ph$10.80 PB 150 236

The purpose of the Graphic Summary is to tabulate for quick reference salient points about selected diseases which may be of significance to the health of the public in the event of biological warfare attack either directly on man or indirectly on his animal protein food supply. This second edition brings information more up-to-date and presents data more completely and, it is hoped, more logically.

Army Chemical Warfare Labs., Army Chemical Center, Md.
A PRIMARY PULMONARY NEOPLASM IN THE GOAT, by Erwin G. Pearson. May 60, 15p. 13 refs. CWLR-2397; AD-239 306.
Order from LC mi$2.40, ph$3.30 PB 149 906

A type of pulmonary tumor found occasionally in Angora goats is reported. The tumor is composed of nests of squamous cells growing in a small amount of connective tissue stroma. The tumor arises from metaplastic bronchial epithelium. The neoplasm shows no definite signs of malignancy, and is considered to be a benign papilloma. (Author)

Chemisches Institut, Marburg (West Germany).
SEROLOGY OF DNA, by H. Witzel. Final rept. for 15 Jan 59-15 Jan 60 on Contract DA 91-591-EUC-1043. [1960] 14p.
Order from LC mi$2.40, ph$3.30 PB 149 338

The purpose of this program was: (1) to define more closely the anti-DNA (desoxyribonucleic-acid) reactions which can be detected in about two thirds of the patients suffering from systemic lupus erythematosus; (2) to study clinically and serologically patients suffering from systemic lupus erythematosus.

School of Aviation Medicine, Brooks AFB, Tex.
HUMAN CARDIOACCELERATIVE RESPONSES TO HYPOXIA IN COMBINATION WITH HEAT, by Henry B. Hale. Sep 59, 14p. 7 refs. Rept. 60-14; AD-229 899.
Order from LC mi$2.40, ph$3.30 PB 150 283

The effects of high ambient temperature on heart rate responses to moderate reductions in oxygen pressure were determined in healthy human males. With air temperature approximating 50° C., and hypoxia equivalent to that at 14,000 or 18,000 feet altitude, most of the subjects showed intensified responses; but several experienced marked bradycardia and syncope (or near syncope). Both kinds of response indicate that special precautions should be taken in flying operations to avoid the occurrence of even mild degrees of hypoxia when ambient temperature is relatively high. (Author).

Pharmacology and Toxicology

Army Chemical Research and Development Labs., Army Chemical Center, Md.
THE PROTECTIVE ACTION OF THE OXIMES P2S AND 2-PAM LACTATE ALONE OR AS ADJUNCTS AGAINST GB VAPOR IN DOGS, by James W. Crook, Alvin I. Goodman and others. July 60, 15p. 6 refs. CRDLR-3021.
Order from LC mi$2.40, ph$3.30 PB 150 223

P2S and 2-PAM lactate administered orally in doses of 30 to 75 mg/kg 2.5 to 4 hours prior to lethal exposures to GB vapor (6 to 9 LCt50's) offer effective protection to dogs when supported by an intramuscular dose of atropine (5 mg/kg) within 1 minute after exposure. Neither of the oximes is effective treatment when given alone. 2-PAM lactate and atropine mixtures given intravenously to dogs 1 minute after a lethal exposure to GB vapor also offer adequate protection. Intramuscular administration of this mixture is ineffective.

Army Chemical Warfare Labs., Army Chemical Center, Md.
LIST OF REPORTS PUBLISHED UNDER THE HEALTH HAZARDS OF MILITARY CHEMICALS PROGRAM TO 1 MAY 1957. 30 July 57, 15p. 146 refs. CWL Special pub. 2-1.
Order from LC mi$2.40, ph$3.30 PB 150 546

This report released for sale to the public 11 Oct 60.

Reports are listed under: Acetylene derivatives; ammonia; aniline; boron compounds; cleaning agents; clothing impregnating agents; epoxides; fluorine compounds; furfuryl alcohol; halogenated hydrocarbons (fire extinguishants); hydraulic and lubricating fluids; hydrazine and derivatives; hydrogen peroxide; mercaptans; nitric acid; nitro compounds, nitrites and nitrates; perchlorates; tetrazoles; general.

Army Chemical Warfare Labs., Army Chemical Center, Md.
PULMONARY AND CARDIOVASCULAR EFFECTS OF SARIN IN TREATED DOGS, by Glenn D. Lubash, Irwin Gribetz, and Rudolph P. Johnson. June 60, 19p. 20 refs. CWLR-2389; AD-239 153.
Order from LC mi$2.40, ph$3.30 PB 149 970

Peripheral vascular collapse is an important cause of death, despite therapy with atropine and artificial respiration, after enormous doses of ChE inhibitors. Sarin was used to induce hypotension in dogs. Blood pressure was maintained despite injections as large as 500 LD50's when artificial respiration and atropine were used. Intravenous atropine reversed elevated tracheal pressures and heartblock. Metaraminol, norepinephrine, and molar sodium lactate administered after atropine and artificial respiration produced no satisfactory responses in hypotensive (and hypoxic) animals. Normotensive animals given metaraminol had significant complications with rise in blood pressure. The value of treatment with atropine and artificial respiration is re-emphasized. (Author)

[Army] Chemical [Warfare] Labs., Army Chemical Center, Md.
THE RABBIT AND RAT AS TEST ANIMALS FOR SCREENING CANDIDATE FOR TREATING NERVE GAS POISONING, by J. H. Wills, G. E. Groblewski, and L. M. Somers. June 54, declassified 9 June 60, 12p. Medical Labs. Research rept. no. 289.
Order from LC mi$2.40, ph$3.30 PB 150 123

Parallel assays of the comparative prophylactic potencies in GB poisoning of a series of 9 atropine-mimetic compounds in the rabbit and the rat yielded a coefficient of rank correlation of +0.71. A similar comparison of 7 bis-quaternary, ganglionic-blocking drugs, administered as adjuncts to atropine, yielded a coefficient of rank correlation of +0.11.

Ohio State U. Research Foundation, Columbus.
CARDIO-RESPIRATORY RESPONSES TO ENVIRONMENTAL STRESS, by Fred A. Hitchcock. Final rept. on Contract DA 49-007-MD-189. June 59, 81p. 62 refs. Rept. no. 479; AD-226 852.
Order from LC mi$4.80, ph$13.80 PB 149 999

The first two portions of this report deal with the cardio-respiratory effects of carbon monoxide inhalation in the anesthetized dog. Section one involves a study of the adaptive responses to sublethal concentrations of carbon monoxide. Here emphasis was placed on the pulmonary ventilation and its regulation and related changes in blood gas tensions and acid-base balance. Section two deals with the cardio-respiratory events preceding death due to inhalation of lethal concentrations of carbon monoxide. In this phase major interest was with respect to cardiac output, blood pressure, peripheral resistance, and pulmonary ventilation. A characteristic pattern of peripheral collapse, hypotension, and decline in cardiac output preceded by irregular respiration was observed. The abruptness of the final hemodynamic collapse was striking. The third and last section of this report describes preliminary investigation into the problem of distribution of inspired air among the pulmonary alveoli. A theoretical equation is derived describing the decline in alveolar nitrogen concentration following inhalation of oxygen where the oxygen mixed homogeneously with the functional residual air. An "efficiency index" based on the ratio of the observed decrement in alveolar nitrogen concentration to the theoretical decrement was then developed. Data obtained on normal human subjects indicated considerable variation in pulmonary "mixing efficiency" from breath to breath. (Author)

LIQUID SCINTILLATOR BETA COUNTING OF IRON-59 IN CLEAR AND COLORED SYSTEMS, by Thomas P. Leffingwell, Robert W. Reiss, and George S. Melville. Mar 60, 11p. 14 refs. AFSAM rept. 60-15.
Order from LC mi$2.40, ph$3.30 PB 148 081

National Bureau of Standards $Fe^{59}Cl_3$ was employed in model systems to quantitate liquid scintillator beta counting of Fe^{59}. In systems which contain a colored iron-orthophenanthroline chelate, decline in counting efficiency is a linear function of color density for the concentration gradient investigated. However, presence of the colored chelate causes an increased photon yield relative to the corresponding visibly colorless sample. The enhanced photon yield elevates the entire coincidence counting efficiency curve by approximately 6 percent. The enhancement phenomenon is (1) chelate concentration dependent, (2) beta particle energy dependent, (3) at its maximum at the emission peak of the scintillators in the counting system employed, (4) effected only in the presence of the scintillators, and (5) gamma ray independent. (Author) (See also PB 138 120)

School of Aviation Medicine, Brooks AFB, Tex.
THE EFFECTS FROM MASSIVE DOSES OF HIGH DOSE RATE GAMMA RADIATION ON MONKEYS, by John E. Pickering, Wright H. Langham, and Walter A. Rambach. [1959] 415p. 132 refs. Rept. 60-57.
Order from LC mi$11.10, ph$62.10 PB 150 220

Twenty-eight thousand curies of an equilibrium mixture of Ba-La^{140} were used to expose groups of Macaca rhesus to radiation doses of from 880 to 40,000 r at a dose rate of 1,000 r/min. Survival time varied inversely with the total delivered dose, although there is a dose range in which survival time is independent of total dose. Cinematography shows alternating periods of almost complete incapacitation and partial recovery. Measurable hematological changes can be produced as early as 5 min after the start of radiation at 1,000 r/min, maximal effects can be reached within 10 to 20 min, and some recovery can occur even while additional radiation exposure is continued. Rhesus monkeys demonstrate (a) accelerated respiration rate at all radiation doses except the 1,000-r, (b) increased tidal volume with 1,000-r and 2,500-r doses and a decrease with larger doses, (c) no significant changes in the respiratory minute volume with 1,000 r, a marked increase with 2,500 r, and a progressive decrease with dose with larger radiation doses, and (d) a slightly elevated oxygen consumption rate with 1,000 r, no significant change with 2,500 r and a suppression with the larger doses. Blood lactate levels increase immediately following exposures, and blood pyruvate increases at the higher doses. Ocular changes occur only if the eyes have been irradiated directly. Acute cytologic effects were less conspicuous in monkeys exposed to mixed neutron and gamma irradiation than in animals receiving comparable doses of irradiation from a pure gamma source. There is a reversal in the degree of biologic response within a fixed time interval, as judged by the extent of cellular destruction.

Tracerlab, Inc., Waltham, Mass.
[TABLE OF CARBON-14 RADIOACTIVITY MEASUREMENTS ON SAMPLES OF PLANT EXTRACTS]. Final rept. for 1 Sep-31 Dec 57. AD-213 157.
Order from LC mi$1.80, ph$1.80 PB 150 124

The results are tabulated of carbon-14 radioactivity measurements on samples of plant extracts obtained from plants treated with carbon-14 labeled compounds. Analysis of each sample was performed by combustion of all or a portion of the plant material to $C^{14}O_2$, distillation and purification of the gas before its introduction into an ionization chamber, and counting of the gas using a Lindemann-Ryerson electrometer. (Author)

Walter Reed Army Inst. of Research, Washington, D. C.
THE DETERMINATION OF INTERNALLY DEPOSITED RADIOACTIVE ISOTOPES IN THE MARSHALLESE PEOPLE BY EXCRETION ANALYSIS, by Kent T. Woodward, Ariel G. Schrodt and others. [1960] 19p. 11 refs. DASA-1180.
Order from OTS $0.50 PB 161 950

Since resettlement of the Marshallese people on Rongelap atoll in July 1957, the urinary excretion level of cesium^{137} has increased about 140 fold and about 20 fold for strontium^{90}. Zinc^{65} was readily detected in samples from the March 1958 medical survey. The estimated mean body burden at equilibrium for cesium^{137} is about 1.5 microcuries or about 1/6 of the tolerance recommended by the International Commission for Radiological Protection for non-industrial populations. For strontium^{90} the mean body burden of the exposed Rongelap group in March 1958 was estimated to be two millimicrocuries. This is about nine percent of the expected equilibrium value of 23 millimicrocuries. The equilibrated strontium^{90} burden is about 1/5 of tolerance. The estimated mean body burden of zinc^{65} for Rongelap subjects in March 195? is about 85 percent of the equilibration value of 0.6 microcuries and the equilibration value is 1/70 of tolerance. THE DONOR PROPERTIES OF TRIPHENYLARSINE OXIDE, by David J. Phillips and S. Y. Tyree. Technical rept. no. 5 on The Synthesis of New Inorganic Molecules, Contract Nonr-855(05). 1 Sep 59, 19p. 25 refs. AD-230 255.
Order from LC mi$2.40, ph$3.30 PB 148 861

The coordination chemistry of triphenylarsine oxide with a variety of acceptors has been investigated. New substances have been isolated and characterized by molecular conductance measurements in nitrobenzene, cryoscopic molecular weight measurements in freezing nitrobenzene, magnetic susceptibility measurements, and infrared spectra. Most of the halides appear to be non-electrolytes, whereas the nitrate and perchlorates appear to be saltlike.

Pennsalt Chemicals Corp., Wyndmoor, Pa.
THE COMPOSITION AND PROPERTIES OF ZIRKLOR, by F. L. Scott, H. Q. Smith, and I. Mockrin. Technical rept. no. 7 on Contract Nonr-2687(00). 10 Sep 59, 9p. AD-227 024.
Order from LC mi$1.80, ph$1.80 PB 148 863

The Zirklor sample was an inert material, stable towards water and a gamut of organic solvents, but it was attacked by aqueous bases. No intrinsic reaction was noted between Zirklor and sodium methylate in ether. After 6 hr refluxing of Zirklor with sodium ethoxide in ethanol, 13% of the theoretical quantity of available chloride ion was released; 52% was released after 146.5 hr at 78°C. The product was heterogenous and amorphous. An attempt to react Zirklor with benzene in a Friedel-Crafts reaction produced no evidence of any HCl evolution and no appreciable formation of any phenylated zirconium compound.

SYNTHESIS OF HETEROCYCLIC COMPOUNDS, by Michael P. Cava. Final rept. for 1 June 55-30 Nov 57. 1 Dec 57, 29p. AD-156 963.
Order from LC mi$2.70, ph$4.80 PB 150 125

It is well known that derivatives of phenoxyacetic acid, especially those bearing halogen substituents in the ring, may show marked plant hormonal activity. The objective of the work described here was to prepare a number of heterocyclic analogs of such compounds.

The basic series chosen for intensive study was the pyridine series; more specifically, the synthesis of substitution products and analogs of 2-pyridoxyacetic acid were given primary consideration. (Author)

OXYGEN VIBRATION AND DISSOCIATION RATES IN OXYGEN-ARGON MIXTURES, by M. Camac and A. Vaughan. Rept. on Contracts AF 04(647)278 and DA 19-020-ORD-4862. Dec 59, 86p. 30 refs. Research rept. 84; AFBMD-TR-60-22; AD-234 035.
Order from LC mi$4.80, ph$13.80 PB 147 830

Experimental measurements of vibration and dissociation relaxation of O_2 in O_2-Ar mixtures were obtained from 1200° K to 8000° K. The vibration and dissociation relaxation rates become comparable at about 8000°K temperature. The experimental data indicates that there is at least a factor of 2 decrease in the dissociation rate at high temperatures (above 8000°K) where the vibration is not in equilibrium. (Author)

ON AUTOMATIC CHEMICAL KINETICS ANALYZER, by Freeman W. Cope. Rept. no. 8 on Task MR005.15-0002.7. 8 Aug 60, 21p. 4 refs. NADC MA-6024; TED Proj. ADC RS-7045-5915M.
Order from LC mi$2.40, ph$4.80 PB 150 222

This paper describes equipment that automatically produces a graph of the mass-action differential equation of a chemical reaction while the reaction is taking place. From a spectrophotometer or other instrument, this apparatus accepts a voltage that is proportional to the concentration (x) of one of the reactants. It computes $\frac{dx}{dt}$ continuously and automatically and plots a graph of $\frac{dx}{dt}$ vs. x. Inspection of this graph immediately shows whether zero, first, or higher order kinetics are involved. Zero and first order rate constants can be directly measured from the graph. Electrical filtering usually must be used to reduce the high frequency noise which is amplified by the differentiator circuit. The effects of the filtering on the mass-action differential equation plot are described in detail. (Author)

KINETICS OF FAST HOMOGENEOUS GAS REACTIONS, by Harold S. Johnston and Henry J. Bertin, Jr., Doctoral thesis (Stanford U.) Technical rept. on Contract Nonr-222(56). [1957] 44p. 26 refs. AD-226 150.
Order from LC mi$3.30, ph$7.80 PB 147 577

Heat of formation of nitrosyl fluoride: The absorption spectrum of nitrosyl fluoride was obtained in the near UV, and the 3 fundamental frequencies of the excited electronic state were determined. A rough estimate of the dissociation energy of the excited electronic state was obtained from the observed progressions. The dissociation energy of the ground electronic state was obtained indirectly by the thermochemical determination of the heat of the nitric oxide-fluorine reaction. The emission spectrum of the nitric oxide-fluorine flame was photographed. Absorption and emission spectra of nitrosyl fluoride: The absorption spectrum of nitrosyl fluoride in the near UV was studied, and 18 electronic-vibrational bands were found. The reaction of nitric oxide and fluorine is chemiluminescent, even with low temperature reaction conditions. The flame spectrum was continuous and was assigned to a radiative 2-body combination of NO and F.

Feltman Research Labs., Picatinny Arsenal, Dover, N. J.
LIGHT-SCATTERING AND VISCOSITY STUDY OF POLY(n-LAURYL METHACRYLATE) IN AN IDEAL SOLVENT, by Hsueh T. Lee and David W. Levi. Aug 60, 56p. 7 refs. Technical rept. FRL TR-1.
Order from LC mi$3.60, ph$9.30 PB 148 303

Poly(n-lauryl methacrylate) was fractionated from benzene solution using isopropanol as the nonsolvent. Phase separation studies were used to estimate the θ temperature in n-amyl alcohol and in isoamyl alcohol. Light-scattering and viscosity measurements were carried out on dilute solutions of the polymers in n-amyl alcohol at 29.5°C (θ temperature). The relation between molecular weight and intrinsic viscosity is compared with that determined in another theta solvent. Studies of the chain dimensions in solution have clarified anomalies that were observed earlier. Unperturbed chain extension of methacrylate ester polymers is discussed. (Author)

THE SOLVATION OF ELECTROLYTES IN DIOXANE-WATER MIXTURES, AS DEDUCED FROM THE EFFECT OF SOLVENT CHANGE ON THE STANDARD CHEMICAL POTENTIAL, by George Baughman, Ernest Grunwald, and George Kohnstam. Rept. on [Contract Nonr-988(02)]. [1959] 33p. 29 refs. AD-226 964.
Order from LC mi$3.00, ph$6.30 PB 150 108

The rate of change of the standard chemical potential with changing mole fraction of water, dF^o/dZ_1, was measured in 50.00 wt-% dioxane-water for a variety of electrolytes. Values obtained at 25.00° for $2dF^o_f/dZ_1$ were (in kcal per formula weight): NaOH, -17.6; NaCl, -13.8; KCl, -13.8; $(CH_3)_4NCl$, -13.5; RbCl, -13.2; CsCl, -12.5; LiCl, -11.5; KBr, -11.3; $NaNO_3$, -9.8; KI, -8.5; HCl, -7.9; sodium naphthalenesulfonate (β), -4.5; $NaClO_4$, -4.0; $(C_6H_5)_4PCl$, +0.2; $HClO_4$, +0.6; $NaB(C_6H_5)_4$, +15.4. Qualitatively, the positive values mean that these electrolytes are stabilized by addition of dioxane, in spite of the decreasing dielectric constant. Thermodynamic expressions were derived which relate the formal, experimental quantities, F^o and dF^o/aZ_1, for a dissolved substance to the corresponding quantities for the actual equilibrium mixture of solvated species. Then, assuming that the Born equation applies to each of the species in the equilibrium mixture, it was shown that these electrolytes are not solvated exclusively by water. More accurate theoretical treatments confirmed this result. Minimum values of the average dioxanation number were estimated for each electrolyte. The values tended to increase in the same order as the experimental values of $2dF^o_f/dZ_1$. Results indicate that dioxane can compete on fairly equal terms with water for the solvation of electrolytes. (Author)

Hull U. (Gt. Brit.).
THE INHIBITION OF THE HYDROGEN-OXYGEN REACTION BY METHANE, by R. R. Baldwin, D. Booth and others. Rept. on Contract AF 61(052)62. [1960] 29p. 24 refs. AFOSR-TN-60-298.
Order from LC mi$2.70, ph$4.80 PB 150 039

A preliminary study of the effect of a range of higher hydrocarbons on the second limit of the $H_2 + O_2$ reaction was made during the course of a war-time investigation. To elucidate the mechanism of inhibition, simpler hydrocarbons were selected and preliminary results with propane and detailed results with ethane have already been reported. With both hydrocarbons, the linear relation between explosion pressure and hydrocarbon mole fraction, obtained with the higher hydrocarbons has been confirmed over a wide range of conditions. With methane, however, the features of the inhibition show a remarkable difference from those of the higher hydrocarbons. This report describes these features in detail, and accounts for the difference between the behavior of methane and the higher hydrocarbons.

[Illinois U., Urbana].
FINAL REPORT, by E. Rabinowitch. Rept. for 1 Oct 51-30 Sep 59 on [Contract Nonr-1834(16)] [1959] 35p. 36 refs.
Order from LC mi$3.00, ph$6.30 PB 149 985

The general aim of the research was to gather information on the properties of chlorophyll and other plant pigment in vitro and in vivo which may be relevant to their function in photosynthesis. A considerable amount of valuable information has been obtained, but the specific nature of the processes involved in the conversion of light into chemical energy in photosynthesis still remains elusive. This applies in particular to the role of transfer and migration of energy among pigment molecules, which has been the central theme of the research. (See also PB 136 764)

Institute de Quimica Fisica (Spain).
ENERGY TRANSFER IN ORGANIC VAPOURS, by A. P. Masiá and M. D. Sonet. Annual technical rept. no. 1, 1 Mar 59-29 Feb 60, on Contract DA 91-591-EUC-1086. [1960] 54p. 23 refs; AD-234 911.
Order from LC mi$3.60, ph$9.30 PB 147 614

The "hot wire" method was used to measure the thermal conductivities of gaseous CCl_4, $CBrF_3$, CBr_2F_2, and CBr_2Cl_2 at different pressures and temperatures. The main part of the apparatus is a conductivity cell consisting of a Pt wire of 0.0376 mm diameter. This cylinder contains the gas under study.

Kent State U., Ohio.
THE MEASUREMENT OF THE PROTON-PROTON SEPARATIONS IN APPROPRIATE HYDRATES BY THE NUCLEAR MAGNETIC RESONANCE TECHNIQUE, by J. W. McGrath and A. A. Silvidi. Final rept. on Contract AF 49(638)168. 27 Aug 60, 31p. 37 refs. AFOSR-TR-60-103.
Order from LC mi$3.00, ph$6.30 PB 150 224

The proton-proton separations in hydrated water in ten compounds have been measured by the Pake method using proton magnetic resonance. The mean value is 1.595 ± 0.003 A with a range in values from 1.56 to 1.61 A. The orientations of the water molecule have been determined for eleven compounds. In every instance the orientation appears to be determined by formation of hydrogen bonds between the water oxygen and the nearest pair of electronegative atoms. In one instance, T_1 for protons in barium bromide monohydrate which is normally very long is sharply reduced. An rf unit for use in NMR spectrometers was designed, built and tested.

Laboratoire Méditerranéen de Recherches Thermodynamiques (France).
RESEARCHES ON THE PHENOMENA OBSERVED WHEN A BODY IS MOVING IN AN IONIZED ATMOSPHERE BY THE METHOD OF THE REVOLVING ARM, by F. Marcel Devienne and A. Roustan. Technical note on Contract AF 61(052)124. July 60, 77p. 3 refs. AFOSR-TN-60-907.
Order from LC mi$4.50, ph$12.30 PB 150 345

The phenomena produced on a body moving in an ionized atmosphere arising in the vicinity of the trajectory of the body were studied by the revolving arm method. Ionization was obtained with a high frequency field produced by an oscillator whose frequency may range between a few and a hundred megacycles. A pulse generator was used to study the equilibrium phenomena in a rarefied gas. The ionization was measured by means of Langmuir probes, generally plane. A study was made of the ionic current received by a metallic surface in function of the motion speed. The experiment shows that this variation is smaller than the theory points out, since the plates in motion are not quite clean, and the impurities, when charged, produce an electrical potential that tends to repulse the ions. The rise of temperature of an ionized gas was measured by comparing it with a non-ionized gas at the same pressure. Variations of ionic density were produced at the time of the passage of the revolving arm. The measurements show the influence of numerous factors on the perturbation caused by the motion of a body moving in an ionized medium. (Author)

Louisiana State U., Baton Rouge.
DOUBLE LAYER STRUCTURE AND RELAXATION METHODS FOR FAST-ELECTRODE PROCESSES. II. FARADAIC IMPEDANCE MEASUREMENTS, by Hiroaki Matsuda. Technical rept. no. 37 on Contract Nonr-330(00). Sep 59, 8p. 6 refs.
Order from LC mi$1.80, ph$1.80 PB 148 867

The elements of the equivalent circuit for the faradaic impedance are derived, due consideration being given to the structure of the double layer in the solution of the boundary value problem. It is shown that the classical theory is applicable but that measured exchange current densities and transfer coefficients must be corrected. The phase angle which is also affected can exceed π/4 when the reactants are strongly attracted in the diffuse double layer. Comparison is made with a similar treatment for the galvanostatic double pulse method. (Author)

Metallic Surfaces Research Labs., Ltd. Uxbridge, (Gt. Brit.)
THE EFFECT OF HIGH FREQUENCY HEATING ON THE DIFFUSION PROPERTIES OF ONE METAL INTO ANOTHER, by R. L. Samuel and J. D. Samuel. Annual technical rept. no. 1, 1 Apr 59-1 Apr 60, on Contract DA 91-591-EUC-1094. 10 Apr 60, 48p.
Order from LC mi$3.30, ph$7.80 PB 149 427

Further tests in confirmation of methods established in the previous period or utilizing new techniques have been carried out on the systems chromium-iron and chromium molybdenum. Solid-solid diffusion of chromium into iron has been studied on cylindrical specimens chromium-plated prior to the high-frequency diffusion treatment. A temperature range of 900°C to 1200°C has been covered and the results of systematic investigation confirm broadly that the rate of diffusion of chromium into Armco iron is accelerated by a factor of up to x 10 as compared to conventional methods of heating. Gas-solid diffusion of chromium into iron has been investigated by two methods. One, referred to as the "test tube" method, where the reacting gas is generated "in situ" has given variable results ranging from low diffusion rates to near-maximum rates. These results are discussed and some explanations are advanced to account for the variations observed. The other gas-solid diffusion method relies on the passage of chromium halide in vapor form around the iron specimen. The method of frequency measurement and a discussion on temperature control are given. The general conclusions are that all methods, correctly applied, give results which are broadly equivalent. Three general lines of explanation are suggested to account for the accelerated diffusion observed.

Naval Ordnance Lab., White Oak, Md.
A KINETIC STUDY OF THE LEAD-THIOUREA REACTION, by Marriner K. Norr. 15 June 58, 39p. 6 refs. NAVORD rept. 6168; AD-214 823.
Order from LC mi$3.00, ph$6.30 PB 147 566

A study of the reaction between lead nitrate, thiourea, and sodium hydroxide is given. The reaction was followed by analyzing for lead and total hydroxide. The ratio of sodium hydroxide to lead nitrate consumed during the reaction was found to be 2.0, within the experimental error. The reaction orders with respect to hydroxide and biplumbite ions vary with time: the former initially being zero and rising to one or two, the latter initially being 2.4 and falling to 1.25 ± 0.03. The reaction apparently is autocatalyzed by lead sulfide. (Author)

North Carolina U., Chapel Hill.
CHRONOPOTENTIOMETRY WITH CURRENT REVERSAL, by Richard M. King and Charles N. Reilley. Rept. on Contract AF 49(638)333. 16 Mar 60, 15p. 5 refs. UNC-Chem. no. 4-CNR; AFOSR-TN-60-766.
Order from LC mi$2.40, ph$3.30 PB 150 121

The transition time ratios for chronopotentiometry with current reversal are derived for the case in which the product of the forward electrochemical reaction decomposes immediately and irreversibly to two or more species which are not electrochemically active at the potential of the forward reaction but which do react consecutively following current reversal. The usual assumptions of semi-infinite linear diffusion control of mass transport are made. The derived results are found to be in good agreement with the experimental results of Geske. (Author)

Pennsylvania U., Philadelphia.
LOW TEMPERATURE IMPURITY CONDUCTION IN n-TYPE SILICON, by Kenneth Atkins, Robert Donovan, and Roger Walmsley. Technical rept. no. 1 on Contract Nonr-551(28). June 59, 43p. 41 refs.
Order from LC mi$3.30, ph$7.80 PB 147 889

This thesis describes measurements made on specially selected silicon samples to investigate the phenomenon of impurity conduction at low temperatures.

Phillips Petroleum Co., Bartlesville, Okla.
A CALORIMETRIC STUDY OF TRAPPED RADICALS PRODUCED BY GAMMA RADIATION, by Raymond L. Arnett, Eugene D. Guth, and Julius R. Berreth. Rept. on Contract AF 49(638)45. Sep 59, 49p. 20 refs. Research Div. rept. no. 2574-60R; AFOSR-TN-59-894; AD-235 427.
Order from LC mi$3.30, ph$7.80 PB 149 002

Several pure gases in the crystalline state (ammonia, methane, nitrogen, argon) and a glass of ammonia, water, acetone, have been irradiated in a gamma field. The amounts of energy stored in the solids are determined by calorimetry. A description is given of the calorimeter and experimental techniques.

Polytechnic Inst. of Brooklyn, N. Y.
COMPLEX CHEMICAL EQUILIBRIA BY MINIMIZING FREE ENERGY, by Leonard M. Naphtali. Rept. on Contract AF 49(638)165. Jan 60, 8p. 1 ref. AFOSR-TN-60-228; PRL-60-1; AD-233 497.
Order from LC mi$1.80, ph$1.80 PB 148 998

A technique is described for computing complex chemical equilibria by the minimization of free energy without utilizing the ideal gas assumption. An equilibrium in a system of 10 components was computed in 20 sec as a Fortran II subroutine with the IBM 704.

Princeton U., N. J.
NON-LINEAR PRESSURE OSCILLATIONS IN A COMBUSTION FIELD, by Gerald Rosen. Rept. on Project Squid, Contract Nonr-1858(25). Oct 59, 11p. 6 refs. Technical rept. PR-98-P; AD-227 730.
Order from LC mi$2.40, ph$3.30 PB 149 493

The unsteady combustion of liquid propellant droplets entrained in a burned gas flow is studied in terms of an idealized mathematical model. The model is used to derive an associated equation for non-linear pressure oscillations. Two necessary and sufficient conditions for unstable oscillations follow from a discussion of this equation. (Author)

FUEL CELL SYSTEMS, by John E. McCormick. July 60, 20p. 4 refs. RADC TN-60-118.
Order from OTS $0.50 PB 161 972

This report discusses the thermodynamics of fuel cells, describes six different types of cells that have been proven feasible, and lists the advantages and limitations of these six types of cells. (Author)

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
THE MEASUREMENTS OF THE VAPOR PRESSURE OF ATOMIC SPECIES FROM SPECTROPHOTOMETRIC MEASUREMENTS OF THE ABSORPTION OF THE RESONANCE LINES. IV. STANDARD ENTHALPY OF FORMATION OF SILICON CARBIDE, AND OSCILLATOR STRENGTH OF THE SILICON 2516 LINE, by G. L. Vidale. Rept. on Contract AF 04(647)269. July 60, 44p. 21 refs. Technical Information Series R60SD333. AD-239 281.
Order from LC mi$3.30, ph$7.80 PB 148 878

Spectrophotometric measurements of the absorption of the Si_{2516} resonance line were made of the equilibrium vapor over silicon metal and over silicon carbide, utilizing a hollow cathode discharge tube source previously described to generate a thin resonance line. From the ratio of the pressure of silicon atoms over silicon and over SiC, the standard free energy of formation was computed at 1700°K. The value of the standard heat of formation was then obtained with the aid of the known entropies and heats of warming of the various compounds.

Technical U., Vienna (Austria).
THE BEHAVIOR OF STREAMING AEROSOLS AND THEIR INTERACTION WITH ADSORBING SURFACES, by Alfred Dobrowsky. Final technical rept. for 1 Dec 59-31 Jan 60 on Contract DA 91-591-EUC-1349. 28 Feb 60, 26p. AD-238 720.
Order from LC mi$2.70, ph$4.80 PB 149 433

Functional correlation between filter mass, filter length, filter cross-section area, streaming velocity, pressure drop and filter collection efficiency are investigated on aerosol filters made of wadding, cellulose acetate and wood pulp fibers. The experimental equipment is described. The method is shown for getting experimental data and formulas, to facilitate further studies on this subject.

Tiltman Langley, Ltd. (Gt. Brit.)
TRACER STUDIES OF MIXING IN THE WAKE OF FLAME HOLDERS, by D. B. Spalding. Technical (scientific) note no. 2 on Contract AF 61(514)1213. 30 Nov 59, 111p. 3 refs. AFOSR-TN-60-1004.
Order from LC mi$6.00, ph$18.30 PB 150 359

The wake regions of four axially-symmetrical flameholders have been studied by the injection of a tracer (argon) at one location and the analysis of the tracer concentration at a second location. Both injection and sampling locations were varied so as to provide comprehensive description of mixing patterns in terms of influence coefficients, surveys being carried out when the gas stream was pure air (cold flow) and when the gas stream was a propane-air mixture burning behind the baffle (hot-flow). The influence coefficients were used to enable predictions to be made of the flameholding characteristics of the baffles, in terms of their dimensionless "chemical loading factor" for extinction. It was demonstrated that the values of the influence coefficients, and the sizes of the recirculation zones, were appreciably larger for the hot-flow than for the cold. Loading factors predicted from the hot-flow influence coefficients are therefore an order of magnitude greater than those based on the cold-flow coefficients. (Author).

Western Reserve U., Cleveland, Ohio.
THE OXYGEN ELECTRODE ON CARBON SURFACES, by M. O. Davies, Milton Clark and others. Technical rept. no. 11 on Contract Nonr-2391(00). 15 Nov 59, 108p. 37 refs. AD-237 103.
Order from LC mi$5.70, ph$16.80 PB 148 070

Anodic and cathodic polarization measurements and differential capacitance measurements have been made by interrupter techniques for the oxygen-hydrogen peroxide couple in alkaline solutions with carbon electrodes of the semi-lyophobic type. The results of these measurements have been compared with the surface area, pore distribution, and resistance for a large number of active carbons with different physical properties from various manufacturers. Surface areas and pore distributions have been determined by gas adsorption and desorption methods for both the original carbon and the carbon after incorporation into the electrodes. The polarization has been found to correlate particularly with that portion of the pore distribution

corresponding to radii in the range 4×10^{-7} to 2×10^{-6}cm and to show little correlation with micro pores with radii of 10^{-7} cm. or less. Indications are that the electrolyte does not penetrate into the micro pore structure. The results of this investigation should prove useful in applied work involving the oxygen cathode on carbon electrodes. (Author)

EARTH SCIENCES

Ballistic Research Labs., Aberdeen Proving Ground, Md.
THE GENERATION AND PROPAGATION OF SEISMIC ENERGY FROM A BURIED EXPLOSIVE SOURCE, by A. A. Thompson. June 60, 26p. Memo. rept. no. 1267.
Order from LC mi$2.70, ph$4.80 PB 150 091

When energy was measured near a deeply buried explosive source in sand, the seismic generation process proved to be of much longer duration than was expected from consideration of the rate at which the medium was loaded by a detonation. Since a large portion of the energy is applied to the medium while its particles are decelerating, the resistive forces of the strained medium are dominant during a good part of the time in which energy is transferred from the exploding source to the soil. Furthermore, the characteristics of the medium are more important in determining the frequency of oscillatory motion at a distance from the buried explosive source, than the loading rate as related to the detonation rate of the explosive. The detonation rate also had relatively little effect on the attenuation of seismic energy that was generated and propagated in the medium. Some conclusions are suggested concerning the use of seismic energy measurements, for determining mechanical energy input, and for prediction of damage to buried structures. (Author)

Climatology and Meteorology

Air Force Cambridge Research Center, Bedford Mass.
CONTRIBUTIONS TO SATELLITE METEOROLOGY, by William K. Widger, Jr. June 60, 272p. 77 refs. GRD Research Notes no. 36; AFCRC-TN-60-427.
Order from LC mi$11.10, ph$42.60 PB 150 161

This report discusses: a concept of a meteorological system; applications of meteorological satellites; studies of large-scale cloudiness in the Northern Hemisphere; cloud patterns as seen from altitudes of 250-850 mi; the possibility of measuring cloud velocities from a satellite; a system for the meteorological use of satellite television observations; a photogrammetric method of obtaining the camera axis and its application in determining the time of photos taken from a space vehicle; synoptic-scale radiation processes; studies of atmospheric radiation as observed from satellites; a preliminary investigation of the nature of the infrared view of the earth's atmosphere from a satellite; satellite observations of infrared radiation; detection of ozone amounts from satellite measurements; and a generalized, schematic flow chart for the reduction and processing of satellite meteorological data. USE OF ASYNOPTIC DATA IN ANALYSIS AND FORECASTING. 11 Mar 60, 30p. 1 ref. AWSM-105-10.
Order from LC mi$2.70, ph$4.80 PB 147 788

Asynoptic data are defined and the importance of utilizing them is stressed. A variety of feasible procedures for plotting, displaying, and analyzing asynoptic reports are illustrated for reconnaissance data, aireps, upper-air soundings, and surface data. Applications of these forecasting, briefing, and met watch are discussed.

THE DETECTION BY CPS-9 RADAR AND SHORT RANGE FORECASTING OF SEVERE AND VERY SEVERE THUNDERSTORMS, by Charles R. Shackford. Scientific rept. no. 5 on Contract AF 19(604)5204. 31 Dec 59, 20p. 9 refs. AFCRC-TN-59-660; AD-234 146.
Order from LC mi$2.40, ph$3.30 PB 147 875

The discovery exists that an important radar characteristic of severe and very severe thunderstorms is the reflectivity maximum at levels above 10,000 ft. As a result, a new operational technique was found necessary by which the reflectivity at various levels aloft of the most intense core of a thunderstorm can be quickly determined, and a practical method for doing this is described. The reflectivity profile of an echo can be obtained in 3 min or less and the values at 3 significant levels can be compared for forecast purposes with standard values associated in the past in New England with severe and very severe storms - i. e., storms which may possibly or are likely to produce tornadoes. The method also makes it possible to obtain more frequent reflectivity profile measurements, a very important consideration to meteorological research. (Author)

THE COMPUTATION OF RAWINSONDE FLIGHTS BY GENERAL PURPOSE AUTOMATIC COMPUTERS, by Abraham Arnold and Marvin J. Lowenthal. 15 Oct 59, 25p. 8 refs. USASRDL Technical rept. 2063; AD-227 098.
Order from LC mi$2.70, ph$4.80 PB 147 825

The computation required for a rawinsonde flight is presented. Separate equations are given so that each element of meteorological information may be computed from the output data of Rawin Set AN/GMD-1( ). The equations are then programmed for a general purpose automatic computer which computes the temperature, humidity, height, and wind values from the raw data. (Author)

HYGROTHERMOGRAPH SET AN/TMQ-10 ( ), by Joseph A. Siderman and Edward Lieblein. 1 June 59, 37p. USASRDL Technical rept. 2039; AD-219 317.
Order from LC mi$3.00, ph$6.30 PB 147 820

Results indicate that a satisfactory, low-cost indicator and indicator-recorder with medium accuracy can be

made available. Temperature elements that are accurate and reliable in the desired operating range are available for use with these models. At the present time, however, there are no humidity elements that are suitable for the intended application. Difficulties with existing humidity elements are saturation, short life resulting in high replacement rates, poor repeatability, nonlinear characteristics, poor accuracy, and poor response at low temperatures. A satisfactory humidity element must be developed before further development of the AN/TMQ-10( ) system can be continued. (Author)

A SIMPLE THUNDERSTORM WARNING DEVICE, by Heinz W. Kasemir. 15 June 59, 12p. USASRDL Technical rept. 2046; AD-219 318.
Order from LC mi$2.40, ph$3.30 PB 147 823

The first model of a thunderstorm warning device, using the dependence of the electrostatic field amplitude of lightning strokes on the distance to record the approach of a thunderstorm, is described. A warning bell or light can be set to give an alarm if the approaching thunderstorm underpasses a given distance which can be chosen between 10 and 150 miles. A plus-or-minus log recorder characteristic is applied to cover the wide variation of the field amplitude without range switching. The instrument is simple and inexpensive, and the maintenance is kept to a minimum. (Author)

THE REVERSAL OF STRATOSPHERIC WINDS OVER NORTH AMERICA, by Arthur D. Belmont. Scientific rept. no. 1 on Contract AF 19(604)6618. 22 June 60, 89p. 18 refs. GMI rept. no. 2063; GRD-TN-[60]-490.
Order from LC mi$4.80, ph$13.80 PB 149 309

The prevailing monthly frequency and mean zonal component of easterly and westerly winds from 15 to 30 km are presented in the form of 48 vertical cross sections along the west and east coasts of North America for about five years of record. The tropical easterlies move northward in April and the polar easterlies (existent to some extent all winter) are first prevalent in March. Mid-latitude westerlies separate the two easterly belts in March and April, but in May there is easterly flow at most latitudes above 23 km except near the pole. By July easterlies prevail down to at least 15 km in low latitudes, to 20 km in mid-latitudes, and to 15-17 km at polar latitudes. In August the polar and tropical easterlies are separated and by September the tropical easterlies start retreating to their minimum frequency which is reached apparently in November. (Author)

THE CENTRAL CIRCULATION OF THE ATMOSPHERE IN THE LIGHT OF MORE RECENT INVESTIGATIONS, by Freidrich Defant. Technical (Scientific) note no. 3 on Contract AF 61(514)963. Apr 59, 39p. 35 refs. AFCRC-TN-59-438; AD-234 548.
Order from LC mi$3.00, ph$6.30 PB 148 250

Extensive synoptic studies carried out for selected periods in midwinter 1956 and based on a total careful check of all the radiosonde ascents of the Northern Hemisphere (temperature and wind) allowed to specify the following important basic phenomena inside the General Circulation of the Atmosphere: (1) A threefold subdivision of the tropopause-level by means of two hemispheric tropopause breaks. (2) A classification of the radiosonde ascents giving important information about the baroclinic structure of the atmosphere. (3) Characteristic Polarfront Jetstream and Subtropical Jetstream have to be clearly distinguished from each other. (4) Meandering behaviour of the Subtropical Jetstream in form of suddenly occurring and rapid northward advances of it (subtropical impulses) towards higher latitudes with simultaneous formation of strong and extensive blocking-anticyclones over midlatitudes. The effect of these on the Polarfront Jet circulation has been demonstrated. These phenomena are discussed in this article.

International Inst. of Meteorology, U. of Stockholm (Sweden)
THE HORIZONTAL AND VERTICAL WIND PROFILES OF THE SUBTROPICAL AND POLAR JET FOR JANUARY 1-7, 1956 AND THE VARIATION OF THE EQUIVALENT BAROTROPIC LEVEL., by Hassam Taba. Technical (Scientific) note no. 4 on Contract AF 61(514)963. 2 July 59, 28p. 6 refs. AFCRC-TN-59-662; AD-234 426.
Order from LC mi$2.70, ph$4.80 PB 147 874

All the available wind information over central, west and north Europe, the Atlantic Ocean, the United States and Canada was studied for a period of seven days, January 1-7, 1956 0300 Z. Mean horizontal and vertical wind profiles were computed at 100 km intervals from the axis of both jets and are discussed. Both on these profiles, the average wind and the equivalent barotropic level is computed. It is shown that the height of the equivalent barotropic level changes as the distance from the axis of the jet varies. The equivalent barotropic level is shown to have a maximum height of 432 mb at the axis of the subtropical jet and a minimum height of 560 at a distance of 1000 km north of the polar jet. An average E. B. L. is computed and is shown to have a height of 505 mb. (Author)

TROPOSPHERIC BEHAVIOR ASSOCIATED WITH THE ARCTIC STRATOSPHERIC WARMING PHENOMENON, by Paul R. Julian. Final rept. Pt. 1 on Contract AF 19(604)2190. Dec 59, 111p. 31 refs. AFCRC-TR-60-240(1).
Order from LC mi$6.00, ph$18.30 PB 149 978

Eight winters, 1952 through 1959, have been investigated in an effort to ascertain tropospheric behavior occurring concurrently with the warming phenomenon. A precise definition of the warming phenomenon was formulated by assuming that the transition of the Canadian Arctic stratosphere from a baroclinic state, with wind speeds at 100mb two to three times those at 500mb, to a near-barotropic state, with the wind speeds at 100 and 500mb almost equal, was the systematic, and annually-recurring event of interest. The large-scale tropospheric behavior was determined by computing pressure-change charts from 30-day mean sea-level charts ending and commencing on the approximate date at which the stratospheric transition began. In all eight winters the sea-level pressure was observed to increase in the Canadian Arctic and decrease in middle latitudes as the transition occurred in the stratosphere. In the four winters with transition dates occurring before 1 March, the increase in arctic pressures was accompanied by a southward movement of the belt of maximum tropospheric westerlies and a pronounced primary index cycle. In the four winters with transition dates in March, the association of the polar pressure rises with an index cycle was not as clear, apparently because positive pressure anomalies at high lititudes existed previous to the transition date. Two winters of data from the Antarctic indicated increases in station pressures over the continent, as the antarctic stratospheric transition occurred.

Quartermaster Research and Engineering Center, Natick, Mass.
THE NIGHTTIME INFLUENCE OF IRRIGATION UPON DESERT HUMIDITIES, by Ivan Bennett and Ronald A. Nelson. July 60, 46p. 13 refs. Technical rept. EP-136.
Order from LC mi$3.30, ph$7.80 PB 150 184

A moderate increase was observed in moisture content of the air in the oasis compared with desert air. The magnitude of the increase was related to the general moisture level of the two prevailing summer air-masses; with dry Pacific air the increase amounted to 15 to 20 F degrees in dewpoint, and with moist air from the Gulf of Mexico it was limited to 5 to 10 F degrees. Similar but smaller differences were noted between moist and dry cropland within the oasis. Advection of moist air from the oasis into the desert could not be sharply delimited quantitatively, but within the first few hundred yards from the edge of the oasis, advection diminished rapidly and seemed barely evident at one mile. Nighttime evaporation and small daytime storage of heat in the oasis soil, contrasted with negligible nighttime evaporation and large heat storage in the soil of the desert, combined to produce minimum daily temperatures 5 to 15 F degrees lower in the oasis than in the adjoining desert. (Author)

A FLIGHT INVESTIGATION OF THE PERFORMANCE OF LOW CEILING/VISIBILITY METEOROLOGICAL EQUIPMENT. Rept. on Contract Cca-29773. Dec 54, 367p. 11 refs. Sperry rept. no. 5245-4059.
Order from LC mi$11.10, ph$56.10 PB 147 958

A flight test program to evaluate operationally the ceilometer-transmissometer system of measuring low ceiling/visibility weather with respect to what the pilot sees from the cockpit during actual weather ILS approaches has been conducted by Sperry Gyroscope Company, Division of The Sperry Corporation, under contract to the Air Navigation Development Board. This project has been conducted under the technical supervision of the Weather Bureau. A general analysis of the flight test data has been performed. The results of this analysis can be used to determine what a pilot will see from the cockpit under observed meteorological and photometric conditions at any airport equipped with the ceilometer-transmissometer system. Information which is not currently available to the pilot, such as the points from which he can first see the ground, the approach lights, and the end of the runway, can be obtained from this system. This information, when used by the pilot, can provide an improvement in approach success and an increase in the safety of instrument approaches. (See also PB 144 114)

Stanford Research Inst., Menlo Park, Calif.
ON METEOROLOGICAL OBJECTIVE ANALYSIS AND MODEL THEORY, by Manfred M. Hall. Final rept. on Contract AF 19(604)5703. July 60, 43p. 2 refs. GRD-TR-60-293; SRI Proj. 2890.
Order from LC mi$3. 30, ph$7. 80 PB 150 173

The development of a system for the analysis of meteorological distributions by the objective treatment of observational data is systematically discussed. The information sources are considered to fall into three categories: (1) data concurrent with the time of the space-distribution analysis, (2) near-past data containing information which may be extrapolated forward in time to the analysis, and (3) well-past data from which come physical laws, statistical and empirical relationships, and subjective, learned, skills. The investigation is limited to considerations of the space-time analysis of the state parameters (pressure, temperature and density) and the wind. The state-parameters are dealt with from the point of view of interrelationships, degree of independence, manners of specification, and transformations. The analysis system is built up on the use of a dynamical-numerical model as data vehicle. The basic system of governing equations is illustrated with density as principal dependent variable of state, and the importance of the horizontal-mass-divergence is indicated. The mass-continuity equation is shown to have a near-perfect numerical analogue. The mechanism by which the atmosphere maintains approximate geostrophic balance is considered. Numerical techniques are suggested for possible realization of this wind alignment to a natural degree in the integration without rigid imposition in the model. The propagation of meteorological "noise" and its suppression is also discussed. (Author)

DESIGN OF THE MOBILE MICROMETEOROLOGICAL STATIONS EMPLOYED ON PROJECT GREEN GLOW by William H. Clayton and Jerry D. Merryman. Final rept. on Contract AF 19(604)4562. Jan 60, 91p. 3 refs. Reference 60-IT; AFCRC-TR-60-252.
Order from LC mi$5. 40, ph$15. 30 PB 149 570

This paper outlines the design and construction of two mobile micrometeorological stations developed specifically for use on Project Green Glow and for study of the atmospheric boundary layer generally. The two stations are identical with respect to parameters measured and sensors employed, and differ only in the method of data readout. Station 2 (to which the major part of the discussion is devoted) presents the data as sequential parameter values in digitized form on typewritten sheets and punched cards, while Station 1 utilizes the familiar strip chart recorders and electrical counters. (Author)

MICROMETEOROLOGICAL DATA PROJECT GREEN GLOW. VOLUME I. WET AND DRY BULB TEMPERATURE, STATION 3, by William H. Clayton. Scientific rept. no. 1 on Contract AF 19 (604)5527. June 60, 700p. Reference no. 60-8D1; GRD-TN-60-489.
Order from LC mi$11. 10, ph$105. 90 PB 150 181

Two mobile micrometeorological stations were employed for the collection of these data. These stations, designated 2 and 3 on the accompanying field map, were equipped for air temperature measurements (wet and dry bulb) at eight levels, wind speed at eight levels, wind direction at one level, soil temperature at seven levels, soil heat flux, insolation, reflected insolation, net radiation, soil moisture, and standard surface observations. Only wet and dry bulb temperature values from Station 3 are given in this report.

Weather Services, Inc., Boston, Mass.
DEVELOPMENT OF A METHOD OF FORECASTING THE OCCURRENCE AND BASE ALTITUDE OF CONTRAIL FORMATION. Scientific rept. on Contract AF 19(604)1961. 20 Jan 60, 47p. AFCRC TN-60-231.
Order from LC mi$3. 30, ph$7. 80 PB 146 466

To forecast the occurrence of contrails, a simple mathematical predicting model was developed. This was based primarily on the shape of the ascent curve. The mathematical problem was one of discriminant analysis, in which a linear combination of three slopes was found, which maximized the ratio of the variability of the resulting combination between the two categories, contrails and no contrails. The discriminant values found for all cases separated well ranging from 85% to 100% correct. In the forecasting of the height of contrail formation, an equation was developed using the prevailing height of the tropopause to indicate approximate height of contrail formation and the height at which the -50C temperature occurred. The data was normalized providing a forecasting method, effective regardless of location. A graph of this equation resulted in a simple method of forecasting contrail height. (Author).

Wisconsin U. [Madison].
AN EXPERIMENT IN STRATIFIED CLIMATOLOGY OF UPPER WINDS, by Walter I. Christensen, Reid A. Bryson, and Charles W. Hutchins. Scientific rept. no. 2 on Contract AF 19(604)5191. Feb 60, 79p. 6 refs. AFCRC-TN-60-201; AD-235 072.
Order from LC mi$4. 50, ph$12. 30 PB 148 252

As an experiment in stratified climatology, a contingency technique is tested for forecasting 300 mb geostrophic winds over a central point in a given area for the month of March. Eight years of data (1950-1957 is incorporated into the forecast scheme and March 1958 is used for verification. Results are compared with other objective and subjective forecast methods with the results of this study comparing favorably with other objective methods but not surpassing the accuracy level of the Joint Numerical Weather Prediction Unit. Simplicity and rapidity of application of this contingency technique is preserved and stressed. It is believed that this method has merit and further research in this area may provide more significant results. (Author)

Wisconsin U. [Madison]
AN EXPERIMENT IN THE INTERPOLATION OF PRESSURE CONTOUR PATTERNS IN AREAS OF MISSING DATA, by James R. Blankenship, Reid A. Bryson, and Lyle H. Horn. Scientific rept. no. 1 on Contract AF 19(604)5191. Feb 60, 55p. 4 refs. AFCRC-TN-60-200; AD-235 071.
Order from LC mi$3. 60, ph$9. 30 PB 148 251

A method of interpolating the pressure pattern into an area of missing data is studied from adjacent areas of known data. The method is used to describe the known portions of the northern hemispheric 500-mb flow by the use of orthogonal polynomials. This method reduces the 500-mb contour pattern to a mathematical formula, which if converted back to the original map will usually contain 95% of the variance of the original 500-mb chart. By the use of the variable coefficients of the orthogonal polynomials, the values for these same coefficients can be interpolated for the silent area. This study indicates that a silent area chart can be produced by this method with an average accuracy of 88% or greater. The basic premise of this approach is that all weather patterns are themselves globally inter-dependent, therefore, the coefficients of the known area must reflect at least the main conditions in the missing area. The basic data were obtained from the US Navy project AROWA map series. This data, being on IBM cards, made it possible to utilize the IBM 650 electronic computer. (Author)

Wisconsin U., Madison.
HEAT FLUX IN LAKE MENDOTA, by John A. Dutton and Reid A. Bryson. Technical rept. no. 2 on Contract Nonr-1202(07). June 59, 106p. 15 refs.
Order from LC mi$5. 70, ph$16. 80 PB 150 049

In Chapter I the heat budget of the lake's surface is examined. Starting with a relationship that combines the factors of net radiation, evaporation, transfer of heat to the air, and the change in heat content of the lake, the balance of these factors from month to month are developed. The result is a quantitative understanding of how the heat provided by the sun at the lake's surface is partitioned through various processes, and how this partitioning changes with the season. Chapter II shows quantitatively how the heat which is transferred through the surface of the lake is distributed with depth, and demonstrates the development and decay of thermal structure through the ice-free season of the lake. A well-known method of solving Fourier's heat conduction equation is developed and applied to the lake. The first results of the attempt to relate the observed parameters of the lake to those of the atmosphere are presented in Chapter III. The value of the concept of the lake as an integrator of the climate is shown through the high correlation of lake surface temperatures and the average of air temperatures over periods from one week to a month.

ELASTIC PLATES WITH SIMPLY SUPPORTED STRAIGHT BOUNDARIES, RESTING ON A LIQUID FOUNDATION, by Arnold D. Kerr. Rept. on Bearing Capacity of Floating Ice Sheets, Contract DA 11-190-eng-34. Sep 59, 18p. 14 refs. SIPRE Research rept. 59; AD-237 338.
Order from LC mi$2. 40, ph$3. 30 PB 149 134

The deflection expression of an infinite plate subjected to a concentrated force is used with the "method of images" to obtain solutions for 6 plates with simply supported edges. The semi-infinite plate, the wedge-shaped plate, and its special case, the rectangular corner plate, are solved in closed form; and the infinite strip, the semi-infinite strip, and the rectangular plate are solved as rapidly convergent series. Behavior under a concentrated force is studied in more detail for the semi-infinite plate and the rectangular corner plate. Relationships for obtaining bending moments, shear forces and reaction distributions as well as derivatives of the kei-function with respect to r and θ are given. (Author)

Denver U. [Colo.]
PLASTIC DEFORMATION OF FLOATING ICE PLATES SUBJECTED TO STATIC LOADS, by Arnold D. Kerr. Rept. on Bearing Capacity of Floating Ice Sheets, Contract DA 11-190-eng-34. Sep 59, 15p. 12 refs. SIPRE Research rept. 57; AD-237 533.
Order from LC mi$2.40, ph$3.30 PB 149 132

The problem is analyzed mathematically for decreasing and increasing rates of deflection. The analysis is based on the assumptions that for decreasing rates of deflection the floating ice plate will deform under lateral load without failure until the weight of the displaced water is equal to that of the load, and that for increasing rates, deflection increases until the ice plate collapses under and near the load. It is also suggested that the total deflection at a certain time is the result of the elastic deflection surface and the plastic deflection due to shear only, the shear forces obeying Newton's law of viscosity. Deflection equations for plastic deflection due to shear are derived for an infinite plate subjected to a line load, an infinite plate subjected to a concentrated force (axially symmetrical flexure), and an infinite plate subjected to uniform circular load. Equations for elastic deflection to be added to the plastic deflection due to shear are suggested. According to the statements and assumptions made and the results obtained, the total system of an ice plate resting on a liquid base can be considered as a Kelvin body for the case of decreasing rates of deflection. GEODETIC DISTANCE AND AZIMUTH COMPUTATIONS FOR LINES OVER 500 MILES. Rev. Dec 59, 90p. 27 refs. ACIC Technical rept. no. 80.
Order from OTS $2.25 PB 161 994

This is the third and final report of a series containing the results of a geodetic investigation of existing formulae suitable for computing geodetic distance and azimuth of the basic geodetic curves; the geodesic, normal section and great elliptic arc. It recommends those formulae not too complex for general use and adaptable to desk calculator and electronic digital computer. Eighteen equations were evaluated; seven for the great elliptic; seven for the geodesic and four for the normal section. The accuracy criteria for this report are set at 1:100,000 in length and one second of arc in azimuth. (Author). (See also PB 124 647, PB 131 980).

Aeronautical Chart and Information Center, St. Louis, Mo.
A PHOTOCHEMICAL PROCESS FOR PREPARATION OF MASTER TERRAIN MODELS, Aug 60, 13p. 7 refs. ACIC Interim Technical rept. no. 91.
Order from OTS $0.50 PB 161 993

The primary purpose of this report is to present a standardized procedure for rapidly and economically preparing master terrain model surfaces by photomechanical methods to support production of shaded relief masters now being prepared by artist airbrush and hand rendering. Further processing of these products can afford users wide selection of related topographic items. In this procedure, white light is admitted through a variable-toned transparency directly into a particular sentized liquid plastic (initially formulated and patented by Haloid Xerox, Inc.) for a predetermined exposure. Exposure of this projected image will produce a hardened three-dimensional surface of the plastic, thus reducing conventional terrain model making to a more simplified photomechanical operation. Reproduction of this master with select molding media will provide various photographic and thermo-formed by-products. The process described here does not intend to furnish all-purpose solutions to user requirements, but does afford rapid means of effectively portraying terrain detail in 3-dimensional form and provides stimulas to continue investigation toward improving photomechanical techniques and products relating to terrain identification and simulated effects useful to analysis, training, and briefing. (Author).

STUDY OF VEGETATION AND TERRAIN CONDITIONS FROM AERIAL PHOTOGRAPHY, by P. E. Truesdell. Final rept. on Proj. TED PIC PH-4747.4. May 59, 81p. PIC rept. 207/59-U.
Order from LC mi$4.80, ph$13.80 PB 150 786

This report released for sale to the public 11 Oct 60.

A study was conducted concerning the interpretation of vegetation and associated terrain conditions from aerial photography obtained from a selected area in the Northern Hemisphere. The study consisted of a field trip to the area to be investigated and laboratory work with the aerial photography as a basis for determining the recognition characteristics of the vegetation observed on the field trip. It is concluded that, the study will be an aid to the photo interpreter in becoming familiar with certain vegetation types and their associated terrain conditions. (Author)

STUDY OF THE SOILS OF THE EBRO VALLEY. I. PROVINCES OF LOGRONO AND NAVARRA, by J. M. Albareda, F. Monturiol and others. Final technical rept. for 1 Mar 59-30 Feb 60 on Contract DA 91-591-EUC-1085. [1960] 126p. 25 refs. AD-235 137.
Order from LC mi$6.30, ph$19.80 PB 147 622

Soil maps were drawn of the provinces of Navarra and Logrono with special consideration of the study of profiles in the terrain. The maps and a study of the geological characteristics of both provinces allowed the establishment of 11 different soil series, in some of which the lithosoil stage was also mapped. Four distinct sectors corresponding to 4 different natural regions, with their different reliefs and patterns were distinguished. The types of climate which correspond to these 4 natural regions were studied supported by climatological data. The geological history of the Ebro Valley, the main mineral resources, and the terrain belonging to different ages and stories are described; the lithology of the different materials was analyzed. Studies were made of spontaneous vegetation, in which the main constitutive species of the xerophytic thicket and humid woodland, hydrography, and agrarian economy are examined. The mineralogical study of sands and clays was undertaken of the 11 soil series. Study of clays revealed the constancy of the illite-kaolinite association. Different Fe forms, particularly geothite, were very abundant in every profile. The results of the mineralogical analysis of the heavy fractions indicated that very resistant species such as tourmaline, zircon, and rutile predominate. Opaque grains were very abundant.

THE NEXT TEN YEARS IN OCENAOGRAPHY (A SURVEY OF THE GROWTH POTENTIAL TO EXISTING INSTITUTIONS) by Gordon G. Lill, A. E. Maxwell, and F. D. Jennings. 1 Jan 59, 33p. 5 refs.
Order from LC mi$3.00, ph$6.30 PB 150 586

This report released for sale to the public 11 Oct 60.

Several groups, including the Office of Naval Operations, members of Congress and the Committee on Oceanography of the National Academy of Sciences - National Research Council, have requested that a broad long range program of oceanographic research be formulated to present the current status and the future requirements that are necessary to maintain the needs of the country. This document has been prepared as an essential part of that research.

DATA REPORT FOR TWO IGY CRUISES, by Hugh J. McLellan. Rept. on Contract N7onr-48702. Apr 59, 117p. 2 refs. Reference 59-15D; AD-220 390.
Order from LC mi$6.00, ph$18.30 PB 148 270

Cruise 58-H1 was carried out March 23 to April 3, 1958. A line of stations to a maximum depth of 3500 meters was occupied along the 94°30' W meridian crossing the Gulf of Mexico from North to South. The locations of stations are shown on the track chart. Fourteen hydrographic stations were occupied, 4 bottom cores taken and 144 B. T. observations made. Cruise 58-H4 May 13 to June 29, 1958. The track followed and the positions at which observations were made are shown. In all 90 hydrographic stations were occupied. Twenty-eight bottom cores were taken and 410 B. T. observations made.

COMPOSITION OF RADIATION TRAPPED IN THE GEOMAGNETIC FIELD AT ALTITUDES UP TO 1,000 KILOMETERS, by Francis E. Holly and Richard G. Johnson (Lockheed Missile and Space Research Lab.) Mar 59, 18p. 5 refs. AFSWC-TN-59-15; AD-216 354.
Order from LC mi$2.40, ph$3.30 PB 147 815

An instrument package containing 8 Geiger tubes was flown at an altitude of 1,000 km in a region of the lower Van Allen radiation belt. Five different thicknesses of absorber were used to obtain a range spectrum of penetrating particles. The radiation penetrating 30 $\frac{mg}{cm^2}$ Al absorber (> 160 kev electrons) was determined, by magnetic selection, to be predominantly electrons. Ninety-nine percent of the flux in the measurement energy range (30 kev to 4 Mev for electrons) would not penetrate the same absorber thickness as a 600 kev electron. A trapped high energy component was observed. (Author)

IONOSPHERIC DISTURBANCES FOLLOWING A SOLAR FLARE, by G. E. Hill. Scientific rept. no. 6 on Research Concerning Forecasting Anomalous Propagation at High Latitudes, Contract AF 19(604)4092. Aug 60, 46p. 14 refs. Technical rept. RAD-TR-60-22; AFCRC-TN-60-598.
Order from LC mi$3.30, ph$7.80 PB 150 341

Northern Hemispheric charts of f min, foEs, and foF2 at intervals of 3 hours have been constructed for the disturbed period from 12 through 15 September 1957. Enhanced f min values have been found over the polar cap on 12 September. By the time of the sudden commencement (SC) of geomagnetic activity (0046Z, 13 September) the f min disturbance spread outward to the auroral zone. Following the SC, the f min disturbance formed in an elliptically shaped ring around the earth while the polar cap f min disturbance dissipated. The elliptical ring (coincident with constant dip lines) then expanded southward, and by 0900Z, the approximate time of the main phase, the f min ring disturbance reached a constant dip of about 72 degrees. Just to the north of this ring, in Canada, a crescent-shaped sporadic E disturbance developed. It also moved southward. Subsequently, a band of sporadic E appeared over northern Asia. The foF2 disturbance began about the time of the SC and lasted about 36 hours. On the basis of the f min and foEs patterns, it is concluded that prior to the SC, solar corpuscles impinge on the lower ionosphere directly from outside of the earth's "magnetosphere". The post-SC f min and foEs disturbances is attributed to trapped radiation drifting at relatively low altitudes (below about 2000 km). The southward expansion of the disturbances is a result of the strengthening of the solar stream. (Author).

INSTRUMENTATION USED FOR IONOSPHERE ELECTRON DENSITY MEASUREMENTS, by William J. Cruickshank. May 60, 20p. 7 refs. Technical note no. 1317; AD-239 903.
Order from LC mi$2.40, ph$3.30 PB 150 093

The technique employed for the measurement of ionospheric electron densities through study of differential propagation effects on two-phase coherent frequencies broadcast from high altitudes is discussed. A brief description of the stable airborne transmitters and of the rocket vehicle designated "Strongarm" which was used in an initial experiment to carry the airborne transmitters to an altitude of 1,000 miles is presented. The very narrow band receivers and recording equipment needed to provide data reception and information separation are discussed. A summary is given of the results of the two "Strongarm" rockets that have been fired, and the schedule of future experiments is outlined. (Author)

DETERMINATION OF IONOSPHERE PARAMETERS BY MEANS OF A SATELLITE ANTENNA-TYPE PROBE, by W. W. Zachary, E. A. Wolff, and M. Katzin. Scientific rept. no. 1 on Contract AF 19(604)6656. 30 June 60, 57p. 11 refs. Rept. no. CRC-6656-1; GRD-TN-60-492.
Order from LC mi$3.60, ph$9.30 PB 149 844

A spherical antenna-type probe for determining the parameters of the ionosphere is described. This consists of a main slot around which are disposed pairs of small orthogonal slots. By applying a driving voltage to the main slot and measuring the input impedance as well as the voltages induced in the orthogonal slots, the ionization density, collision frequency, and vector earth's magnetic field may be determined. These are local values since the reaction of the medium on the probe is effectively limited to distances of the order of less than a wavelength. As a preliminary to the main analysis, the input admittance of a slotted plane antenna in a magneto-ionic medium is analyzed. The solution is obtained in a form suitable for numerical evaluation. Measurement systems for the determination of the quantities necessary to evaluate the parameters of the ionized medium are considered. Three systems are shown and their relative advantages and disadvantages are outlined. A suitable measurement system appears to be quite feasible of realization. (Author)

THEORETICAL AND LABORATORY STUDIES IN CHEMICAL AERONOMY, by William J. Schade. Final rept. for 1 Mar 57-30 Apr 60 on Contract AF 19(604)2144. Apr 60, 14p. 8 refs. AFCRC-TR-60-241.
Order from LC mi$2.40, ph$3.30 PB 149 535

A new portable high-speed ultraviolet spectrograph is described. The specifications of the instrument are given. A laboratory source for the study of some aeronomic chemical reactions is considered. This source is seen to be useful for studying the recombination processes of atomic oxygen. (Author)

International Inst. of Meteorology, U. of Stockholm (Sweden).
INVESTIGATIONS ON THE DETAILED STRUCTURE OF THE ATMOSPHERE IN NORTHERN HEMISPHERE MID-SUMMER (15-20 JULY 1957, IGY-DATA) by Friedrich Defant. Technical (scientific) note no. 5 on Contract AF 61(514)963. 1 Sep 59, 126p. AFCRC-TN-59-664; AD-234 430.
Order from LC mi$6.30, ph$19.80 PB 147 873

Contents:
Synoptic situation (15-20 July 1957); worldwide check on the summer tropopause-level and on the level of maximum wind; position of polarfront jet and subtropical jet; the summer-polarfront
Presentation of mean vertical temperature distributions in each of the special selected atmospheric spaces (polar, midlatitude, tropical, and in the vicinity of the summer subtropical jet) and a comparison of these average distributions with that obtained for mid-winter periods.
Presentation of frequency distributions of temperature for various isobaric surfaces in each of the atmospheric space selected in order to demonstrate the conservative character of the average temperature in each space; proof for the existence of 3 principal air masses as opposed to system of 2 principal masses (polar - tropical)
Dependence of the summer temperature on latitude in various levels of the naturally subdivided atmospheric spaces
Presentation of mean meridional cross-sections of the actual and the potential temperature for northern hemisphere summer
Average values of the vertical gradient of potential temperature in each of the atmospheric spaces; presentation and discussion of a mean meridional cross-section of the static stability for northern hemisphere summer

ENERGY TRANSFORMATION AND VERTICAL FLUX PROCESSES OVER THE NORTHERN HEMISPHERE, by Clayton E. Jensen. Scientific rept. no. 1 on Planetary Circulations Project, Contract AF 19(604)6108. Aug 60, 260p. 39 refs. AFCRC-TN-60-460.
Order from LC mi$11.10, ph$39.60 PB 149 971

The integrals in the mechanical energy equation representing energy transformation and vertical flux processes have been individually evaluated as a function of selected pressure layers and as a function of a broad division of eddies in the atmosphere over the Northern Hemisphere for January and April 1958. Values of the vertical divergence of energy and measures of the energy transformation process have been introduced into the energy balance equation leaving a residual which approximates the order of magnitude of the dissipative action within the particular region of the atmosphere being sampled. (Author)

INFRARED STUDIES OF THE ATMOSPHERE, by J. W. Birkeland, R. L. Bowman and others. Final rept. for 1 Sep 57-30 Mar 60 on Thermal Radiation Methods of Atmospheric Probing, Contract AF 19(604)2759. Apr 60, 97p. 4 refs. GRD TR-60-285.
Order from LC mi$5.40, ph$15.30 PB 150 163

The results of a two and one-half year program of investigating the atmosphere by infrared techniques are described. Measurements have been made of the abundance of atmospheric carbon monoxide, nitrous oxide, and methane. High-resolution spectra of NH_3 and ND_3 have been analyzed, and methods for the wavelength calibration of infrared spectrometers have been developed. Investigations of the pressure modulation of infrared absorption by gases have been conducted, and a search for the molecule NH_4OH in mixtures of NH_3 and H_2O has been undertaken using infrared techniques.
Included in the report are:

The Abundance of Atmospheric Carbon Monoxide above Columbus, Ohio, by J. H. Shaw. Pub. in The Astrophysical Jnl. 128:428-440, Sep 58.
Abundance of Nitrous Oxide in Ground-Level Air, by J. W. Birkeland and J. H. Shaw. Pub. in the Jnl. of the Optical Society of America 49:637-638, June 59.

Rensselaer Polytechnic Inst., Troy, N. Y.
UTILIZATION OF ENERGY OF THE UPPER ATMOSPHERE, by P. Harteck, R. R. Reeves, Jr., and G. G. Mannella. Final technical rept. on Contract AF 19(604)2205. 8 Apr 60, 35p. 14 refs. AFCRC-TR-60-264.
Order from LC mi$3.00, ph$6.30 PB 149 863

A research program dealing with problems connected with the chemistry of the upper atmosphere has been carried on for three years. The program covered laboratory investigations on chemical reactions and atom chemistry; and the evaluation of the HARE, a vehicle designed to use the energy of recombination of O-atoms as a means of propulsion. In connection with this work, an experiment was carried out on the NRL-52 rocket at White Sands, New Mexico, to measure the O-atom concentration of the upper atmosphere.

INVESTIGATION OF LARGE EXPANSION DIFFUSERS FOR MINIMUM ROTOR AREA, by Jean F. Duvivier and Robert B. McCallum. Rept. on Contract DA 44-177-tc-486. Nov 59, 102p. 56 refs. Technical rept. 81-1; AD-233 528.
Order from LC mi$5.70, ph$16.80 PB 147 831

Means of reducing the size of a ducted fan for a given thrust and exit area were investigated. Short diffusers with expansion ratios from 4 to 8.71, were studied in two-dimensional and three-dimensional flow downstream of an operating fan with several wall shapes; center vanes, boundary layer control by localized suction and air injection, and shaped center bodies were used to control the flow in the diffusers. Various pressure distributions and velocity profiles were measured

Airborne Instruments Lab., Mineola, N. Y.
EVALUATION OF OMNI-BEARING-DISTANCE SYSTEM OF AIR NAVIGATION, by W. R. Rambo, J. S. Pritchard and others. Summary rept. Oct 50, 42p. 7 refs. Rept. no. 540-1.
Order from LC mi$3.30, ph$7.80 PB 147 952

The Omni-Bearing-Distance (OBD) system of air navigation is based on range and bearing information furnished from a preselected single site by a UHF Distance-Measuring Equipment (DME) and a VHF Visual Omnidirectional Range (VOR). The addition of a Course-Line Computer enables flight between any two selected points within the service area of the ground equipments. The principal objective of the evaluation program was to determine the accuracy of the navigation information provided by an OBD facility within its coverage area.

American Machine and Foundry Co., Chicago, Ill.
MODEL TESTS AND STUDIES OF THE PROBLEMS OF DYNAMIC TENSIONS IN AIRCRAFT-ARRESTING GEAR CABLES, by Frank T. Sasaki, Norman F. Eslinger, and Glen L. Neidhardt. Rept. on Contract AF 33(616)5282. Oct 59, 190p. 10 refs. WADC Technical rept. 59-495; AD-237 294.
Order from OTS $3.00 PB 171 007

A one-tenth scale model aircraft arresting gear incorporating a cable tension alleviation device was tested. It is concluded that the analytical method employed is practical and can be used to determine cable behavior in an arresting gear with sufficient accuracy. The theoretical treatment of cable waves as kinks was observed as a realistic approximation from high-speed photography. The tests indicate that the absence of cable hysteresis causes greater travel of the alleviator sheaves. A servo-controlled tension-alleviating device for aircraft-arresting gear systems is shown to be feasible. Controlled movable sheaves are employed, the motion being restrained by a servo-controlled breaking force. The fundamental physical parameters of wire rope are discussed, and the use of titanium or alloys instead of steel is proposed.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
STATISTICAL QUALITY CONTROL IN THE IRAN PROGRAM, by W. G. Ireson. Technical rept. no. 43 on Contract N6onr-25126. 23 Oct 59, 14p. AD-228 271.
Order from LC mi$2.40, ph$3.30 PB 149 502

Armour Research Foundation, Chicago, Ill.
DEVELOPMENT OF AN OZONE ANALYZER FOR USE IN AIRCRAFT, by Joseph F. Roesler and C. R. McCully. Rept. for 1 Apr 58-30 June 60 on Contract AF 19(604)3884, continuation of Contract AF 19(604)1814. June 60, 25p. ARF 3128-12; Final rept.; GRD-TR-60-282.
Order from LC mi$2.70, ph$4.80 PB 149 862

The objective of this program was to develop an instrument to detect 0-100 ppm of ozone for use in aircraft at altitudes up to 80,000 ft. The resulting analyzer detects 0.1 ppm of ozone with an accuracy of 10%. It has a sensitivity of 44 μv/ppm of ozone and a response time of 22-30 sec. Field tests of the ozone analyzer have not only showed that it is practicable, but they have led to additional improvements in sensitivity and stability. The instrument is sensitive to changes in humidity, but a dry ice trap has been successfully employed to remove moisture without removing ozone. Changes in ambient temperature and flow rate have no effect on drift-resistant system.

Armour Research Foundation, Chicago, Ill.
EVALUATION AND ALLOY DEVELOPMENT OF HOT-WORK DIE STEELS FOR STRUCTURAL PURPOSES, by Michael Schneider and John P. Sheehan. Rept. for 15 Apr 58-30 June 59 on Metallic Materials, Contract AF 33(616)5633. May 60, 94p. 32 refs. WADC Technical rept. 59-705.
Order from OTS $2.25 PB 171 008

A program to investigate the tensile properties of three commercial hot-work die steels, Vascojet 1000, Potomac M, and Peerless 56 has been carried out. The results indicate that in sheet form these materials are essentially equivalent and developed the following nominal peak properties when air cooled from 1850°F and double tempered at 1000°F: 295,000 psi ultimate tensile strength; 233,000 psi yield strength at 0.2% offset; and 7% elongation in 2 in. gage length. Approximately 30 experimental alloy steels were melted, in which most of the common alloying elements were investigated to determine their effects on tensile properties. Of these, several developed yield strengths of 280,000-290,000 psi, ultimate tensile strengths of 340,000-360,000 psi and tensile elongatons of 3-5% in 2 in. gage length on sheet material approximately 0.080 in. thick. (Author)

Arnold Engineering Development Center [Tullahoma, Tenn].
SOME COMMENTS CONCERNING THE DEVELOPMENT TRENDS AND GROWTH CHARACTERISTICS OF TURBOJET ENGINES, by Robert E. Smith, Jr. Rept. on ARO, Contract AF 40(600)800. Mar 60, 33p 3 refs. AEDC TN-60-54.
Order from LC mi$3.60, ph$6.30 PB 149 975

Some of the development trends of the turbojet engine for aircraft application in the United States in terms of changes in overall engine performance and component performance are shown for the period 1943-1958. The changes in performance resulting from changes in basic design and from refinements (growth) of a given design are presented. Only performance of unsupercharged engines at military rated power at sea level static conditions is considered. Performance improvements in American-designed engines are compared with improvements in English-designed engines over the period from 1943 to 1951. (Author)

Avco Corp., Nashville, Tenn.
DESIGN, DEVELOPMENT AND FABRICATION OF A LIGHT WEIGHT AIRFRAME. Monthly progress rept. no. 2 for June 1960 on Contract DA 33-008-ORD-1968. 15 July 60, 88p. This report includes "Light Weight Airframe Stress Analysis", Rept. SR-000-010.
Order from LC mi$4.80, ph$13.80 PB 150 047

Specific problems solved are: (a) the re-design of the weight support structure at Station 43.00 to provide greater rigidity; (b) a thorough study of methods of providing a safety lock for the locking ring at the body break at Station 48.00; and (c) the selection of material and design of the sealing gasket at Station 48.00. (See also PB 149 302)

Avco Corp., Nashville, Tenn.
DESIGN, DEVELOPMENT AND FABRICATION OF A LIGHT WEIGHT AIRFRAME, by A. V. Forte. Monthly progress rept. no. 3, July 60, on Contract DA 33-008-ORD-1968. 15 Aug 60, 31p. 3 refs.
Order from LC mi$3.00, ph$6.30 PB 150 279

The structural arrangement was established based on an aluminum honeycomb construction which design studies had shown best satisfied the optimum requirements of weight, shell stability, aerodynamic smoothness, deflection and strength criteria. Materials were selected for the Airframe design which would meet the service requirement of safety withstanding a 400°F temperature exposure for 5 minutes. The test program which defined the proposed methods for substantiating the structural, environmental and mechanical requirements of the airframe was completed and submitted for approval. (See also PB 150 047).

Battelle Memorial Inst., Columbus, Ohio.
THE EVALUATION OF THE EFFECTS OF VERY LOW TEMPERATURES ON THE PROPERTIES OF AIRCRAFT AND MISSILE METALS, by Leonard P. Rice, James E. Campbell, and Ward F. Simmons. Rept. for 1 May 59-29 Feb 60 on Metallic Materials, Contract AF 33(616)6345. June 60, 61p. WADD TR-60-254.
Order from OTS $1.75 PB 171 016

In the past few years, the use of liquefied gases such as oxygen, nitrogen, hydrogen, and helium has increased enormously in the aircraft and missile industries. There is a great deal of interest in metallic materials to store, transport, or otherwise handle these extremely low-temperature liquids. This investigation presents the tensile and hardness properties of eight different alloys of interest to the aircraft and missile industries at temperatures ranging from -253 C (liquid hydrogen) to room temperature. These alloys are Ti-6Al-4V, Ti-5Al-2.5Sn-1V, Ti-16V-2.5Al, and B-120VCA (all beta alloy) titanium alloys, 17-7PH, PH15-7Mo, and Type 301XH stainless steels, and Vascojet 1000 alloy steel. In general, the values for hardness, elastic modulus, and tensile and yield strengths of these materials tended to increase as the test temperature was reduced to -253 C. However, of the eight alloys investigated, the Ti-6Al-4V and the Ti-4Al-3Mo-1V titanium alloys and the Type 301XH stainless steel were the only ones that did not reveal a serious loss of ductility or did not fracture before reaching 0.2 per cent offset strain at -253 C. (Author)

Bio-Mechanics Lab., Tufts U., Medford, Mass.
LIGHT-WEIGHT SEATING: DESIGN RESEARCH ON A NYLON NET SEAT. ONE OF A SERIES OF STUDIES PERTAINING TO CREW COMPARTMENT HABITABILITY FOR EXTENDED MISSIONS, by Jess Forrest, Edward A. Wade and others. Rept. on Biophysics of Space Flight, Contract AF 33(616)3068. Dec 58, 39p. 18 refs. WADC Technical rept. 58-309; AD-209 380.
Order from OTS $1.00 PB 151 702

This report describes a design research program for a light-weight aircraft seat made from nylon netting. An empirical approach was used to evaluate a series of exploratory designs and to modify solutions on the basis of subjective reports by individuals occupying the seats. A number of specific design problems were investigated with the results indicating that human factors requirements of a seat for long term occupancy can be met by a nylon net seat. (Author)

Chicago Midway Labs., U. of Chicago, Ill.
THERMAL PROTECTION OF STRUCTURAL, PROPULSION, AND TEMPERATURE-SENSITIVE MATERIALS FOR HYPERSONIC AND SPACE FLIGHT. PART I. RELATIVE PERFORMANCE OF ABLATING MATERIALS EXPOSED TO LOW AND HIGH HEAT FLUX ENVIRONMENTS, by John H. Bonin and Channon F. Price. Rept. for Aug-Oct 58 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)6006. May 60, 62p. WADC Technical rept. 59-366, Part I.
Order from OTS $1.75 PB 161 956

The experimental equipment used is briefly described, and test results for 19 different test specimens are presented. The data are used to compare the relative performance of the ablating materials with heat sink materials on a weight-per-unit area basis. (Author)

David Taylor Model Basin, Washington, D. C.
STATIC BEHAVIOR OF A RECTANGULAR PLAN FROM GEM MODEL UTILIZING AN INTEGRATED SYSTEM FOR LIFT AND PROPULSIVE THRUST, by Anibal Alfredo Tinajero. June 60, 29p. 4 refs. Aero rept. 948.
Order from LC mi$2.70, ph$4.80 PB 149 898

Augmentation, propulsive thrust ratios, and efficiency ratios were obtained for range of jet nozzle angles and tangential jet deflection angles. It was confirmed that theoretical equations predicting performance of GEM in hovering regime are valid for all jet discharge angles if proper efficiency values are chosen. (Author)

A MATHEMATICAL ANALYSIS OF SOME PHASES OF AIR TRAFFIC FLOW, by E. L. Fritz, R. S. Grubmeyer, and R. S. Miller. Rept. on Study of Air Traffic Flow Problems, Contract AF 33(616)3613. July 58, 61p. 5 refs. ARDC Technical rept. 58-57; AD-204 051.
Order from LC mi$3.90, ph$10.80 PB 150 585

This report released for sale to the public 11 Oct 60.

The mechanics of flow control in the enroute area using speed-reduction flow-control methodswere investigated and mathematically defined with suitable models. Since the samples frequently included large numbers of consecutive arrival intervals occupied by aircraft after smoothing, the probability of smoothed groups of aircraft of various sizes was investigated analytically for three values of system loading. The mechanics of flow control in the enroute area were investigated using a combination of speed-up and slow-down control to see what benefits were derived therefrom. Navigation errors were then introduced into the enroute area smoothing problem. The effect of error on the flow-control process was investigated as was a multiple check-point technique for limiting the effect of the error. Some new equipments and procedures required for an efficient speed-control system were discussed. Use of a 30-minute speed-control area at seven airports in the New York and Pittsburgh Air Route Traffic Control areas was examined. The percentage of delay absorbed by slow-down varied from 50% to 97%.

Guggenheim School of Aeronautics, Georgia Inst. of Tech., Atlanta.
AN INVESTIGATION OF AN APPROACH TO THE PROBLEM OF DETERMINING THE OPTIMUM DESIGN OF SHROUDED PROPELLERS. APPENDIX I. VORTEX SYSTEM. APPENDIX II. CALCULATION OF THRUST AND POWER. APPENDIX III. DETERMINATION OF THE OPTIMUM LOADING FOR A HEAVILY LOADED PROPELLER HAVING AN INFINITE NUMBER OF BLADES. APPENDIX IV. OUTLINE OF DESIGN PROCEDURES FOR SHROUDED PROPELLERS, by Robin B. Gray and Walter Castles, Jr. Rept. on Contract DA 44-177-TC-24. May 60, 92p. 7 refs. TREC 60-44.
Order from LC mi$5.40, ph$15.30 PB 150 116

Two methods of obtaining the necessary optimum combination of design parameters for a lightly loaded, single rotation shrouded propeller are described for the case in which the ultimate wake vortex system moves as a rigid body and is composed of helical vortex filaments of equal geometric pitch. One method employs the electrical potential tank techniques while the other uses a digital computer to numerically integrate the Biot-Savart relation. The optimum blade bound vortex distribution for a two-bladed and a four-blade propeller having an ultimate wake geometric pitch of 1.308 as determined by the potential tank method is presented for illustrative purposes. The results of the computer method were inconclusive due to wake end numerical inaccuracies. However, it is concluded that the digital computer approach is the most promising and the recommendation is expressed that any further work be in this area. (Author)

DETERMINATION OF IONOSPHERE PARAMETERS BY MEANS OF A SATELLITE ANTENNA-TYPE PROBE, by W. W. Zachary, E. A. Wolff, and M. Katzin. Scientific rept. no. 1 on Contract AF 19(604)6656. 30 June 60, 57p. 11 refs. Rept. no. CRC-6656-1; GRD-TN-60-492.
Order from LC mi$3.60, ph$9.30 PB 149 844

A spherical antenna-type probe for determining the parameters of the ionosphere is described. This consists of a main slot around which are disposed pairs of small orthogonal slots. By applying a driving voltage to the main slot and measuring the input impedance as well as the voltages induced in the orthogonal slots, the ionization density, collision frequency, and vector earth's magnetic field may be determined. These are local values since the reaction of the medium on the probe is effectively limited to distances of the order of less than a wavelength. As a preliminary to the main analysis, the input admittance of a slotted plane antenna in a magneto-ionic medium is analyzed. The solution is obtained in a form suitable for numerical evaluation. Measurement systems for the determination of the quantities necessary to evaluate the parameters of the ionized medium are considered. Three systems are shown and their relative advantages and disadvantages are outlined. A suitable measurement system appears to be quite feasible of realization. (Author)

INVESTIGATIONS ON THE DETAILED STRUCTURE OF THE ATMOSPHERE IN NORTHERN HEMISPHERE MID-SUMMER (15-20 JULY 1957, IGY-DATA) by Friedrich Defant. Technical (scientific) note no. 5 on Contract AF 61(514)963. 1 Sep 59, 126p. AFCRC-TN-59-664; AD-234 430.
Order from LC mi$6.30, ph$19.80 PB 147 873

Contents:
Synoptic situation (15-20 July 1957); worldwide check on the summer tropopause-level and on the level of maximum wind; position of polarfront jet and subtropical jet; the summer-polarfront
Presentation of mean vertical temperature distributions in each of the special selected atmospheric spaces (polar, midlatitude, tropical, and in the vicinity of the summer subtropical jet) and a comparison of these average distributions with that obtained for mid-winter periods.
Presentation of frequency distributions of temperature for various isobaric surfaces in each of the atmospheric space selected in order to demonstrate the conservative character of the average temperature in each space; proof for the existence of 3 principal air masses as opposed to system of 2 principal masses (polar - tropical)
Dependence of the summer temperature on latitude in various levels of the naturally subdivided atmospheric spaces
Presentation of mean meridional cross-sections of the actual and the potential temperature for northern hemisphere summer
Average values of the vertical gradient of potential temperature in each of the atmospheric spaces; presentation and discussion of a mean meridional cross-section of the static stability for northern hemisphere summer

ENERGY TRANSFORMATION AND VERTICAL FLUX PROCESSES OVER THE NORTHERN HEMISPHERE, by Clayton E. Jensen. Scientific rept. no. 1 on Planetary Circulations Project, Contract AF 19(604)6108. Aug 60, 260p. 39 refs. AFCRC-TN-60-460.
Order from LC mi$11.10, ph$39.60 PB 149 971

The integrals in the mechanical energy equation representing energy transformation and vertical flux processes have been individually evaluated as a function of selected pressure layers and as a function of a broad division of eddies in the atmosphere over the Northern Hemisphere for January and April 1958. Values of the vertical divergence of energy and measures of the energy transformation process have been introduced into the energy balance equation leaving a residual which approximates the order of magnitude of the dissipative action within the particular region of the atmosphere being sampled. INFRARED STUDIES OF THE ATMOSPHERE, by J. W. Birkeland, R. L. Bowman and others. Final rept. for 1 Sep 57-30 Mar 60 on Thermal Radiation Methods of Atmospheric Probing. Contract AF 19(604)2759. Apr 60, 97p. 4 refs. GRD TR-60-285.
Order from LC mi$5.40, ph$15.30 PB 150 163

The results of a two and one-half year program of investigating the atmosphere by infrared techniques are described. Measurements have been made of the abundance of atmospheric carbon monoxide, nitrous oxide, and methane. High-resolution spectra of NH_3 and ND_3 have been analyzed, and methods for the wavelength calibration of infrared spectrometers have been developed. Investigations of the pressure modulation of infrared absorption by gases have been conducted, and a search for the molecule NH_4OH in mixtures of NH_3 and H_2O has been undertaken using infrared techniques. Included in the report are:
Pressure Modulation of Infrared Absorption. I. Entire Vibration-Rotation Bands, by James C. Gilfert and Dudley Williams. Pub. in the Jnl. of the Optical society of America 48:765-769, Nov 58.
The Abundance of Atmospheric Carbon Monoxide above Columbus, Ohio, by J. H. Shaw. Pub. in The Astrophysical Jnl. 128:428-440, Sep 58.
Abundance of Nitrous Oxide in Ground-Level Air, by J. W. Birkeland and J. H. Shaw. Pub. in the Jnl. of the Optical Society of America 49:637-638, June 59.

UTILIZATION OF ENERGY OF THE UPPER ATMOSPHERE, by P. Harteck, R. R. Reeves, Jr., and G. G. Mannella. Final technical rept. on Contract AF 19(604)2205. 8 Apr 60, 35p. 14 refs. AFCRC-TR-60-264.
Order from LC mi$3.00, ph$6.30 PB 149 863

A research program dealing with problems connected with the chemistry of the upper atmosphere has been carried on for three years. The program covered laboratory investigations on chemical reactions and atom chemistry; and the evaluation of the HARE, a vehicle designed to use the energy of recombination of O-atoms as a means of propulsion. In connection with this work, an experiment was carried out on the NRL-52 rocket at White Sands, New Mexico, to measure the O-atom concentration of the upper atmosphere.

INVESTIGATION OF LARGE EXPANSION DIFFUSERS FOR MINIMUM ROTOR AREA, by Jean F. Duvivier and Robert B. McCallum. Rept. on Contract DA 44-177-tc-486. Nov 59, 102p. 56 refs. Technical rept. 81-1; AD-233 528.
Order from LC mi$5.70, ph$16.80 PB 147 831

Means of reducing the size of a ducted fan for a given thrust and exit area were investigated. Short diffusers with expansion ratios from 4 to 8.71, were studied in two-dimensional and three-dimensional flow downstream of an operating fan with several wall shapes; center vanes, boundary layer control by localized suction and air injection, and shaped center bodies were used to control the flow in the diffusers. Various pressure distributions and velocity profiles were measured

Airborne Instruments Lab., Mineola, N. Y.
EVALUATION OF OMNI-BEARING-DISTANCE SYSTEM OF AIR NAVIGATION, by W. R. Rambo, J. S. Pritchard and others. Summary rept. Oct 50, 42p. 7 refs. Rept. no. 540-1.
Order from LC mi$3.30, ph$7.80 PB 147 952

The Omni-Bearing-Distance (OBD) system of air navigation is based on range and bearing information furnished from a preselected single site by a UHF Distance-Measuring Equipment (DME) and a VHF Visual Omnidirectional Range (VOR). The addition of a Course-Line Computer enables flight between any two selected points within the service area of the ground equipments. The principal objective of the evaluation program was to determine the accuracy of the navigation information provided by an OBD facility within its coverage area.

American Machine and Foundry Co., Chicago, Ill.
MODEL TESTS AND STUDIES OF THE PROBLEMS OF DYNAMIC TENSIONS IN AIRCRAFT-ARRESTING GEAR CABLES, by Frank T. Sasaki, Norman F. Eslinger, and Glen L. Neidhardt. Rept. on Contract AF 33(616)5282. Oct 59, 190p. 10 refs. WADC Technical rept. 59-495; AD-237 294.
Order from OTS $3.00 PB 171 007

A one-tenth scale model aircraft arresting gear incorporating a cable tension alleviation device was tested. It is concluded that the analytical method employed is practical and can be used to determine cable behavior in an arresting gear with sufficient accuracy. The theoretical treatment of cable waves as kinks was observed as a realistic approximation from high-speed photography. The tests indicate that the absence of cable hysteresis causes greater travel of the alleviator sheaves. A servo-controlled tension-alleviating device for aircraft-arresting gear systems is shown to be feasible. Controlled movable sheaves are employed, the motion being restrained by a servo-controlled breaking force. The fundamental physical parameters of wire rope are discussed, and the use of titanium or alloys instead of steel is proposed.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
STATISTICAL QUALITY CONTROL IN THE IRAN PROGRAM, by W. G. Ireson. Technical rept. no. 43 on Contract N6onr-25126. 23 Oct 59, 14p. AD-228 271.
Order from LC mi$2.40, ph$3.30 PB 149 502

Armour Research Foundation, Chicago, Ill.
DEVELOPMENT OF AN OZONE ANALYZER FOR USE IN AIRCRAFT, by Joseph F. Roesler and C. R. McCully. Rept. for 1 Apr 58-30 June 60 on Contract AF 19(604)3884, continuation of Contract AF 19(604)1814. June 60, 25p. ARF 3128-12; Final rept.; GRD-TR-60-282.
Order from LC mi$2.70, ph$4.80 PB 149 862

The objective of this program was to develop an instrument to detect 0-100 ppm of ozone for use in aircraft at altitudes up to 80,000 ft. The resulting analyzer detects 0.1 ppm of ozone with an accuracy of 10%. It has a sensitivity of 44 μv/ppm of ozone and a response time of 22-30 sec. Field tests of the ozone analyzer have not only showed that it is practicable, but they have led to additional improvements in sensitivity and stability. The instrument is sensitive to changes in humidity, but a dry ice trap has been successfully employed to remove moisture without removing ozone. Changes in ambient temperature and flow rate have no effect on drift-resistant system.

Armour Research Foundation, Chicago, Ill.
EVALUATION AND ALLOY DEVELOPMENT OF HOT-WORK DIE STEELS FOR STRUCTURAL PURPOSES, by Michael Schneider and John P. Sheehan. Rept. for 15 Apr 58-30 June 59 on Metallic Materials, Contract AF 33(616)5633. May 60, 94p. 32 refs. WADC Technical rept. 59-705.
Order from OTS $2.25 PB 171 008

A program to investigate the tensile properties of three commercial hot-work die steels, Vascojet 1000, Potomac M, and Peerless 56 has been carried out. The results indicate that in sheet form these materials are essentially equivalent and developed the following nominal peak properties when air cooled from 1850°F and double tempered at 1000°F: 295,000 psi ultimate tensile strength; 233,000 psi yield strength at 0.2% offset; and 7% elongation in 2 in. gage length. Approximately 30 experimental alloy steels were melted, in which most of the common alloying elements were investigated to determine their effects on tensile properties. Of these, several developed yield strengths of 280,000-290,000 psi, ultimate tensile strengths of 340,000-360,000 psi and tensile elongatons of 3-5% in 2 in. gage length on sheet material approximately 0.080 in. thick. (Author)

SOME COMMENTS CONCERNING THE DEVELOPMENT TRENDS AND GROWTH CHARACTERISTICS OF TURBOJET ENGINES, by Robert E. Smith, Jr. Rept. on ARO, Contract AF 40(600)800. Mar 60, 33p. 3 refs. AEDC TN-60-54.
Order from LC mi$3.00, ph$6.30 PB 149 975

Some of the development trends of the turbojet engine for aircraft application in the United States in terms of changes in overall engine performance and component performance are shown for the period 1943-1958. The changes in performance resulting from changes in basic design and from refinements (growth) of a given design are presented. Only performance of unaugmented engines at military rated power at sea-level static conditions is considered. Performance improvements in American-designed engines are compared with improvements in English-designed engines over the period from 1943 to 1951. (Author)

Avco Corp., Nashville, Tenn.
DESIGN, DEVELOPMENT AND FABRICATION OF A LIGHT WEIGHT AIRFRAME. Monthly progress rept. no. 2 for June 1960 on Contract DA 33-008-ORD-1968. 15 July 60, 88p. This report includes "Light Weight Airframe Stress Analysis", Rept. SR-000-010.
Order from LC mi$4.80, ph$13.80 PB 150 047

Specific problems solved are: (a) the re-design of the weight support structure at Station 43.00 to provide greater rigidity; (b) a thorough study of methods of providing a safety lock for the locking ring at the body break at Station 48.00; and (c) the selection of material and design of the sealing gasket at Station 48.00. (See also PB 149 302)

Avco Corp., Nashville, Tenn.
DESIGN, DEVELOPMENT AND FABRICATION OF A LIGHT WEIGHT AIRFRAME, by A. V. Forte. Monthly progress rept. no. 3, July 60, on Contract DA 33-008-ORD-1968. 15 Aug 60, 31p. 3 refs.
Order from LC mi$3.00, ph$6.30 PB 150 279

The structural arrangement was established based on an aluminum honeycomb construction which design studies had shown best satisfied the optimum requirements of weight, shell stability, aerodynamic smoothness, deflection and strength criteria. Materials were selected for the Airframe design which would meet the service requirement of safety withstanding a 400°F temperature exposure for 5 minutes. The test program which defined the proposed methods for substantiating the structural, environmental and mechanical requirements of the airframe was completed and submitted for approval. (See also PB 150 047).

Battelle Memorial Inst., Columbus, Ohio.
THE EVALUATION OF THE EFFECTS OF VERY LOW TEMPERATURES ON THE PROPERTIES OF AIRCRAFT AND MISSILE METALS, by Leonard P. Rice, James E. Campbell, and Ward F. Simmons. Rept. for 1 May 59-29 Feb 60 on Metallic Materials, Contract AF 33(616)6345. June 60, 61p. WADD TR-60-254.
Order from OTS $1.75 PB 171 016

In the past few years, the use of liquefied gases such as oxygen, nitrogen, hydrogen, and helium has increased enormously in the aircraft and missile industries. There is a great deal of interest in metallic materials to store, transport, or otherwise handle these extremely low-temperature liquids. This investigation presents the tensile and hardness properties of eight different alloys of interest to the aircraft and missile industries at temperatures ranging from -253 C (liquid hydrogen) to room temperature. These alloys are Ti-6Al-4V, Ti-5Al-3Mo-1V, Ti-16V-2.5Al, and B-120VCA (all-beta alloy) titanium alloys; 17-7PH, PH15-7Mo, and Type 301XH stainless steels; and Vascojet 1000 alloy steel. In general, the values for hardness, elastic modulus, and tensile and yield strengths of these materials tended to increase as the test temperature was reduced to -253 C. However, of the eight alloys investigated, the

Ti-6Al-4V and the Ti-4Al-3Mo-1V titanium alloys and the Type 301XH stainless steel were the only ones that did not reveal a serious loss of ductility or did not fracture before reaching 0.2 per cent offset strain at -253 C. (Author)

Bio-Mechanics Lab., Tufts U., Medford, Mass.
LIGHT-WEIGHT SEATING: DESIGN RESEARCH ON A NYLON NET SEAT. ONE OF A SERIES OF STUDIES PERTAINING TO CREW COMPARTMENT HABITABILITY FOR EXTENDED MISSIONS, by Jess Forrest, Edward A. Wade and others. Rept. on Biophysics of Space Flight, Contract AF 33(616)3068. Dec 58, 39p. 18 refs. WADC Technical rept. 58-309; AD-209 380.
Order from OTS $1.00 PB 151 702

This report describes a design research program for a light-weight aircraft seat made from nylon netting. An empirical approach was used to evaluate a series of exploratory designs and to modify solutions on the basis of subjective reports by individuals occupying the seats. A number of specific design problems were investigated with the results indicating that human factors requirements of a seat for long term occupancy can be met by a nylon net seat. (Author)

Chicago Midway Labs., U. of Chicago, Ill.
THERMAL PROTECTION OF STRUCTURAL, PROPULSION, AND TEMPERATURE-SENSITIVE MATERIALS FOR HYPERSONIC AND SPACE FLIGHT. PART I. RELATIVE PERFORMANCE OF ABLATING MATERIALS EXPOSED TO LOW AND HIGH HEAT FLUX ENVIRONMENTS, by John H. Bonin and Channon F. Price. Rept. for Aug-Oct 58 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)6006. May 60, 62p. WADC Technical rept. 59-366, Part I.
Order from OTS $1.75 PB 161 956

The experimental equipment used is briefly described, and test results for 19 different test specimens are presented. The data are used to compare the relative performance of the ablating materials with heat sink materials on a weight-per-unit area basis. (Author)

David Taylor Model Basin, Washington, D. C.
STATIC BEHAVIOR OF A RECTANGULAR PLAN FROM GEM MODEL UTILIZING AN INTEGRATED SYSTEM FOR LIFT AND PROPULSIVE THRUST, by Anibal Alfredo Tinajero. June 60, 29p. 4 refs. Aero rept. 948.
Order from LC mi$2.70, ph$4.80 PB 149 898

Augmentation, propulsive thrust ratios, and efficiency ratios were obtained for range of jet nozzle angles and tangential jet deflection angles. It was confirmed that theoretical equations predicting performance of GEM in hovering regime are valid for all jet-discharge angles, if proper efficiency values are chosen. (Author)

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
A MATHEMATICAL ANALYSIS OF SOME PHASES OF AIR TRAFFIC FLOW, by E. L. Fritz, R. S. Grubmeyer, and R. S. Miller. Rept. on Study of Air Traffic Flow Problems, Contract AF 33(616)3613. July 58, 61p. 5 refs. ARDC Technical rept. 58-57; AD-204 051.
Order from LC mi$3.90, ph$10.80 PB 150 585

This report released for sale to the public 11 Oct 60.

The mechanics of flow control in the enroute area using speed-reduction flow-control methodswere investigated and mathematically defined with suitable models. Since the samples frequently included large numbers of consecutive arrival intervals occupied by aircraft after smoothing, the probability of smoothed groups of aircraft of various sizes was investigated analytically for three values of system loading. The mechanics of flow control in the enroute area were investigated using a combination of speed-up and slow-down control to see what benefits were derived therefrom. Navigation errors were then introduced into the enroute area smoothing problem. The effect of error on the flow-control process was investigated as was a multiple check-point technique for limiting the effect of the error. Some new equipments and procedures required for an efficient speed-control system were discussed. Use of a 30-minute speed-control area at seven airports in the New York and Pittsburgh Air Route Traffic Control areas was examined. The percentage of delay absorbed by slow-down varied from 50% to 97%.

Guggenheim School of Aeronautics, Georgia Inst. of Tech., Atlanta.
AN INVESTIGATION OF AN APPROACH TO THE PROBLEM OF DETERMINING THE OPTIMUM DESIGN OF SHROUDED PROPELLERS. APPENDIX I. VORTEX SYSTEM. APPENDIX II. CALCULATION OF THRUST AND POWER. APPENDIX III. DETERMINATION OF THE OPTIMUM LOADING FOR A HEAVILY LOADED PROPELLER HAVING AN INFINITE NUMBER OF BLADES. APPENDIX IV. OUTLINE OF DESIGN PROCEDURES FOR SHROUDED PROPELLERS, by Robin B. Gray and Walter Castles, Jr. Rept. on Contract DA 44-177-TC-24. May 60, 92p. 7 refs. TREC 60-44.
Order from LC mi$5.40, ph$15.30 PB 150 116

Two methods of obtaining the necessary optimum combination of design parameters for a lightly loaded, single rotation shrouded propeller are described for the case in which the ultimate wake vortex system moves as a rigid body and is composed of helical vortex filaments of equal geometric pitch. One method employs the electrical potential tank techniques while the other uses a digital computer to numerically integrate the Biot-Savart relation. The optimum blade bound vortex distribution for a two-bladed and a four-blade propeller having an ultimate wake geometric pitch of 1.356 as determined by the potential tank method is presented for illustrative purposes. The results of the computer method were inconclusive due to time and financial limitations. However, it is concluded that the digital computer approach is the more promising and the recommendation is suggested that any further work be in this area. (Author)

Hiller Aircraft Corp. [Palo Alto, Calif.]
ANNULAR NOZZLE EJECTOR, SUMMARY REPORT, PHASE I PROGRAM, by C. H. Spiegelberg. Rept. on Contract Nonr-2840(00). Nov 59, 57p. 8 refs. Rept. no. ARD-243.
Order from LC mi$3.60, ph$9.30 PB 150 209

The purpose of the complete program is to show the effect of scale and the elevated temperature of the primary flow on ejector performance through the design, construction and testing of a full scale annular nozzle ejector using a jet engine as the source of the hot primary gas. Phase I of the program included small scale model tests for determining the geometry of the full size hardware and also includes detail design of the full scale ejector and test hardware.

Just, W.
LATERAL-DIRECTIONAL STABILITY AND CONTROL OF HELICOPTERS. EFFECT OF DESIGN PARAMETERS, by W. Just, H. Georgi, and U. Schwellinger. Final Technical rept. no. 1, 1 Oct 58-30 Oct 59, on Contract DA 91-591-EUC-959. [1959] 236p. 1 ref.
Order from LC mi$10.20, ph$36.30 PB 149 908

The present theoretical study deals with control and stability investigations of helicopters, especially with lateral-directional stability. Theories of various degrees of accuracy have been presented and compared against each other. In order to ascertain the effect of the design parameters upon the stability qualities, numerous examples have been computed. Diagrams have been plotted against the design parameters for the time to damp to 1/2 amplitude, for the time to double the amplitude or, for the period of oscillation, as well as for the stability measurement t_w/T resp. t_b/T. Furthermore, the courses of motion as functions of time have been computed for excitations in form of square pulse, step pulse, and sinusoidal pulse. (Author)

Contents:
An introduction to the icing problem
Trajectories of water drops around streamlined bodies
Removing the ice
The energy transfers at an icing surface
Analysis of the separate modes of energy transfer
The complete energy balance and some applications
The design of a continuously anti-iced air-heated wing
Intermittent heating
Meteorological conditions for design

National Aviation Facilities Experimental Center, Atlantic City, N. J.
AIRCRAFT INSTALLATION AND OPERATION OF AN EXTINGUISHING-AGENT CONCENTRATION RECORDER, by James E. Demaree and Paul R. Dierdorf. 25 Sep 59, 35p. 1 ref. Technical Development rept. no. 403.
Order from OTS $1.00 PB 161 991

This report covers the utilization of a gas-analyzing instrument for evaluating aircraft fire-extinguishing systems. This instrument records the extinguishing-agent air concentrations resulting when the extinguishing system is discharged, and thereby provides a means of evaluating the aircraft extinguishing system under actual flight conditions. This report is intended to serve as an instruction manual for installation and operation of the instrument. Calibration data based on available information to aid in the reduction and interpretation of the test data obtained also are included The instrument and the principles of operation are described briefly. (Author)

National Aviation Facilities Experimental Center, Atlantic City, N. J.
INSTALLATION AND TESTING OF VISUAL GLIDE PATH INDICATORS, by Richard S. Griffith. Final rept. June 60, 87p. 12 refs.
Order from OTS $2.25 PB 161 992

Flight tests were conducted to comparatively evaluate five different types of visual glide path indicators. The systems installed at the National Aviation Facilities Experimental Center (NAFEC) were: Westinghouse Tri-Color, Navy Mirror, USAF Interim Mirror, Australian Cumming-Lane, and British RAE. All of the systems were set up on Runway 13, and as nearly as possible, each system was adjusted to the same vertical angle as the ILS glide path. A wide cross section of pilots from all segments of aviation participated. A cross section of aircraft was employed, from a Piper Tri-Pacer to the Boeing 707. Initial testing was directed toward selecting the more promising systems followed by concentrated testing and comparative evaluation of the selected systems. Accordingly, the last six weeks of the program were devoted to comparative evaluation of the Australian Cumming-Lane and the British RAE system. Subjective data indicate that more pilots prefer the RAE system than prefer the Cumming-Lane. All pilots but one indicated that a requirement exists, under certain conditions, for visual glide path assistance. Theodolite recordings show that no significant differences exist in the maximum range at which the lights can be seen (with respect to the systems named above), or in the maximum range at which guidance is available. The RAE system, however, provides guidance to a lower altitude than does the Cumming-Lane system. (Author)

National Research Labs., Ottawa (Canada).
RADIAL GRIDS WITH WATER INJECTION FOR SUPPRESSING THE NOISE OF JET ENGINES, by H. U. Wisniowski. 21 Mar 60, 31p. 13 refs. Aeronautical rept. LR-281.
Order from LC mi$3.00, ph$6.30 PB 149 744

Noise-suppression experiments were made with water sprays introduced into the stream of exhaust gases from a jet engine by means of radial grids with tubular perforated arms. This method proved to be very satisfactory for the test cell installation with an appreciable length of exhaust duct. An over-all noise-level reduction of 31.5 db. was obtained at a water flow rate of 259 Imp. gal./min. for a jet engine of 100 lb./sec. mass flow. In the field installation, the

method was found less attractive because of the necessity of using a rather long exhaust duct to obtain higher noise attenuation. It was shown that a cylindrical shroud mounted on the grid suppresses the noise (called "hoot") produced when the grid is mounted too far from the engine final nozzle. (Author)

NOISE AND VIBRATION TEST OF THE KD2G-1 (FIREFLY) TARGET P/A, by Everett O. Throndsen. 22 June 49, declassified 12 June 56, 53p. Proj. TED MTC PA-203; Technical rept. no. 50.
Order from LC mi$3.60, ph$9.30 PB 148 628

A series of vibration tests of the KD2G-1 (FIREFLY) target pilotless aircraft was conducted to: (a) measure the frequencies and amplitudes of vibration present at various points of the airframe as a result of operation of the pulsejet engine, (b) measure the over-all level and frequency content of the acoustic noise within the fuselage when the engine is operating, (c) make a functional check of KD2G-1 equipment during periods of engine operation.

[Pacific] Missile [Range] Port Mugu, Calif.
STABILITY AND CONTROL ANALYSIS OF THE RPS-2 AUTOPILOT/KD2R-2 AIRFRAME COMBINATION, by L. E. Day. Rept. on Proj. TED MTC EL-310. 15 Jan 50, declassified 12 June 56, 109p. 12 refs. Technical rept. no. 65.
Order from LC mi$5.70, ph$16.80 PB 148 634

An analysis has been made of the stability and control characteristics of the RPS-2 autopilot and KD2R-2 target P/A combination. This analysis was based on the frequency-response characteristics of the autopilot that were obtained by laboratory tests and on the calculated aerodynamic frequency-response characteristics of the airframe. The characteristics of both the autopilot and the airframe were combined in accordance with standard servomechanism theory. Stability was determined by the Nyquist criterion.

TESTS OF THE KD2C-1 POWER PLANT, by Ray Fremlin. 24 Mar 50, declassified 12 June 56, 69p. Technical rept. no. 69.
Order from LC mi$3.90, ph$10.80 PB 148 635

Captive flight tests were made with the KD2C-1 (SKEET) target P/A that incorporated an internally mounted 14-inch pulsejet engine. These tests were made to evaluate performance of the power plant and to compare the performance with that of an identical, bare engine mounted externally in the free air stream.

Princeton U., N. J.
EFFECT OF C. G. POSITION, DUCT AREA RATIO AND DUCT ANGLE RATIO ON THE PERFORMANCE OF AN AERIAL JEEP, VTOL TYPE AIRCRAFT, by Joseph J. Traybar. Rept. on Contract DA 44-177-TC-524. Jan 60, 47p. 6 refs. Dept. of Aeronautical Engineering rept. no. 494.
Order from LC mi$3.30, ph$7.80 PB 150 186

Theoretical investigations are made on the performance of aerial jeep-type aircraft as influenced by various configuration changes. The primary objective of this report is the study of the relative effects on the power caused by selected design variations rather than the determination of the total power required for a specific vehicle. Attention is given to a configuration which utilizes ducted rotors in a triangular arrangement. It is assumed that the ducted rotors can be rotated with respect to the fuselage and that control is obtained by differential variations in thrust. The forward flight equilibrium equations are derived using simple momentum theory where duct angle of attack, exit slipstream velocity and forward speed are the variables. The specific quantities changed in order to determine their relative effects on the power are duct area ratio, duct angle of attack ratio and longitudinal center of gravity location. (Author)

THEORETICAL INVESTIGATION OF DUCTED PROPELLER AERODYNAMICS. VOLUME I. THEORETICAL DEVELOPMENTS, by Th. Theodorsen. Rept. on Contract DA 44-177-TC-606. 10 Aug 60, 87p.
Order from LC mi$4.80, ph$13.80 PB 149 934

This report covers certain theoretical developments, including some new ones of fundamental aspects. The theory of the line sink in a two-dimensional wing represents a classical solution in the airfoil theory. Closed expressions are given for the hitherto unknown pitching moment. There is a short appendix giving certain specific design and performance problems.

Republic Aviation Corp., Farmingdale, N. Y.
THEORETICAL INVESTIGATION OF DUCTED PROPELLER AERODYNAMICS. VOLUME II. REVIEW AND ANALYSIS OF EXPERIMENTAL INVESTIGATIONS ON DUCTED FANS, by Th. Theodorsen. Rept. on Contract DA 44-177-TC-606. 10 Aug 60, 250p. 84 refs.
Order from LC mi$11.10, ph$37.80 PB 149 935

A comprehensive survey of published experimental work on ducted fan configurations is made, which gives an outline of some analytic relations used to document and analyze experimental result. It then selects a number of experimental papers which make significant and consistent contributions and analyzes

their results in detail. Major subsections deal with the performance in the static or hovering case of the configuration, with performance fields for the case where the fan is moving in axial direction and with the analysis of the performance in non-axial flow which is the flow encountered by a configuration making a transition from hovering to forward flight. Specific observations derived from the analysis, concerning the distribution of rolling and pitching moments for a shrouded and unshrouded propeller, evidence and recognition of flow separation on the shroud, etc., follow. Special arrangements of fans in wing, multiple fan arrangements, and ground proximity effects are reviewed. The concluding part briefly reviews the general considerations that go into the design of ducted fan systems. (See also PB 149 934)

WATER RECOVERY SYSTEMS (MULTI-VARIABLE) by Harold Wallman and Stanley M. Barnett. Rept. on Equipment for Life Support in Aerospace, Contract AF 33(616)6425. Mar 60, 76p. 50 refs. WADD Technical rept. 60-243.
Order from OTS $2.00 PB 171 022

A study has been conducted to determine the optimum design of several urine-to-potable-water recovery systems for use on space flights having different flight durations and crew sizes. Phase change processes, solvent extraction, ion exchange, membrane processes and integrated systems are covered. On the basis of the evidence presented, it has been recommended that: (1) a simple distillation unit be used for flights of six or more with up to two men, (2) a vapor compression system be used for long flights (four days or more) having large crews (three to twenty men), and (3) sufficient water be stored aboard the vehicle for flights of short duration. Recommendations are also made for a laboratory study of other promising methods of water recovery. It has been concluded that a healthy man can ingest water reclaimed from urine without incurring any harmful effects. (Author)

STUDIES AND INVESTIGATIONS OF AGGLOMERATION AND DEAGGLOMERATION OF SOLID PARTICLES, by Clyde Orr, Jr., J. M. Dallavalle and others. Final rept. 15 June 57. 76p. 5 refs. AD-150 490.
Order from LC mi$4.50, ph$12.30 PB 150 131

The deagglomeration of powder masses and the tensile strength of powders were investigated. Deagglomeration was studied by blowing powders with a series of gas pressures through capillary tubes of various diameters and lengths. Particle size distributions were determined after passage through the tubes, and the velocity of powder movement was determined by high-speed photography. Deagglomeration was also carried out by blasting powders through an annular port at various pressures. The tensile strengths were measured by forming a bed of powder on a device one part of which moved on precision ball bearings. Essentially complete deagglomeration was attained for all powders For the finest powders, this required a gas pressure of 400 psi, a tube diameter no greater than 0.02 in., and a tube length of up to 3 inches. The tensile strengths of bulk, dry, biological powders were in the range of 2×10^{-3} to 9×10^{-3} psi, or less than the strength of the material of which the powder was composed. The tensile strengths of bulk uncompacted FT-3 and FP were 8.6×10^{-3} and 6.0×10^{-3} psi. respectively. No definite correlation existed between the bulk tensile strength of powders and its ease of dispersibility. The force of adhesion of spheres to solid surfaces was proportional to the particle diameter. Washing generally increased the dispersibility of bacterial powders. Grinding had less influence on dispersion. (See also PB 140 304).

A BASIC STUDY OF THE PHYSICS OF AEROSOL FORMATION. Quarterly technical rept. no. 4 for 1 Apr-1 July 52. 1 July 52, 63p. 21 refs.
Order from LC mi$3.90, ph$10.80 PB 150 128

The dimensional analysis for the swirl chamber atomizer is presented. It was found that an analysis based on initial conditions at the orifice versus an analysis based on the design parameters was possible. This lead to the formulation of the mode of atomization, mean droplet diameter ratio, and orifice diameter ratio, as functions of the Reynolds Number, Z number, T number peculiar to the swirl chamber atomizer and angles of spray. A recapitulation of a Study of Aerosols in general is discussed. Conditions for aerosols formation before, during and after atomization are explained. The process of film formation is discussed. In order to lessen the burden of a mathematical analysis it was suggested that the elimination of the rotational component in the film formation be achieved by having laminar liquid flow impinge on a flat circular disk. The subsequent disintegration phenomena for four cases (spurious, drop, ligament and film formation) is presented.

Pennsylvania State [U., University Park].
A BASIC STUDY OF THE PHYSICS OF AEROSOL FORMATION. Quarterly technical rept. no. 5 for 1 July-1 Oct 52. 1 Oct 52, 49p. 31 refs.
Order from LC mi$3.30, ph$7.80 PB 150 129

Chapter I is essentially a thorough critique of a recent Russian treatise on capillary waves. Some errors in it have been pointed out, and the treatment therein has been extended. Further expansion of the theory of stability of two liquid surfaces is indicated. Chapter II presents some contributions to the theory of sedimentation and decay of aerosols, based essentially on an existing detailed treatment by Dr. Charles A. Boyd. The problems of correction of mass-percent recovery and of the particle-size distribution are dealt with in some detail. (See also PB 150 128)

Pennsylvania State [U., University Park] Pa.
A BASIC STUDY OF THE PHYSICS OF AEROSOL FORMATION. Quarterly technical rept. no. 6 for 1 Oct-31 Dec 52. 1 Jan 53, 80p. 67 refs.
Order from LC mi$4.50, ph$12.30 PB 149 986

Chapter I is the description of the Spray Chamber with its auxiliary equipment, namely the Hydraulic System, the Shutter-Mechanism, the Vacuum System for Sampling, and the Exhaust System. Chapter II is a critical analysis, from a statistical point of view, of the several droplet-size distribution formulas which have been proposed in the past. It is proposed that the population distribution of droplet sizes be described by use of the confidence-interval technique. Chapter III contains about 60 new titles dealing with literature in the field of sprays, together with their brief abstracts. These will be incorporated in the new edition of the "Bibliography on Sprays" which is under preparation at present. Chapter IV contains the photographs and drawings pertaining to the Closed Spray Chamber and its Auxiliary Equipment. (Author)

Pennsylvania State [U., University Park]
A BASIC STUDY OF THE PHYSICS OF AEROSOL FORMATION. Quarterly technical rept. no. 7 for 1 Jan-31 Mar 53. 1 Apr 53, 76p. 6 refs.
Order from LC mi$4.50, ph$12.30 PB 150 130

Chapter 1 is a derivation of the most general form of the Orr-Sommerfeld equation for laminar boundary layers. In Chapter 2 the theory of conformal mapping with free streamlines is applied to jet theory. Chapter 3 presents an attempted extension of the theory of Borodin and Dityakin 1951 for the instability of the interface of two viscous fluids to the case of a sheet. Work on size distribution by the settling method is covered in Chapter 4. Chapter 5 presents a brief introduction to the subject of spinning disc atomization. Chapter 6 is a summary of the work done on nozzle and shutter-calibration in an attempt to get reproducible amounts of fluids sprayed into a closed tank. (See also PB 150 129)

DESIGN AND OPERATION OF DEHUMIDIFIED NAVAL WAREHOUSES. July 54, 64p. NAVSANDA PUB. 230.
Order from LC mi$3.90, ep$12.30 PB 149 615

This report released for sale to the public 23 Sep 60.

Part A covers the operation of the dehumidification equipment, care and maintenance of instruments, and the maintenance of the warehouse as a container for materials. Part B covers the storage of materials in dehumidified warehouses, preparation of the material for storage, and the coordination of material handling operations with open door time to reduce the admission of humid air.

Engineer Corps, Washington, D. C.
SOIL AS A FACTOR IN SHOALING PROCESSES, A LITERATURE REVIEW. June 60, 51p. 81 refs. Technical Bulletin no. 4.
Order from LC mi$3.60, ph$9.30 PB 149 742

This literature survey was made to assess, on the basis of available information, the probable influence of soil properties on the transport, deposition, and stability of shoal materials in estuaries. Descriptions are presented of the physical and engineering characteristics of soil, particularly the clay minerals, kaolinite, montmorillonite, and illite, which are carried in suspension and may be deposited in shoal areas. The various factors influencing the process of sedimentation are discussed; these include hydraulic factors, sediment type and concentration, salinity, temperature, pH, organic matter, industrial wastes, etc. Finally, available information is presented on the mode of deposition and physical characteristics of the sediment deposits. The results of the literature survey show that the principal source of shoal materials is suspended, fine-grained soil material carried into an estuary by fresh-water streams. The suspended sediment tends to flocculate in the presence of salt water, forming aggregates which settle to the bottom and form shoals. The rate of settling is influenced primarily by the salinity of the water; temperature and turbulence of the water, and nature and concentration of the soil particles are of lesser importance.

Admiral Corp., Chicago, Ill.
EVALUATION AND DEVELOPMENT OF MIL-C-14157 CAPACITORS FOR NUCLEAR RADIATION ENVIRONMENT, by E. R. Pfaff. Scientific rept. no. 4 on Contract NObsr-77612. Aug 60, 129p. 1 ref.
Order from LC mi$6.30, ph$19.80 PB 149 902

In the second environmental test all of the irradiated samples failed in 312 hours. Twenty-one of the fifty control units remained on test at 320 hours. Units with C_{16-18} Alkyl biphenyl dielectric fluid failed very rapidly. The failure rate for Bis(phenoxyphenyl) either unit was similar to the standard unit and slightly lower for the Monoisopropylbiphenyl unit. With the special units the gas formation is no longer a problem. The addition of inhibitor may improve the gamma failure rate of these units significantly and the use of the larger group will improve the statistical significance of the results. THE MATHEMATICS OF FRESNEL REGION FIELD DISTRIBUTIONS FOR PLANE RECTANGULAR APERTURE ANTENNAS, by Arthur L. Haywood. Master's thesis. Rept. for Nov 58-Jan 59. [1959] 13p. 16 refs. WADC TR-59-462; AD-230 705.
Order from LC mi$2.40, ph$3.30 PB 150 591

This report released for sale to the public 11 Oct 60.

The problem of determining the near-field gain of a plane rectangular aperture antenna is treated quantitatively. The Fresnel integrals are used as the chief mathematical tool in evaluating the double integrals for electrical intensities in the far-zone (Fraunhofer region) and the near-zone (Fresnel region). The study ends with the quantitative determination of operationally significant quantities in important practical systems. The systematic formulation of this antenna theory and its application are directed to the mathematician whose primary interest is rigor, and the practical engineer who desires only a final working formula or a set of charts. The mathematical representations are in forms that provide an insight into the physical aspects of the problem and reasonable quantitative accuracy in their numerical evaluation. (Author)

EVALUATION OF MIDGET-TYPE, 28-VOLT, DIRECT-CURRENT RELAYS. Final rept. Rept. on TED Project no. ADC-EL-52059. 4 Aug 54, 11p. 6 refs. Rept. no. NADC-EL-L5457 (Revision A), supersedes same of 25 May 54; AD-44 470.
Order from LC mi$2.40, ph$3.30 PB 152 020

This report released for sale to the public 11 Oct 60.

Ten commercially available midget-type, 28-v, dc, 2-pole and 4-pole double-throw relays were evaluated for conformance with the drawing requirements and applicable requirements for Spec. no. MIL-R-6106 (ASG). Seven of the 10 relays were unsatisfactory. The following midget-type, 28-v, dc relays were approved for use in naval aircraft: (1) type R, parts no. A-54504 and B-54504; (2) type SM, parts no. 28026-0, revision A, and 28027-0, revision A; and (3) type TM, parts no. C4595 and C4596.

Air Crew Equipment Lab., Naval Air Material Center, Philadelphia, Pa.
MULTIPURPOSE ELECTRONIC TIMER, by R. L. Burdick. Rept. on TED Projects NAM AE-1403 and AE1403.2. 27 Oct 59, 13p. NAMC ACEL-420; AD-228 355.
Order from LC mi$2.40, ph$3.30 PB 149 554

An economical, versatile, and dependable electronic timer was developed for intervals of 0.1 to 30 sec which can be used to control apparatus or machinery. Three modes of operation are available: (1) a momentary electrical event initiates a condition of predetermined duration; (2) an electrical event of sufficient duration initiates a condition of predetermined duration; and (3) two conditions, each of independent and predetermined duration, alternate. In addition, external signals may be superimposed to (1) begin an interval in progress over again or (2) terminate an interval in progress producing the same effect as if the interval had been permitted to terminate normally. Dependability, accuracy, and stability are discussed. Construction, calibration, and operation instructions are included, together with suggestions for integrating this timer with particluar needs. (Author)

STUDY OF PRINTED ANTENNAS, by J. A. McDonough, R. G. Malech, and J. Kowalsky. Final rept. for June 54-July 55 on Contract DA 36-039-sc-63116. Aug 55, 57p. 6 refs. Rept. no. 3232-1.
Order from LC mi$3.60, ph$9.30 PB 150 677

This report released for sale to the public 11 Oct 60.

This report discusses several types of printed antenna arrays and related feeds and baluns. Detailed consideration is given to the Franklin array, Chireix-Mesny array, and the capacitively coupled collinear array. Experimental techniques, such as probing the magnitude and phase distribution of the current along a printed array and measuring the impedance and phase velocity that characterize printed balanced lines are described. The antenna performance characteristics for the types of arrays that were studied are given, including gain, loss, impedance, size, side-lobe levels, and half-power beamwidths.

Alford, Andrew, Consulting Engineers, Boston, Mass.
ANTENNA GROUP OA-716(XE-1)/GL, by Fred Abel and W. Hugo Liepmann. Final technical rept. on Contract DA 36-039-sc-64491. Jan 60, 28p. 6 refs. AD-236 104.
Order from LC mi$2.70, ph$4.80 PB 148 545

The Antenna Group OA-716(XE-1)/GL is a passive, high-gain, transportable, search antenna system used with a receiving set to detect the presence of electromagnetic signals throughout the frequency range of 12,000 megacycles to 18,000 megacycles. A broadly directional antenna, 10 - 15° horizontal beam width, is used for searching. A highly directional antenna, 1 - 1.5° horizontal beam width, is used for direction finding. The vertical beam width of both antennas is 10 - 15°. Both antennas are circularly polarized. Position or velocity servos are used to rotate the antennas. The azimuth orientation of the antennas is indicated on direction indicator dials, and the intercepted signal may be fed to a receiving set. A broadband waveguide rotary joint was developed for use in this antenna system. The device involves a pair of broadband circularly polarized horns coaxially arranged pointing into one another. The transfer of energy from one horn to the other is very nearly

constant as one horn is axially rotated with respect to the other, and the transfer is accomplished with very little attenuation (about 1 db) over a 1.5 to 1 frequency range. (Author)

Applied Mathematics and Statistics Labs., Stanford U., Calif.
INCREASED RELIABILITY WITH MINIMUM EFFORT, by Arthur Albert and Frank Proschan. Technical rept. no. 50 on Contract N6onr-25140. 9 Oct 59, 29p. 2 refs. AD-227 453.
Order from LC mi$2.70, ph$4.80 PB 149 943

A specific mathematical model is formulated describing the situation of improving the system reliability with minimum expenditure of effort. Also shown is how to determine that allocation of effort among subsystems which yields the desired system reliability at minimum total expenditure of effort.

Arizona U., Tucson.
TRANSISTOR EQUIVALENT CIRCUIT CRITERIA, by Thomas L. Martin, Jr., David J. Sakrison and others. Final rept. on Contract DA 36-039-sc-67465. 30 Aug 56. 83p. 7 refs. AD-107 814.
Order from LC mi$4.80, ph$13.80 PB 147 539

A hybrid parameter equivalent circuit for the common emitter connection is developed. The basic circuit is modified for high frequency use in such a way that the parameters of the equivalent circuit are independent of frequencies. Methods of measuring these various parameters are discussed in detail and circuit diagrams are provided for each such measurement. The proposed transistor equivalent circuit is then used in the analytical development of circuit design equations and criteria for low pass, high pass, and band pass amplifiers. (Author)

Armour Research Foundation, Columbus, Ohio.
INVESTIGATION AND DEVELOPMENT OF CIRCULAR WAVEGUIDE COMPONENTS, by Alva C. Todd, Dick M Joe, and Demetrios P. Kanellakos. Rept. on Contract AF 33(616)3973. Apr 59, 136p. 16 refs. WADC Technical rept. 58-661; AD-207 247.
Order from LC mi$6.90, ph$21.30 PB 150 589

This report released for sale to the public 11 Oct 60.

The design and development are presented of components for use in a circular waveguide system employing the low-loss TE_{01} circular electric wave mode. Components were investigated with regard to direct scaling for use with 2.710-in. ID and 0.725-in. ID circular waveguide at 9.375 kmc and 35 kmc, respectively. Direct scaling for the increased waveguide diameter used in this program was found practicable in certain cases, however, in other instances major modification of dimensions were required. Some new components were developed. These components include a straight waveguide section, a flexible waveguide section, couplings, transitions, bends, a mode absorber, a rotary joint, a high-power load, a low-power load, waveguide switches and windows. Proposed designs are presented for directional couplers and ferrite components. All experimental work was done in the X-band. (Author)

SYNTHETIC VIDEO AS AN ELECTRONICS COUNTER-COUNTER MEASURE: A STUDY OF PULSATED AND STEADY STATE SYMBOLOGY, by Charles Fried and Claude D. Patton. Aug 60, 24p. 5 refs. Technical memo. 11-60.
Order from LC mi$2.70, ph$4.80 PB 150 087

A study was conducted to determine the effectiveness of pulsing a suggested Antiaircraft Operations Center (AAOC) symbol in overcoming the concealment effects of white noise jamming. Pulsing resulted in a flickering symbol on a Plan Position Indicator. Four degrees of jamming intensity were studied along with four flicker rates, 0, 2, 4, and 8 cycles per second. The psychophysical technique of method of limits was used to determine if flicker improved detection with a background of jamming. The results indicate that no advantage is gained in pulsing a synthetic symbol in overcoming the effects of jamming. A discussion of this result with a review of procedures is included. (Author)

Army Signal Research and Development Labs., Fort Monmouth, N. J.
CHARACTERISTICS OF MICROWAVE DUPLEXER TUBES UNDER SPURIOUS RADIATION CONDITIONS, by Irving Reingold. 31 Mar 59, 27p. 5 refs. USASRDL Technical rept. 2042; AD-220 395.
Order from LC mi$2.70, ph$4.80 PB 147 821

An investigation was conducted on several types of TR duplexer tubes and a waveguide filter commonly used in systems, to determine their effectiveness in rejecting spurious microwave radiation. The devices studied were all designed for operation in the 2800-megacycle frequency band. The low power level characteristics of these devices were checked over a frequency range of 2600 to 35,000 megacycles. Results of the investigation showed that neither the TR tube nor the waveguide filter can be relied upon to provide adequate protection against unwanted signals at frequencies higher than the operational frequency of the system incorporating the device. Other techniques for providing crystal protection without undue sacrifices in insertion loss, or other operational system characteristics, are described and recommended for use by microwave system designers. (Author)

FREQUENCY REPEATABILITY OF CRYSTAL IMPEDANCE METER TS-330/TSM, by Marvin Bernstein. 15 May 60, 12p. USASRDL Technical rept. 2118; AD-237 335.
Order from LC mi$2.40, ph$3.30 PB 149 415

Quartz crystal units, operated within the frequency range of 1.0 to 15.0 mc, were subjected to repeated frequency measurements after simulating the recalibration of the C. I. Meter TS-330/TSM by readjusting the oscillation amplitude level and frequency of the test set in the calibrate condition. Generally, it was found that the oscillation frequency of plated AT resonators is critically dependent upon drive; that the 0 to 100 milliampere RF meter cannot be used to adjust the drive level within accurate enough limits; that with a proper

standardized test procedure, frequency resetrability of the Crystal Impedance Meter TS-330/TSM is better than 10^{-7} throughout the range of the instrument except at the very lowest capacitance settings of the tuning dial. (Author)

ENGINEERING SERVICES ON TRANSISTORS, by M. M. Atalla, C. A. Bittmann and others. Interim technical rept. no. 16, 1 Jan-31 Mar 59, on Contract DA 36-039-sc-64618. [1959] 22p; AD-219 227.
Order from LC mi$2.70, ph$4.80 PB 149 001

Transistor reliability: Preliminary results of continuing studies of thermally oxidized silicon surfaces show progress toward a better quantitative understanding and the development of a model for the mechanism of oxidation. New and improved transmission-type transistors: Fabrication of M2107 microwave germanium transistors has shown that structure employing a 0.5 mil wafer thickness and 2 mil by 2 mil mesa are feasible. Evaluation of these transistors indicates that a further reduction of the base width to 1/4 micron and a decrease in the base doping will be necessary to meet the design objectives. Feasibility of the design of the M2090 n-p-ν-n transistor was demonstrated by operation of rated frequency and power output. Control of the diffusion processes has exceeded the objective of 10%. Transistor test methods: Substantial amounts of drawing information up-to-dating, prove-in instruction writing, and remaining equipment design and construction were completed this period on the final model of the 5- to 250-mc transistor phase set. (See also PB 140 251)

Bell Telephone Labs., Inc. [New York].
ENGINEERING SERVICES ON TRANSISTORS, by J. R. Ligenza, C. A. Bittmann and others. Iterim technical rept. no. 17, 1 Apr-30 June 59, on Contract DA 36-039-sc-64618. 15 July 59, 37p. 3 refs.
AD-227 825.
Order from LC mi$3.00, ph$6.30 PB 148 329

Transistor reliability: The kinetics of reactions of various alkali hydroxides with thermally grown silicon dioxide on silicon surface were determined. The rate of reaction is temperature dependent and has an activation energy of 17.0 kcal/mol. in the 100 to 300°C temperature range. These reactions provided one controlled means for localized oxide removal necessary for contacting purposes. New and improved transmission type transistors: Evaluation of the M2107 transistor has shown the structure to be capable of operation in the 1 to 5 kmc region. The observation of lower values of f_T than predicted for 1/4 micron base thicknesses indicates the possibility that too high a base surface concentration was employed, and that a modification of the doping levels will be necessary to meet the design objectives. Recent changes in the base layer diffusion process for M2090 transistors have made possible the fabrication of base layer diodes (p-ν-n+) having excellent reverse bias characteristics. A comparison of transistors of comparable maximum frequency of oscillation indicates that oscillator efficiency improves with increasing current gain cutoff frequency. Transistor test methods: Principal remaining work is concerned with accuracy evaluation. (Author) (See also PB 149 001)

ENGINEERING SERVICES ON TRANSISTORS, by J. R. Ligenza, B. A. Bittmann and others. Interim technical rept. no. 18, 1 July-30 Sep 59, on Contract DA 36-039-sc-64618. 15 Oct 59, 45p. 1 ref.
AD-232 248.
Order from LC mi$3.30, ph$7.80 PB 148 330

Studies have continued on the properties of thermal oxides on silicon, oxidized silicon surfaces, and oxidized silicon junctions. Considerable progress toward a detailed understanding of the process of oxidation has been made recently through study of the infrared transmission properties of the oxide films and the use of the isotopic frequency-shift in the absorption peaks associated with the O^{18} isotope. Work has continued on the M2107 microwave germanium transistor for 3-kmc service and on the M2090 2-watt silicon transistor for service in the 50 to 100-mc band. Processing difficulties have limited the fabrication of M2107 transistors. Theoretical studies and high frequency electrical measurements on the transistors fabricated to date have shown that the initial design chosen was not optimum. M2090 transistors fabricated within the past quarter were capable of delivering 2 watts at over 100 mcps when a collector bias of 80 volts was used. Transistors with thinner intrinsic layers are being fabricated in order to improve the power oscillator performance at lower collector biases. (Author) (See also PB 148 329)

ON THE OPTIMUM SYNTHESIS OF SAMPLED DATA MULTIPOLE FILTERS WITH RANDOM AND NONRANDOM INPUTS, by H. C. Hsieh and C. T. Leondes. Rept. on Contract AF 49(638)438. Feb 60, 43p. 8 refs. AFOSR-TN-60-440. AD-239 646.
Order from LC mi$3.30, ph$7.80 PB 149 170

This report considers the synthesis of optimum sampled data multipole filter with n inputs and m outputs. The signal portion of each input is assumed to consist of a stationary random component and a polynomial with unknown coefficients but known maximum order. Each signal is corrupted by stationary random noise. The filter under investigation is linear, time invariant, and has finite memory. Each input to the filter consists of a sequence of impulses with a constant period T. Each impulse is assumed to have an area equal to the value of the signal plus noise at the sampling instant. The synthesis procedure to be developed is to specify the weighting functions of the filter such that the system error, which is defined as the difference between the actual and ideal outputs, has zero ensemble mean and the system ensemble mean square error is minimum. The weighting functions thus obtained will have, in general, abrupt jumps at the sampling instants but they are continuous within the sampling intervals.

ELECTROMAGNETIC PROPERTIES OF INSULATORS, I, by Vinay Ambegaokar (Doctoral thesis) and Walter Kohn. Technical rept. no. 9 on Contract Nonr-760(13). [1959] 43p. 16 refs. AD-227 621.
Order from LC mi$3.30, ph$7.80 PB 148 866

A discussion is presented on the response of a perfect insulator to weak external electromagnetic fields of long wavelength from a many particle point of view. The method is to treat the Coulomb interaction between all electrons to all orders of perturbation theory and analyze the structure of the corresponding Feynman graphs. A result of this graphical analysis shows that the response of the many particle system to long wavelength external fields of arbitrary polarization is completely described by a single frequency-dependent dielectric constant. (Author)

ELECTROMECHANICAL FILTERS: 100 Kc CARRIER AND SIDEBAND FILTERS, by W. D. Peterson and R. N. Muret. Rept. no. 8 (Final), 1 Apr-30 Sep 57, on Contract DA 36-039-sc-73039. 28 Oct 57, 38p. IDR-W429-3A; AD-201 254.
Order from LC mi$3.00, ph$6.30 PB 149 368

A number of experimental filters have been built to arrive at designs and performance limits consistent with the present state of the art. Results obtained by these filters are discussed and compared with the specifications set forth in Signal Corps Technical Requirements SCL-1721. A discussion of the possible advancement of the state of the art is discussed. A metallurgical research program has shown that powder metallurgy techniques can be employed to produce alloys for disk resonators with excellent characteristics over a wide range of temperatures. These alloys, however, did not exceed the performance characteristics of the batch of commercially available Ni-Span "C" employed in the experimental samples. (Author)

ELECTROMECHANICAL FILTERS: FEASIBILITY INVESTIGATION FROM 50 KC TO 1 MC, by W. D. Peterson and R. N. Muret. Rept. no. 17 (Final), 1 Apr 57-28 Dec 58, on Contract DA 36-039-sc-73039. 31 Mar 58, 25p. IDR-W429-5; AD-201 255.
Order from LC mi$2.70, ph$4.80 PB 149 369

This report covers the feasibility of fabricating electromechanical filters to the requirements of SCL-1721 in the frequency range of 50 Kc to 1 Mc. Probable characteristics of filters in this frequency range are compared by means of curves. Relative advantages and/or disadvantages are discussed for the various frequencies. Conclusions are drawn as to which of the possible frequencies might be the best choice for optimum filter characteristics. (Author)

RESEARCH INVESTIGATION DIRECTED TOWARD EXTENDING THE USEFUL RANGE OF THE ELECTROMAGNETIC SPECTRUM, by P. Kusch. Quarterly progress rept. no. 1, 16 Dec 59-15 Mar 60, on Contract DA 36-039-sc-78330, and rept. on Contracts Nonr-266(45), AF 49(638)-(-507, -557, and -631). 15 Mar 60, 41p. 25 refs. CU 3-60 SC-78330.
Order from LC mi$3.30, ph$7.80 PB 147 633

Cerenkov radiation in the K-band range has been observed in a system that has recently been under design and study. An experimental investigation of the parameters governing the generation of power has been started. An M-band maser radiotelescope is in an advanced stage of design and construction and details of the system are described. The purpose of the radiotelescope is to obtain data from which it should be possible to determine the density of oxygen in the atmosphere as a function of height above the earth's surface. Progress in the design of a maser to operate at the frequency of the hyperfine structure line of atomic hydrogen is reported. Studies directed in the achievement of maser action at infra-red frequencies are continuing. Molecular spectroscopy by use of masers is discussed. Work in a variety of studies of atomic hyperfine structures by several techniques is reported. (See also PB 146 112)

Cruft Lab., Harvard U., Cambridge, Mass.
A DIPOLE ANTENNA COUPLED ELECTROMAGNETICALLY TO A TWO-WIRE TRANSMISSION LINE (THEORETICAL AND EXPERIMENTAL STUDIES) by Kun-Mu Chen. Scientific rept. no. 6 (Series 2) on Contract AF 19(604)4118. 10 Mar 60, 67p. 7 refs. AFCRC-TN-60-387.
Order from LC mi$3.90, ph$10.80 PB 150 197

A dipole antenna coupled electromagnetically to a two-wire transmission line is studied theoretically and experimentally. The antenna currents induced when the transmission line has (1) a standing-wave pattern, (2) a traveling-wave pattern, (3) an unbalanced current, are considered. The variations of antenna currents

with (1) the angle of rotation of the antenna, (2) the length of the antenna, (3) the distance separating the antenna from the line, (4) the spacing of the line, are investigated. (Author)

MOLECULAR AMPLIFIERS AND GENERATORS, by H. R. Lewis. Triannual progress rept. no. 5, 1 Feb-31 May 59, on Contract DA 36-039-sc-73031. 15 June 59, 16p. AD-225 337.
Order from LC mi$2.40, ph$3.30 PB 149 367

Equipment was set up and tested for paramagnetic resonance work in the 40-50 kmc range and the 50-70 kmc range. The hamiltonian describing the energy levels of Cr^{3+} in TiO_2 was checked by observing the spectrum at frequencies of 45 and 57 kmc. The spectrum was previously observed only at 9 and 24 kmc. A program was written for the IBM 650 computer to calculate transition probabilities for spin 3/2 ions in axial or othorhombic environments. Using this program, computations were made for the Cr^{3+} ion in TiO_2 at points of interest for maser operation. Population inversion was observed at 4.2°K in Cr^{3+} in TiO_2. While the population difference achieved was not sufficient to produce amplification, it is believed that minor modifications will produce an operating maser using this new material shortly. The signal frequency in this experiment was 24 kmc; the pump frequency was 50 kmc. (Author)

HETERODYNE FREQUENCY METER AND CALIBRATOR, by R. W. Gran. Final development rept. for 12 Mar 53-30 June 57, on Contract NObsr-63310. 15 July 57, 25p. AD-141 003.
Order from LC mi$2.70, ph$4.80 PB 148 856

A heterodyne frequency meter has been developed which will measure frequencies directly to six significant figures over a frequency range of 500 to 30,000 mc. The system involves the usual heterodyne oscillator principles, plus an automatic beat counting system, plus an electrical, linear, interpolation device.

Defense Electronic Products, Radio Corp. of America, Camden, N. J.
TIME DIVISION MULTIPLEX SYSTEMS, by W. J. Bieganski, L. M. Glickman and others. Final rept. for 1 Jan-31 May 56 on Contract DA 36-039-sc-64459. 29 June 56, 82p. 21 refs. AD-102 296.
Order from LC mi$4.80, ph$13.80 PB 149 102

The purpose of this project was to develop a model time division multiplex system, using circuits and techniques applicable to time division multiplexed communications, which will be more reliable, less complex, lighter, of greater stability, and which may also be produced at reduced cost. The study phase is divided into the following parts: (1) study of time division multiplex systems; (2) general investigation of circuit techniques; (3) investigation of transistor circuits; and (4) investigation of magnetic circuits. The experimental model development (Phase II) is divided into the following parts: (1) final development of circuit blocks; (2) layout and packaging; (3) construction of the models; and (4) final tests.

Directorate of Labs., Wright Air Development Div., Wright-Patterson AFB, Ohio.
ERROR ANALYSIS FOR DETERMINATION OF TARGET POSITION AND VELOCITY FROM TWO OR MORE OBSERVERS, by Edouard E. Perret. June 60, 38p. 1 ref. WADD Technical note 60-70.
Order from OTS $1.00 PB 161 979

If a target is observed from two or more separate points, it may be possible to determine the target's position and motion from the measurements obtained. However, since these measurements contain errors, there will be errors in the determination of the target's position and velocity. This paper investigates the significance of statistical errors of measurement of target position and velocity for any location of the target relative to the observers by the following two measuring systems: (1) System employing angle only information from two observers. (2) System employing range only information from three observers. Gaussian errors with zero mean are assumed throughout. The various errors for each measuring system are first considered individually and then combined. This yields statistical error boundaries in target position which are determined by ellipses for the two dimensional case and by ellipsoids for the three dimensional case. The main axes of the error geometries and their angles relative to some reference are computed and their loci plotted for any target position. (Author)

Electric Storage Battery Co., Yardley, Pa.
INVESTIGATION OF AgO PRIMARY BATTERIES, by P. Ruetschi and R. F. Amlie. Quarterly rept. no. 3, 1 Dec 59-29 Feb 60, on Contract DA 36-039-sc-78319. 31 Mar 60, 21p. 5 refs.
Order from LC mi$2.70, ph$4.80 PB 149 610

The solubility of Ag_2O and AgO in alkaline electrolyte has been studied by a polarographic technique using a rotating platinum electrode. Evidence is presented that AgO in contact with alkaline electrolyte does not dissolve to produce a divalent silver species in solution. Also, the self-discharge of the electroformed AgO plate is nearly the same as for the best chemical AgO sample. (Author) (See also PB 147 974)

A NEW METHOD OF DRIVING-POINT FUNCTION SYNTHESIS, by Wan Hee Kim. Interim technical rept no. 1 on Contract DA 11-022-ORD-1983. 1 Apr 56, 61p. 41 refs. [OOR rept. 1571:...] AD-91 478.
Order from LC mi$3.90, ph$10.80 PB 150 727

This report released for sale to the public 3 Oct 60.

A new method for synthesizing driving-point functions with passive, linear, bilateral elements in non-series-parallel structures is presented. The method is based on topological analysis and on the analysis of network poles and zeros. By the new method, the driving-point functions which can be synthesized with a minimum number of elements are found, and the minimum number of reactive elements required to realize a minimum function is given. These results extend the relationship of the number of elements in a network realization to the order of the driving-point function. The synthesis method is reduced to solving simultaneous equations for the value of each element. The minimum function synthesis method is shown to be a modification of Pantell's process.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
ON MINIMAL REALIZATION OF RC TWO-PORTS, by S. L. Hakimi and J. B. Cruz, Jr. Interim technical rept. no. 18 on Contract DA 11-022-ORD-1983. 4 Mar 60, 28p. 5 refs. OOR rept. no. 2207.7-E; AD-238 874.
Order from LC mi$2.70, ph$4.80 PB 150 393

From a given RC-realizable open-circuit voltage transfer function, some lower bounds are obtained for the minimum possible number of elements in the network. In the case of bilinear and biquadratic functions, network realizations have been tabulated which are minimal although not all realizable biquadratic functions are covered. In the case of an n-pole transfer function with symmetrically clustered zeros, a realization involving at most two elements more than the minimum requirement is obtained using Guillemin's parallel ladder procedure. The effects of interchanging the input terminals and interchanging the R's and C's in a network are also considered. (Author)

DETECTION OF NON-GAUSSIAN SIGNALS IN GAUSSIAN NOISE, by Richard L. Townsend. Rept. on Contract DA 19-020-ORD-4637. June 60, 12p. 7 refs. Rept. 7967-R-5; OOR rept. no. 2001.4-E; AD-240405.
Order from LC mi$2.40, ph$3.30 PB 150 408

Considerable difficulty is generally encountered when attempting to determine the structure of a likelihood ratio test for the detection of non-gaussian signals in the presence of additive gaussian noise. Consideration is given to the possibility of detecting such signals by sub-optimum means. The performance of a class of suboptimum tests which are obtained by averaging over the signal ensemble the optimum test for each ensemble member is evaluated. Besides having the advantage of being very simple in form, this class of tests compares favorably with the optimum test for a wide range of signals. (Author)

NON-LINEAR ADAPTION IN MANUAL CONTROL SYSTEMS, by Robert W. Roig. Rept. on Contracts NObs-72017 and DA 19-020-ORD-4637. June 59, 87p. 11 refs. Rept. nos. 7420-R-4 and 7967-R-2; [OOR rept. 2001:...] AD-226 293.
Order from LC mi$4.80, ph$13.80 PB 150 405

The human operator, as a feedback control element, has been tested in a simple control system utilizing random input signals from a non-Gaussian process. The rms error performance of the human operator has been evaluated and compared with that obtainable from an optimum linear system. The form of the error response for the human operator and the optimum linear system is also compared. The results indicate that the manual control system produces a mean square error which is comparable to that of a highly constrained optimum linear system. However, the human operator shows a more adaptable control characteristic than the optimum linear system when the form of the error response is compared. The human operator was tested using visual displays of the error signal which allowed him to view a portion of the immediate past history of the error and which showed only the instantaneous value of the error. A comparison of the results show no significant advantage for one display over the other. (Author)

Electronic Systems Lab., Mass. Inst. of Tech., Cambridge.
OPTIMUM CONTROL SYSTEMS FOR A CLASS OF STOCHASTIC SIGNALS, by Robert B. Streets, Jr. Rept. on Contract DA 19-020-ORD-4637. Mar 60, 53p. 9 refs. Rept. 7967-R-4; OOR rept. no. 2001.3-E; AD-240 404.
Order from LC mi$3.60, ph$9.30 PB 150 409

The class of stochastic signals considered is composed of data components which are continuous sections of analytic arcs, and of Gaussian noise components. Analytic arcs denote a linear combination of known functions and random coefficients which possess a Gaussian distribution. (Author)

NONLINEAR ANALYSIS OF A TRANSISTOR HARMONIC OSCILLATOR, by D. O. Pederson and R. S. Pepper. Rept. on Contract N7onr-295(29). 15 Oct 59, 25p. 1 ref. Rept. no. 96; Series no. 60, issue no. 255; AD-230 507.
Order from LC mi$2.70, ph$4.80 PB 149 497

The analysis of a tuned-collector transistor oscillator concerns the development of both graphical and piecewise linear techniques for obtaining the composite negative resistance characteristic that is presented to the tank circuit. This is done for the common-emitter connection of the transistor; however, the common-base connection can also be used. With the negative resistance characteristic, conventional phase plane and limit cycle analysis can be used to predict the oscillator output. Higher order effects are inspected, and it is found that the simplifying assumptions made are quite valid. Thus, the second order differential equation provides a good approximation of the system. Experimental results are given that show predicted and observed values are within a few percent for amplitude of oscillation, period of oscillation, and wave shape, i.e., harmonic content. (Author)

Electronics Research Lab., U. of California, Berkeley.
OPERATIONAL ANALYSIS OF FINITE-PULSED SAMPLED-DATA SYSTEMS, by T. Nishimura. Rept. on Contract AF 18(600)1521. 10 May 60, 39p. 9 refs. Series no. 60, issue no. 279; AFOSR-TN-60-510.
Order from LC mi$3.00, ph$6.30 PB 149 092

The theory of the operational analysis of the finite-pulse-width system is developed in this report. The closed-form expression of the response from such system is described by means of several well-known operators such as the z-transform, the modified z-transform and the simple form of the p-transform. Finding the incremental responses and their superposition is the basic principle of the theory and it is also applied to two-sampler systems as well as multi-rate sampling systems. (Author)

INVESTIGATIVE RESEARCH PERTAINING TO CATALYTIC HEATING OF PRIMARY BATTERIES, by Herbert J. Greenberg. Final rept. (including Quarterly rept. no. 2) for 1 May-31 Dec 59 on Contract DA 36-039-sc-78914. [1960] 27p.
Order from LC mi$2.70, ph$4.80 PB 149 611

The technical approach to be followed for a fuel-catalyst program is presented. Ignition of methanol at -40°F without the addition of an external heat source was found to be unattainable. Self sustaining combustion of methanol at -40°F min. was demonstrated, but only with preheating of the fuel-air mixture. Ignition of methane was tried, but required an external heat source also (glow coil), and then was effected only when a temperature of +470F was reached. (Author)

Feltman Research Lab., Picatinny Arsenal, Dover, N. J.
COMPLIANT ELECTRODES FOR DIELECTRIC MEASUREMENTS, by Andrew R. Blanck. Aug 60, 12p. 4 refs. Technical notes no. FRL-TN-1.
Order from OTS $0.50 PB 161 670

Compliant Electrodes which give improved surface contact were developed. (Compliant Electrodes are electrodes which conform or "comply" to the surface of the test specimen. The surface may be essentially planar or curved.) This technique is simpler than those using the pasted foil, flexible foil, painted, or evaporated electrodes and will give more reproducible results because of the intimate contact with the specimen surface. If a conductive silicone elastomer is used for the electrodes they can be used for measurements from -100° to +400°F. When electrodes of different shapes are required to suit the dimensions of available test material, they may be easily and quickly fabricated in the laboratory. (Author).

General Electric Microwave Lab., Palo Alto, Calif.
MEASUREMENT AND CONTROL OF HARMONIC AND SPURIOUS MICROWAVE ENERGY, by Vernon G. Price. Final rept. Change B for Dec 59-Apr 60 on Contract AF 30(602)1670. 20 May 60, 83p. 22 refs. Rept. TIS R60ELM112-5; RADC TR-60.
Order from LC mi$4.80, ph$13.80 PB 150 281

An experimental harmonic calorimeter was fabricated to measure harmonic powers in waveguides. By measuring the sum of the power levels of the individual waveguide modes at a given harmonic frequencies, one can quickly measure the total power without recourse to mathematical analysis. This simpler measurement method (compared with the probe analysis method) is accomplished at the expense of identification of the individual modal power levels. S-band and L-band model ferrite attenuators were received for test and evaluation. A summary of these tests and the test methods is included. In order to continue the study and investigation of the reduction of spurious outputs in microwave systems, a novel filter arrangement was conceived which makes it possible to achieve a relatively narrow band pass filter characteristic as well as a broad stop band characteristic. A preliminary design for a filter of this type is included. (Author) (See also PB 148 534)

General Telephone and Electronics Labs., Inc., Bayside, N. Y.
STUDY OF NONLINEAR EFFECTS ON SEMICONDUCTIVE MATERIALS, by E. Conwell, V. Fowler, and J. Zucker. Final rept. on Contract AF 19(604)5714. 31 Mar 60, 107p. 15 refs. TR 60-206, 301.4; AFCRC-TR-60-148; AD-239 723.
Order from LC mi$5.70, ph$16.80 PB 149 168

The objectives of this program were to study nonlinearities in conductivity and dielectric constant of silicon and germanium at microwave frequencies, and to determine efficiency of harmonic generation at milli meter and sub-millimeter wavelengths attainable by use of these nonlinearities.

Gilfillan Bros., Inc., Los Angeles, Calif.
INTERROGATOR SET AN/UPX-16. Final rept. on Contract AF 30(602)2054. 12 Apr 60, 29p. RADC rept. no. TR-60-90.
Order from LC mi$2.70, ph$4.80 PB 148 770

The equipment consists of two AN/UPX-4 Interrogators, one modified as a directional channel and the other modified to be a reference channel. The two together

are used to provide both active and passive side-lobe suppression for the Mark X IFF/SIF system. The active technique, known as Interrogation Side-Lobe Suppression (ISLS), minimizes false replies, reduces total aircraft "dead time"; and also minimizes actuation of the Aircraft AOC. The passive technique, known as Responser Side-Lobe Suppression (RSLS) minimizes display of signals which are valid replies to other interrogators. The use of these side-lobe suppression techniques results in marked system improvement. (Author)

Haskins Labs., New York.
RESEARCH ON AUDIBLE OUTPUTS OF READING MACHINES FOR THE BLIND, by J. Bastian. Progress rept. no. 4 for 1 July 59-30 June 60 on Contract V1005M1253. [1960] 52p. 1 ref.
Order from LC mi$3.60, ph$9.30 PB 149 881

The basic problems towards which the research has been directed are the formulation and testing of rules for speech synthesis and the study of isolated spoken words with a view to their combination into acceptable sentences. The objective in both cases is an audible output for a reading machine that will be like speech or acceptable as speech.

Hazeltine Electronics Corp., Little Neck, N. Y.
INSTRUCTION BOOK FOR RADAR SAFETY BEACON TEST SET TYPE 2.3NA3. Rept. on Contract NOas-55-438-c. 1 Mar 55, 30 Nov 55, 225p.
Order from LC mi$9.90, ph$34.80 PB 147 959

Radar Safety Beacon Test Set Type 2.3NA3 is a portable, a-c operated instrument, designed to perform rapid pre-flight checks of installed Radar Safety Beacon, Type III, airborne transponders. The following features of these beacons (transponders) are checked simultaneously: (a) transmitter frequency, (b) relative transmitter power output, (c) decoding of interrogations, (d) reply codes, (e) receiver frequency, and (f) relative receiver sensitivity. The results of these checks are simultaneously resolved into a single REJECT or ACCEPT indication on an operating panel meter.

HRB-Singer, Inc., State College, Pa.
DESIGN FOR MAINTAINABILITY, by George Grant, James M. McKendry. Rept. 5 on Human Factors in Maintenance, Contract N61339-330. 4 Apr 60, 25p. 12 refs. Technical rept. NAVTRADEVCEN-330-1
Order from LC mi$2.70, ph$4.80, PB 150 174

Maintainability can be quantitatively defined as the speed with which troubles are detected, localized, and corrected. A minimization of this "downtime" can occur through the use of any number of approaches: (a) improving equipment design, (b) improving technicians' skills via training, and (c) providing more effective maintenance aids, especially trouble-shooting guides. The purpose of the work reported in this summary document was aimed at devising methods for achieving the first goal, which seems to be the most basic of the three mentioned above.

HRB-Singer, Inc., State College, Pa.
DESIGN FOR MAINTAINABILITY. SUPPLEMENT I. AN EXPERIMENTAL INVESTIGATION OF EQUIPMENT PACKAGING FOR EASE IN MAINTENANCE, by J. M. McKendry, J. F. Corso and others. Rept. 5 on Human Factors in Maintenance, Contract N16339-330. 4 Apr 60, 123p. 5 refs. Technical rept. NAVTRADEVCEN 330-1, Supplement 1.
Order from LC mi$6.30, ph$19.80 PB 150 175

A preliminary examination of maintenance research showed that human engineering recommendations were primarily restricted to exterior characteristics of equipment. This technical report summarizes the findings of a study which was aimed at attacking the maintenance problem at a more basic level, that of devising equipment packaging philosophies which should decrease fault localization time. Four such philosophies were devised. The "Standard Method" weighed factors such as: heat loss, component and unit size, and component weight, to arrive at a compromise which varied for each equipment made. A "Component Grouping" method placed similar components together. A "Circuit Grouping" method placed similar circuits together. A "Logical Flow" technique employed a modular concept where subdivisions were made when the signal underwent a marked change. (See also PB 150 174)

HRB-Singer, Inc., State College, Pa.
DESIGN FOR MAINTAINABILITY. SUPPLEMENT II. SURVEY INFORMATION: (A) DESCRIPTION OF THE TRAINING DEVICE TECHNICIAN; (B) ENGINEERS' ESTIMATES OF CIRCUITS AND SYSTEM MAINTAINABILITY, by J. M. McKendry, G. Grant, and J. F. Corso. Rept. 5 on Human Factors in Maintenance, Contract N61339-330. 4 Apr 60, 111p. 10 refs. Technical rept. NAVTRADEVCEN 330-1, Supplement 2.
Order from LC mi$6.00, ph$18.30 PB 150 176

The survey data obtained from TRADEVMEN included: background and training, work environment, organization of the work group, familiarity and preferences in regard to tests equipments and manuals, troubleshooting techniques, and the relationship between fault localization time and fault correction time. It was found that only the more experienced men knew enough to give accurate preferences about the above categories. For this reason, the data included apply to a more experienced group only. Design and Field Engineers were questioned about system and equipment troubleshooting procedures. Most of this information dealt with specific representative circuits and included such aspects as test point and component location, parameters important in troubleshooting, and the test equipment needed to check these parameters. No significant differences were noted between the replies of field and design engineers. It was also found that both engineers and technicians preferred to use similar procedures in troubleshooting a system. (Author) (See also PB 150 175)

DESIGN FOR MAINTAINABILITY. SUPPLEMENT III. ANTHROPOMETRY OF ONE HANDED MAINTENANCE ACTIONS, by P. Baker, J. M. McKendry, and G. Grant. Rept 5 on Human Factors in Maintenance, and Contract N61339-330. 4 Apr 60, 39p. 7 refs. Technical rept. NAVTRADEVCEN 330-1, Supplement 3.
Order from LC mi$3.00, ph$6.30 PB 150 177

In examining present and anticipated maintenance tasks, four basic types of dynamic maintenance actions were isolated: (a) the motion required to turn screwdrivers and spintites, (b) the action required to grasp, remove and replace plug-in units, (c) the action required to grasp, turn, and cut with pliers and wirecutters, and (d) the motion required to turn wrenches. The space envelopes required for each of the above actions was determined by a photographic process. Subjects employed in the study included experienced and inexperienced subjects with 95th percentile hand sizes. The dimensions for each envelope were obtained. (A more exact listing of dimensions would also subdivide the last action (d above) according to the main turning axis, i.e., a horizontal or vertical turning axis.) It was found that there seem to be three main factors influencing the size of the space envelope required for a task. The first, and most important, was the type of action required. The second was the size of the component or tool being manipulated, and the third, the tightness of the component mounting socket. (Author) (See also PB 150 176)

DESIGN FOR MAINTAINABILITY. SUPPLEMENT IV: MAINTAINABILITY HANDBOOK FOR ELECTRONIC EQUIPMENT DESIGN, by J. M. McKendry, G. Grant and others. Rept. 5 on Human Factors in Maintenance, Contract N61339-330. 4 Apr 60, 384p. 184 refs. Technical rept. NAVTRADEVCEN 330-1-4.
Order from OTS $5.00 PB 161 025

This handbook provides data which should be useful for the designer in improving the maintainability of existing equipment. Greater maintainability can be achieved by the use of any combination of four different approaches: (1) the improvement of technical proficiency of repairmen by training, (2) the improvement of maintenance aids available to the technician, (3) the improvement of equipment design, and (4) the improvement of the layout and arrangement of the work situation. The third approach which is the main approach covered in the handbook is described in detail. (See also PB 150 177)

Hughes Aircraft Co., Culver City, Calif.
ARBITRARILY POLARIZED PLANAR ANTENNAS, by F. J. Goebels, Jr. and K. C. Kelly. Rept. on Contract AF 33(600)31582. July 59, 29p. 6 refs. Technical memo. no. 592.
Order from LC mi$2.70, ph$4.80 PB 148 275

This report describes the analysis and design of a class of two-dimensional, planar antennas which can radiate and receive constant shape pencil beams with arbitrary elliptical polarization (including the special cases of linear polarization and polarization in either circular sense) by a simple adjustment in the feed circuit. Such radiators are termed arbitrarily polarized antennas. Their basic radiating element is an annular slot whose broadside radiation pattern displays 8 db sidelobes in all ϕ planes. Arraying such elements readily produces lowered sidelobes. Standing-wave and traveling-wave array designs are discussed and results of experiments conducted at X-band are given. (Author).

Hughes Aircraft Co., Culver City, Calif.
TWO-DIMENSIONAL MODEL FOR THE EVALUATION OF RADOME ANALYSIS APPROXIMATIONS, by Alexander D. Jacobson. Rept. on Contract AF 33(038)28634. June 58, 62p. 11 refs. Technical memo. no. 580; AD-207 279.
Order from LC mi$3.90, ph$10.80 PB 147 507

Several methods in common use for analyzing antenna-radome pointing errors involve two major assumptions: (1) the electric field existing in the presence of the radome on a surface lying between the antenna and the radome, can be approximated by the electric field measured over the surface in the absence of the radome; and (2) the interior field can be transmitted through the radome wall using plane-wave plane-sheet transmission coefficients. The validity of these assumptions is evaluated by employing them to determine the field of a 2-dimensional model and comparing the results to the exact fields of this system.

Illinois U., Urbana.
HIGH-TEMPERATURE ELECTRICAL INSULATING INORGANIC COATINGS ON WIRE, by David L. Wilcox, Clifton G. Bergeron and others. Rept. for Feb 59-Feb 60 on Electrical and Electronic Materials, Contract AF 33(616)3943. May 60, 75p. 5 refs. WADC Technical rept. 58-12; Part III.
Order from OTS $2.00 PB 161 954

This report discusses the work on flexibility of coated wire, coating trials on clad copper wires, firing procedure for two coats of 58C on copper wire, vitreous silica and boron nitride mill additions to glass coating 58C, and vitreous coatings sheathed with organics. Also, test data were obtained on high-temperature insulated wire supplied by various manufacturers. A heat treatment of the coating increased coating flexibility. Sheathing of vitreous coatings with organics showed promise as a method of retaining the flexed vitreous coating on the wire. (Author) (See also PB 151 943)

THIN FILM CIRCUIT FUNCTIONS, by H. J. Beatty, W. N. Carroll and others. Quarterly progress rept. no. 1, 1 Aug-31 Oct 59, on Contract DA 36-039-sc-84547. [1959] 72p. 10 refs. AD-232 959.
Order from LC mi$4.50, ph$12.30. PB 150 807

This report released for sale to the public 13 Oct 60.

The initial effort is presented of a long range research and development program on the formation of miniature functional thin film circuit units, of essentially planar form factor, which will provide a broad

range of basic electronic functions for Army electronic equipment. A functional thin film circuit is an integrated combination of single and/or multi-layer films which is capable of transforming a given form of input energy into a desired form of output energy (e.g. providing a specific electronic function) when connected to associated electronic circuitry. The ultimate objective of the long range program is a circuit fabrication method which, in conjunction with appropriate optimum integration techniques, will make possible the reduction in size of electronic equipment by several orders of magnitude over what is attainable with existing methods (including the Army Micromodule technique with its current types of microelements). THIN FILM CIRCUIT FUNCTIONS, by H. J. Beatty, W. N. Carroll and others. Quarterly progress rept. no. 2, 1 Nov-31 Jan 60, on Contract DA 36-039-sc-84547. [1960] 48p. 3 refs. AD-235 639.
Order from LC mi$3.30, ph$7.80 PB 150 808

This report released for sale to the public 13 Oct 60.

The following information is given on preliminary circuit selections: bulk-component design of IF and RF amplifiers as related to difficulty in fabricating high-valued thin film inductors; the film layout of the OR switching circuit; anticipated parts densities; a description of artwork used in photo-etch mask fabrication; results of initial circuit fabrications and difficulties encountered. A thermo-compression bonding machine, results achieved, and ease of bonding with three metallic systems (copper, aluminum, and gold) are described. Glass has been selected as substrate material on the basis of S_iO undercoating studies. However, some circuits will be deposited on sapphire. Also discussed are fabrication equipment and multilayering techniques, including topological factors, materials selection, substrate processing and post-fabrication processing; plans for environmental tests and surface protection of passive elements and chip-type active elements are presented. Experimental data are presented concerning vapor-deposition growth of single-crystalline semiconductor layers by the disproportionating reaction of S_iI_2. Also described is a method of approximating impurity concentrations in samples from resistivity measurements over a temperature range. (Author) (See also PB 150 807)

International Telemeter Corp., Los Angeles, Calif.
HIGH-SPEED ELECTRONIC CIRCUITS. Technical rept. no. 23 [on Contract AF 30(602)1566]. 20 Nov 57, 116p. RADC-TN-58-13; AD-148 546.
Order from LC mi$6.00, ph$18.30 PB 147 803

The following high speed electronic circuits are discussed: scanner circuit, high-speed logic circuits, flip flops, flip-flop gating circuits, buffers, special gating boards, super cathode follower, high-speed clocks, low-to-high speed clock, power supplies, power supply sequencer, and low- and high-speed board testers.

John Hopkins U., Baltimore, Md.
REPRESENTATION AND ANALYSIS OF SIGNALS. PART V. FLOW-GRAPH REPRESENTATION OF SYSTEMS AND SYSTEM DYNAMICS, by W. H. Huggins. Rept. on Contracts AF 19(604)1941 and Nonr-248(53). 15 Nov 59, 97p. 10 refs. AFCRC-TN-59-971; AD-235 141.
Order from LC mi$5.40, ph$15.30 PB 148 301

Flow-Graph Representation of Systems: The flow-graph representation which may be used to express and investigate the relations between the signals (i.e. observables) of a system is discussed. For linear and constant-parameter systems, the flow-graph can be manipulated to solve the simultaneous equations that describe the system. The flow-graph leads to the programming of a computer and provides a technological esperanto which is well adopted to the needs of systems modeling.. System Dynamics: The extension of the flow-graph concepts to dynamical systems is accomplished by introducing the exponential signal, A exp(st), which is characteristic of all linear, stationary systems. The concepts, usually obtained by application of the Laplace transform, are shown to emerge naturally as a consequence of the use of this characteristic signal to describe linear stationary operators. This approach offers an enhanced appreciation of the ties between signals and systems. Application to both deterministic and stochastic systems is illustrated. (Author) (See also PB 137 788)

Land-Air, Inc., Holloman, N. Mex.
PHASE LOCK TRACKING FILTER, by W. M. Riker and Claude Rudy. Final rept. (Revised) on Contract DA 29-040-ORD-1010. Nov 58, rev. Nov 59, 167p. 1 ref. LA-59-04, formerly LA-58-16 dated Nov 58; AD-231 347.
Order from LC mi$7.80, ph$25.80 PB 147 575

The Phase-Lock Tracking Filter is a closed-loop system which generates a signal, and phase-compares it with data containing the desired Doppler signal, then evaluates it through bandpass selection. The system accepts real-time or recorded real-time data over a signal intelligence range of 250 cps to 100 kc at a minimum level of .02 volts rms having a noise-to-signal content of no more than 16 db. Analog outputs of velocity, acceleration, and correlation are provided. Single-frequency outputs of the restored Doppler signal and a biased frequency containing the restored Doppler are available for digital operations, and for photographic recordings utilizing the cathode-ray oscillograph. The Model 1 is housed in a de luxe desk-type console, equipped with controls and meters which provide quick-look information. The Model 4 is housed in a standard equipment rack. Both models utilize improvements which became feasible after a trial period of operational use in the field. (Author)

Martin Co., Baltimore, Md.
RADIOISOTOPE TUBE HEATER. Rept. on Thermionics and Solid State Electronic Technology, Contract AF 33(616)6325. Mar 60, 66p. WADD Technical rept. 60-246.
Order from OTS $1.75 PB 171 015

The feasibility of heating a vacuum tube cathode using a radioisotope-fueled heat source was demonstrated when emission and amplification were obtained using a 200-curie Polonium-210 heat source, encapsulated in a double stainless steel container, to heat the cathode of a Type X-766 vacuum tube built by Eitel-McCullough, Inc. The tube and heat source were assembled together and provided with a manual temperature control system. Operation of the temperature control system proved that the decreasing heat output of a decaying radioisotope can be controlled to obtain constant cathode temperature. Tube characteristics were obtained using an electrical simulated heater prior to final tests with the radioisotope fuel source installed. No correlation was obtained between the characteristics obtained with the two heating systems because the maximum cathode temperature achieved using the radioisotope was 640°C, while the cathode temperature for the electrically heated tests was 700°C. Various tube configurations were tested prior to final tests, and the conceptual design of an operational tube is presented. (Author)

Mauch Labs., Inc., Dayton, Ohio.
THE DEVELOPMENT OF A READING MACHINE FOR THE BLIND, by H. A. Mauch. Summary rept. for 1 July 59-30 June 60 on Contract V1005 M-1943. 30 June 60, 11p.
Order from LC mi$2.40, ph$3.30 PB 150 140

Scanning optimization studies and photocell studies support the expectation of eventual attainment of recognition operation, using a "spelled speech" output. Basic solutions were found for the identification of characters other than small letters and of various types of print. Code studies for the word synthesizer resulted in the adoption of a 6-bit code which follows closely the principles of conventional codes. Only 48 of the possible 64 combinations need be used. This will keep the size and weight of the machine within acceptable limits. Important improvements were introduced regarding matrix design, word separation techniques, control relay circuitry, and reliability of mechanical operation. Functional models of the scanning device including opaque projector and display panel, as well as of the word synthesizer, were built and demonstrated.

Mellon Inst., Pittsburgh, Pa.
HIGH TEMPERATURE PRINTED CIRCUITRY. Final rept. for 1 Oct 56-30 Apr 60, on Computer Components Fellowship no. 347, Contract AF 19(604)1959. 1 June 60, 25p. 3 refs. AFCRC-TR-60-154.
Order from LC mi$2.70, ph$4.80 PB 149 147

The various contractually-assigned Fellowship objectives are presented together with a brief summation of the successive accomplishments in each research area over the entire contract term. In every case, reference is made to the specific scientific quarterly report in this series in which the cited investigations may be found. (Author) (See also PB 149 146)

Melpar, Inc., Falls Church, Va.
GENERATION OF MULTIPOLARIZED ELECTROMAGNETIC WAVES FOR ECM APPLICATIONS, by Edward F. Henry. Scientific rept. no. 1 on Contract AF 19(604)4988. Apr 60, 36p. 3 refs. AFCRC-TN-60-592.
Order from LC mi$3.00, ph$6.30 PB 149 751

Two methods are described for generating a multipolarized wave for ECM jamming purposes. Both methods generally involve the excitation of two orthogonally oriented linear antennas at slightly different frequencies. Discussions and mathematical analyses of the performances of both systems are presented, and some experimental data is included. General design considerations are also outlined. Curves of theoretical relationships are plotted to illustrate performance characteristics. (Author)

Michigan U. Research Inst., Ann Arbor.
DESIGN CONSIDERATIONS FOR A CAPACITANCE-MODULATED VFO, by T. W. Butler, Jr. Technical memo. no. 60 on Contract DA 36-039-sc-63203. Sep 58, 21p. 3 refs. 2262-159-T; AD-208 106.
Order from LC mi$2.70, ph$4.80 PB 147 607

The use of ferroelectric capacitors in the design of a band switching capacity-modulated VFO which will meet FCC specifications regarding Narrow-Band frequency modulation (NFM) is presented. The chief advantage of NFM is that it reduces or eliminates certain types of interference to broadcast reception and is quite simple and inexpensive to construct using capacitance-modulation techniques. (Author)

Michigan U. Research Inst., Ann Arbor.
ELECTRIC-TUNED CAPACITY-MODULATED VHF OSCILLATOR, by T. W. Butler, Jr. Technical memo. no. 59 on Contract DA 36-039-sc-63203. Aug 58, 25p. 2 refs. 2262-186-T; AD-208 108.
Order from LC mi$2.70, ph$4.80 PB 147 606

A method of utilizing the voltage tuning characteristics of ferroelectric capacitors in an electric tuned capacity modulated VHF oscillator is described. The oscillator employs titanate ceramic capacitors as both the tuning and modulating elements. The capacity of the tuning elements is varied by changing the electric field applied to the capacitors. The oscillator may be designed to work in the VHF and UHF regions where reactance-tubes and phase modulation methods are unwieldy. This electric-tuned capacity-modulated VHF oscillator is the result of a development program designed to indicate the direction engineers can take in developing a voltage tunable frequency modulated oscillator suitable for operational use. (Author)

Microwave Associates, Inc., Burlington, Mass.
INVESTIGATION OF DUPLEXING TECHNIQUES AT HIGH DUTY CYCLE CONDITIONS, by Lawrence Gould. Quarterly progress rept. no. 6, 1 Jan-31 Mar 60, on Contract DA 36-039-sc-78233. [1960] 17p.
Order from LC mi$2.40, ph$3.30 PB 149 609

The leakage power and recovery time characteristics of crystal protector TR tubes designed for high duty cycle duplexers have been investigated. The results show that the leakage power is strongly dependent on receiver mismatch. The role of the various elements of the tube in controlling leakage power and recovery time is described. Preliminary results on a semiconductor switch yield a switching ratio of 0.6 db to 30 db with variation of voltage from -6v to +1 v. (Author). (See also PB 146 796).

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
REFLEX MULTIPACTOR EFFECT, by B. Epsztein. Rept. on Contract AF 18(600)1505. 22 Sep 59, 18p. Research rept. R-763-59; PIB-691; AFOSR-TN-59-1103 AD-228 708.
Order from LC mi$2.40, ph$3.30 PB 149 997

This paper is concerned with the theoretical study of a new type of multipactor which can take place on a single surface in the presence of a tangential d. c. magnetic field. The analysis shows that the presence of this effect depends only on the ratio of the cyclotron frequency corresponding to the applied magnetic field to the operating frequency, once a threshold for the r. f. field is reached. The value of this threshold depends on the secondary emission properties of the surface. Conditions for stable reflex multipactor are given. (Author)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
SYNTHESIS AND APPLICATIONS OF LINEAR AND NONLINEAR NETWORKS, by A. B. Giordano. Final rept. for 1 Feb 54-31 May 59 on Contract Nonr-839(05). 15 June 59, 31p. 3 refs. Rept. no. R-747-59; PIB-675; AD-220 686.
Order from LC mi$3.00, ph$6.30 PB 147 612

Details are presented of accomplishments relating to network analysis and synthesis, applications of magnetic amplifiers, nonlinear electronic circuits, and information-networks, including staff and special reports issued. (Author)

PROJECT TINKERTOY: A BUREAU OF AERONAUTICS INDUSTRY PREPAREDNESS MEASURE. 30 June 52, declassified, 54p. 4 refs.
Order from LC mi$3.60, ph$9.30 PB 149 618

This report released for sale to the public 23 Aug 60.

The code name TINKERTOY has been given to a system of modular design of electronic equipment especially adaptable to mechanized production. The TINKERTOY System is one of a number of possible embodiments of the building-block principle of construction whereby a variety of complicated electronic equipments may be assembled from a number of small standardized units. Each such unit, or module, consists normally of an electron tube and its associated passive components.

Naval Research Lab., Washington, D. C.
LUMINANCE REQUIRED OF OPAQUE AND TRANSPARENT CATHODE-RAY-TUBE PHOSPHORS, by R. H. Brown. 19 Aug 60, 9p. 10 refs. NRL rept. 5504.
Order from LC mi$1.80, ph$1.80 PB 146 610

Detection and recognition of objects presented on intensity-modulated screens depend on human properties of luminance discrimination and on electronic parameters of the display. An analysis has been made of the human requirements in terms of the variation in the incremental luminance of a signal as a function of the background luminance, and the minimal luminance of a signal for a radar display was derived utilizing assumptions based on state-of-the-art considerations regarding electronic parameters. The theoretical minimal luminance required of the conventional opaque phosphors, with and without circular-polarizing filters, and of the recently developed transparent phosphors were compared with the luminous output currently available. It was determined that at present the opaque phosphor in conjunction with a circular-polarizing filter provides the most visible signal when there is considerable illumination on the display. It seems likely, however, that with further development and by careful choice of the electronic parameters the low available luminance of the transparent phosphors may be increased enough to provide the most visible signal, since the luminance required is less than is required on the opaque phosphors. (Author)

Naval Research Lab., Washington, D. C.
PARASITIC SPIRAL ARRAYS, by R. M. Brown, Jr. and R. C. Dodson. Interim rept. 15 Aug 60, 39p. 6 refs. NRL rept. 5497.
Order from LC mi$3.00, ph$6.30 PB 146 394

The radiation pattern of an array of circularly polarized elements can be scanned by a mechanical rotation of the elements, since the element phase is a function of orientation. This principle has been used in the design of two different arrays of Archimedean spirals, one a "parasitic lens array" and the other a "parasitic reflector array." The lens consists of two arrays of spirals mounted on opposite sides of a conducting plane, each spiral on one side being connected by a transmission line to a corresponding spiral on the opposite side. A feed horn is used to illuminate one of the arrays; the energy received by this array passes through the ground plane via the transmission lines and is reradiated by the spirals on the far side. If the elements are rotated to particular orientations, the incident spherical wave can be focused, and, further, the beam can be scanned if the spirals are rotated properly. The spiral reflector is a single array (using no transmission lines) mounted above a ground plane and, like the lens, is illuminated by a feed horn. It has the same focusing and scanning properties as the lens. Neither array is limited to circular polarization. With a combination of right- and left-hand elements, linear polarization can be used. Twenty-element lenses (two by ten) and 100-element reflectors (ten by ten) have been built and the results have verified the predicted performance. (Author)

Naval Research Lab., Washington, D. C.
A TARGET SIMULATOR, by A. J. Stecca, N. V. O'Neal, and J. J. Freeman. Interim rept. 9 Feb 56, declassified 2 Oct 57, 20p. 10 refs. NRL rept. 4694.
Order from LC mi$2.40, ph$3.30 PB 150 587

This report released for sale to the public 11 Oct 60.

A radar target simulator for quantitative analysis of target noise is described and its correspondence with theory analyzed. The basic idea is the utilization of suitable voltages developed by synchro generators to represent the reflections from a complex target. Experiments to determine target noise characteristics as a function of target reflectivity distribution, target motion, and steady-state tracking error are described. It is shown that the total noise power is independent of target motion, whereas both tracking error and reflectivity distribution and target motion on the noise spectrum is exhibited, increasing rates of target rotation cause the greatest redistribution of the noise power from the low-frequency region to higher frequencies. (Author)

Naval Research Lab., Washington, D. C.
THERMOELECTRICITY, by J. W. Davisson, Joseph Pasternak and others. Status rept. no. 5, Aug 60, 64p. NRL memo. rept. 1089.
Order from OTS $1.75 PB 161 977

Progress continues to be good on thermoelectric materials development. Higher efficiencies continue to be achieved both in materials for Peltier cooling and for power generation, with no indication of reaching a point of diminishing returns. Particularly encouraging are the early results from high energy radiation damage studies. Two studies have progressed to the point where at least preliminary results can be evaluated. The prospects for useful military applications of thermoelectric systems now appear very good. A substantial number of the thermocouple elements exceeded design hopes in efficiency and power output though the average performance of the production runs of elements are considerable lower. Development programs and feasibility studies are in various stages of progress covering a wide range of power levels. The most difficult measurements are those of thermal conductivity, especially at high temperature. In the appendix a discussion on the methods used for measuring thermal conductivity is presented. (See also PB 147 307)

EFFECTS OF RADIATION IMPEDANCE VARIATION ON SONAR TRANSDUCER PERFORMANCE IN A LARGE ARRAY, by Ralph S. Woollett. 27 July 59, 25p. 6 refs. USL Research rept. no. 428; AD-226 248.
Order from LC mi$2.70, ph$4.80 PB 150 291

The transducer elements in a large array have different radiation impedances because of the acoustic interaction effects among the elements. The characteristics of the transducer element which are of operational interest, such as power capacity, efficiency, phase shift, and input impedance, depend on radiation impedance and hence are different for different elements. In this report equations relating these performance factors to radiation impedance are given for a simple piezoelectric type of transducer. Numerical results are presented for an array of identical transducer elements of this class, using radiation impedance data which were recently calculated for a large spherical array of pistons. The effects of the radiation impedance variation on array performance were judged moderate enough to be accommodated without much change in conventional practices. (Author).

OPTIMUM TRANSMISSION OF CONTINUOUS SIGNAL OVER A SAMPLED DATA LINK, by S. S. L. Chang. Rept. on Contract AF 49(638)586. June 60, 12p. 4 refs. Technical rept. 400-11; AFOSR-TN-60-492; AD-239 440.
Order from LC mi$2.40, ph$3.30 PB 148 945

A method for simultaneous optimization of the presampling filter and post sampling filter in a sampled data link is derived together with an equation for evaluating the mean square error. These equations are simple and easy to use, and the method has been illustrated by applying it to a typical design problem.

New York U. Coll. of Engineering, N. Y.
A REGENERATIVE NON-LINEAR FEEDBACK SYSTEM, by Paul E. Fleischer. Rept. on Contract AF 49(638)586. May 60, 26p. Technical rept. 400-10; AFOSR-TN-60-433. AD-239 439.
Order from LC mi$2.70, ph$4.80 PB 148 944

A feedback system proposed for reducing the effect of a non-linear plant on system performance is investigated. The feedback system operates by comparing the actual output with the desired system output (internally generated) and using this difference as an actuating signal. It is shown that the arrangement, while of novel configuration, is completely equivalent to a single loop feedback system. A typical system is investigated to provide an illustration of the conclusions drawn from this study.

Ordnance Research Lab., Pennsylvania State U., University Park.
A MINIATURE LOW-FREQUENCY SELECTIVE AMPLIFIER, by Wesley Grant Houser. Rept. no. 47 on Contract NOrd-16597. 2 Jan 59, 66p. 11 refs. AD-211 718.
Order from LC mi$3.90, ph$10.80 PB 150 298

Theoretical and experimental investigations reveal that a selective amplifier having a center frequency in the 2 to 15 cps range and a bandwidth less than 10 per cent of the center frequency can be constructed by using a transistor amplifier and a parallel-T feedback network. The circuit, excluding power supply, can be confined to a space measuring 3" by 2 1/4" by 1". The transistor amplifier requires current, as well as voltage, feedback. The parallel-T network is, therefore, required to operate under finite loading. The loading effects are: (a) a positive shift in center frequency, and (b) an increase in bandwidth. The derived equations are able to predict these effects within 2.6 per cent in center frequency and within 16 per cent in bandwidth. (Author)

PROPAGATION-DISTORTION OF BANDS OF LARGE-AMPLITUDE ACOUSTIC NOISE. I. THEORETICAL ANALYSIS OF THE PLANE WAVE CASE, by Wayne A. Burnett and Eugene Ackerman. Rept. on Generation, Propagation, Action, and Control of Acoustic Energy, Contract AF 33(616)2772. May 60, 55p. 6 refs. WADD Technical rept. 60-232.
Order from OTS $1.50 PB 171 021

The problem of the propagation of finite amplitude sound waves from a noise source is considered. After a review of the history of the problem, second order techniques are developed and applied to the problem of narrow bands of noise, less than an octave wide at the generator. Five cases of qualitatively different propagation behavior can be distinguished depending on the ranges of frequencies and sound pressure level. For three of the five cases the second order techniques developed are adequate. Unsuccessful attempts at more general solutions are briefly summarized in the appendix, along with suggestions for extending the analyses and increasing the validity of the final solutions. (Author)

NUCLEAR RADIATION RESISTANT POWER TRANSISTORS, by G. F. Watson. Quarterly progress rept. no. 1, 15 May-15 Aug 59, on Contract DA 36-039-sc-78307. [1959] 38p; AD-229 893.
Order from LC mi$3.00, ph$6.30 PB 149 000

Preparations for nuclear irradiations were made. The nuclear reactor at the MIT reactor center was selected as the radiation source. The surface barrier transistor dosimeter technique was used to calibrate the reactor. It was found that exposure in core tube 3GV6 for periods of 1.8 min and 18 min will provide accumulated dosages of 10^{13} and 10^{14}NVT, respectively. Large-area jet etching techniques advanced to the stage where a cabinet model jet etcher was constructed and put in operation. Emitter pits 95 mils diam and collector pits 115 mils diam were etched with this system. The machine incorporates a new illumination technique. An electrochemical jet plating machine, for the formation of emitter and collector electrodes, is now being constructed. The feasibility of forming emitter and collector electrodes by evaporation techniques is being studied. Indium electrodes as large as 100 mils diam were evaporated onto the surface of large unetched diffused blanks. Satisfactory micro alloying was obtained in units heated to 200°C with an indium pellet placed on the evaporated electrode. (Author)

RESEARCH ON HIGH-TEMPERATURE SWITCHING DEVICES, by E. Zimmerman. Quarterly status rept. no. 4, 1 Feb-30 Apr 60 (Final technical rept. 1 May-30 Apr 60) on Contract AF 19(604)5719. June 60, 38p. 3 refs. Philco no. H-2227-F; ERD-TR-60-167.
Order from LC mi$3.00, ph$6.30 PB 149 832

The object was to conduct a theoretical and experimental investigation of semiconductor switching devices capable of high-temperature (150°C or more) performance, and comparable or superior at low and medium temperatures to existing devices. The wide-gap material GaAs was used initially in analog type, subsequently in bipolar transistor structures, and finally in tunnel diodes. Single-crystal GaAs was grown by horizontal zone-melt techniques. Two main purification methods were investigated: reaction conditions were held constant while element purification procedures were varied; a standard purification procedure was used to study probable contamination from boat materials. Two diffusion methods - box diffusion and sealed-tube diffusion - were studied as techniques for forming junctions and for converting crystals to the desired type and resistivity. Three bipolar transistor structures were evaluated: the homogeneous base NPN and PNP transistors, and mesa NPN transistor. Techniques were developed that yielded high-frequency GaAs tunnel diodes with an f_{MAX} of 3.5 Gc and a potential f_{MAX} of 10 Gc.

INTERFEROMETER DEVELOPMENT, by John E. Walsh and Hans E. Band. Final rept. on Contract AF 19(604)5435. 29 Feb 60, 74p. 46 refs. P&B Pub. no. 602; AFCRC-TR-60-120.
Order from LC mi$4.50, ph$12.30 PB 148 952

An investigation has been made of the application of correlation techniques to the controlling of multi-element antenna patterns and the enhancement of the signal-to-noise ratio of signals derived from such systems. The primary objective is the production of single-lobed patterns of high resolution using a minimum number of antenna elements. One of the simplest configurations involves two linear arrays of fixed lengths and phase center spacing. The element spacing of the two arrays differs, but exceeds one wavelength. This results in a loss of gain over that of a closely spaced, non-ambiguous array, but allows reduction of the number of elements. Correlation of the added output of one array with that of the other will reduce all major lobes but one, provided only one signal of a given frequency is incident on the antenna system. The correlator also reduces incident noise especially if an additional fixed time delay is introduced between the additive array signals prior to correlation. An attempt has been made to produce patterns by multiplication of signals from a continuous aperture antenna, with the sum of the outputs of individual array elements. For the purposes of drift-free multiplication, amplitude modulation is imposed on the RF signal, preferably at the transmitter. The multiplier is followed by an audio filter tuned to the modulation frequency, from which the desired product signal is obtained.

The performance characteristics of A-size Mg $MgBr_2$ m-dinitrobenzene dry cells are compared with those of comparable size magnesium and zinc-manganese dioxide cells. The m-dinitrobenzene cells give more hours of service to 0.90 volt than the manganese dioxide cells over the entire range of discharge tests. On the basis of watt-minute capacity per unit of volume, they are superior to the zinc-electrolytic MnO_2 cells at all but low power output levels but are inferior to the magnesium-African MnO_2 cells. On a weight basis, the organic cells are superior to the zinc-electrolytic MnO_2 cells over the entire range of power output levels, and have a greater watt-minute/g capacity than the magnesium-MnO_2 cells at power outputs greater than 15 milliwatts. The use of a mercurous bromide inhibitor in AA-size Mg| $MgBr_2$ | m-dinitrobenzene cells has resulted in a 25% improvement in cell capacity at low current drains. Capacities of 75 watt-hours/lb have been obtained from these cells. Half-cell potential studies of various heterocyclic nitro compounds indicate that the nitropyridine compounds show promise for use as cathode materials in primary cells because of their high-cathode potentials and efficiencies. (Author)

This report released for sale to the public 12 Oct 60.

The effect of various ratios of Cabot and Darco G-60 blacks on the performance of A-size $Mg/MgBr_2$/m-Dinitrobenzene cells was studied. It was found that the maximum theoretical cell capacities were obtained at m-DNB/Cabot ratios of 2.1:1 (218 Amp-Min), and m-DNB/Darco ratios of 1.1:1 (196 Amp-min), assuming a 65% Mg efficiency. Based on actual performance data, optimum experimental capacities were obtained at ratios of 1.5 to 2:1 for the Cabot and 0.3-0.5:1 for the Darco blacks. The effect of mercurous salts in the electrolyte continued to be beneficial especially at low current drains. A-size $Mg/MgBr_2$/m-DNB cells made with this inhibitor gave 15-20% more hours of service on 166 2/3-ohm continuous discharge tests than comparable cells containing only a chromate inhibitor. Shelf-life data obtained from AA- and A-size magnesium dry cells containing various aromatic dinitrobenzene and various nitropyridine and nitroquinoline compounds as cathodes, indicate a favorable three month shelf-life for these dry cells. Electrochemical studies of various dinitropyridine compounds are presented in addition to half-cell potential data for various aromatic hydroxy compounds. For the latter compounds, the effect of such factors as group substitution, aromaticity, and pH on the operating potential and coulombic capacity are discussed. The use of these compounds as anode materials in galvanic cells is also considered. (Author) (See also PB 150 579)

PRIMARY CELLS UTILIZING ORGANIC COMPOUNDS AS THE ACTIVE COMPONENTS, by J. B. Eisen and R. Glicksman. Quarterly rept. no. 3, 15 Dec 58-14 Mar 59, on Contract DA 36-039-sc-78048. [1959] 56p. 12 refs.
Order from LC mi$3.60, ph$9.30 PB 150 581

This report released for sale to the public 12 Oct 60.

Studies of the effect of water on cell performance were made with A-size $Mg/MgBr_2$/m-DNB cells wherein the m-DNB/carbon black ratio was held constant while the H_2O/m-DNB ratio was varied. For these cells, the cathode efficiencies were found to increase with increasing H_2O/m-DNB ratios at the low ratios and to assume more constant values at the high H_2O/m-DNB ratios. A comparison of $Mg/MgBr_2$/m-DNB and $Mg/Mg(ClO_4)_2$/m-DNB dry cells indicates that on heavy drain (16 2/3-ohm) tests the perchlorate cells are superior, however on low drain (166 2/3-ohm) tests they do not perform as well as the cells with a magnesium bromide electrolyte. A consideration of alternative designs for the conventional round $Mg/MgBr_2$/m-DNB cell indicates that greater performance gains can be obtained with flat type cells rather than with a round "inside-out" type of cell. Half-cell potential and experimental dry cell data of various nitropyridine compounds are presented in addition to half-cell potential data for various aromatic amine and aminophenol compounds. For the latter compounds, the effect of such

factors as group substitution, aromaticity, and pH on the operating potential and coulombic capacity are discussed. The use of these compounds as anode materials in galvanic cells is also considered. (Author) (See also PB 150 580)

This report released for sale to the public 13 Oct 60.

A study of the effect of various high overvoltage metal chromates in the cathode mix on the cell performance of $Mg/MgBr_2$/m-DNB cells indicates performance gains may be obtained with the use of Hg_2CrO_4 and $ZnCrO_4$. Additional studies dealing with the use of a $Mg(ClO_4)_2$ electrolyte in organic cells shows the optimum electrolyte concentration in $Mg/Mg(ClO_4)_2$/m-DNB cells to be 0.8 to 1.8 molar. A study of a number of cell variables such as separator materials, blending techniques, and wetting agents is being made with inside-out type $Mg/MgBr_2$/m-DNB flat cells. Thus far organic flat cells have been made which give 68.5 watt-hr/lb at the 31 hr discharge rate. Half-cell potential and experimental dry cell data of nitrofuran, nitrothiophene, and other five membered heterocyclic nitro compounds are presented and their use as cathode materials in primary cells is considered. Performance data for $Mg/MgBr_2$/m-DNB cells in the Signal Corps Radio Set AN/PRC-35 are presented. (Author). (See also PB 150 581).

This report released for sale to the public 12 Oct 60.

Work is being continued on the design of a practical flat type $Mg/MgBr_2$/m-DNB cell. At the present stage of their development these cells give 50 - 60 watt-hours/lb at discharge rates of 10 to 20 hours. Additional studies of the use of mercuric salt inhibitors in $Mg/MgBr_2$/m-DNB cells indicate performance gains of 15 - 20% at low current drains can be obtained with the use of HgS, HgSe, and HgTe additives. Data on the thermal and vacuum-thermal blending of m-DNB and carbon black indicate performance gains on high rate tests can be obtained with thermal treatments of Darco carbon black. Shelf-life data for A-size $Mg/MgBr_2$/m-DNB cells indicate a favorable six month shelf life for these cells. Impedance measurements of AA-size $Mg/MgBr_2$/m-DNB cells under a variety of conditions show these cells to have greater impedance than the Leclanche cells, especially at low frequencies and light current drains. A study of the electrochemical characteristics of organic hydrazine and hydroxylamine compounds is presented. The data indicate that hydrazine is a more attractive anode material than any of its organic derivatives. (Author) (See also PB 150 582)

$Mg/MgBr_2$/m-DNB flat cells on single cell tests simulating the BA-317 tests have given 12 hours service. The inner-anode and inner-cathode flat cell designs were found to give similar performance. The temperature coefficient for A-size $Mg/MgBr_2$/m-DNB cells was found to be 0.87 watt-hours/lb/°C. Shelf-life data for A-size $Mg/MgBr_2$/m-DNB cells continues to be favorable. Optimum performance for A-size $Mg/MgBr_2$/m-DNB cells using Columbia carbon was obtained from cells using a 3:1 m-DNB to carbon ratio. Experimental half-cell potential discharge data show the nitropyrimidine and nitrosopyrimidine derivatives to have a higher cathode potential than their benzene analogues. INVESTIGATION ON CERAMIC SEALS FOR ELECTRON TUBES, by Austin H. King. Final rept. for 9 Apr 59-31 Mar 60 on Contract AF 19(604)5706. 25 Apr 60, 39p. AFCRC-TR-60-151.
Order from LC mi$3.00, ph$6.30 PB 150 190

This report includes a review of the whole program to work out reliable methods for making seals for evaluation. Two types of seals are needed in vacuum tubes: a ductile braze for sub-assembly to accommodate some mismatch of expansion coefficients, and a reactive seal with suitably low vapor pressure and temperature for making the final seal in a vacuum. These requirements are met by a copper braze to a metallized ceramic and a reactive seal of Ni-Ti eutectic for the final seal. Details for making each type of seal are discussed. Figures of tensile strength are in doubt when derived from tests in compression or twisting, or from published values for the ceramics. Measurement of seal strength is here made by direct tensile tests. This method is applicable to the ceramics alone as well as to the seals. (Author)

This report released for sale to the public 11 Oct 60.

A radar target simulator for quantitative analysis of target noise is described and its correspondence with theory analyzed. The basic idea is the utilization of suitable voltages developed by synchro generators to represent the reflections from a complex target. Experiments to determine target noise characteristics as a function of target reflectivity distribution, target motion, and steady-state tracking error are described. It is shown that the total noise power is independent of target motion, whereas both tracking error and reflectivity distribution and target motion on the noise spectrum is exhibited, increasing rates of target rotation cause the greatest redistribution of the noise power from the low-frequency region to higher frequencies. THERMOELECTRICITY, by J. W. Davisson, Joseph Pasternak and others. Status rept. no. 5, Aug 60, 64p. NRL memo. rept. 1059.
Order from OTS $1.75 PB 161 977

Progress continues to be good on thermoelectric materials development. Higher efficiencies continue to be achieved both in materials for Peltier cooling and for power generation, with no indication of reaching a point of diminishing returns. Particularly encouraging are the early results from high energy radiation damage studies. Two studies have progressed to the point where at least preliminary results can be evaluated. The prospects for useful military applications of thermoelectric systems now appear very good. A substantial number of the thermocouple elements exceeded design hopes in efficiency and power output though the average performance of the production runs of elements are considerable lower. Development programs and feasibility studies are in various stages of progress covering a wide range of power levels. The most difficult measurements are those of thermal conductivity, especially at high temperature. In the appendix a discussion on the methods used for measuring thermal conductivity is presented. EFFECTS OF RADIATION IMPEDANCE VARIATION ON SONAR TRANSDUCER PERFORMANCE IN A LARGE ARRAY, by Ralph Woollett. 2 July 59, 25p. 6 refs. USL Research rept. no. 428. AD-226 248
Order from LC mi$2.70, ph$4.80 PB 150 291

The transducer elements in a large array have different radiation impedances because of the acoustic interaction effects among the elements. The characteristics of the transducer element which are of operational interest, such as power capacity, efficiency, phase shift and input impedance, depend on radiation impedance and hence are different for different elements. In this report equations relating these performance factors to radiation impedance are given for a simple piezoelectric type of transducer. Numerical results are presented for an array of identical transducer elements of this class, using radiation impedance data which were recently calculated for a large spherical array of pistons. The effects of the radiation impedance variation on array performance were judged moderate enough to be accommodated without much change in conventional practices. (Author).

A REGENERATIVE NON-LINEAR FEEDBACK SYSTEM, by Paul E. Fleischer. Rept. on Contract AF 49(638)586. May 60, 26p. Technical rept. 400-10; AFOSR-TN-60-433. AD-239 439.
Order from LC mi$2.70, ph$4.80 PB 148 944

A feedback system proposed for [illegible] a non-linear plant on system performance is investigated. The feedback system operates by comparing the actual output with the desired system output (internally generated) and using this difference as an actuating signal. It is shown that the arrangement, while of novel configuration, is completely equivalent to a single loop feedback system. A typical system is investigated to provide an illustration of the conclusions drawn from this study.

A MINIATURE LOW-FREQUENCY SELECTIVE AMPLIFIER, by Wesley Grant Houser. Rept. no. 47 on Contract NOrd-16597. 2 Jan 59, 66p. 11 refs. AD-211 718.
Order from LC mi$3.90, ph$10.80 PB 150 298

Theoretical and experimental investigations reveal that a selective amplifier having a center frequency in the 2 to 15 cps range and a bandwidth less than 10 per cent of the center frequency can be constructed by using a transistor amplifier and a parallel-T feedback network. The circuit, excluding power supply, can be confined to a space measuring 3" by 2 1/4" by 1". The transistor amplifier requires current, as well as voltage, feedback. The parallel-T network is, therefore, required to operate under finite loading. The loading effects are: (a) a positive shift in center frequency, and (b) an increase in bandwidth. The derived equations are able to predict these effects within 2.6 per cent in center frequency and within 16 per cent in bandwidth. (Author)

On the basis of watt-minute capacity per unit of volume, they are superior to the zinc-electrolytic MnO_2 cells at all but low power output levels but are inferior to the magnesium-African MnO_2 cells. On a weight basis, the organic cells are superior to the zinc-electrolytic MnO_2 cells over the entire range of power output levels, and have a greater watt-minute/g capacity than the magnesium-MnO_2 cells at power outputs greater than 15 milliwatts. The use of a mercurous bromide inhibitor in AA-size Mg| $MgBr_2$ | m-dinitrobenzene cells has resulted in a 25% improvement in cell capacity at low current drains. Capacities of 75 watt-hours/lb have been obtained from these cells. Half-cell potential studies of various heterocyclic nitro compounds indicate that the nitropyridine compounds show promise for use as cathode materials in primary cells because of their high cathode potentials and efficiencies. PRIMARY CELLS UTILIZING ORGANIC COMPOUNDS AS THE ACTIVE COMPONENTS, by J. B. Eisen and R. Glicksman. Quarterly rept. no. 2, 15 Sep-14 Dec 58, on Contract DA 36-039-sc-78048. [1958] 58p. 19 refs.
Order from LC mi$3.60, ph$9.30 PB 150 580

This report released for sale to the public 12 Oct 60.

The effect of various ratios of Cabot and Darco G-60 blacks on the performance of A-size Mg/$MgBr_2$/m-Dinitrobenzene cells was studied. It was found that the maximum theoretical cell capacities were obtained at m-DNB/Cabot ratios of 2.1:1 (218 Amp-Min), and m-DNB/Darco ratios of 1.1:1 (196 Amp-min), assuming a 65% Mg efficiency. Based on actual performance data, optimum experimental capacities were obtained at ratios of 1.5 to 2:1 for the Cabot and 0.3-0.5:1 for the Darco blacks. The effect of mercurous salts in the electrolyte continued to be beneficial especially at low current drains. A-size Mg/$MgBr_2$/m-DNB cells made with this inhibitor gave 15-20% more hours of service on 166 2/3-ohm continuous discharge tests than comparable cells containing only a chromate inhibitor. Shelf-life data obtained from AA- and A-size magnesium dry cells containing various aromatic dinitrobenzene and various nitropyridine and nitroquinoline compounds as cathodes, indicate a favorable three month shelf-life for these dry cells. Electrochemical studies of various dinitropyridine compounds are presented in addition to half-cell potential data for various aromatic hydroxy compounds. For the latter compounds, the effect of such factors as group substitution, aromaticity, and pH on the operating potential and coulombic capacity are discussed. The use of these compounds as anode materials in galvanic cells is also considered. (Author) (See also PB 150 579)

PRIMARY CELLS UTILIZING ORGANIC COMPOUNDS AS THE ACTIVE COMPONENTS, by J. B. Eisen and R. Glicksman. Quarterly rept. no. 3, 15 Dec 58-14 Mar 59, on Contract DA 36-039-sc-78048. [1959] 56p. 12 refs.
Order from LC mi$3.60, ph$9.30 PB 150 581

This report released for sale to the public 12 Oct 60.

Studies of the effect of water on cell performance were made with A-size Mg/$MgBr_2$/m-DNB cells wherein the m-DNB/carbon black ratio was held constant while the H_2O/m-DNB ratio was varied. For these cells, the cathode efficiencies were found to increase with increasing H_2O/m-DNB ratios at the low ratios and to assume more constant values at the high H_2O/m-DNB ratios. A comparison of Mg/$MgBr_2$/m-DNB and Mg/$Mg(ClO_4)_2$/m-DNB dry cells indicates that on heavy drain (16 2/3-ohm) tests the perchlorate cells are superior, however on low drain (166 2/3-ohm) tests they do not perform as well as the cells with a magnesium bromide electrolyte. A consideration of alternative designs for the conventional round Mg/$MgBr_2$/m-DNB cell indicates that greater performance gains can be obtained with flat type cells rather than with a round "inside-out" type of cell. Half-cell potential and experimental dry cell data of various nitropyridine compounds are presented in addition to half-cell potential data for various aromatic amine and aminophenol compounds. For the latter compounds, the effect of such factors as group substitution, aromaticity, and pH on the operating potential and coulombic capacity are discussed. The use of these compounds as anode materials in galvanic cells is also considered. (Author) (See also PB 150 580)

PRIMARY CELLS UTILIZING ORGANIC COMPOUNDS AT THE ACTIVE COMPONENTS, by J. B. Eisen and R. Glicksman. Quarterly rept. no. 4, 15 Mar-14 June 59, on Contract DA 36-039-sc-78048. [1959] 53p. 6 refs. AD-226 587.
Order from LC mi$3.60, ph$9.30 PB 150 582

This report released for sale to the public 13 Oct 60.

A study of the effect of various high overvoltage metal chromates in the cathode mix on the cell performance of Mg/$MgBr_2$/m-DNB cells indicates performance gains may be obtained with the use of Hg_2CrO_4 and $ZnCrO_4$. Additional studies dealing with the use of a $Mg(ClO_4)_2$ electrolyte in organic cells shows the optimum electrolyte concentration in Mg/$Mg(ClO_4)_2$/m-DNB cells to be 0.8 to 1.8 molar. A study of a number of cell variables such as separator materials, blending techniques, and wetting agents is being made with inside-out type Mg/$MgBr_2$/m-DNB flat cells. Thus far organic flat cells have been made which give 68.5 watt-hr/lb at the 31 hr discharge rate. Half-cell potential and experimental dry cell data of nitrofuran, nitrothiophene, and other five membered heterocyclic nitro compounds are presented and their use as cathode materials in primary cells is considered. Performance data for Mg/$MgBr_2$/m-DNB cells in the Signal Corps Radio Set AN/PRC-35 are presented. (Author). (See also PB 150 581).

PRIMARY CELLS UTILIZING ORGANIC COMPOUNDS AS THE ACTIVE COMPONENTS, by J. B. Eisen, R. A. Walck, and R. Glicksman. Quarterly rept. no. 5, 15 June-14 Sep 59, on Contract DA 36-039-sc-78048. [1959] 63p. 21 refs. AD-229 118.
Order from LC mi$3.90, ph$10.80 PB 150 583

This report released for sale to the public 12 Oct 60.

Work is being continued on the design of a practical flat type Mg/$MgBr_2$/m-DNB cell. At the present stage of their development these cells give 50 - 60 watt-hours/lb at discharge rates of 10 to 20 hours. Additional studies of the use of mercuric salt inhibitors in Mg/$MgBr_2$/m-DNB cells indicate performance gains of 15 - 20% at low current drains can be obtained with the use of HgS, HgSe, and HgFe additives. Data on the thermal and vacuum-thermal blending of m-DNB and carbon black indicate performance gains on high rate tests can be obtained with thermal treatments of Darco carbon black. Shelf-life data for A-size Mg/$MgBr_2$/m-DNB cells indicate a favorable six month shelf life for these cells. Impedance measurements of AA-size Mg/$MgBr_2$/m-DNB cells under a variety of conditions show these cells to have greater impedance than the Leclanche cells, especially at low frequencies and light current drains. A study of the electrochemical characteristics of organic hydrazine and hydroxylamine compounds is presented. The data indicate that hydrazine is a more attractive anode material than any of its organic derivatives. (Author) (See also PB 150 582)

PRIMARY CELLS UTILIZING ORGANIC COMPOUNDS AS THE ACTIVE COMPONENTS, by J. B. Eisen, R. A. Walck and others. Quarterly rept. no. 6, 15 Sep-15 Dec 59, on Contract DA 36-039-sc-78048. [1959] 67p. 13 refs. AD-234 156.
Order from LC mi$3.90, ph$10.80 PB 150 584

This report released for sale to the public 12 Oct 60.

Mg/$MgBr_2$/m-DNB flat cells on single cell tests simulating the BA-317 tests have given 12 hours service. The inner-anode and inner-cathode flat cell designs were found to give similar performance. The temperature coefficient for A-size Mg/$MgBr_2$/m-DNB cells was found to be 0.87 watt-hours/lb/°C. Shelf-life data for A-size Mg/$MgBr_2$/m-DNB cells continues to be favorable. Optimum performance for A-size Mg/$MgBr_2$/m-DNB cells using Columbia carbon was obtained from cells using a 3:1 m-DNB to carbon ratio. Experimental half-cell potential discharge data show the nitropyrimidine and nitrosopyrimidine derivatives to have a higher cathode potential than their benzene analogues. INVESTIGATION ON CERAMIC SEALS FOR ELECTRON TUBES, by Austin H. King. Final rept. for 9 Apr 59-31 Mar 60 on Contract AF 19(604)5706. 25 Apr 60, 39p. AFCRC-TR-60-151.
Order from LC mi$3.00, ph$6.30 PB 150 190

This report includes a review of the whole program to work out reliable methods for making seals for evaluation. Two types of seals are needed in vacuum tubes: a ductile braze for sub-assembly to accommodate some mismatch of expansion coefficients, and a reactive seal with suitably low vapor pressure and temperature for making the final seal in a vacuum. These requirements are met by a copper braze to a metallized ceramic and a reactive seal of Ni-Ti eutectic for the final seal. Details for making each type of seal are discussed. Figures of tensile strength are in doubt when derived from tests in compression or twisting, or from published values for the ceramics. Measurement of seal strength is here made by direct tensile tests. This method is applicable to the ceramics alone as well as to the seals. (Author)

A PRECISION CONDUCTANCE BRIDGE OF NEW DESIGN, by George J. Janz and James D. E. McIntyre. Technical note no. 12 on Contract AF 49(638)50. June 60, 18p. 10 refs. AFOSR-TN-60-652; AD-240 365.
Order from LC mi$2.40, ph$3.30 PB 149 436

A conductance bridge in which the essential component is a precision impedance comparator and which combines speed, wide range, and high accuracy in measurements is described. While fundamentally similar in design and operation to the precision A. C. conductance bridges known today, the present design has the attractive features of simplicity of construction from unitized

components available on the market, and provision for use of the "four-leads" cell technique to eliminate connecting lead effects in remote conductance measurements. (Author)

STEP TRANSFORMERS WITH LARGE TRANSFORMATION RATIO, by Edward Malowicki. July 60, 56p. 8 refs. RADC-TR-60-87.
Order from LC mi$3.60, ph$9.30 PB 150 268

This report is concerned with the problem of matching two real impedances whose ratio is large, for example, 36, over a wide band of frequencies, such as 65 to 285 megacycles, in the VHF band. The matching device considered, called a step transformer, is composed of cascaded lengths of transmission lines which may differ from each other in length and characteristic impedance. Results of investigation indicate that for a given maximum ripple, the Tchebyscheff transformer gives the best wideband performance with the least number of sections for the values of ρ and VSWR considered. (Author)

CYLINDRICAL REFLECTORS FOR DIRECTING AND CONCENTRATING MICROWAVE BEAMS, by R. G. Fellers and F. E. Rouffy, Jr. Rept. on Contract AF 18(603)43. 1 Apr 60, 52p. 18 refs. AFOSR-TN-60-427; AD-237 565.
Order from LC mi$3.60, ph$9.30 PB 148 026

The straight-line transmission performance of a full-paraboloidal microwave antenna transmission system at 35.3 KMc was investigated theoretically and experimentally. To determine if the performance of this free space transmission system could be improved, four cylindrically shaped aluminum-foil-surfaced reflectors were designed, constructed, and placed midway in the transmission path so as to effect a 90° "corner-reflection" of a transmitted beam, and in so doing to concentrate the beam in order to obtain a power gain over straight-line transmission. At the total transmission distances, D^2/λ, $2D^2/\lambda$, $4D^2/\lambda$ (36 ft., 72 ft., 144 ft.), transmission losses with a plane reflector were compared with the straight-line transmission losses; within meter accuracy (±0.2db.) these losses were measured as equal. Power gains resulting from the use of the cylindrically curved reflectors were then measured as gains over plane reflector transmission. Within the discrete range of transmission total distance, the minimum power gain was measured as 2.8 db. at D^2/λ. The maximum power gain was measured as 5.3 db. at $4D^2/\lambda$. Empirical rules were made for estimating the gain produced by the various curved reflectors. Design equations and considerations are presented for the construction of curved reflectors.

Stanford Electronics Labs., Stanford U., Calif.
AN IMPROVED ELECTROLYTIC TANK FOR DESIGNING ELECTRON GUNS, by A. S. Creason and M. D. Hare. Rept. on Contract DA 36-039-sc-73178. 25 Jan 60, 43p. 9 refs. Technical rept. no. 314-1.
Order from LC mi$3.30, ph$7.80 PB 147 912

This paper describes an improved electrolytic tank and circuit for rapidly and conveniently designing the focus electrodes of the Pierce type of electron gun for either solid or hollow beams. The tank has glass-epoxy-resin sides and a plate-glass bottom. It is rigid enough to be supported without distortion on three adjustable legs and light enough to be portable within the laboratory. The potentials from a maximum of twenty-four probes along the edge of the simulated electron beam are measured by a null method. To accommodate the two beam boundaries of a hollow-beam gun, signals from either of two sets of probes can be switched into the circuit. To avoid undesirable capacitance effects, the system uses a high-power, low-impedence signal source and a high-conductivity electrolyte.

Stanford Electronics Labs., Stanford U., Calif.
THE THEORY OF TWO PORTS, by J. G. Linvill. Rept. on Contract Nonr-225(44). 15 Oct 59, 29p. 4 refs. Technical rept. no. 1505-2.
Order from LC mi$2.70, ph$4.80 PB 149 491

The power gains, port immittances, and sensitivities of amplification to parameter variation are functions of the two-port parameters and terminating impedances. Expressions for these functions in terms of the common parameter types and the terminating immittances are necessary in amplifier design. It is simply shown that expressions for these functions in terms of general parameters can be written which are applicable for any particular parameter type. Two-port network theory is generalized here to treat the case of contaminating signals due to noise, temperature variation, or distortion. The form of the present discussion is definition of parameters which characterize the generation of contaminating signals in the two-port. In a subsequent step the transmission is considered of the contaminating signals from their point of origin to the output where they corrupt the desired signal being transmitted. In the final step one can select optimum terminating impedances which minimize corruption of the desired signal by the contaminating ones. (Author)

TRANSHORIZON MEASUREMENT TECHNIQUES IN RADIO-WAVE PROPAGATION, by A. T. Waterman, Jr. Rept. on Contract DA 36-039-sc-73151. 15 Aug 58, 14p. Technical rept. no. 770-2.
Order from LC mi$2.40, ph$3.30 PB 149 405

In microwave transmission to distances well beyond the horizon, the received signal generally exhibits a characteristic fading. Measurements made on the received signal, in order to be considered representative, must be averaged over a time interval long compared with the period of the slowest fading component. Alternatively it is possible to perform certain kinds of measurements in a time interval short relative to the fastest fading components. Such a measurement yields an "instantaneous" picture of the effects produced by atmospheric conditions. A critical type of experiment involves the swinging of a narrow beam in order to resolve those signal components whose phase interrelationship determines the fading. This report discusses the information that can be obtained by using phased-array techniques in radio-wave propagation experiments.

Stanford Research Inst., Menlo Park, Calif.
RESEARCH IN MICROELECTRONICS USING ELECTRON-BEAM-ACTIVATED MACHINING TECHNIQUES, by Kenneth R. Shoulders. Interim scientific rept. on Contract Nonr-2887(00). Sep 60, 216p. 85 refs. SRI Proj. 2863.
Order from OTS $3.50 PB 171 027

Investigations into methods for obtaining electronic data processing systems of biological complexity indicate the feasibility of using over 10^{11} one-micron-sized active elements in a one-cubic-inch machine. An active element based upon the quantum mechanical tunneling of electrons from a metal into high vacuum is proposed that has an estimated switching time of 10^{-10} seconds; couples well to similar and accessory components; promises immunity to temperature variations; and seems adaptable to self-forming manufacturing methods giving component uniformity. Light detectors and generators and electrostatically operated electromechanical devices such as relays and filters seem to fulfill the requirements for accessory components so that all electronic functions could be accomplished with this microelectronic system; in addition, a micro document system would allow permanently stored data to be retrieved at a 10^{10} bit-per-second rate. A micromachining method for fabricating film materials is presented in which an electron beam is used to form a chemically resistant film on the material being machined, which is subsequently etched in vacuum by a molecular beam. This high-speed process has resolution capabilities of several hundred angstrom units; can process electronically clean materials with minimum contamination; and may ultimately be suited for the economical production of one-cubic-inch data processing systems having 10^{11} active components. (Author)

Stanford Research Inst., Menlo Park, Calif.
ROUNDED CORNERS IN MICROWAVE HIGH-POWER FILTERS AND COMPONENTS, by Seymour B. Cohn. Technical note no. 1 on Contract AF 30(602)1998. June 60, 41p. 13 refs. RADC-TN-60-148.
Order from LC mi$3.30, ph$7.80 PB 149 983

Various high-power filter configurations of importance are described, and the structural corners at which electric-field concentrations occur are pointed out. A number of simplified geometries are then shown that can represent the essential portions of the practical structures with sufficient accuracy for ordinary purposes. Formulas and graphs for these simplified geometries are presented that give the ratio of the maximum electric field strength on the boundary to a uniform reference field strength at a point sufficiently removed from the corner. In some cases the boundary shape is derived such that the electric field strength along the curve is constant. These constant-field-strength boundaries are optimum shapes from the standpoint of power-handling ability.

Stewart-Warner Electronics Corp., Chicago, Ill.
SYSTEM STUDY OF ATC INTERROGATION PATH SIDE-LOBE SUPPRESSION TECHNIQUES. Final rept. on Contract NOas-56-1013-d. [1959] 96p. 14 refs.
Order from LC mi$5.40, ph$15.30 PB 148 641

This is an engineering study and investigation leading to the development of an interrogation path side-lobe suppression system for use with the Common System Air Traffic Control Radar Beacon System. The three pulse system is proposed whereby the ground antenna is fed through a magic T connection so that the interrogation pattern is normal while the reference pattern which covers the side-lobe region has a notch in the forward direction. A system of pulse spacing for suppression is worked out so that suppression of transponders in the side-lobe region is accomplished with no modification to the airborne transponders now in use.

Technical Development Center, Federal Aviation Agency, Indianapolis, Ind.
THE NAVY ELECTRONICS LABORATORY PILLBOX ANTENNA AND ITS EFFECT UPON ATC RADAR BEACON INTERROGATION, by Joseph E. Herrmann, Jr Owen E. McIntire, and Kenneth Wise. Aug 58, 22p. 2 refs. Technical development rept. no. 361.
Order from LC mi$2.70, ph$4.80 PB 147 942

The NEL Fox II pillbox antenna is an advancement in the state-of-the-art because the side lobes of the radiation pattern are of very low level. The evaluation program was concentrated on a determination of the effects that such an antenna would have on transponder interrogation. The results of the tests clearly indicate that very little improvement in system interrogation characteristics can be gained by use of an antenna having very low side lobes at installations where reflections are equal to, or greater than, those near TDC. Reflected main-lobe signals cancelled the interrogation duty-cycle improvements which were expected. It is felt that a significant improvement could be obtained at better sites. However, results of site surveys completed at some of the major airports indicate that little if any, improvement can be expected. (Author)

Technical Development Center [Federal Aviation Agency] Indianapolis, Ind.
A STUDY OF THE AIR TRAFFIC CONTROL RADAR BEACON SYSTEM CHARACTERISTICS, by Joseph E. Herrmann, Jr. Oct 57, 57p. 3 refs. Technical development rept. no. 329.
Order from LC mi$3.60, ph$9.30 PB 147 941

All data presented is based on the premise that this system must be compatible with the military beacon system and discussions are limited to those characteristics that can be changed without affecting the feature of compatibility. Nominal operating frequencies, transmitted powers, pulse lengths, and pulse spacing are accepted as basic system requirements. (Author)

Technische Hochschule, Munich (West Germany).
WAVE PROPAGATION IN A PLASMA CABLE WITH AN IMPRESSED LONGITUDINAL MAGNETIC FIELD, by H. Riedel and J. Thelen. Technical final rept. for 1 Apr 59-31 Mar 60 on Contract AF 61(052)79. 1960, 84p. 13 refs; AD-241 298.
Order from LC mi$4.80, ph$13.80 PB 150 247

A comparison between theory and experiment brings the following final results: In contrary to theory the upper propagation limit of the forward wave is displaced by strong magnetic fields ($\Omega > \omega_0$) to values of

frequency greater than plasma frequency, nearly up to the gyro frequency. Apart from that at least a qualitatively good correlation with theory is obtained in both cases: forward wave and backward wave.

Willow Run Labs., U. of Michigan, Ann Arbor.
ELECTRON-NUCLEAR INTERACTION IN RUBY AND ITS EFFECT ON THE RUBY MASER, by George Makhov, Robert Terhune and others. Memo. on Project Michigan, Contract DA 36-039-sc-78801. July 60, 10p. 5 refs. 2900-175-R.
Order from LC mi$1.80, ph$1.80 PB 149 456

It has been found that changes in the polarization of the Al^{27} and Cr^{53} nuclei in ruby affect markedly the absorption or emission of microwave power associated with the electron-spin resonance of the Cr^{+++} ion. This effect has been used to observe weak nuclear resonances and to change markedly the operating characteristics of the maser. (Author)

A DISCUSSION OF TWO METHODS OF COMPUTING A FINDING EPHEMERIS FOR A CLOSE EARTH SATELLITE, by P. M. Fitzpatrick and G. B. Findley. May 60, 36p. 10 refs. APGC-TN-60-23; AD-237 628.
Order from LC mi$3.00, ph$6.30 PB 148 096

The instantaneous position of an artificial earth satellite is known when its altitude above the earth's surface and its geographical latitude and longitude are determined. Two procedures for computing a finding ephemeris are discussed: (1) use of the well-known relations of celestial mechanics to determine the geocentric equatorial rectangular coordinates, and (2) use of less familiar vectorial elements to derive similar results. Both methods should be useful for predicting satellite positions during a period of a few days following a satellite fix. The orbital elements are considered to be constant except for secular variations in the longitude of the node and the argument of the perigee arising from the oblateness of the earth. The two methods were used to compute sub-satellite latitudes and longitudes. Results of these computations are presented. (Author)

Air Proving Ground Center, Eglin AFB, Fla.
HYPERVELOCITY IMPACT FACILITY. LIGHT-GAS PROJECTOR. Mar 60, 24p. 4 refs. APGC-TN-60-22; AD-235 295.
Order from LC mi$2.70, ph$4.80 PB 147 817

A review of the Air Proving Ground Center's new hypervelocity projector and impact facility is presented pictorially. At present velocities of greater than 15,000 fps are obtainable at simulated altitudes up to 100,000 ft. Cameras operating at speeds from 1,200,000 to 2,400,000 frames per second record the impact data. Development of the facility is continuing. An improved projector which will provide higher velocities is being fabricated. Equipment to accurately record these high velocities and the impact results is currently in the testing stage. (Author)

EVALUATION OF BALLOON CONDITIONER FOR ARTILLERY, by Ruth M. Welt. 15 Oct 59, 11p. 2 refs. USASRDL Technical rept. 2074; AD-228 447.
Order from LC mi$2.40, ph$3.30 PB 147 826

A simple, improved method of preconditioning meteorological balloons under field conditions is required for artillary use. Laboratory and flight tests were preformed which compared balloons preconditioned by the standard hot water method with balloons preconditioned by pressure cooker, steam generator, and heating mantle method. Results almost as good as with hot water were given by use of the heating mantle (dry heat) and it was recommended for field test by the Artillery Board. Maximum design performance of a particular balloon still requires the use of hot water for preconditioning. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
VARIABILITY OF BALLISTIC DENSITY AND BALLISTIC DENSITY DEPARTURE TABLES, by Marvin Lowenthal. 10 Nov 59, 12p. 5 refs. USASRDL Technical rept. 2079.
Order from LC mi$2.40, ph$3.30 PB 147 827

Based on a series of firings conducted at Fort Sill, Oklahoma, in April 1958, temporal and spatial variations of ballistic density were investigated for periods up to six hours and distances up to 500 miles. Comparisons of these data with the Ballistic Density Departure Tables permit a listing of the various sources of ballistic density in order of preference. It is concluded that the density departure tables should be used only as a backup system when other meteorological data are unavailable. (Author).

ADVANCES IN THE DYNAMIC ANALYSIS OF RANGE DATA, by Charles H. Murphy. May 60, 40p. 12 refs. Memo. rept. no. 1270; AD-239 402.
Order from LC mi$3.00, ph$6.30 PB 149 091

The usual analysis of the dynamics of motion of a missile fired in a ballistic range is limited to symmetric missiles with constant mass. This analysis was extended by J. D. Nicolaides (AD-26 405) to cover the motion of a symmetric missile with misaligned lifting surfaces and a constant roll rate. Three additional extensions to the analysis of pitching and yawing motions are described: (1) motion of a burning rocket; (2) motion of a slightly asymmetric missile with varying roll rate; and (3) motion of missile with nonlinear aerodynamic moments. These extensions are each illustrated with actual experimental data. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
BRL SHOCK TUBE TESTS OF AN AIR FORCE - PAN AMERICAN AIRWAYS SELF-RECORDING, PRESSURE-TIME GAGE, by Charles H. Hoover. June 60, 24p. 1 ref. Memo. rept. no. 1276; AD-240 397.
Order from LC mi$2.70, ph$4.80 PB 150 092

Pan-American Airways built self-recording mechanical pressure-time gages similar to gages employed extensively by the Ballistic Research Laboratories. The PAA gages are used to determine shock-wave overpressures from accidental explosions of missile and space vehicle propulsion units. A gage was sent to Aberdeen for dynamic testing in the BRL 24" Shock Tube. This report gives the results of this test and a comparison of the records from the PAA gage with those from an electronic standard gage. The Pan-American gage compares favorably with the standard gage and with results from the similar BRL gage. (Author)

Physics research directed toward the ultimate development of a defense system against ballistic missiles. The work has been subdivided into three parts: (1) launch phase, (2) mid-course (with a further breakdown into experimental and theoretical) and (3) re-entry. Detailed discussions of the relationship between the various investigations and ballistic missile defense from the scientific standpoint are given at the beginning of each section.

Diamond Ordnance Fuze Labs., Washington, D. C.
A MISSILE-AIRCRAFT ENCOUNTER SIMULATOR WITH TYPICAL APPLICATIONS, by Richard F. Butler. 21 Dec 59, 41p. 12 refs. TR-757; AD-233 965.
Order from LC mi$3.30, ph$7.80 PB 147 794

The DOFL-developed encounter simulator is used as an aid in estimating fuzing and burst points for fixed-angle fuzed missiles used against various targets. With the methods developed herein, the simulator can be used to (1) evaluate the effectiveness of fuze-warhead systems against arbitrary targets by analyzing data from operational missile test flights and (2) estimate optimum fuze-warhead parameters needed for proposed systems to achieve the desired effectiveness. Three techniques are discussed for finding points of intersection of the light beam, that represents the fuze-antenna beam or the warhead lethal pattern, with a target model.

Diamond Ordnance Fuze Labs., Washington, D. C.
SUMMARY OF HEAT-POWDER CALORIMETRY, by Raymond H. Comyn and Ira R. Marcus. 1 Aug 60, 22p. 9 refs. Technical rept. TR-862.
Order from LC mi$2.70, ph$4.80 PB 149 421

This report summarizes DOFL investigations in the calorimetry of gasless pyrotechnic mixtures which have been published previously in separate reports. These papers outline the development of two instruments: the DOFL quality control calorimeter for production use; and the DOFL microcalorimeter for research studies. The production calorimeter may be used for measuring heat inputs between 800 and 1200 cal with a precision of ±0.32 percent. The microcalorimeter has an accuracy of about 1 percent and may be used for measuring heat inputs of 100 to 300 cal at ambient temperatures between -65°F and +165°F. (Author)

INFLUENCE OF SILVER COATINGS ON IGNITION BEHAVIOR OF COLLOIDAL LEAD AZIDE, by Bruno Reitzner. Aug 60, 14p. 5 refs. Technical rept. FRL TR-2.
Order from LC mi$2.40, ph$3.30 PB 148 915

Colloidal α-lead azide was coated with small amounts of silver (0.25 - 10.0 atom %). The coatings were applied by reducing silver nitrate with hydrazine hydrate in a methanol-water solution in which lead azide was suspended. The metallic silver was found to be predominantly located near the edges of smaller or irregularly shaped lead azide crystals. Ignition tests run between 351°C and 411°C gave ignition times ranging from infinity to 0.035 second. Coating the material with 1 atom % of silver reduced its ignition times by as much as 60%. However, the ignition times of material coated with 10 atom % of silver were up to 1.5 times as high as those of the uncoated material.

The apparent activation energies, E*, were calculated from the Semenov equation at temperatures ranging from 377° to 389°C. Deviations from the Semenov equation were found at both higher and lower temperatures. E* for the uncoated lead azide was found to be 132 ± 10 kcal/mole. Values of 120 ± 10 kcal/mole and 138 ± 5 kcal/mole were found for materials coated with 1 atom % and 10 atom % of silver, respectively. The increase in thermal sensitivity of the material coated with about 1 atom % silver is explained as due to the catalytic action of the silver. (Author)

Frankford Arsenal, Philadelphia, Pa.
RATE OF FIRE IN RECOILLESS RIFLES, by R. Boritz. Sep 59, 26p. 6 refs. Memo. rept. M60-3-1.
Order from LC mi$2.70, ph$4.80 PB 148 661

A method for the calculation of rate of fire for recoilless weapons is described. Rate of fire limitations in recoilless rifles are a result of degradation of material strength with increase of temperature. Based on this, it is possible to calculate maximum permissible sustained rates of fire. The calculation of average system temperatures after firing a specified number of rounds, at specified times, with specified external conditions, is presented for several different assumptions. Cooling methods are discussed and sample calculations are presented.

Frankford Arsenal, Philadelphia, Pa.
ULTRASONIC INSPECTION OF EXPERIMENTAL ALUMINUM ARMOR PLATE, by Helen Smolen. 26 Aug 59, 24p. 5 refs. Test rept. T60-1-1; AD 229 500.
Order from LC mi$2.70, ph$4.80 PB 150 305

Ultrasonic tests were performed to locate areas yielding gradients of ultrasonic response in experimental aluminum armor plate. Representative areas were subjected to tensile impact and metallographic tests. Because it is difficult to determine precisely which portion of a given volume may introduce the ultrasonic gradients observed, no conclusion could be drawn as to the ability of ultrasonics to detect structural deviations other than comparatively gross discrete flaws. Armor plate, portions of which had been subjected to ballistic test, were examined to determine the relationship between ballistic test results and ultrasonic response. The average percentage of noise level, which was characteristic of each plate, did not correlate with ballistic test results, in that a ballistically good plate appeared to be as likely to yield a high average noise level as a ballistically bad plate. No edge cracks were located in the many plates examined during the course of this program. However, results obtained under an earlier study indicate that this type of flaw is easily detected ultrasonically, as are other comparatively gross flaws. Standard immersion techniques introduced problems which may be overcome by use of a modified immersion technique which is described. (Author).

General Electric Co., Schenectady, N. Y.
DISPERSION OF THE HERMES A3 MISSILE: RANGE ERRORS DUE TO VARIATION IN POSITION AND VELOCITY AT THE END OF CONTROL, by R. F. Drenick. Rept. on Project Hermes [Contract DA 30-115-ORD-23]. 30 Aug 48, declassified 17 Nov 58, 34p. 2 refs. Rept. no. 55263.
Order from LC mi$3.00, ph$6.30 PB 149 466

The Hermes A3 missile is a surface-to-surface missile, subject to very stringent requirements concerning the accuracy of hitting. These requirements suggested a study of all factors which might, in the absence of proper control, produce impact errors, and of possible means of reducing these errors. An account is given in this report of the range errors which would result if the missile position or velocity have deviated from the desired standard at the time at which guidance is discontinued. The conclusion is reached that control principles similar to those of the German V-2 in which control ceases at some time before impact, are not likely to insure the specified accuracy. The methods of differential corrections are generalized in this report from the form which they take in conventional ballistics to that form which would apply to guided missile ballistics. (Author)

General Electric Co., Schenectady, N. Y.
GROUND VIBRATION TESTS OF THE HERMES A1 TEST VEHICLE, by E. A. Zeitlin. Rept. on Project Hermes [Contract DA 30-115-ORD-23]. 27 Apr 49, 47p. 5 refs. Rept. no. 55276.
Order from LC mi$3.30, ph$7.80 PB 149 469

The object of the vibration tests was to determine the natural frequencies, the vibration characteristics, and the location of the nodal lines for the significant modes of vibration of the main airframe components of the Hermes A1 test vehicle. The information has been used in (a) flutter analyses, (b) calculations of torsional divergence, (c) study of possible coupling between oscillations of the main airframe components, (d) investigation of possible coupling action between control, guidance, and structural components of the missile viewed as an elastic body.

THE HERMES A-3 FLIGHT SIMULATOR, by N. M. Bengston. Rept. on Project Hermes [Contract DA 30-115-ORD-23]. July 49, declassified 17 Mar 58, 22p. Technical Information Series R49A0525.
Order from LC mi$2.70, ph$4.80 PB 149 471

The 50,000:1 variation in dynamic pressure imposed by the Hermes A-3 trajectory creates particular problems in design of autopilot and means for testing it. An electrical integrator type of analogue computer has been designed to simulate the missile equations. Actual componenta complete the remainder of the flight simulation loops. (Author)

General Electric Co., Schenectady, N. Y.
UPWASH FIELD INDUCED BY THE HERMES B-1 WING AT SEVERAL MACH NUMBERS, by H. R. Koenig. Rept. on Proj. Hermes, Contract [DA 30-115-ORD-23]. Dec 50, declassified 17 Mar 58. 16p. 4 refs. Technical Information Series rept. no. R50A0525.
Order from LC mi$2.40, ph$3.30 PB 149 205

The upwash field induced by the B-1 wing is presented for several Mach numbers. Since the purpose of this study was to determine the effect of upwash on the tail fin performance, the upwash field is plotted in the plane perpendicular to the free stream direction and passing through the leading edge of the rail fins. (Author)

General Electric Co., Syracuse, N. Y.
S-BAND ATTENUATION IN THE OXYGEN-ALCOHOL ROCKET MOTOR, by R. H. Morrison. Rept. on Proj. Hermes, Contract [DA 30-115-ORD-23] June 50, declassified 17 Mar 58. 46p. 8 refs. Technical Information Series rept. no. R49A0535.
Order from LC mi$3.30, ph$7.80 PB 149 203

The attenuation of an S-band beam through the flame of a 16,000-pound thrust oxygen-alcohol motor (Hermes A-1 missile) was measured. No average attenuation was measured; there were transient attenuations of the order of 20 db at the start and shut down and random transient attenuations of 5-10 db during smooth burning period. Some noise attenuation showed on the records. (Author)

Hughes Aircraft Co., Culver City, Calif.
DISPLAY AND CONTROL REQUIREMENTS FOR MANNED SPACE FLIGHT, by Charles O. Hopkins, Donald K. Bauerschmidt, and M. J. Anderson. Rept. on Human Performance in Advanced Systems, Contract AF 33(616)6033. Apr 60, 217p. 175 refs. WADD Technical rept. 60-197.
Order from OTS $3.50 PB 161 987

A study was made of the display and control requirements for a manned orbital vehicle of the "space-ferry" type. The mission included ground launch, rendezvous with a satellite station already in orbit, re-entry into the earth's atmosphere, and landing at a selected base on earth. Display and control requirements were determined for vehicle attitude control while in orbit, orbital plane change, minimum energy transfer between circular orbits at different altitudes, and deorbit for re-entry into the earth's atmosphere. Displays, controls, and control panels were designed to meet these requirements. Representations of these displays and controls were constructed and incorporated into full-scale mockups of cockpits for two alternate display and control systems. (Author)

Institute of Metals and Explosives Research, U. of Utah, Salt Lake City.
FRAMING CAMERA OBSERVATIONS OF ULTRA-HIGH VELOCITY PENETRATION IN TRANSPARENT TARGETS AND A MECHANISM FOR CRATER EXPANSION, by R. W. Bartlett and R. T. Keyes. Rept. on Contract AF 18(603)100. 31 Mar 60, 21p. 5 refs. AFOSR-TN-60-851.
Order from LC mi$2.70, ph$4.80 PB 150 167

A mechanism of cratering in metal targets impacted by shaped charge jets in which the hole diameter is expressed as a function of striking velocity jet diameter, densitites of target and jet, and the yield strength of the target is presented and compared with measured hole diameters in several different metals struck by iron, copper and aluminum jets at various velocities. The same mechanism is expanded to account for the dynamics of crater formation, i.e., the lateral rate of expansion of the crater. Theoretical curves are compared with experimental results obtained by means of microsecond framing camera techniques for steel jets penetrating several transparent substances of different densities. Some additional results pertaining to vaporization in ultra-high velocity impact also are given. (Author)

Naval Ordnance Lab., Corona, Calif.
PRIMARY FACTORS THAT AFFECT THE DESIGN OF GUIDED MISSILE FUZING SYSTEMS, by K. A. Van Orsdel. 8 July 60, 16p. NAVWEPS rept. 5953; NOLC rept. 452.
Order from LC mi$2.40, ph$3.30 PB 149 794

The primary factors that must be taken into consideration preparatory to designing any guided missile fuzing system or fuze component are listed in outline form. Main categories of factors affecting missile fuze design are: Weapon System General Requirements, Tactical Conditions, Target Characteristics, Missile Characteristics, Warhead Characteristics, and Weapon System Logistics and Field Operation. Several factors are listed under each category. (Author)

COMPOSITE PROPELLANT PROCESSING. PLASTIC MANDREL FABRICATION. 1 July 59, 15p. NOTS TP 2307.
Order from LC mi$2.40, ph$3.30 PB 150 290

Strong, lightweight plastic mandrels can be fabricated from aluminum-filled epoxy resins very economically and in a very short time. These plastic mandrels are accurate reproductions of aluminum or wooden mandrels.

Naval Ordnance Test Station, China Lake, Calif.
INTERVAL TIMER MARK 5 MOD 1; LATIN-SEQUENCE ENVIRONMENT TEST FOR QUALITY ASSURANCE AND IMPROVEMENT, by K. G. Clemans and R. E. Crescenti. 6 May 59. NOTS TP 2254; NAVORD rept. 6554.
Order from LC mi$3.90, ph$10.80 PB 149 530

This report presents a logical, inexpensive, yet comprehensive, method of qualification testing with application to the Mk 5 Mod 1 Interval Timer. Qualification testing of this type has general application in development as well as procurement programs where the test conditions imposed are presumed non-destructive. (Author)

Naval Weapons Lab., Dahlgren, Va.
EVALUATION OF BLOW-OUT PIPE SYSTEMS FOR USE ON TERRIER MISSILE SHIPS, by A. C. Samuels. 11 Aug 60, 49p. 1 ref. NWL rept. no. 1714.
Order from LC mi$3.30, ph$7.80 PB 150 276

The Naval Weapons Laboratory has conducted two blow-out pipe tests to determine the structural adequacy of the closed blow-out pipe system installed in check-out areas of DLG-9 class TERRIER missile ships and to determine the feasibility of replacing the portable section of blow-out pipe by an inlet funnel installed on the bulkhead in check-out areas on proposed DLG-16 and DLG(N)-25 class TERRIER missile ships. These tests were conducted during the period from 5 May 1960 to 13 May 1960 using TERRIER BT-3 sustainers. The results of the two tests indicate that the closed system as used on the DLG-9 class ships is more effective than the proposed DLG-16 open system in removing the exhaust gases from a burning sustainer. As a result the closed system reduces the hazards to personnel, and is to be preferred. (Author)

North Carolina State Coll., Raleigh.
ON THE THEORY OF MOTION OF A NEAR EARTH SATELLITE, by Raimond A. Struble and William F. Campbell. Technical memo. no. 4 on Contract DA 36-034-ORD-2733. June 60, 5p. 7 refs. OOR rept. no. 2125.9-M; AD-238 904.
Order from LC mi$1.80, ph$1.80 PB 150 400

First and second order solutions of the equations of motion of a near earth satellite were obtained. These solutions are completely general without restrictions on eccentricity or orbital inclination. Though the traditional orbital plane of astronomy is employed, a non-elliptical orbit in this plane displays the basic geometry more readily than would the traditional osculating ellipse. (Author).

SHOCK, VIBRATION AND ASSOCIATED ENVIRONMENTS. PART IV. June 59, 143p. 20 refs. Bulletin no. 27; AD-212 977.
Order from LC mi$7.20, ph$22.80 PB 150 286

This report released for sale to the public 26 Sep 60.

Design and use of vibration test jigs and fixtures: Nature of the vibration testing problem; Design criteria for vibration test jigs and fixtures; Scope of the vibration fixture problem; Vibration fixtures for large test items; Multi-purpose environmental test fixtures; A critical look at vibration fixture performance; Investigation of vibration fixture materials; Comments on seminar on jigs and fixtures; Experimental and theoretical study of an oil film slider; Improved version of the fluid film method of stabilizing an auxiliary vibration table; Oil-film supported table for vibrating large components; Building an inertial guidance facility. Correlation of the effects of laboratory vs service environments on hardware: Real and simulated environment; A specification writer's viewpoint; Damage accumulation in relation to environmental testing; Method of equating long duration-low intensity and short duration-high intensity random vibration; Evaluating the effects of logistic environments on missile reliability; Reliability and mechanical design. Information exchange: National Bureau of Standards calibration service for vibration pickups; Ad Hoc Committee on transportation hazards; Research program on random vibration.

Picatinny [Research Center] Picatinny Arsenal, Dover, N. J.
DEVELOPMENT OF DELAY POWDERS, by Burton Werbel and Seymour Lopatin. Apr 58, 37p. 2 refs. Technical rept. 2477; AD-159 055.
Order from LC mi$3.00, ph$6.30 PB 148 991

The effects of the following factors on the burning characteristics of the barium chromate/boron system have been investigated: (a) chemical composition; (b) vapors; (c) external pressure; and (d) temperature.

[Picatinny Research Center] Picatinny Arsenal, Dover, N. J.
THE ROLE OF PARAFORMALDEHYDE IN THE PREPARATION OF HMX BY THE PICATINNY PROCESS, by Thomas C. Castorina, Frederick S. Holahan and others. Feb 58, 40p. 25 refs. Technical rept. 2481; AD-157 692.
Order from LC mi$3.00, ph$6.30 PB 148 992

To find means of further improving the yield of HMX from the Picatinny Arsenal (PA) nitrolysis of hexamine, the role of paraformaldehyde in the reaction was traced with carbon-14. These results demonstrate that both HMX and RDX molecules are derived from chemically equivalent carbon atoms or methylene groups. Thus the role of the $(CH_2O)_x$ is postulated as increasing the concentration of methylene groups in the percursors of HMX/RDX thereby making more efficient use of the nitrogen in the hexamine possible.

Pitman-Dunn Labs. Group, Frankford Arsenal, Philadelphia, Pa.
FLUID DYNAMIC MODEL OF INTERIOR BALLISTICS, by S. Jarvis, Jr. Feb 60, 55p. 4 refs. Memo. rept. M60-24-1.
Order from LC mi$3.60, ph$9.30 PB 149 055

Equations are derived for the transient one-dimensional motion of a propellant gas-propellant grain mixture capable of giving, qualitatively, the effect on the interior ballistic process of factors not included in space-mean models. These general equations and certain one-parameter reductions are discussed, and the computing difficulties assessed. A few extreme simplifications, which allow analysis of certain representative features, are made and the results given. (Author)

Remington Arms Co., Inc., Bridgeport, Conn.
DEVELOPMENT AND FABRICATION OF PERCUSSION PRIMER FOR BAG LOADED WEAPONS, by R. A. Sahlin. Monthly progress rept. no. 2, 31 May-30 June 60, on Contract DA 19-020-ORD-5200. 14 July 60. 6p.
Order from LC mi$1.80, ph$1.80 PB 149 831

Approximately one hundred XM-82 primers were made. Product performance tests were conducted with satisfactory performance indicated. Work on the Remington alternate has continued with inner cases processed through drawing and heading. A considerable amount of experimental work of the outer case has been done and is continuing in an attempt to achieve drawing dimensions. (See also PB 149 325)

Rock Island Arsenal Lab., Ill.
DENSITY VERSUS VISCOSITY AS IT INFLUENCES THE ACTION OF A RECOIL MECHANISM, by H. C. Muffley. 11 Mar 60, 27p. 10 refs. Rept. no. 60-598; AD-234 720.
Order from LC mi$2.70, ph$4.80 PB 147 340

The influence of density and viscosity of the hydraulic oil on the functioning of a hydropneumatic recoil mechanism was investigated under firing conditions with a 105 MM Howitzer Recoil Mechanism and three oils varying in density and viscosity. The data indicated that changes in density had a significant effect on the operation of the mechanism. Increasing the density of the oil manifested itself in shorter recoil length and increased pressures. Variations in viscosity, however, did not influence the functioning of the mechanism significantly. (Author)

Solid Propellant Information Agency, Johns Hopkins U., Silver Spring, Md.
JOINT ARMY-NAVY-AIR FORCE IGNITABILITY PANEL. PROCEEDINGS OF THE THIRD MEETING HELD AT APPLIED PHYSICS LABORATORY, SILVER SPRING, MARYLAND, JUNE 19, 1959. Rept. on Contract NOrd 7386. [1959] 81p. 12 refs.
Order from LC mi$4.80, ph$13.80 PB 150 779

This report released for sale to the public 14 Oct 60.

The purpose of the Ad Hoc Panel on Ignitability is to review the existing procedures and equipment for measuring the ignitability of solid propellants and to standardize on one of these techniques if at all possible. The primary purpose of the third meeting was to review the results obtained from a round-robin ignitability testing of four standard propellants and to utilize conclusion drawn from this review to formulate recommendations for a standard ignitability apparatus. (Author)

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
A METHOD FOR CALCULATING THE THERMAL IRRADIANCE UPON A SPACE VEHICLE AND DETERMINING ITS TEMPERATURE, by Thomas L. Altshuler. Rept. on Contract AF 04(647)269. Aug 60, 59p. 15 refs. Technical Information Series R60SD386.
Order from LC mi$3.60, ph$9.30 PB 149 846

A method is presented for determining the thermal irradiance upon a space vehicle due to direct solar radiation, planetary thermal radiation, and planetary albedo. From this information the temperature of a space vehicle can be obtained. Calculations can be made for various space vehicle altitudes above a planet and for various solar angles with respect to both the planet and space vehicle. The planets and natural satellites considered are the Earth, Moon, Mars and Venus. (Author)

Springfield Armory, Mass.
DEVELOPMENT OF THE PERMETRON GAGE FOR THE MEASUREMENT OF 20MM BARREL BORE PLATING THICKNESS, by H. P. Hatch and C. N. Julian. Rept. on Engineering of Application of Non-destructive or Simulated Testing Methods and Equipment to Small Arms Weapon Items. 3 Apr 60, 19p. SA-TR20-6003; AD-238 004.
Order from LC mi$2.40, ph$3.30 PB 150 017

The Permetron operates on the principle that the coupling between two windings linked by a magnetic circuit varies with the permeability of the magnetic circuit. The magnetic circuit consists of the core carrying the two windings, the barrel steel, and the interposed chromium. If the magnetic characteristics of the barrel steel and core are held constant, then the magnetic circuit variable affecting permeability will be the thickness of chromium. In this instrument, coupling is indicated in terms of a secondary output voltage with controlled primary input current. This output voltage varies directly with the permeability of the magnetic circuit and therefore is a function of the thickness of the chromium plate. A low frequency, 60 cps, is employed to reduce eddy currents, and to minimize the effect of variation in the magnetic properties of both the barrel steel and the deposited chromium. The maximum error in thickness measurement is 0.33×10^{-3} inches. (Author)

Stanford Research Inst., Menlo Park, Calif.
VOLTAGE BREAKDOWN OF ANTENNAS AT HIGH ALTITUDES, by W. E. Scharfman and T. Morita. Technical rept. 69 on Contract AF 19(604)3458. Apr 60, 100p. 16 refs. AFCRC-TN-60-750
Order from LC mi$5.40, ph$15.30 PB 149 897

The signal received from electronic systems on various missiles has contained evidence of voltage breakdown on antennas at altitudes from 50,000 to 300,000 feet at VHF, UHF, and microwave frequencies. Since continuous telemetry and tracking information is often necessary to determine impact position and system performance, an experimental investigation has been made of the power-handling capabilities of antennas at high altitude. The principal aims of the study are (1) to determine the physical mechanisms involved, (2) to measure and tabulate experimental data on breakdown field strength for various antenna types, and (3) to study methods for improving the power-handling capabilities of antennas.

Watervliet Arsenal, N. Y.
FIRING TESTS ON T42E1 AND T32E1 IGNITERS IN THE 105MM T254E2 TANK GUN, by F. J. Dashnaw and K. C. Stotz. Feb 60, 26p. Technical rept. WVTRR-6002.
Order from LC mi$2.70, ph$4.80 PB 145 817

A number of igniters were test fired in a 105MM, T254E2 gun tube and breech ring assembly in addition to insulation tests. It was determined that the gun would perform satisfactorily, from an electric firing standpoint, using either a capacitive discharge power source or a 24 volt battery, under normal room conditions. The direct battery power source is recommended because of lower space requirements and fewer possible difficulties. (Author)

Watervliet Arsenal, N. Y.
AN OPTICAL METHOD FOR MEASURING STRAIGHTNESS OF GUN TUBE BORES, by D. Bisceglia and P. M. Casey. Dec 59, 27p. Technical rept. WVT RI 5906.
Order from LC mi$2.70, ph$4.80 PB 146 478

This project was initiated to provide a telltale system which would be more accurate and require less skill of the operator. Using optical principles, bore inspection can be accomplished in a reasonable time by using a machine in which the tube can be indicated to a common center line of machine spindle and instrument optical axis. This system is the most precise technique available for process and acceptance inspection of finished and semi-finished bores. However, the use of this technique for determining the axis of rough cored holes is not recommended for medium size cannon since the benefits derived do not offset the increased time required to perform this operation. The equipment developed is applicable to machine alignment and the telltale record sheet designed is applicable to either optical or mechanical telltale readings. (Author)

Watervliet Arsenal, N. Y.
TRANSIENT THERMAL STRESSES IN GUN TUBES, PART I, by C. C. Mow, M. J. Pascual, and J. J. Pascual. Mar 60, 104p. 8 refs. Technical rept. WVT RR-6003.
Order from OTS $2.50 PB 161 475

The study was made to determine the temperature field and thermal stress distribution in a gun tube (hollow cylinder) assumed for simplicity to be infinitely long. The boundary conditions considered were independent of axial distance, and dependent only upon time. Various functions of time were considered in fixing the temperature at the inner wall. The choice of these functions was determined by the data obtained in the actual firing of a gun. All quantities are in dimensionless form. The dimensionless temperature fields were determined in a closed form, while the thermal stresses were left in an integral form and solved by numerical integration using an IBM 650 digital computer. Numerical results were obtained for various parameters which cover most of those of interest to the Ordnance Corps. (Author).

Arctic Aeromedical Lab., Ladd AFB, Alaska.
PRELIMINARY STUDIES ON ELECTRIC INCINERATOR TOILETS FOR USE UNDER REMOTE ARCTIC CONDITIONS, by Jack D. Douglas. May 60, 12p. Technical note AAL-TN-60-7.
Order from LC mi$2.40, ph$3.30 PB 150 027

It is felt that electric incineration would be an effective and satisfactory means of human waste disposal at remote arctic sites. An electric incinerator toilet, which had originally been developed for use aboard aircraft, was modified and field tested for possible ground use. Numerous difficulties inherent in the unit manifested themselves during the period of the tests. However, results of the tests did indicate that electric incineration would be a feasible means of human waste disposal. Recommendations were made for the construction of an electric incinerator toilet designed for ground use. (Author)

Army Engineer Research and Development Labs., Fort Belvoir, Va.
DECONTAMINATION OF WATER CONTAMINATED WITH PLUTONIUM, by Maurice Pressman and Don C. Lindsten. Rept. for 24 Feb-3 Apr 59 on Removal of CBR Contaminants from Water. 12 Jan 60, 91p. 26 refs Research rept. 1613-RR; AD-234 603.
Order from LC mi$5.40, ph$15.30 PB 147 816

The report concludes that: (a) The Army Mobile Water Purification Unit is capable of removing essentially all particulate plutonium from water by the standard processes of coagulation with ferric chloride and limestone disinfection, and diatomite filtration; (b) the Army Mobile Water Purification Unit is capable of removing 72% of the plutonium from contaminated tap water in which most of the plutonium is in soluble form. The percentage is increased to 89 by the addition of 600 ppm activated carbon and 97.5 percent by the addition of 100 ppm activated carbon and 97.5 percent by the addition of 100 ppm of clay to clear raw water and by raising pH to 11.4; (c) mixed-bed ion-exchange resin and high-capacity cation-exchange resin on the hydrogen cycle are both capable of removing over 99% soluble plutonium from contaminated water; (d) a proposed Army squad method of removing CBR agents from water is capable of removing over 99.9 percent plutonium activity even when in the soluble form; (e) cation-exchange water-softening unit is ineffective; (f) alum coagulation and sand filtration is 95% effective; (g) activated carbon in high dosage is an effective adsorbent; and (h) lime-soda softening is 97% effective. This bibliography includes author, geographical and subject indexes. (See also PB 147 220)

Naval Civil Engineering Lab., Port Hueneme, Calif.
COMPARTMENT-TYPE AIR LOCK STUDIES, by Ernest N. Hellberg. Final rept. 28 June 60, 38p. 8 refs. Technical rept. 036.
Order from LC mi$3.00, ph$6.30 PB 149 230

A portable, prefabricated, interior air lock has been developed and compared against the BUDOCKS standard, exterior one. Extensive tests under various building-pressures, air flows, and environments revealed that both locks operated satisfactorily when airflow exceeded 300 cfm; that the NCEL lock had inadequate air-flow regulation; and that the BUDOCKS lock was unwieldy. NCEL redesigned its air lock to incorporate the best features of both the BUDOCKS and the NCEL prototype, and to eliminate their shortcomings. Considering the final NCEL lock suitable for interior use is recommended. (Author)

SPECIFICATIONS AND COSTS OF A STANDARDIZED SERIES OF FALLOUT SHELTERS, by W. E. Strope, L. G. Porteous, and A. L. Greig. 6 Oct 59, 153p. 29 refs. Research and development technical rept. USNRDL-TR-366.
Order from OTS $3.00 PB 161 973

Basic performance specifications are developed to govern the design of personnel shelters to provide protection against radioactive fallout. Consideration is also given to protection against blast, heat, and fires. Design specifications and cost estimates are prepared for a shelter based on a 25 ft by 48 ft ammunition storage magazine. Provision is made for 14-day occupancy by 100 people. The cost differentials of various choices of performance characteristics are estimated. The design is in sufficient detail to permit construction. Shelters of this type may have wide application in residential areas, industrial plants, and military installations. (Author)

Northwestern Technological Inst., Evanston, Ill.
THE DYADIC COMPUTATION OF A GENERALIZED NETWORK MODEL OF A SEWAGE TREATMENT SYSTEM, by W. R. Lynn (U. of Miami) and A. Charnes. ONR Research Memo no. 19 on Temporal Planning and Management Decisions under Risk and Uncertainty [and] Systems Analysis of Municipal Sewage Treatment, Contract Nonr-1228(10). Oct 59, 23p. 5 refs. AD-230 198.
Order from LC mi$2.70, ph$4.80 PB 149 500

A computational method is presented and demonstrated for the analysis of a problem involved in the determination of the most economical sewage treatment system by which certain impressed effluent standards of quality can be attained. A sewage treatment system was considered as a combination of unit operations which may be employed in series or parallel. Each of the unit operations has the capacity for effecting some change (e.g., a reduction) in the quantity of the waste which utilizes the operation. The cost of each operation per unit of sewage treated varies from operation to operation as does the effect of each operation on the quality of the waste. (Author)

Ship Building

Bureau of Ships, Washington, D. C.
SHOP PRACTICE SUGGESTIONS NO. 2. Nov 60, 24p.
Order from OTS $0.50 PB 171 024

The suggestions included are for fitting brushes; multiple gasket cutter; compressor linear extractor; segmented anode pencils; coaming around fuel tanks; gas test holes; stuffing tube area templates; reworked stellite bushings; plate-stretching bars; ammeter records shaft trepanning; blueprint machine roller cover; gas holes in doubler plates; welding electrode holder; hole cutter for aluminum plate; undercut gage; adjusting SPS-8 potentiometer; toggle switch guard; deck drain sleeves; photographs of electronic wiring; boat gripes; lifeboat equipment air-freed; ventilation spools; SASS bridge crane; repairing uptakes; LST bow ramp gaskets; casting tin-bronze manifolds; purge plug for pipe; microswitch checker; valve seat grinder; soldering tips modified; jet cable reel rims; metal photo process; metallic splice gear; cold storage space; jet blast deflector alignment; bomb elevator hatch; crane radiator petcock; pipes through aluminum; penetration reinforcements; hydraulic control valves; torpedo tube gage; steam catapult cylinders; surplus STS plating; roller grip couplings; battery cell handling case; battery cell test plug; cable marking; catapult winch frame racks; cutting torch tips reconditioned; bilge keel installation; sea chest blank; globe stop-lift-check valve; brake applicator valve; steam catapult jack; fuel status chart. (See also PB 161 715)

David Taylor Model Basin, Washington, D. C.
STRUCTURAL EVALUATION OF HYDROFOILS OF GIBBS AND COX BOAT SEA LEGS, by Louis A. Becker. July 60, 24p. 5 refs. Rept. no. 1401.
Order from LC mi$2.70, ph$4.80 PB 152 019

This report released for sale to the public 11 Oct 60.

Strains were measured in the hydrofoils and struts of the Gibbs & Cox boat SEA LEGS for known static loads, for operation in calm water under steady-state conditions and forced maneuvers, and for operation in 5-ft waves. Underway loads and load factors were determined. Experimental and theoretical stresses were compared. Motions and accelerations of the boat were also measured during the underway trials. It is concluded that the hydrofoil system is adequate to withstand the stresses resulting from operation in waves up to 5 ft in height at speeds up to 23 knots. (Author)

TMB 3-BLADED SUPERCAVITATING PROPELLER SERIES, by E. B. Caster. Aug 59, 29p. 5 refs. Rept. 1245.
Order from LC mi$2.70, ph$4.80 PB 150 676

This report released for sale to the public 11 Oct 60.

A theoretical series of 3-bladed supercavitating propellers, having a hub radius of 0.2 of the propeller radius and an expanded area ratio of 0.5, is presented. The design parameters for these propellers are plotted in the form of nondimensional coefficients which enable a complete design to be obtained. (Author)

Hamburg U. (Germany).
ROLL RESONANCE IN A TRANSVERSE SWELL, by Hellmut H. E. Baumann. Technical rept. on Contract no. 62558-1544/2237. May 59, 100p. 14 refs.
Order from LC mi$5.40, ph$15.30 PB 150 011

The roll oscillations of a ship in a seaway are generated by both horizontal and vertical accelerations. The two types of stationary roll states due to these different components are considered for the general case of nonlinear restoring moments and damping. With a suitable assumption for the exciting function (wave profile), analytical expressions are devised for the dependence of the amplitude and periods of the roll oscillation on

those of the swell. The response curves and the stability limit of the forced oscillations can be evaluated if the phase integral and period of the undamped oscillation in calm water are known. (Approximate methods of evaluating these as functions of the roll amplitude are given). The method is illustrated for two different cases of righting arm curves. (Author)

FOOD FOR SPACE TRAVEL: AN EXAMINATION OF CURRENT CAPABILITIES AND FUTURE NEEDS, by Albert A. Taylor, Beatrice Fintelstein and Robert E. Hayes. July 60, 71p. 67 refs. ARDC-TR-60-8.
Order from LC mi$4.50, ph$12.30 PB 150 234

The state of progress and present capabilities in nutrition, food technology, and food service supporting equipment for manned space flight are described and evaluated in terms of future needs. The study is broad in scope. It describes feeding in very short to very long space missions. Preflight feeding provisions are described as well as partially regenerative systems and, finally, the requirements of a closed ecology are considered. A section is devoted to permissable preflight foods. Varied menus are offered for flights of short, medium, and long duration in an ascending order of variety, consumer acceptance, and support equipment. (Author)

SUITABLE INSULATED CONTAINERS FOR TRANSPORT OF MATERIALS HAVING CRITICAL THERMAL TOLERANCES TO HEAT, by John R. Cavanaugh. July 57, 9p. Technical note AAL-TN-57-44.
Order from OTS $0.50 PB 161 974

The container, "Chest, Plastic, Field, Insulated," Stock No. 6545 NSL, manufactured by Koch Mfg. Company was selected as the most feasible container investigated. This container and its test contents were subjected to internal temperatures ranging from +69° F. to -88° F. (estimated). During the evaluation of the "Chest, Plastic, Field" a specimen temperature below -70° F. was maintained for a period of 66 hours and 30 minutes, when the test was concluded. At conclusion of the test only 20% of the dry ice in the inner chest had sublimed. (Author)

STABILITY OF EXTERNALLY PRESSURIZED GAS JOURNAL BEARINGS, by Lazar Licht. Rept. on Contract Nonr-2342(00). Oct 59, 36p. 8 refs. I-A2049-8; AD-228 299.
Order from LC mi$3.00, ph$6.30 PB 149 489

A stability analysis is developed for gas journal bearings having externally pressurized pads, symmetrically spaced along the circumference. Simplifying assumptions are made and equations of flow and motion are stated in terms of perturbation quantities. The case considered is when the journal, initially in an eccentric equilibrium position, begins to move in an arbitrary direction under the influences of a small, random disturbance. Methods of factorizing and simplifying the characteristic determinants are shown, with the objective of reducing the work of examining the roots of characteristic equations. Special cases, such as the bidirectional thrust bearing and that of the journal initially in concentric position are discussed. Numerical and semi-experimental procedures of determining the coefficients of characteristic equations are outlined. Stability tests are suggested. A simple numerical example is included. Bearing parameters affecting stability are discussed. (Author)

Lincoln Lab., Mass. Inst. of Tech., Cambridge.
PRESSURE DISTRIBUTION, STABILITY, AND RESTORING TORQUE OF AN EXTERNALLY PRESSURIZED BEARING, by R. A. Greenberg. Master's thesis. Rept. on Contract AF 19(604)5200. 2 Feb 59, 20p. 3 refs. Technical rept. no. 198; AD-212 979.
Order from LC mi$2.40, ph$3.30 PB 147 587

A theoretical analysis of an externally pressurized bearing consisting of an annular disc nearly parallel to an infinite plate is conducted. The results are presented in the form of dimensionless graphs of the pressure distribution, load capacity and flow requirements of the bearing. Also, a dimensionless graph of the restoring torque of the bearing for small deflections is presented. These results indicate that maximum stability is attained for a ratio of inner diameter to outer diameter of the annulus in the range of 0.2 to 0.3. (Author)

Southern Research Inst., Birmingham, Ala.
AN INVESTIGATION OF ELECTROPOLISHING AS A TECHNIQUE FOR PRODUCING TAPERED WIRE, by Dan B. Darden. Technical note no. 2, 1 Dec 59-29 Feb 60, on Contract AF 08(635)391. 10 Mar 60, 17p. APGC-TN-60-44.
Order from LC mi$2.40, ph$3.30 PB 149 848

Previous tests on carbon steel music wire had shown no deterioration of tensile strength after electropolishing. Further investigation has shown that the electropolished wire has fatigue strength slightly superior to the unpolished wire. Metallurgical examination of polished and unpolished wires showed some structural differences, but these could not be definitely attributed to electropolishing. Photographs of specimens are included. A schematic of a production facility for tapered wire is shown. The cost of producing the first 40,000-foot tapered wire is estimated to be about $5000. Production wires could possibly be produced for as little as $100, plus the cost of material. No further experimental work under this contract is contemplated. (Author) (See also PB 144 573)

Southern Research Inst., Birmingham, Ala.
AN INVESTIGATION OF ELECTROPOLISHING AS A TECHNIQUE FOR PRODUCING TAPERED WIRE, by Dan B. Darden. Final technical rept. for 1 May 59-1 Mar 60 on Contract AF 08(635)391. 6 May 60, 48p. 6 refs. APGC-TR-60-28.
Order from LC mi$3.30, ph$7.80 PB 149 353

Tests were run on carbon steel music wire and Type 302 stainless steel wire to determine what change in unit strength would result from electropolishing 0.050- and 0.030-inch-diameter wire down to 0.020 inch. This was to evaluate electropolishing as a technique for manufacturing a continuously tapered tow cable for aerial targets. The stainless steel wire increased in unit strength from 276,000 psi at 0.0495-inch diameter to 374,000 psi at 0.023-inch diameter. The carbon steel music wire unit strength remained substantially constant. The flexural fatique strength of the electropolised carbon steel wire was found to be slightly superior to unpolished wire. Metallurgical examination of polished and unpolished carbon steel specimens showed some structural differences, but these could not be definitely attributed to electropolishing. It is estimated that a single 40,000-foot tapered wire could be produced for about $5000, with subsequent wires for about $100 each, exclusive of materials. (Author) (See also PB 149 848)

Transport, Traction and Hoist Facilities

Airborne Instruments Lab., Inc., Mineola, N. Y.
DATA ON NEW YORK AREA AIR TRAFFIC DENSITIES, by James S. Perry. Rept. on Contract NOas-56-678-c. Jan 57, 71p. 2 refs. Rept. no. 3803-1; AD-141 226.
Order from LC mi$4.50, ph$12.30 PB 147 956

The main purpose of this report has been to examine some of the aspects of air traffic in the New York area; utilizing the air-route radar display as a data-gathering tool. The parameters explored have been: total airborne traffic counts (with category breakdowns added), relation of total airborne traffic to movement data, density distributions and track composites, sector counts, separation data, airway load rates, accuracy of fix reporting, and holding-pattern sizes.

Land Locomotion [Lab.] Ordnance Tank-Automotive Command, Center Line, Mich.
A SOIL VALUE SYSTEM FOR LAND LOCOMOTION MECHANICS, by W. L. Harrison, T. Czako and others. Dec 58, 100p. 72 refs. Research rept. no. 5; AD-218 323.
Order from LC mi$5.40, ph$15.30 PB 149 277

Contents:
Physical soil and snow values for the determination of vehicle thrust
Physical soil and snow values for the determination of vehicle motion resistance
Geometrical terrain values for the determination of vehicle's operational speed
OTAC instruments for the measurement of physical soil values
The Caterpillar Corp. instruments for the measurement of physical soil values
Instrumentation for the measurement of terrain geometry
Techniques of soil measurement
Practical significance and applications of the physical soil value system
- Rigid wheel performance
- Prediction of rigid wheel sinkage
- Rolling resistance of pneumatic tires in soft soils
- Drawbar pull of tracked vehicles
- Wheels in viscous mud

Physical soil values in relation to moisture content and soil composition

Soil values and a definition of soil trafficability and vehicle mobility
Prediction of the WES Cone Index by means of land locomotion soil values.
Classification of soils and the significance of their parameters in land locomotion
Soil values and their measurements in the Soviet block

MATERIALS

Aeronautical Materials Lab., Naval Air Material Center, Johnsville, Pa.
INVESTIGATION OF THE EFFECTS OF VOLATILE CORROSION INHIBITORS ON MIL-B131C BARRIER MATERIALS, by D. Minuti and I. H. Custis. Final rept. on Proj. TED NAM AE 42144. 29 Jan 60, 13p. 3 refs. Rept. no. NAMC ANL AE 1105; AD-234 825L.
Order from LC mi$2.40, ph$3.30 PB 149 525

Investigation of the compatability of MIL-B-131C barrier materials with volatile corrosion inhibitors revealed that Type I volatile corrosion inhibitor-treated carriers had little or no effect on the water vapor transmission rate of MIL-B-131C barriers, although the resealability of some vinyl-faced barriers was affected. Type II materials caused delamination of all the polyethylene as well as a vinyl-faced barrier with resultant higher water vapor transmission rates. (Author)

MATERIALS REVIEW NO. 7, by Arthur Lyem. May 60, 101p. 330 refs. CWL Special Publication 4-18.
Order from OTS $2.50 PB 161 971

Three hundred and thirty articles from various journals have been abstracted. The review is broken down into five major headings: (1) high polymers, (2) plastic materials, (3) synthetic fibers, (4) metals and inorganic materials, and (5) miscellaneous and new concepts. (Author) (See also PB 161 463)

[Army] Signal [Research and Development Lab.] Fort Monmouth, N. J.
THE DEVELOPMENT OF SNOW MANUFACTURING TECHNIQUES BY USE OF CLIMATIC TEST COLD ROOMS, by Alexander J. Brickler. Rept. on Operation Snowflake. 4 Dec 48, 22p. 5 refs. Engineering rept. no. 1032.
Order from LC mi$2.70, ph$4.80 PB 150 685

This report released for sale to the public 11 Oct 60.

Snow can be made in limited quantity in the cold rooms of the Climatic Test Laboratory by the chilling of moisture clouds formed from steam injected into the rooms. The process can be made continuous so that a snow fall of approximately 3 inches can be produced by a 36 hour run. (Author)

Massachusetts U., Amherst.
SOME MECHANICAL AND OPTICAL PROPERTIES OF CFN POLYMERS, by H. Kawai and R. S. Stein. Technical rept. no. 16 on Contract Nonr-2151(00). 15 Oct 59, 19p. 12 refs. AD-232 563.
Order from LC mi$2.40, ph$3.30 PB 149 482

SC-CFN-GBV polymer, prepared from single sublimed R_f butyro amidine and R_f glutaro imidine obtained from doubly distilled R_f glutaro nitrile, was heat-treated and hot-pressed between aluminum foil and cellophane. The starting mole ratio was 1.3 butyro amidine to 1 glutaro imidine. A continuous and translucent circular film of the polymer laminate was obtained by a special casting technique. The diameter and thickness of the film was about 5 and 0.02 cm, respectively. The mechanical and optical properties of the polymer film were measured simultaneously at various temperatures, the former being measured by a modified instron tensile tester and the latter by an optical system which crosses the polymer film at various angles of 90° to 45°. Data indicated that the stress relaxation at 33°C was small and reached an equilibrium beyond about 10 min. The equilibrium stress was proportional to the applied strain at least within 20% strain. A check was made on the ideal rubber elasticity behavior. The number of cross links/cc, N_C, calculated from the inclination of the straight line portion (within the strain of 9%) was 2.58×10^{19}/cc. The apparent value of N_C was determined as 2.02×10^{19}/cc, indicating that the number of effective cross-links decreases slightly beyond the strain of 10%. The birefringence change decreased in an earlier stage and then increased. The increase appeared earlier when the strain was greater.

Minnesota U., Minneapolis.
RHEOLOGICAL PROPERTIES OF ADHESIVES CONSIDERED FOR INTERFACE DAMPING, by J. S. Whittier. Rept. for June 57-Dec 59 on Metallic Materials, Contract AF 33(616)6828. June 60, 70p. 10 refs. WADD Technical rept. 60-280.
Order from OTS $1.75 PB 171 023

Machines for testing soft adhesives under static compression and shear and under dynamic shear are described. Static creep data in compression and shear are reported for Minnesota Mining and Manufacturing Company's 3M Tape #466. At a given compressive load this material deforms, after sufficient time has elapsed, to an "equilibrium" thickness. Dynamic shear data for 3M Tape #466 are reported for frequencies from 0.1 to 120 cps and for shear strain amplitudes from zero to unity and greater. Stress history and fatigue effects are also mentioned. This material is found to dissipate large amounts of specific damping energy when undergoing safe dynamic shear strains. Spot checks on the dynamic shear properties of three other materials at 11.5 cps are also presented. The terms used for data presentation are explained in the report by giving data reduction formulas. (Author)

CORAL AND CORAL CONCRETE, by William R. Lorman. Final rept. 13 Apr 60, 57p. 22 refs. Technical rept. 068.
Order from LC mi$3.60, ph$9.30 PB 149 232

This manual describes and defines coral reefs, beaches, and elevated formation; presents salient features relative to prospecting for suitable coral deposits, extracting coralline limestone, and processing and stockpiling the aggregate; summarizes findings concerning such physical properties of coral aggregate as bulk density, specific gravity, and absorption; furnishes typical coral concrete mix-proportion data together with anticipated strength values. (Author)

Rodman Lab., Watertown Arsenal, Mass.
APPLICATION OF THE DIGITAL COMPUTER TO MICROHARDNESS DETERMINATION, by K. D. Holmes, E. Deluca, and G. D. Pinching. Apr 60, 9p. 2 refs. Rept. no. RPL 10/24.
Order from LC mi$1.80, ph$1.80 PB 149 571

A simplified method for determining Knoop or Diamond Pyramid microhardness numbers is established by using the digital computer to convert the measured length of the microhardness impression directly to its corresponding hardness number. Numerical tables are set up which eliminate operator calculations, thereby considerably reducing the time and effort necessary for obtaining a microhardness number. (Author)

Ceramics and Refractories

Battelle Memorial Inst., Columbus, Ohio.
CHARACTERISTICS GOVERNING THE FRICTION AND WEAR BEHAVIOR OF REFRACTORY MATERIALS FOR HIGH-TEMPERATURE SEALS AND BEARINGS, by Lewis B. Sibley, Arthur E. Mace and others. Rept. for 1 Mar 58-31 May 59 on Ceramic and Cermet Materials, Contract AF 33(616)3995. May 60, 54p. 4 refs. WADD Technical rept. 60-54.
Order from OTS $1.50 PB 171 010

Various ceramic and cermet materials have been evaluated for unlubricated wear resistance at high sliding speed (100 to 200 fps) and low unit load (5 to 50 psi) in 1000 to 1800°F air. A statistical correlation was obtained between the measured wear rates under these conditions and the coefficient of friction, the thermal-stress-resistance, and the thermal diffusivity of the mated materials on which wear predominated. A mechanism of wear has been evolved based on the above correlation and on the experimental study of friction and wear surface-temperature fluctuations using special transducers and color-motion-picture photography. During high-speed sliding wear appears to be induced by the inability of ceramic and cermet materials to resist thermal stresses produced by temperature gradients within each rubbing surface between small asperities or hot spots in frictional contact and the body of the respective materials. In this situation, the wear rate is influenced both by the configuration of the rubbing parts and by the thermal-stress-resistance properties of the materials. Promising materials for high-temperature high-speed sliding bearings and seals include Al_2O_3-Cr-Mo cermets, SiC ceramics, and TiC-Ni-Mo cermets. (Author)

Battelle Memorial Inst., Columbus, Ohio.
DEVELOPMENT OF METHODS AND INSTRUMENTS FOR MECHANICAL EVALUATION OF REFRACTORY MATERIALS AT VERY HIGH TEMPERATURES, by D. H. Fisher, D. N. Gideon and others. Rept. for 1 Feb 59-31 Mar 60 on Metallic Materials, Contract AF 33(616)6155. June 60, 82p. 79 refs. WADD Technical rept. 60-155.
Order from OTS $2.25 PB 171 012

A mechanical-testing system has been established which is capable of providing tensile and compressive stress-strain data and shear-strength data up to 400 F in vacuum. The results of an evaluation of the system using a molybdenum-0.5 percent titanium alloy in the bar form are presented. Tension, compression, shear and bearing tests were conducted at temperatures up to 3500 F. A detailed description of the testing system and specimen designs is presented. An optical strain-measurement system which permits displacements to be measured directly in the gage section is described. The state-of-the-art report on the development of equipment and techniques of mechanical-properties measurement is based on a survey of literature and discussions with researchers at Battelle and other laboratories. With the objective of developing equipment and technique for use to 6000°F or higher problems to be solved in order that accurate data will be obtained are considered. Recommendations are made concerning furnace design, temperature and strain measurement, and specimen, grip and loading design. In particular, the probable advantages of graphite heaters coated with tantalum carbide are pointed out. (Author)

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
STRAIN AGING OF REFRACTORY METALS, by A. G. Imgram. Rept. on Contract AF 18(600)1375. 12 Aug 60, 64p. 47 refs. DMIC rept. no. 134.
Order from OTS $1.75 PB 151 092

The available data on strain-aging behavior of 12 refractory metals (V, Cb, Ta, Cr, Mo, W, Ru, Rh, Pd, Os, Ir, and Pt) are reviewed and interpreted in terms of dislocation models. (Author).

Fuels, Lubricants, and Hydraulic Fluids

Aerojet-General Corp., Azusa, Calif.
THE ROLE OF BINDER IN COMPOSITE PROPELLANT COMBUSTION, by R. F. Chaiken and W. H. Andersen. Rept. on Contract AF 49(638)566. July 59, 26p. 16 refs. Aerojet rept. no. TN-30; ARPA Order no. 24-59, Task 2; AFOSR TN-59-540; AD-228 340.
Order from LC mi$2.70, ph$4.80 PB 149 772

The interrelation of binder (fuel) and oxidizer during burning of conventional types of solid composite propellants is discussed in terms of the mechanism of the

combustion process. A major feature of most contemporary theories of composite propellant combustion is that diffusion processes are involved in the chemical reactions between the gaseous pyrolysis products of the oxidizer and binder. However, the importance of these diffusion processes in affecting the propellant-burning characteristics depends upon the relative rates of reaction between the oxidizer-binder pyrolysis products and the oxidizer pyrolysis products alone. Utilizing the recently developed "Two-Temperature" and "Thermal Layer" theories of combustion, it is possible to delineate the various effects of these gaseous reactions on the propellant burning rate. These theories have been extended semi-quantitatively to include the effects of dilution, diffusion, and fast chemical reaction of the gasified binder. The combustion of ammonium nitrate and ammonium perchlorate propellants is discussed in terms of the described concepts, and compared with experimental data where possible. Evidence is presented which suggests that the "order-of-magnitude" burning rates of most ammonium-nitrate-based propellants should be determined largely by the chemical decomposition behavior of the oxidizer, with the binder decomposition playing a secondary role. It is not clear that the same situation holds for ammonium-perchlorate-based propellants. (Author)

Air Force Missile Development Center, Holloman AFB, N. Mex.
A TRACER METHOD FOR BURNING RATE MEASUREMENT IN SOLID-PROPELLANT MOTORS, by F. G. Penzig. Aug 60, 24p. 5 refs. AFMDC-TN-60-8.
Order from LC mi$2.70, ph$4.80 PB 150 045

Problems associated with the development of large, solid-propellant rockets are discussed. A new diagnostic method is proposed whereby tracers are imbedded into the grain and are released when the burning zone has reached their particular location. The release is recorded by spectroscopic monitoring of the exhaust flame of the rocket. Consequently, the method permits measurement of the actual burning rate of the propellant in a rocket motor. Research is proposed on the selection of suitable elements and compounds as tracers measurement of the line or band intensity as a function of temperature and concentration, and the ability of spectroscopic signals at low temperature and against background radiation. This study concentrates on the applicability of the method. A number of readily available tracer substances are discussed, including applicability of the method to advanced propellants with high background radiation. (Author)

Army Rocket and Guided Missile Agency, Redstone Arsenal, Ala.
INTRODUCTION TO SOLID-PROPELLANT THERMAL PROPERTY SCALING THEORY, by Ralph D. Doner. 12 Oct 59, 12p. 4 refs. ARGMA TN 1 G4N; AD-227 628.
Order from LC mi$2.40, ph$3.30 PB 149 440

Some implied scaling relations between solid symmetric bodies found in the literature on heat transfer are analyzed and exhibited. A suggested approach to the task of establishing a scaling theory for solid-propellant grain configurations is to extend the theory for solid bodies to include hollow cylinders, and then, by computation and physical tests, find the hollow cylinder equivalent for each type of configuration. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
EVALUATION OF PROPELLANT STABILITY BY OXYGEN TALIANI TEST AND CHEMICAL ANALYSIS, by L. DeAngelis and G. F. Gardin. Aug 59, 14p. 11 refs. Memo. rept. no. 1129; AD-228 834.
Order from LC mi$2.40, ph$3.30 PB 150 297

The oxygen Taliani Test has been extended to measure the chemical stability of single base propellants. The results correlate well with chemical analysis of propellant stabilizer and stabilizer reaction products. The findings were made by aging propellant samples at 80°C, a temperature previously considered too high for obtaining reliable stability data. However, evidence is presented to show that the principal chemical reactions between propellant and stabilizer at this temperature can be considered similar to those occurring at ambient temperatures. Accelerated aging at 80°C and the Oxygen Taliani Test have been used to make quantitative measurements of chemical stability for single base propellants. (Author)

A STUDY OF THE TITANIUM-LIQUID OXYGEN PYROPHORIC REACTION, by J. D. Jackson, P. D. Miller and others. Rept. for 1 June 59-15 Feb 60 on Metallic Materials, Contract AF 33(616)6345. June 60, 59p. 29 refs. WADD Technical rept. 60-258.
Order from OTS $1.50 PB 171 017

A review of the literature indicates that titanium is impact sensitive under liquid oxygen below the acceptable limit for other metals. An experimental program was begun to determine the mechanism of the titanium-LOX reaction. Several factors were investigated singly in a controlled manner using unalloyed titanium (75A) and an alloy (6Al-4V) that were carefully cleaned. The factors were: (1) Exposure of a fresh surface by fracture and tearing (2) Deformation by impact using steel balls (3) Impact of smooth specially cleaned flat surfaces (4) LOX pressure and velocity (5) Galling. The results from this program indicate that no one of the above, per se, is a primary cause of this reaction. A proposed mechanism is that heat generated by impact produces gaseous oxygen, which is compressed at local sites. A fresh surface exposed by the impact reacts with the high-pressure gaseous oxygen. Propagation is dependent on the amount of heat generated and the rate of heat loss from the affected area. (Author)

THE FISCHER-TROPSCH SYNTHESIS ON THE OIL-CIRCULATION PROCESS: EXPERIMENTS WITH A NITRIDED FUSED-IRON CATALYST, by D. Bienstock, J. H. Field and others. [1960] 37p. 23 refs. Rept. of Investigations 5603.
Order from LC mi$3.00, ph$6.30 PB 146 767

Using a nitrided fused-iron catalyst, the Bureau of Mines investigated the Fischer-Tropsch reaction in the oil-circulation process. The nitrided iron was

quite stable and permitted the longest run obtained thus far in the oil-circulation process without the need for reactivating the catalyst--3,700 hours of operation. The effects of several operating variables--temperature, pressure, gas-recycle ratio, space velocity, synthesis-gas composition, and synthesis with and without reflux of oil to the reactor--on the production of oxygenates were studied. The importance of removing reflux oil and of high gas recycle in increasing the oxygenate content was shown. A finished gasoline containing 28 percent by weight alcohols was produced. The research octane number (RON) was 92.9 clear, increasing to 98.5 with the addition of one milliliter of tetraethyl lead (TEL). (Author)

FLAME PROPAGATION IN LIQUID-FUEL DROPLET ARRAYS, by R. Reichenbach, D. Squires, and S. S. Penner. Technical note no. 30 on Contract DA 04-495-ORD-1634; Continuation of Contract DA 04-495-ORD-446. June 60, 18p. 2 refs. OOR rept. no. no. 834.43-C.
Order from LC mi$2.40, ph$3.30 PB 150 402

Flame propagation rates have been determined in one-dimensional arrays of liquid octane droplets burning in air without forced convection. Schlieren photographs of the burning array show the importance of immersion depth in the heated gas region for ignition and flame propagation. The measured flame propagation times for various droplet sizes and droplet spacings are proportional to (immersion depth)$^{-1.5}$. A tentative explanation is proposed for these results. (Author)

RADIATION AND BURNING VELOCITIES OF PROPANE-OXYGEN-NITROGEN MIXTURES, by R. Reichenbach. Technical rept. no. 31 on Contract DA 04-495-ORD-1634. June 60, 30p. 20 refs. OOR rept. no. 834-42-C. AD-239 907.
Order from LC mi$2.70, ph$4.80 PB 150 397

Experiments have been conducted with inert diluent contents (by mass) of 50, 60, 70 and 80 percent nitrogen and with equivalence ratios of 0.6, 0.8, 1.2, 1.4 and 1.6. The spectral intensity ratio was found to be a function not only of the equivalence ratio but also of the percentage of inert diluent. Hence it is not possible, in general, to use spectral intensity ratios as a measure of mixture composition, a procedure that has been used erroneously by a numer of investigators. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
OPTIMUM PROGRAMMING OF PROPELLANTS TO OBTAIN MAXIMUM VELOCITY FROM A TWO-STAGE ROCKET, by Jean Parks and R. H. Olds. Technical rept. Nov 59, 49p. 4 refs. LMSD-288047; AD-231 037.
Order from LC mi$3.30, ph$7.80 PB 148 942

Previous studies have shown that certain combinations of two propellants with significantly different densities and specific impulses will propel a given single-stage rocket to a final velocity greater than that obtainable from the use of either propellant alone. This report extends the investigation to the treatment of a two-stage rocket employing four different propellants, two different propellants in each stage. A method is presented for determining the optimum mode of varying the propellant mixture ration during burning so as to achieve the maximum possible velocity from the two-stage rocket.

Massachusetts Inst. of Tech., Cambridge.
INTERACTIONS AMONG BURNING FUEL DROPLETS. I. A SINGLE FUEL PLATE, by Tau-Yi Toong. Rept. on Contract AF 49(638)629. 31 May 60, 26p. 7 refs. Technical rept. no. 8227-1; AFOSR-TN-60-516; AD-239 513.
Order from LC mi$2.70, ph$4.80 PB 149 461

This is the first of a series of papers, intended to discuss the basic causes and mechanisms of the interactions among burning fuel droplets and their effects on over-all burning rate and combustion stability and roughness in a combustor employing fuel sprays. The boundary-layer equations governing the flow of an oxidizer over a flat plate covered with fuel are solved for a special case, where the flame front can be treated as a discontinuity. The results presented include the profiles of velocity, composition and temperature in the boundary layer adjacent to the fuel plate as well as the evaporation or sublimation rate at the fuel surface and the combustion rate at the flame front. For a given fuel-oxidizer combination and for a given heat transfer required to evaporate (or sublime) one unit mass of fuel, both the evaporation (or sublimation) and the combustion rates per unit plate area and per unit mass velocity of the oxidizer in the free stream are inversely proportional to the square root of the length Reynolds number. With increasing values of the heat ratio, they both increase at a given length Reynolds number, although the ratio of the combustion to evaporation (or sublimation) rates decreases. This latter observation indicates the possibility of a long over-ventilated flame near the wake of a burning fuel droplet. (Author)

Massachusetts Inst. of Tech., Cambridge.
INTERACTIONS AMONG BURNING FUEL DROPLETS. II. TWO PARALLEL FUEL PLATES, by Tau-Yi Toong. Rept. on Contract AF 49(638)629. 31 May 59, 20p. 4 refs. Technical rept. no. 8227-2; AFOSR-TN-60-517; AD-239 669.
Order from LC mi$2.40, ph$3.30 PB 149 462

The interactions between two parallel fuel plates burning in an oxidizer stream are studied by the use of an integral method. Within the region of validity of this method, where the flames adjacent to the plates are separated from each other, the evaporation or sublimation rate at the fuel surface increases with decreasing spacing between the plates, while, in the meantime, the combustion rate at the flame front decreases. These interactions become less important with decreasing value of the heat ratio. Applying the results obtained in this work to the case of two fuel droplets burning side by side, one would predict an increase in both the burning rate and the flame length with decreasing droplet spacing, as long as the flames surrounding the droplets are separated from each

other. These predictions are found to agree well with the experimental results, which will be presented in the third paper of this series. (Author) (See also PB 149 461)

Naval Research Lab., Washington, D. C.
THE STABILIZATION OF SILICONE LUBRICATING LIQUIDS ABOVE 200°C. PART 2. IRON, COPPER, CERIUM, AND OTHER METAL COMPOUNDS, by H. R. Baker and C. R. Singleterry. Interim rept. 12 Aug 60, 27p. 5 refs. NRL rept. 5474.
Order from OTS $0.75 PB 161 449

Silicone liquids have been stabilized against oxidation and gelation so that the useful life at 325°C or below is lengthened 30- to 500-fold over the original oil. The stabilization is accomplished by treating the silicone oil with a cerium soap in the presence of disalicylalpropylenediamine, or a related chelating compound, at 285°C. Similar but less effective stabilization occurs when the cerium soap is replaced by suitable iron, copper, chromium, praseodymium, or europium compounds. This treatment is effective with dimethyl silicones and also with phenyl-substituted types. The percentage improvement obtainable with the phenylated oils decreases with increasing aromatic content; after inhibition the lightly phenylated oils, which have excellent viscosity-temperature characteristics, have as long a life as the highly phenylated oils, heretofore found most stable in high-temperature service. Also, the volatile products of silicone oxidation at 300°C promote premature gelation if they are returned to the liquid under test.

Nonmetallic Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
HIGH TEMPERATURE HYDRAULIC FLUIDS. PART I. CHEMICAL DEGRADATION IN A HIGH TEMPERATURE, HIGH PRESSURE CIRCULATION LOOP, by Leslie R. Drane, Jr. and R. J. Benzing. Rept. on Power Transmission Technology. May 60, 20p. 6 refs. WADD Technical rept. 60-250, Part I.
Order from OTS $0.50 PB 161 965

A study was made to observe the nature and intensity of chemical degradation resulting from severe mechanical shearing stresses at elevated (400°F) temperature. The degradation of these four fluids (two silicones, a silane, and an alkoxy disiloxane) were also studied under static thermal conditions. The physical and chemical properties, particularly viscosity, neutralization number, and flash point showed changes in direction of values with time. Possible mechanisms of break-down to explain observed differences between the static and dynamic tests are discussed. (Author)

EVAPORATION AND BREAKUP OF FUEL DROPLETS IN ONE-DIMENSIONAL GAS FLOW IN A COMBUSTION CHAMBER, by Leonard M. Naphtali and Samuel Z. Burstein. Rept. on Contract AF 49(638)165. Jan 60, 21p. 6 refs. PRL-60-2; AFOSR-TN-60-229; AD-233 498.
Order from LC mi$2.70, ph$4.80 PB 148 999

A mathematical model was formulated of combustion in a rocket motor as controlled by the evaporation process of an arbitrary number of droplets of injected fuel. It was assumed that interaction between single droplets was negligible and that evaporation rates of a distribution of droplets were additive. The results of the evaporation of the fuel droplets were weighed to yield a mass rate flow which was consistent with the conditions in a combustion chamber producing a thrust of about 25,000 lb. The model was programmed as a Fortran II subroutine for the IBM 704. Computations revealed that under a wide range of conditions a cooperative breakup occurred, in which the increased velocity of gases caused droplet breakup, which further increased evaporation. As a result, the overall evaporation occurred suddenly in a narrow zone in the combustion chamber where the velocity gradient was high. It was concluded that droplet breakup was the most important single parameter in spray combustion. The combustion zone tended to be narrow and relatively insensitive to size distribution, mass drop size, velocity, or temperature of the liquid.

DISPLACEMENT AND SHATTERING OF PROPELLANT DROPLETS, by E. Rabin, A. R. Schallenmuller, and R. B. Lawhead. Rept. on Contract AF 18(603)98. Mar 60, 124p. 20 refs. R-2431; AFOSR-TR-60-75.
Order from LC mi$6.30, ph$19.80 PB 150 143

Studies in shock tubes have been conducted to determine the effect of shock waves on the shattering and drag of burning and nonburning liquid fuel droplets. The effect of flow velocity, flow duration, surface tension, and chamber pressure on the breakup characteristics were studied. The critical velocity that would just cause droplet breakup (burning or not) for short-duration flow was found to agree with the equation: $We\ Re^{-1/2} \simeq 0.45$. The drag coefficient for burning and nonburning drops was found to be approximately $C_D = 1.0$.

Leather and Textiles

Fabric Research Labs., Inc. [Dedham, Mass.]
A POSSIBLE APPLICATION OF ORGANIC FIBERS IN HIGH TEMPERATURE ENVIRONMENT, by Myron J. Coplan, Donald H. Powers, Jr. and others. Rept. for Mar-Dec 59 on Air Force Textile Materials, Contract AF 33(616) 6234. June 60, 137p. 90 refs. WADD Technical rept. 60-9.
Order from OTS $2.75 PB 171 020

It is taken as a premise that fabrics used in re-entry drag parachutes (1) require typical textile properties up to deployment but (2) that they need not survive in their original chemical state subsequent to deployment provided the decay occasioned by re-entry conditions (heat, active oxygen, irradiation) does not interfere with the deceleration function. The possible utility of linear organic polymers as the principal chemical species in such materials is examined. Typical organic, metallic and ceramic materials are contracted and the advantages of organic materials are defined. Recognizing that the principal deficiencies of organic polymer fibers are their thermal and thermochemical sensitivity, a survey of their causes is given. A means of employing materials by taking advantage of their thermal degeneration is proposed. A number of specific thermo-chemical reaction schemes and polymer systems are proposed. More experimental effort is required to assure the feasibility of any of the specific schemes proposed. (Author)

Naval Supply Research and Development Facility, Bayonne, N. J.
REFLECTIVE INSULATION IN FABRIC SYSTEMS, by John J. Anderson and George Higginbottom. Sep 59, 21p. 5 refs. Clothing and Textile Div. rept. no. 44.
Order from LC mi$2.70, ph$4.80 PB 146 975

Several fabric systems employing thin metal films which act as far infra-red barriers were tested for conductance and compared against the conductance of the fabric system used in Navy extreme cold weather clothing. Conductance was measured at sea level, 20,000 and 40,000 feet simulated altitude. Metallized fabrics separated by an open mesh spacer provide good insulation comparable to conventional fibrous systems of equal thickness and are lighter in weight. (Author)

DEVELOPMENT OF SHADE STANDARDS AND TOLERANCES FOR SILVER TAN 193, by Frank J. Rizzo, Constantine J. Megas and others. Rept. for 9 Apr 53-15 Apr 58 on Air Force Textile Materials, Contracts AF 33(616)53-221 and AF 33(616)54-107. June 60, 123p. 25 refs. WADD Technical rept. 60-151.
Order from OTS $2.75 PB 171 011

Shade standards and tolerances have been developed for tropical and gabardine weave fabrics in all wool, wool/polyester and polyester/rayon blends. Tolerance spacing is such as to permit interchange of uniform components made for the blend fabrics with components made of all wool so long as the weave construction is common. The limiting factor to such usage is considered to be differences in appearance originating with the gloss of the fibers and not the chromatic and lightness deviations of the tolerance range. Colorfastness is good at 50 Standard Fading Hours for all fabrics, except for the polyester/rayon tropical where the vat dyed rayon permits a rating of good at 120 Standard Fading Hours. Dye formulations selected are practical for routine application and stable to finishing factors. (Author)

Quartermaster Research and Engineering Center, Natick, Mass.
EFFECT OF PICKS PER INCH AND FINISHING PROCEDURES ON THE PROPERTIES OF 1.1-OUNCE NYLON RIPSTOP PARACHUTE FABRIC, by Harold H. Brandt and Leo Linden (Warwick Mills). June 60, 54p. 18 refs. Textile Series rept. no. 113.
Order from LC mi$3.60, ph$9.30 PB 150 265

This report presents the production and laboratory evaluation of 1.1-ounce nylon ripstop fabrics produced with different picks and finished by two different sequences of the finishing operations. It is believed that the information contained in this report will be of value to the textile industry as well as to the military in the production of a nylon canopy fabric which will possess an adequate air permeability during the life of the parachute. ANALYSIS OF AUTOMOTIVE METHACRYLATE LACQUERS, by M. H. Swann. 20 June 60, 8p. 2 refs. CCL #95.
Order from LC mi$1.80, ph$1.80 PB 149 961

The basic resinous portion of the new acrylic automotive lacquers is an alkyl ester of methacrylic acid. They are blended with nitrocellulose and suitable plasticizers in the approximate ratio of 12:4:1 parts by weight. Procedures for measuring the methacrylate resins in typical mixtures of this type have not been available. Use is made of the difference in resistance to saponification to isolate the methacrylate resins. (Author)

Coating and Chemical Lab., Aberdeen Proving Ground, Md.
GEL-TYPE, VERTICAL ADHERENCE PAINT REMOVERS, by A. Mankowich. Rept. no. 1, 20 July 60, 13p. 1 ref. CCL #94.
Order from LC mi$2.40, ph$3.30 PB 149 420

A heavy duty, single phase, alkaline-organic solvent paint remover, formulated during the development of medium pH strippers suitable for use on missile component parts of aluminum, can be converted into stable, vertical adherence strippers by gelling with metallic soaps. A method of preparing the gels has been devised. While such removers are transformed into two liquid layers at 155° F and frozen solid at -40°F, they regain their original consistency and adhesiveness at room temperature. Low alkalinity compositions of this type, suitable for use on aluminum basis metals from the non-corrosivity standpoint, are unsuitable because of almost zero stripping efficiency.

Plastics

Army Engineer Research and Development Labs., Fort Belvoir, Va.
DETERMINATION OF LONG TERM BEHAVIOR OF EXTRUDED PLASTIC PIPE FROM BURST STRENGTH TESTS, by S. Goldfein. 29 July 59, 28p. 11 refs. Rept. 1590-TR; AD-226 688.
Order from LC mi$2.70, ph$4.80 PB 150 199

Four types of thermoplastic pipe were investigated. These included high-density polyethylene, acrylonitrile-butadiene-styrene, high-impact polyvinyl chloride, and normal polyvinyl chloride pipe. Master rupture curves were obtained by plotting hoop stress versus the parameter. The master curves so obtained were then used to predict rupture properties for periods of time from 0.1 hour to 45,000 hours. Good accuracy was obtained by this method. It is concluded that: (a) The parameter $K = \frac{T_o T}{T_o - T}(20 + \log t)$, where T_o = zero strength temperature (degrees R), and t = time (hours), may be used to determine long-term operating pressures of thermo-plastic pipe using burst strength tests at elevated temperatures. (b) The value of zero strength temperature may be determined from molding temperature data or extrapolation of strength-temperature curves, whichever is more feasible. (Author)

Army Engineer Research and Development Labs., Fort Belvoir, Va.
DEVELOPMENT OF NONDESTRUCTIVE TEST FOR PLASTICS, by S. Goldfein. 16 May 60, 49p. 2 refs. Technical rept. 1633-TR.
Order from LC mi$3.30, ph$7.80 PB 150 231

An investigation was made to determine whether a penetration type test could be developed as a nondestructive test for determining the strength of plastic materials and items fabricated from plastics. A penetrator having a circular cross section .130 in. in diameter was forced into 17 different plastic materials. The characteristics of the penetration load-penetration depth curves were studied, as well as the progressive damage to the plastics. Many useful relationships were established, including a relationship between penetration index (a property easily determined with no mark or effect on the material) and the following properties: tensile, shear, and compressive strengths, and tensile modulus. The method is limited to materials and items under which a steel backup plate can be placed. It is concluded that: (a) a mechanical, nondestructive test method based on a penetration test has been developed for use with all types of plastics; (b) new properties designated as penetration proportional limit, penetration strength, and penetration index may be useful in characterizing plastic materials for design or inspection purposes; (c) the test may presently be performed in the laboratory rapidly and with little cost. (Author)

Army Prosthetics Research Lab., Washington, D. C.
A METHOD FOR THE DETERMINATION OF SOIL RESISTANCE OF POROUS LAMINATES, by William C. Wiedman and James T. Hill. June 59, 11p. 1 ref. Technical rept. no. 5932; AD-220 610.
Order from LC mi$2.40, ph$3.30 PB 147 818

A preliminary investigation is described of a method for soiling and cleaning porous laminates. The process consists of blowing finely powdered charcoal on the surface of a laminate sample, measuring its reflectance value on a Color Difference Meter and then cleaning the sample with a stream of air. (Author)

Feltman Research Labs., Picatinny Arsenal, Dover, N. J.
ULTRA-HIGH RESISTANCE MEASUREMENTS OF PLASTICS, by Andrew R. Blanck. Aug 60, 14p. 4 refs. Technical rept. FRL TR-6.
Order from OTS $0.50 PB 161 784

A method has been developed for measuring resistances greater than 10^{16} ohms. This method is based on the use of a voltage divider integrating circuit in conjunction with commercially available high-input impedance electrometers. Accuracy of the technique was confirmed by testing a resistor with a certified value of 10^{13} ohms. The ability to measure these extremely high resistance values is necessary for determining the resistivities of low-loss dielectrics such as Teflon, polystyrene, Mylar, and some epoxies and for determining the insulation resistance and leakage of components and electrical equipment. Teflon was found to have a volume resistivity of 5×10^{19} ohm-cm at a potential gradient of 5 volts/mil and 5×10^{20} ohm-cm at .05 volt/mil. (Author)

Naval Research Lab., Washington, D. C.
PHOTODEGRADATION OF HIGH POLYMERS. PART I. THE HOMOGENEOUS IONIC POLYMERIZATION OF α-METHYLSTYRENE, by R. B. Fox and L. Isaacs. 19 Aug 60, 11p. 30 refs. NRL rept. 5518.
Order from LC mi$2.40, ph$3.30 PB 147 965

A practical method has been developed for the laboratory preparation of poly-α-methylstyrene. The procedure involves the reaction of α-methylstyrene with sodium in tetrahydrofuran solution at a temperature above the ceiling temperature for the monomer concentration used and propagation by cooling to -78°C. All operations are conducted under helium. Optical densities of the solutions just prior to cooling are related empirically to the intrinsic viscosities of the polymers produced, and viscosities are given as a function of polymerization time for a fixed solution optical density. Relatively mono-disperse polymers with predictable molecular weights in the range of 50,000 to 1 million were prepared. Their molecular weight distributions were compared qualitatively by sedimentation methods with those obtained by heterogeneous sodium initiation and boron trifluoride etherate initiation. (Author)

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
THE PYROLYSIS OF PLASTICS IN A HIGH VACUUM ARC IMAGE FURNACE, by Henry L. Friedman. Rept. on Contract AF 04(647)269. May 60, 39p. 7 refs. Technical Information Series R60SD380.
Order from LC mi$3.00, ph$6.30 PB 150 288

An apparatus is described for high vacuum pyrolysis of plastics in an arc-image furnace. A fractionation and analysis scheme is presented, whereby the complex mixture of pyrolysis products may be analyzed accurately. The design of a new gas chromatography valve is included. This experimental approach is able to yield a very complete picture of the chemical composition of pyrolysis products. The rate data were not as accurate as the chemical analyses. The data which may be obtained from such experiments will be useful for ablation studies and for gaining insights to the mechanism of thermal degradation of plastics. (Author)

Applied Mathematics and Statistics [Labs.] Stanford U., Calif.
THE RECURRENCE OF REAL MARKOV PROCESSES, by John Lamperti. Technical rept. no. 27 on Contract Nonr-225(21). 8 June 59, 23p. 5 refs. AD-217 647.
Order from LC mi$2.70, ph$4.80 PB 147 895

Markov processes are considered which have the non-negative reals as their state space, and the property that the transitions made by the process are uniformly bounded. If $\{X_n\}$ are the random variables comprising the process, then for some constant $M < \infty$, $|X_{n+1} - X_n| \leq M$ a. s., $n = 0, 1, 2, \ldots$. Conditions are found under which $X_n \to \infty$ a. s. ($\{X_n\}$ is transient), and also under which $\{X_n\}$ is recurrent. These conditions are in terms of the behavior of the function $F(x, y) = \Pr(X_{n+1} \leq y \mid X_n = x)$ for large values of x. (Author)

California U., Los Angeles.
INCREMENTAL PHASE PLANE ANALYSIS OF NONLINEAR SECOND ORDER DIFFERENCE EQUATIONS, by Richard A. Nesbit. Rept. on Contract AF 49(638)438. Feb 60, 36p. 13 refs. Dept. of Engineering rept. no. 60-28; AFOSR-TN-60-616.
Order from LC mi$3.00, ph$6.30 PB 150 251

The use of the incremental phase plane in the analysis of nonlinear difference equations is discussed. The variable and its first difference are the coordinates of this plane; for each point in the plane there is a unique solution to a second order difference equation. The relation between the trajectories in the incremental phase plane and in the ordinary phase plane is shown for linear paired equations. An isocline method of graphically obtaining the solution to the difference equation is developed. An extension of the isocline method gives a set of curves tangent to the solution path, called path tangent curves. These curves allow convenient description of difference equation switching. Criteria for the determination of the stability of singular points in the incremental phase plane are given for both forms of the difference equation. For continuity of development, a synopsis of related material is presented. It is intended that these techniques may be applied to aid the design of nonlinear sample data systems. (Author)

California U., Berkeley.
LOWER BOUNDS FOR THE FIRST EIGENVALUE OF ELLIPTIC EQUATIONS OF ORDERS TWO AND FOUR by William W. Hooker. Technical rept. no. 10 on Contract AF 49(638)398. Aug 60, 51p. 24 refs. AFOSR-TN-60-806.
Order from LC mi$3.60, ph$9.30 PB 150 237

This dissertation is concerned with the analytic and numerical study of a new method of obtaining lower bounds for the first eigenvalue of elliptic differential equations. The basic feature of this method was developed by M. H. Protter from an idea due originally to Picard.

Carnegie Inst. of Tech. Graduate School of Industrial Administration, Pittsburgh, Pa.
LINEAR PROGRAMMING AND DISCRETE DYNAMIC PROBLEMS, by John F. Muth. ONR memo. no. 67 on Planning and Control of Industrial Operations, Contract [Nonr-760(01)] Oct 59, 11p. 2 refs. AD-227 319.
Order from LC mi$2.40, ph$3.30 PB 149 878

A system is assumed to possess a finite number of states, the probability of being in any particular one depending on the previous state of the system, as well as the process chosen by the decision-maker. The probabilities and the short-run profits for each transition and process constitute the data. The problem is to find the policies leading to maximum profits in the long run. The purpose of this paper is to show that the problem may be handled with extreme point methods of linear programming. By recasting the problem in such terms a variety of efficient algorithms and computing routines are available for practical use.

OPTIMAL PROCESS MEANS AND THE DISTRIBUTION OF COMPLETION TIMES, by John F. Muth. ONR Research memo. no. 66 on The Planning and Control of Industrial Operations, Contract [Nonr-760(01)]. Sep 59, 18p. 4 refs. AD-227 318.
Order from LC mi$2.40, ph$3.30 PB 148 603

Quality control theory is concerned with accepting a batch of a product or detecting when a production process starts to wander or get out of control with

minimal sampling costs for a specified degree of precision. Problems on the optimal design of the process are examined. One of these is choosing the mean of a process to minimize the costs of scrapping and reworking an item. The problem is stated as follows: suppose a single dimension of a part is being machined; for a unit to be acceptable, this dimension must lie between the lower tolerance limit, L, and the upper limit, U. If the relevant dimension is less than L, the item must be scrapped and replaced at an extra cost of S; if greater than U, it may be reworked at an extra cost of R. (Author)

NOTE ON COHOMOLOGY ALGEBRAS OF SYMMETRIC GROUPS, by Minoru Nakaoka. Technical note on Contract AF 18(600)1383. June 60, 19p. 5 refs. AFOSR-TN-60-757.
Order from LC mi$2.40, ph$3.30 PB 150 059

This is a continuation of a previous paper, and deals with the mod p cohomology algebra $H^*(S(m); Z_p)$ of the symmetric group S(m) of degree m, where $1 \leq m \leq \infty$ and p is a prime.

[Colorado U., Boulder]
INFINITE RADICALS IN THE COMPLEX PLANE, by Georgellen Schuske and W. J. Thron. Rept. on Contract AF 49(638)100. [1960] 11p. 8 refs. AFOSR-TN-60-909.
Order from LC mi$2.40, ph$3.30 PB 150 195

The purpose of this paper is to determine conditional convergence regions for sequences $\{u_n\}$ with complex elements. The Stieltjes-Vitali Theorem for normal families of functions is used, together with Herschfeld's criterion for infinite radicals with positive real elements. This method is similar to that used previously in the case of continued fractions.

Columbia U., New York.
ON SOME NON-ORTHOGONAL FACTORIAL DESIGNS, by Gideon Schwarz. Rept. on Contract Nonr-266(59). June 59, 21p. 3 refs. CU-6-59-Nonr-266(59)MS; AD-217 622.
Order from LC mi$2.70, ph$4.80 PB 147 892

A class of multifactorial designs are defined and analyzed. The designs considered have each a total number of observations that can not be divided equally among the cells of the designs. By distributing the observations in a way that is in a certain sense symmetrical, the equations that determine the least squares estimates of the parameters become explicitly solvable. The case of 2 non-interacting factors with arbitrary numbers of levels is treated. In the n-factor case, factors having equal numbers of levels are considered. After defining the designs, the estimates and their variances and covariances are computed. Some general discussions are included of the symmetries and algebraic properties involved. (Author)

SURVEILLANCE SAMPLING PLANS WITH RANDOM TIMES OF INSPECTION, by P. Frank. Technical rept. no. 4 on Contract Nonr-266(55). 10 June 59, 12p. 4 refs. AD-217 623.
Order from LC mi$2.40, ph$3.30 PB 147 894

An analysis is presented of a situation whereby the times of inspection are not fixed in advance, but are chance quantities with continuous distributions. The principal effect is to make the proportion defective a continuous function of time which approaches a constant after a long time has elapsed. The procedure is considered as an approximation to the fixed surveillance sampling plans. The principal mathematical tool is the renewal theory. Age in a renewal process has a stationary distribtuion depending on the replacement policy. The steady state proportion defective becomes a definite integral instead of the infinite sum, which are evaluated in special cases. Consideration is also given to replacement policies which lead to exponential holding times. These results lead to a simple evaluation of speeding up inspection.

A GENERAL THEORY FOR ASYMMETRICAL CONFOUNDED, FACTORIAL EXPERIMENTS, by Badrig Kurkjian. Doctoral thesis. 21 Apr 60, 96p. 24 refs. Technical rept. TR-829.
Order from LC mi$5.40, ph$15.30 PB 150 019

A general theory is developed for the analysis of factorial experiments involving an arbitrary number of factors each at an arbitrary number of levels. The general case is treated where the treatment-combinations are assigned to an appropriate incomplete block design. New resulfs are given for obtaining the best linear estimates (and the associated var-cov matrix) of the various main effect and interaction terms. A large class of partially balanced incomplete block (PBIB) designs with an arbitrary number of associate classes is described which can be treated by the methods of this paper. The theory is applied to two PBIB designs with three associate classes. (Author)

ASYMPTOTIC SOLUTION OF SYSTEMS OF LINEAR ORDINARY DIFFERENTIAL EQUATIONS WITH DISCONTINUOUS COEFFICIENTS, by Clive R. Chester and Joseph B. Keller, Rept. on Contract AF 19(604)5238. Dec 59, 20p. 2 refs. Research rept. no. EM-150; AFCRC-TN-60-111; AD-233 308.
Order from LC mi$2.40, ph$3.30 PB 148 988

A system of linear first order ordinary differential equations is considered in which the coefficient matrix depends upon a parameter k. The asymptotic

form of the solutions of this system are determined for large values of k when the coefficient matrix or some of its derivatives have finite jump discontinuities. The asymptotic form contains terms beyond those previously known. These new terms have discontinuous coefficients, whereas the previously known terms are continuous. The results are applied to the one dimensional propagation of time-harmonic waves.

Institute of Mathematical Sciences, New York U., N. Y.
AN ISOSPECTRAL FAMILY OF RANDOM PROCESSES, by R. A. Silverman. Rept. on Contract AF 19(604)5238. Jan 60, 19p. 7 refs. Research rept. no. EM-151; AFCRC-TN-60-129; AD-233 309.
Order from LC mi$2.40, ph$3.30 PB 148 989

A family of random step functions $\{x_n(t)\}$ is constructed whose members all have the same power spectrum and such that as $n \to \infty$, $x_n(t)$ converges to $x_\infty(t)$, the Gaussian process with the same spectrum. The procedure for calculating the general multivariate distribution of the processes $\{x_n(t)\}$ is illustrated by calculating the univariate, bivariate and trivariate distributions. Also shown is how a suitably constructed univariate entropy can serve as an index of the extent to which $x_n(t)$ has approached the Gaussian limit $x_\infty(t)$. (Author)

A CONSTRUCTIVE FORMULA FOR COMMUNALITIES by Louis Guttman. Technical note no. 4 on Contract AF 61(502)121. Feb 60, 37p. 14 refs. AFOSR-TN-60-1006.
Order from LC mi$3.00, ph$6.30 PB 150 360

Let R be a Gramian matrix of order n. The communality problem of factor analysis is to find a real diagonal matrix U such that $R - U^2$ satisfies two conditions. One condition is that $R - U^2$ be Gramian; a second condition is that U be optimal in some sense. A rather general formula is provided for constructing matrices U for which $R - U^2$ is always Gramian. Given the class of matrices so constructed, one can then go on to impose an optimality condition and yet be assured that the Gramian condition is also maintained.

Kansas U., Lawrence.
PROJECTIONS ONTO SOME FUNCTION SPACES, by B. Grünbaum. Technical rept. no. 23 on Studies in Eigenvalue Problems, Contract Nonr-58304. 1959, 15p. 10 refs. AD-227 298.
Order from LC mi$2.40, ph$3.30 PB 149 941

Estimates are considered for norms of projections onto subspaces (of a special kind) of the Banach spaces of all bounded functions defined on infinite sets. The results obtained generalize those of Sobczyk [Bull. Am. Math. Soc. 47:938-947, 1941] and McWilliams [Notices Am. Math. Soc. 5:838, 1958] that any separable Banach space containing (c_0) [resp. (c)] as a subspace may be projected onto (c_0) [resp. (c)] by a projection P with $\|P\| \leq 2$ [resp. $\|P\| \leq 3$]. For a (real, or complex) Banach space X and a (finite, or infinite) cardinal, k, the projection constant $P_X(X)$ is defined as follows: $P_X(X)$ is the greatest lower bound of reals p which have the property: If Y is a Banach space, if $X \subset Y$, and if the quotient-space Y/X contains a dense set of cardinality less than or equal to k, then there exists a projection P of Y onto X such that $\|P\| \leq p$. If $P_k(X)$ is not only the greatest lower bound but the minimum of the numbers p, the projection constant is called exact. (Author)

A NON-PARAMETRIC COMPARISON OF TWO SAMPLES ONE OF WHICH IS CENSORED, by John G. Saw. Technical rept. no. 12 on Estimation and Testing of Parameters by Order Statistics, Contract DA 36-034-ORD-2184. 1 June 60, 27p. 4 refs. OOR rept. no. 1597.16; AD-240 054.
Order from LC mi$2.70, ph$4.80 PB 150 395

Suppose x and y are random variables with continuous cumulative distribution functions F(x) and G(y). A null hypothesis of the form H_0: F = G is tested. Standard parametric and non-parametric tests are well established when a complete sample is taken from both populations. The assumption is made that a complete sample $x_1, x_2, \ldots, x_n$ is taken from F(x), but that of a sample of size m, taken from G(y), the smallest (r-1) and the largest (m-s) observations are not available for statistical purposes. The properties are investigated of a statistic T, defined (as for the Mann-Whitney U-statistic for complete samples) to be the total number of times an x-observation is less in magnitude than a y-observation. The distribution of T, its consistency against alternatives of the form H_1: F$\neq$G and its asymptotic power, relative to U are also considered. (Author)

A NOTE ON THE ERROR AFTER A NUMBER OF TERMS OF THE DAVID AND JOHNSON SERIES FOR THE EXPECTED VALUE OF THE r-TH SMALLEST OF n ORDERED NORMAL VARIATES, by John G. Saw. Technical rept. no. 13 on Estimation and Testing of Parameters by Order Statistics, Contract DA 36-034-ORD-2184. 15 July 60, 18p. 4 refs. OOR rept. no. 1597.17-M; AD-240 427.
Order from LC mi$2.40, ph$3.30 PB 150 410

Bounds are derived for the error which results in using only a finite number of terms of the David and Johnson series (Biometrica 41:228-40, 1954). The method of Plackett (Ann. Math. Statist. 29:131-42, 1954) and the method of David and Johnson are compared by applying these techniques in a particular case. The convergence of the Plackett series is found to be faster than the David and Johnson series, and the bounds which Plackett gives are found to be sharper than those which are derived for the David and Johnson series. These slight differences are negligible in the light of the computational advantages to the David and Johnson technique over that of Plackett.

PERIODIC RESPONSES AND SUPERPOSITION IN A NONLINEAR CONTROL SYSTEM, by B. A. Fleishman. Rept. on Contract AF 49(638)514. 19 May 60, 24p. 4 refs. RPI MathRep. no. 34; AFOSR-TN-60-477.
Order from LC mi$2.70, ph$4.80 PB 150 262

A simple relay servomechanism (or on-off control system) is subjected to arbitrary periodic input signals, and various periodic responses are studied. Two types of results are obtained. First of all, exact analytical expressions for periodic responses, of harmonic and subharmonic type, and derived in a formal manner, and conditions are established for their validity. Secondly, it is shown that for certain classes of periodic inputs various superposition properties hold; in particular, that the average of the periodic responses to a set of inputs is just the response to the average input. It is thus seen that on-off control systems may display both nonlinear features (subharmonic oscillations) and linear features. (superposition). (Author)

AN INTRODUCTION TO PROBABILITY THEORY: CONTINUOUS SCHEMES, by F. M. Reza. July 60, 97p. 8 refs. RADC-TN-60-67.
Order from LC mi$5.40, ph$15.30 PB 150 241

This report, an extension of RADC-TN-59-129 (PB 144 485), is a survey of the modern theory of probability where the random variable is allowed to assume a continuum of values. With particular attention to those aspects of theory of interest to the Electrical Engineer. The density and distribution function are introduced, and several common distribution functions are discussed. The concept of expected value is introduced and extends to the expectation of finite sums and products of independent random variables. Bivariate and multivariate random variables and linear combinations are discussed. (Author)

THE PREPARATION AND CHARACTERISTICS OF THIN FERROMAGNETIC FILMS. Scientific rept. no. 1, 1 Jan 59-1 Feb 60, on Contract AF 19(604)4978, continuation of Contract AF 19(604)2659. May 60, 39p. 8 refs. AFCRC-TN-60-572.
Order from LC mi$3.00, ph$6.30 PB 150 211

The results are given of an experimental study of the magnetic properties of thin films prepared by chemical methods. Electro-deposition in aqueous solutions and thermal decomposition of carbonyl vapors have shown very encouraging results. Electrodeposited ferromagnetic nickel-iron films having thicknesses in the range 2500 to 3000 Å give reproducible results when a glass substrate is used onto which a conductive layer of gold is sputtered. Films deposited on Mylar having a conductive layer of evaporated chromium and copper also give good magnetic properties. Such films exhibit an average coercive force of about 1.2 oersteds and H_k on 3 to 5 oersteds depending on their composition. Switching constants of 0.05 to 0.20 oersted-microsecond are obtained by application of crossfields of about 0.25 H_k. Films produced by thermal decomposition of carbonyl mixtures do not as yet show comparable magnetic or switching properties. Control of this process is quite difficult, but fairly reproducible results can be obtained by depositing the films on glass substrates and subsequently annealing them in a hydrogen atmosphere. The average values of coercive force obtained after annealing for films of about 3000 Å are 2.5 oersteds. (Author)

SNAPPING OF SHALLOW SPHERICAL SHELLS UNDER STATIC AND DYNAMIC LOADINGS, by Jiro Suhara. Rept. on Contract AF 49(638)160. June 60, 77p. 15 refs. AFOSR-TN-60-831; ASRL TR-76-4.
Order from LC mi$4.50, ph$12.30 PB 150 245

A study of finite deformations of clamped shallow spherical shells subjected to static and dynamic loadings is presented in this report. The solutions of the static problem are obtained by means of both the variational method and the method of expansion in the series of combined Legendre's polynomials. The results are compared with those obtained by Keller and Reiss. Fairly good agreements of both results are obtained for unbuckled branch in the static cases. Dynamic behavior of shallow spherical shells which undergo suddenly applied uniform pressure of infinite duration are investigated using two different methods. In the first a simple trial function for the deformation mode is assumed and the dynamic equation is obtained by variational method; the equation is then solved by means of an electronic analogue computer. Other trials are made to estimate the dynamic maximum deformations due to a given dynamic load. Principle of conservation of energy is used in this case. The analyses involve two sets of solutions. In the first a simple trial function is used while in the other the Legendre's polynomials solutions that were obtained previously for the static problem are used. Estimations of the dynamic snapping loads are given for shells of two kinds of shallowness. (Author)

RESTRAINED COLUMNS, by Morris Ojalvo. Progress rept. no. 38 on Welded Continuous Frames and Their Components, Contract Nonr-610(03). Sep 59, 17p. 12 refs. Fritz Engineering Lab. Rept. no. 278.2; AD-228 395.
Order from LC mi$2.40, ph$3.30 PB 148 605

A method for determining the carrying capacity of restrained columns of constant cross section is described. The type of column failure considered is that due to bending about one of the principal axes of the cross section. The plane of bending is also the plane of the thrust, applied moments and the restraining moments. The method is applicable when the loads are applied to the columns with equal or unequal end eccentricities and can be used for cases where the restraining moments are not linear functions of the end rotations of the column. It also takes into account the inelastic action of the column and thus leads to a solution of the true ultimate carrying capacity of such members. It is shown how convenient nomographs may be developed for columns with one end hinged and for columns with equal applied end moments and with equal rotational restraints at the ends. The availability of nomographs for the latter two cases reduces the effort involved in designing restrained columns to a point where it would be appropriate for design office use. (Author)

EXCITATION OF DISTRIBUTED SYSTEMS, by H. H. Bleich. Technical rept. no. 23 on Contract Nonr-266(08) and Technical rept. no. 1 on Contract Nonr-266(67). Oct 59, 15p. CU-2-59-ONR-266(08)-CE; CU-1-59-ONR(67)-CE.
Order from LC mi$2.40, ph$3.30 PB 149 488

A vibration analysis of very complex distributed systems by exact methods is usually impracticable, and numerical methods using the large computers now available are indicated. The use of numerical methods is roughly equivalent to using a lumped system, but in problems of acoustical fatigue the relatively high frequencies involved may require a rather large number of masses. The purpose of the presentation is a discussion of the appropriate number of masses (or subdivisions of the structure) necessary to obtain a sufficient approximation of the structural response. The matter will be considered for longitudinal and bending vibrations (including shear effects) of linear elastic and viscoelastic members.

INFLUENCE COEFFICIENTS FOR SPHERICAL SHELLS, by B. R. Baker and G. B. Cline, Jr. Technical note on Contract NOrd-17017. June 60, 45p. 12 refs. LMSD-480 817.
Order from LC mi$3.30, ph$7.80 PB 149 969

The differential equations governing the symmetric bending of spherical shells of constant thickness subjected to edge loads are transformed into a form suitable for asymptotic integration. The asymptotic solutions, although obtained in a slightly different manner, are those given previously. These solutions are used to obtain expressions for the influence coefficients of both a spherical cap and the complementary portion of the sphere. The influence coefficients are valid for either shallow or nonshallow spherical shells provided the shells are sufficiently thin. The coefficients are tabulated and the nature of the tables discussed. (Author)

STEADY STATE RESPONSE OF BEAMS WITH TRANSLATIONAL AND ROTATIONAL DAMPING MOTIONS AT THE SUPPORTS, by C. C. Fu and T. J. Mentel. Rept. for Jan-Nov 59 on Materials Analysis and Evaluation Techniques, Contract A AF 33(616)5426. May 60, 52p. 8 refs. WADD Technical rept. 60-60.
Order from OTS $1.50 PB 161 957

Two methods of analysis are presented for the steady state response of beams with translational and rotational damping motions at the supports. The first of these methods uses a continuous model and the second uses a discrete (three-degree-of-freedom) model. Both cases are characterized by non-linear equations and approximate solutions are produced for each. Numerical results are presented giving comparisons and optimum damping configurations. (Author)

VIBRATIONS OF ELASTIC SANDWICH CYLINDRICAL SHELLS, by Yi-Yuan Yu. Technical note no. 7 on Contract AF 49(638)453. Jan 60, 33p. 7 refs. AFOSR TN-60-324; AD-235 026.
Order from LC mi$3.00, ph$6.30 PB 149 662

Previous treatment of vibration of elastic sandwich plates is extended to the vibration study of sandwich cylindrical shells. General theory is developed. Simplified equations are applied to the investigation of axially symmetric and torsional vibrations. (Author)

University Coll., Cork (Eire).
ELASTIC BEAM THEORY FOR THE ELECTRONIC COMPUTER: A RECURRENCE APPROACH, by Patrick M. Quinlan. Technical note no. 9 on Contract AF 61(514)1163. June 60, 42p. 11 refs. AFOSR-TN-60-936.
Order from LC mi$3.30, ph$7.80 PB 150 350

A new comprehensive approach to elastic beam theory is presented based on the use of generalized step functions. The paper is divided into two parts, the first dealing with uniform beams and the second with non-uniform beams. Uniform beam on continuous supports, whether rigid or elastic, is solved using a new formulation of the three-moment equation in conjunction with a shear-recurrence formula - called the three-supports equation. An alternative solution for continuous uniform beams on elastic supports is given using generalized step-functions. Part two, dealing with non-uniform

beams, is based entirely on recurrence formulae obtained from generalized step-function approximations to the deflection and slope equations by differencing. Solutions are obtained for all loading conditions, including concentrated moments and end thrust, or end tension. In all cases the solution is reduced to a number of simultaneous equations and is especially geared to the coming decade, when the solution of such equations on the electronic computer should be regular office routine. PROCEDURES FOR INCLUDING TEMPERATURE EFFECTS IN STRUCTURAL ANALYSES OF ELASTIC WINGS. PART II. A DIGITAL COMPUTER SOLUTION FOR THE EQUIVALENT PLATE METHOD OF THERMOELASTIC ANALYSIS, by Lucien A. Schmidt and Hans A. Balmer. Rept. on Contract AF 33(616)3517. May 59, 173p. 7 refs. WADC Technical rept. 57-754, Pt. II; AD-230 981.
Order from LC mi$8.10, ph$27.30 PB 149 624

A general procedure, employing the IBM 704 EDPM, based on the equivalent plate method of structural analysis for elevated temperature structures previously presented [PB 131 989] has been developed. The program provides a rational method for analyzing the static aeroelastic behavior of thin, low aspect ratio wings subject to elevated temperatures and high wing loadings. The formulation includes coupling between aerodynamic pressures and the thermoelastic distortions, and also coupling between the bending and stretching of the plate. Using the variational principle of Reissner [J. Math. and Phys., 32:1953] and expanding the deflection and the stress function in terms of assumed modes, two coupled nonlinear matrix equations are obtained and solved by successive linearization. The IBM 704 program is used not only to carry out the matrix operations but, of greater importance, to carry out the considerable number of partial differentiations, double integrations, and algebraic operations required to form the matrix elements. Illustrative numerical examples of the use of the generalized digital computer program are given. A discussion of the limitations of the present program as well as suggestions for improvements and extensions conclude the report. (Author)

A SUMMARY OF PERFORATED WALL WIND TUNNEL STUDIES AT THE ARNOLD ENGINEERING DEVELOPMENT CENTER, by M. Pindzola and W. L. Chew. Rept. on ARO, Contract AF 40(600)800 S/A 11(60-110). Aug 60, 36p. 21 refs. AEDC TR-60-9.
Order from LC mi$3.00, ph$6.30 PB 150 165

A summary of the work done at AEDC in the development of perforated walls for application to transonic and supersonic wind tunnels is presented. Results are summarized for normal, slanted, and slotted hole walls in the Mach number range from 0.90 to 2.50. The slotted hole data, presented for the first time, indicate that the characteristics of a perforated wall can be determined independently of the free-stream Mach number. (Author).

RELAXATION PROCESSES AND REACTION RATES BEHIND SHOCK FRONTS IN AIR AND COMPONENT GASES, by K. Wray, J. D. Teare and others. Rept. on Contracts AF 04(647)278 and DA 19-020-ORD-4862. Dec 59, 31p. 25 refs. Research rept. 83; AFBMD-TR-60-26; AD-234 034.
Order from LC mi$3.00, ph$6.30 PB 147 829

Non-equilibrium phenomena in normal shocks is summarized. Three classes of experiments are described: (1) absorption of ultra-violet radiation, (2) emission of optical radiation, and (3) microwave absorption and reflection. The use of these measurement techniques in unraveling the complex phenomena that occur in the non-equilibrium region of normal shocks is outlined. The current values used to correlate the experimental data for the chemical and electronic rate constants are quoted. (Author)

BALLISTIC RESEARCH LABORATORIES' NEW HYPERSONIC TUNNEL, by J. Sternberg. Jan 60, 22p. 6 refs. BRL rept. no. 1076; AD-237 577.
Order from LC mi$2.70, ph$4.80 PB 148 511

The B.R.L. hypersonic wind tunnel, now under construction, is designed to cover the range M = 5 to 10, and will be capable of continuous flow, variable density operation. Full use will be made of the compressor plant for existing supersonic wind tunnels. Three new centrifugal compressors were added to reach a maximum supply pressure of 2200 psi. The tunnel air will be heated to a maximum temperature of 2000°R, using a combustion heater and an electric heater arranged in series. Some of the complications in hypersonic flight at high altitudes are discussed. Departures from a continuum, low Reynolds number effects, and oxygen dissociation in the atmosphere are all important above 250,000 ft. (Author)

A DIRECT METHOD OF MEASURING DENSITY BEHIND SHOCK WAVES, by D. B. Sleator and M. R. Lewis. Dec 59, 19p. 6 refs. Rept. no. 1087; AD-233 901.
Order from LC mi$2.40, ph$3.30 PB 147 789

A direct method of measuring velocity and density behind a shock wave in a shock tube is described which uses the N-like slip region resulting from the interaction of the shock and a small disturbance. The velocity of the slip region along the axis of the shock tube is shown to be the flow velocity. A description of the interaction of a shock wave and a small disturbance is given. Still and streak schlieren photographs and an interferogram of the phenomenon are presented along with a plot of experimental results versus theory showing an error of about 1 per cent. (Author)

Gas Dynamics Lab., Northwestern U., Evanston, Ill.
DISSOCIATION AND IONIZATION EFFECTS IN THE LAMINAR MIXING OF PARALLEL STREAMS, by Richard Frank Hoglund. Rept. on Contract AF 40(600)748. July 60, 132p. 76 refs. AEDC-TN-60-141.
Order from LC mi$6.90, ph$21.30 PB 149 319

The boundary layer approximation is applied to the equations governing the mixing zone between two parallel semi-infinite streams. The two streams differ in composition and temperature, but they are not necessarily in chemical equilibrium. Closed form solutions are obtained for the approach to equilibrium in the mixing zone in the case of equal velocities of the two streams. Frozen flow and equilibrium flow appear as limiting cases of the general solution. A linearized reaction rate law is used for the non-equilibrium situations. These solutions indicate that the major factor contribution to non-equilibrium effects in the constant velocity mixing zone is the presence of non-equilibrium conditions outside of the mixing zone. An approximate solution to the case of unequal free stream velocities is obtained using an equilibrium condition found to be applicable in the constant velocity case. The results of these studies are used to provide a qualitative indication of the effects of dissociation and ionization reactions on the flow field immediately behind a hypersonic body. It is found that the presence of reactions in various regions of this flow field causes individual and discernible change in the wake expansion angle and in the base pressure. (Author)

General Atomic, San Diego, Calif.
THE USE OF MODULATED ATOMIC-BEAM TECHNIQUES FOR THE STUDY OF SPACE-FLIGHT PROBLEMS, by Geoffrey S. Holister, R. T. Brackmann, and Wade L. Fite. Rept. on Contract AF 49(638)356. 14 Oct 59, 20p. 4 refs. GA-1024; AFOSR-TN-59-1033; AD-229 282.
Order from LC mi$2.40, ph$3.30 PB 150 065

In order to investigate atom-surface interactions which affect drag on objects flying in atmospheres where the gas is dissociated (e.g., above 100 km), modulated-atomic-beam techniques were used, with both atomic-oxygen and atomic-hydrogen collisions at common laboratory surfaces being studied. Two types of experiments are discussed. In the first, an incident beam impinges on a surface and the particles leaving the surface are examined with a mass spectrometer. By varying the incident beam and/or surface temperature, thermal accommodation coefficients are determined for a variety of surfaces and gases. Using an incident atomic beam, the probability that an atom will rebound from the surface as a free atom is measured; from examination of the reflected molecular signal, information on the probability of reassociation at the surface is obtained. In the second, the atomic beam, which is monitored mass-spectrometrically, is allowed to strike a surface placed on a torsion balance, and momentum transfer is measured directly. In these experiments, the atomic-beam apparatus is used as an atomic wind tunnel; when a hydrogen-atom beam from a furnace source operating at 3000°K is used, the case of a high-altitude satellite is fairly closely duplicated. Results of a number of experiments using these techniques are presented. (Author)

Guggenheim Aeronautical Lab., Calif. Inst. of Tech., Pasadena.
MODIFIED CROCCO-LEES MIXING THEORY FOR SUPERSONIC SEPARATED AND REATTACHING FLOWS, by Herbert S. Glick. Rept. on Hypersonic Research Project, Contract DA 04-495-ORD-1960. 2 May 60, 118p. 34 refs. Memo. no. 53; AD-239 560.
Order from LC mi$6.00, ph$18.30 PB 149 361

Re-examination of the Crocco-Lees method has shown that the previous quantitative disagreement between theory and experiment in the region of flow up to separation was caused primarily by the improper C(K) relation assumed. A new C(K) correlation, based on low-speed theoretical and experimental data and on supersonic experimental results, has been developed and found to be satisfactory for accurate calculation of two-dimensional laminar supersonic flows up to separation. A study of separated and reattaching regions of flow has led to a physical model which incorporates the concept of the "dividing" streamline and the results of experiment. According to this physical model, viscous momentum transport is the essential mechanism in the zone between separation and the beginning of reattachment, while the reattachment process is, on the contrary, an essentially inviscid process. This physical model has been translated into Crocco-Lees language using a semi-empirical approach, and approximate C(K) and F(K) relations have been determined for the separated and reattaching regions. The results of this analysis have been applied to the problem of shock wave-laminar boundary layer interaction, and satisfactory quantitative agreement with experiment has been achieved. (Author)

Guggenheim Aeronautical Lab., Calif. Inst. of Tech., Pasadena.
A SUMMARY OF THE THEORIES AND EXPERIMENTS ON PANEL FLUTTER, by Y. C. B. Fung. Rept. on AGARD Manual on Aero-Elasticity, Contract [AF 49(638)220.] May 60, 81p. 74 refs. AFOSR-TN-60-224.
Order from LC mi$4.80, ph$13.80 PB 149 764

In recent years a sizable literature has grown out of the field of panel flutter. Much effort was spent in resolving several theoretical difficulties which arise one way or another when one tries to simplify the analytical problem by introducing various limiting cases and approximations. These difficulties are now fairly well understood. In the meantime, a considerable amount

of numerical evaluation has been done so that the technical significance of the problem can be better appreciated. The present article gives a review of various theories, and a summary of the panel-thickness requirements for the prevention of flutter under various circumstances. At the present time, available information on supersonic panel flutter is still incomplete. It is hoped that the present article may provide a guide to the existing literature; and, in projecting the known areas in clear relief, may serve to suggest areas for future research. (Author).

Heat Transfer Lab., U. of Minnesota, Minneapolis.
EFFECT OF BUOYANCY FORCES ON MASS TRANSFER COOLING, by R. Eichhorn. Technical rept. no. 25 on Contract AF 18(600)1226. Feb 60, 16p. 3 refs. AFOSR-TN-60-64.
Order from LC mi$2.40, ph$3.30 PB 149 083

Consideration is given to the constant property laminar boundary layer equations with free convection and mass transfer. It is shown that similar solutions are possible for blowing rate distributions varying as the distance from the leading edge raised to the power $\frac{n-1}{4}$ where n is the exponent in a power law surface temperature distribution. Solutions to the equations in the form of skin friction and heat transfer parameters, and velocity and temperature profiles are presented for the constant wall temperature case for a fluid with Pr = 0.73. The cases considered range from strong suction to strong blowing. Mass transfer has a pronounced effect on the heat transfer but only a slight effect on the skin friction. In light of the solutions presented these effects are shown to be physically rational. (Author)

Küssner, H. G.
RESEARCH ON THE OSCILLATING ELLIPTIC LIFTING SURFACE IN SUBSONIC FLOW, by H. G. Küssner. Technical final rept. on Contract AF 61(052)215. June 60, 75p. 13 refs. AFOSR-TR-60-71.
Order from LC mi$4.50, ph$12.30 PB 150 333

Starting from the linearized Euler equations an integral representation of the pressure of the oscillating elliptic lifting surface in subsonic flow is given for arbitrary downwash distributions and arbitrary yaw angles. The kernel of this integral representation is contructed by means of the Green function of the elliptic plate oscillating in still air. Two methods of determination of the Green function are given. The first one uses infinite series of products of ellipsoidal surface harmonics and Lamè functions. The second method only holds for incompressible flow but gives results in a closed form. This form has been used in order to solve the integral equation for the weight function of the leading edge singularity of the lifting surface. According to this method the special cases of the elliptic lifting surface with infinite aspect ratio and of the circular lifting surface have been treated. Numerical values of the weight functions and of the aerodynamic derivatives have been calculated for a bilinear downwash distribution. The results of this method have been used to check the accuracy of the current collocation method of the three-dimensional lifting surface theory. (Author)

Maryland U., College Park.
ON CONDUCTING FLOW PAST A MAGNETIZED CIRCULAR CYLINDER, by Lan-Keh Chi. Interim technical rept. no. 46 on Fundamental Research in Applied Mathematics, Contract DA 36-034-ORD-1486. June 60, 46p. 4 refs. OOR rept. no. 407:55; AD-239 906.
Order from LC mi$3.30, ph$7.80 PB 150 396

The flow of a conducting fluid past a magnetized sphere was considered by Ludford and Murray. It is of interest to know what will happen if the finite sphere is replaced by an infinitely long circular cylinder. A steady incompressible and inviscid fluid is considered. Results are obtained first for a two-dimensional magnetic dipole, pointing downstream, at the center of the cylinder and then for a general magnetic distribution inside the cylinder. Only the first-order effects of the weak magnetic field are considered. The discussion is valid for arbitrary conductivity of the cylinder, as long as it is finite. The situation when the magnetic dipole field is frozen into the cylinder is also discussed. A matching between the Stokes and the Oseen small R_m expansions for the flow past the cylinder with a dipole inside is carried out explicitly to a certain number of terms. It is found that a new perturbation series whose leading term is of order $R_m^2 \log R_m$, should be introduced into the Stokes expansion. (Author).

Mississippi State U., State College.
THE APPLICATION OF SUCTION TO A TWO-DIMENSIONAL LAMINAR SEPARATION BUBBLE, by F. M. Burrows and B. G. Newman (U. of Cambridge). Research rept. no. 27 on Contract Nonr-978(01). 1 Oct 59, 67p. 11 refs. AD-228 532.
Order from LC mi$3.90, ph$10.80 PB 149 858

The effect of suction or blowing through a perforated surface in the vicinity of a laminar separation bubble was investigated. The bubble was produced at a sharp corner on one wall of a small wind tunnel and the tests were made at a low Mach number under effectively 2-dimensional conditions. It was found that the size of the bubble and the thickness of the boundary layer downstream were reduced by increasing the suction and were similarly increased by much smaller amounts of blowing. Five different distributions of transpiration were tested and the various parameters describing the turbulent boundary layer downstream of reattachment were found to depend on the total quantity of flow removed and to be very nearly independent of the distribution itself. The measured values of pressure rise in the region of reattachment were roughly in agreement with a simple momentum analysis which includes the effect of transpiration. It is concluded that the application of suction near a short bubble on a high-lift wing will in general be beneficial unless the possible forward movement of the separation point leads to the formation of a long bubble. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
PRESSURE AND LAMINAR HEAT TRANSFER DISTRIBUTION AT THE NOSE REGION OF A SEMI-CIRCULAR TOROID AT M_∞ = 3 AND 8, by Victor Zakkay and Marian Visich, Jr. Rept. on Contract AF 33(616)6118. July 60, 47p. 10 refs. ARL Technical note 60-127; PIBAL Rept. no. 547; AD-240 120.
Order from LC mi$3.30, ph$7.80 PB 149 749

The experimental results of the pressure and heat transfer measurements about a semicircular toroid having a ratio of minor to major radius equal to 0.255 are presented. Pressure distributions have been measured at M_∞ = 3 for several angles of attack and at zero angle of attack for M_∞ = 8. Heat transfer measurements were obtained at zero and 10° angles of attack at M_∞ = 8. The experimental pressure distribution over the body for all the conditions presented here is predicted satisfactorily by the modified Newtonian pressure distribution followed by a Prandtl-Meyer expansion. The experimental heat transfer results along the plane of symmetry are in good agreement with a theoretical two-dimensional analysis. Good agreement between experimental values and the two-dimensional analysis is also obtained for the heat transfer outside of the plane of symmetry by taking into account the effect of crossflow.

Polytechnic Inst. of Brooklyn, N. Y.
SOME ASPECTS OF DRAG REDUCTION FOR LIFTING WING-BODY COMBINATIONS AT SUPERSONIC SPEED, by Lu Ting. Rept. on Contract AF 18(600)694. May 58, 29p. 3 refs. PIBAL rept. no. 445; AFOSR-TN-58-423; AD-158 226.
Order from LC mi$2.70, ph$4.80 PB 147 804

It has been shown that favorable antisymmetric modifications of the fuselage near the mid-wing can provide significant drag reductions in lifting wing-body combinations. The investigation of the present report shows that for a prismatic body of rectangular cross section with given volume (or cross section area) mounted on a mid-wing of given span and swept back, the lift-drag ratio of the wing-body combination with the favorable antisymmetric modifications will be higher if the basic body has a lower height-width ratio.

Princeton U., N. J.
AN ANALYSIS OF THE EFFECTS OF PERFECT GAS PARAMETERS ON GAS TURBINE PERFORMANCE, by Andrew G. Hammitt. Rept. on Contract AF 49(638)465. Dec 59, 31p. 5 refs. Aeronautical Engineering rept. 500; AFOSR-TN-60-225.
Order from LC mi$3.00, ph$6.30 PB 149 755

The effect of different gases on the performance of a gas turbine cycle has been considered. If the gas is perfect, three parameters: specific heat ratio, speed of sound, and viscosity are sufficient to characterize its properties. The effects of specific heat ratio and speed of sound are more significant unless the viscosity exhibits very large variations. A gas of low specific heat ratio and high speed of sound is advantageous for the operation of the heat exchangers while a high specific heat ratio and low speed of sound makes the turbo machinery simpler. The best gas would depend on the relative cost of the different types of equipment. (Author)

Princeton U., N. J.
FREE MOLECULE FLOW OVER NON-CONVEX BODIES, by Ira M. Cohen. Rept. on Contract AF 49(638)465. Feb 60, 42p. 19 refs. Aeronautical Engineering rept. no. 497; AFOSR-TN-60-190.
Order from LC mi$3.30, ph$7.80 PB 149 754

The problem considered in this report is the determination of the velocity distribution function f and the heat transfer rate at any point on a surface of arbitrary shape immersed in a free molecule flow field. A theory is developed in which the mass flux incident on the surface of a non-convex body is expressed as the solution of an integral equation. Then, the fundamental transport properties at the surface are given in terms of appropriate integrals over velocity space. As an example, a hemisphere in an infinite speed ratio flow is considered. (Author)

Princeton U., N. J.
ON THE LIMITING STRUCTURE OF THE EDGE OF A HYPERSONIC BOUNDARY LAYER WITH VERY COLD FREE STREAMS, by N. C. Freeman, S. H. Lam. Rept. on Contract AF 49(638)465. May 59, 27p. 3 refs. Aeronautical Engineering rept. no. 468; AFOSR TN 59-690; AD-240 233.
Order from LC mi$2.70, ph$4.80 PB 149 753

The structure of the edge of a hypersonic boundary layer in the limit of zero free stream temperature is analyzed with conventional boundary layer approximations for a gas with arbitrary Prandtl number Pr and viscosity law $\mu \alpha T^s$. It is shown that for certain combinations of Pr and s the velocity profile has a discontinuity in slope at the edge of the boundary layer. The boundary layer thickness in this limit is always finite for $S > -1$. For $S < -1$ no limiting solution exists for any Pr. (Author)

Royal Coll. of Science and Tech., Glasgow (Scotland).
THE HODOGRAPH METHOD APPLIED TO FLOW PAST PROFILES AND IN JETS, by D. C. Pack. Technical final rept. on Contract AF 61(514)1170. Apr 60, 61p. 23 refs. AFOSR-[TR]-60-61.
Order from LC mi$3.90, ph$10.80 PB 150 038

A study of the two-dimensional, steady flow of a gas at sonic and near-sonic speed, and in particular, the flow past wedge-shaped bodies of finite length, placed in either an infinite stream, a jet or a (two-dimensional) wind-tunnel with parallel walls, has been made by using the equations of motion expressed in terms of hodograph variables.

Stanford U., Calif.
DEVELOPMENT OF A FINITE-DIFFERENCE METHOD FOR COMPUTING A COMPRESSIBLE LAMINAR BOUNDARY LAYER WITH INTERACTION, by I. Flügge-Lotz and Er-Yung Yu. Rept. on Contracts AF 18(600)1488 and AF 49(638)550. 15 May 60, 143p. 27 refs. Div. of Engineering Mechanics technical rept. no. 127; AFOSR-TN-60-577; AD-242 421.
Order from LC mi$7.20, ph$22.80 PB 150 340

The compressible laminar boundary layer equations in their original form, i.e., with u, v, i as dependent variables and x, y as independent variables, have been solved numerically by employing the explicit finite-difference method. The physical problems that have been treated are the two-dimensional boundary layer flows along a constant temperature wall with or without pressure variation. For each of the flow models considered the numerical solutions were obtained for the

following four different cases: (1) $M_\infty = 0.5$, $T_w/T_{ad} = 0.5$ (isothermal cooled wall); (2) $M_\infty = 0.5$, $T_w/T_{ad} = 2.0$ (isothermal heated wall); (3) $M_\infty = 3.0$, $T_w/T_{ad} = 0.5$; and (4) $M_\infty = 3.0$, $T_w/T_{ad} = 2.0$. In each case, flows with zero pressure gradient and those with positive ramp pressure gradient have been separately investigated. It is found that the explicit difference scheme works very satisfactorily for case (1). For cases (2) and (3) the difference scheme is found somewhat unstable in a narrow region next to the wall. Case (4), i.e., $M_\infty = 3.0$ and heated wall, is the worst condition so far encountered.

Stanford U., Calif.
STRUCTURES AND MATERIALS FOR FINITE LIFETIME, by N. J. Hoff. Technical rept. no. 1 on Contract Nonr-225(30). Aug 58, 60p. 25 refs. SUDAER no. 81.
Order from LC mi$3.60, ph$9.30 PB 150 052

The aerodynamic heating accompanying supersonic and hypersonic flight renders design for infinite lifetime impossible. At moderately high temperatures creep sets in and causes rupture in tension and buckling in compression even under relatively small loads if they act for a sufficiently long time. At extremely high temperatures the structural material, or its protective covering, melts, vaporizes, sublimes or burns. The analyst must be able to calculate the lifetime of the structural elements in order to ensure the safety of the structure. A few simple methods of analysis are presented in the report with the aid of which approximate calculations of the lifetime can be carried out. (Author)

Tiltman Langley, Ltd. (Gt. Brit.)
AN ITERATIVE ANALOGUE COMPUTOR FOR STUDY OF THE TURBULENT FLAME PROPERTIES OF ELEMENTARY COMBUSTION CHAMBERS, by A. J. Cooper and L. C. Hutcheon. Technical (scientific) note no. 3 on Contract AF 61(514)1213. 30 Nov 59, 35p. 11 refs. AFOSR-TN-60-993.
Order from LC mi$3.00, ph$6.30 PB 150 354

An iterative analogue computor has been designed and built for solving up to 20 simultaneous equations of the form $\tau_j = \frac{1}{L} \sum_k b_{jk} \psi(\tau_k)$ where L is an adjustable parameter (eigenvalue). b_{jk} is a set of up to 20 x 20 coefficients and ψ is a linear or non-linear relationship. Equations of this form arise in the study of turbulent flame patterns in combustion chambers. b_{jk} is then a set of influence coefficients which relate the local temperature τ_j at any point j to the rates of heat generation at k points throughout the flame, and ψ is a reaction rate function which relates the heat generated at any one point to its own temperature. The coefficients are measured by argon tracer methods using a flow of air through a model combustion chamber, and the computor has been used to predict extinction points for different combustion chamber configurations on the assumption of a theoretical reaction rate function. The computor operates in an iterative manner, approaching the correct solution by a series of successive approximations. The whole system is described, and operating and maintenance instructions are given.

OPERATION AND CALIBRATION OF THE LOW DENSITY WIND TUNNEL, by Raymond L. Chuan, Lee M. Springer, and Serge A. Waiter. Technical note on Contract AF 18(603)95. 15 July 60, 43p. 7 refs. USCEC rept. 56-215; AFOSR-TN-60-649.
Order from LC mi$3.30, ph$7.80 PB 149 959

For the experimental investigation of rarefied gasdynamics a low density wind tunnel has been developed which is capable of producing flows at lower density, higher Mach number, higher temperature, and with a larger flow field than has been possible in the past, in order that slip, transitional and free molecule flows can be studied with large regions of interest susceptible to probing with appropriate instruments, and with flow durations sufficiently long to ensure equilibrium conditions in all measurements.

STUDIES IN THE HEATING OF A SUPERSONIC GAS STREAM BY A RADIO FREQUENCY DISCHARGE, by Frederick O. Smetana. Technical note on Contract AF 18(603)95. 15 July 60, 103p. 24 refs. USCEC rept. 56-214; AFOSR-TN-60-648.
Order from LC mi$5.70, ph$16.80 PB 149 958

The background and problem areas of the application of radio frequency discharge to heating a supersonic gas stream are discussed. An apparatus was constructed to permit the effectiveness of this technique to be studied by calorimetry. Results indicate that about 10% of the power taken from the a. c. line appeared as heat in the gas. Through modifications in the electrical circuitry this probably can be increased to 15%. This technique introduces a negligible percentage of unwanted contaminants. On the other hand, small quantities of C_4F_8 mixed with N_2 were found to decrease the N_2 recombination time substantially. Tests were also made using argon alone and mixed with nitrogen. Maximum gas temperatures at the end of the nozzle were obtained with argon alone, being 660°K. Limited spectroscopic and microwave interferometer investigations were also conducted. (Author)

ELASTIC-PLASTIC ANALYSIS OF A CYLINDRICAL TUBE, by R. E. Weigle. Mar 60, 21p. 5 refs. Technical rept. WVTRR-6007.
Order from LC mi$2.70, ph$4.80 PB 146 396

This report contains an elastic-plastic analysis of a cylindrical tube subjected to an internal pressure P of sufficient magnitude to cause plastic deformation. Results are presented in graphical form for the open-end tube. Comparison with the plane strain case is made for a wall ratio $\frac{b}{a} = 2$.

END EFFECTS IN MAGNETOHYDRODYNAMIC CHANNEL FLOW, by Frank Fishman. Rept. on Contract AF 04(647)278. June 59, 16p. 1 ref. Research rept. 78; formerly Research note 135; AFBMD-TN-59-5; AD-227 866.
Order from LC mi$2.40, ph$3.30 PB 147 828

Some effects associated with the termination of electrodes and magnetic field in an otherwise uniform magnetohydrodynamic channel flow are investigated theoretically. Because of the end effects, the electrodes may carry more, or less, current than the same length of electrode in the middle of a long channel; this leads to the definition of a length representing the end correction for current. Similarly a difference in the total force on the working fluid leads to a length representing the end correction for force. These lengths are calculated for various geometries. The electrical efficiency of a channel acting as a generator is computed for these same conditions. It is shown that the end effects decrease generator efficiency least if the magnetic field extends at least one-half a channel height beyond the end of the electrodes (for generators of high nominal efficiency). Under these conditions, and if the electrodes are not less than 1% of the channel height long, they have an effective length for current about 0.4 channel heights greater than their actual length. INVISCID MODES OF INSTABILITY OF FLOW, by W. H. Reid. Scientific rept. no. 1 on Contract AF 19(604)7236. May 60, 20p. 11 refs. AFCRC-TN-60-443.
Order from LC mi$2.40, ph$3.30 PB 149 804

The inviscid modes of instability in flow over a slightly concave wall are studied and it is shown that if $UdU/d\eta > 0$, where $U(\eta)$ is the unperturbed velocity distribution, then oscillatory solutions do not occur. For a velocity distribution in the form of two straight lines the problem can be solved exactly, and detailed results are given for the first two convective modes of instability. If the fluid is considered to be a perfect electrical conductor, then this flow can be completely stabilized by a transverse magnetic field of magnitude $\mu H^2/4\pi\rho = 0.5752\ U_0^2(\delta/R)$, the numerical coefficient here being not too sensitive to the form chosen for the mean velocity distribution. (Author)

A LIOUVILLE THEOREM FOR SHALLOW-WATER WAVES, by R. E. Meyer. Technical rept. no. 21 on Contract Nonr-562(07). Oct 59, 39p. 11 refs. AD-227 828.
Order from LC mi$3.00, ph$6.30 PB 149 937

The non-linear equations governing 2-dimensional gravity waves on shallow water to the first approximation are shown not to possess any solutions free of limit lines at all points and times, except for the solution representing uniform motion. The proof involves a generalisation of the usual concept of solution, and a corresponding existence theorem is given by means of an explicit representation. An important part of the argument is based on a dual set of invariance concepts, but some new results concerning a singular partial differential equation are also required for the proof. (Author)

California Inst. of Tech., Pasadena.
ON CATHODIC PROTECTION IN CAVITATION DAMAGE, by Milton S. Plesset. Rept. on Contract Nonr-220(28). July 59, 35p. 8 refs. Engineering Div. rept. no. 85-12; AD-226 971.
Order from LC mi$3.00, ph$6.30 PB 147 793

An experimental procedure has been developed which makes possible accurate and reproducible determinations of cavitation damage. This procedure has been applied to a study of the effect of cathodic currents on cavitation damage. A series of experiments in which the test liquid was a solution of salt in water showed a reduction in cavitation weight loss for all of the materials examined when the test specimen was made the cathode of an electrolytic cell and when the conditions were such that gas was evolved at the specimen surface. This protective effect against cavitation damage increased with increasing magnitude of the cathodic current. These observations support the view that the protective effect was due to the layer of hydrogen gas evolved on the surface of the specimen. A similar protective effect was observed when the specimen was made the anode in a test liquid which was buffered distilled water; in this situation the gas evolved at the specimen surface is oxygen. Additional evidence for this protective mechanism of a gas layer on the specimen surface was found in a series of experiments in which voltage applied to the cell was reduced to a level at which no gas was evolved on the surface. There was no protective effect with the specimen cathodic or anodic. (Author)

REMARKS ON CAVITATION IN TURBOMACHINES, by A. J. Acosta and A. Hollander. Rept. on Contract Nonr-220(24). Oct 59, 42p. 32 refs. Engineering Div. rept. no. 79.3.
Order from LC mi$3.30, ph$7.80 PB 149 514

Starting with the occurrence and discussion of the importance of cavitation in turbomachines, the development of the various stages of cavitation in a machine is reviewed, followed by a discussion of the various dimensionless parameters used to describe cavitating performance in a turbomachine. The calculations of optimum inlet diameter are carried out in terms of assumed acceptable cavitation parameters. Various methods of determining the minimum cavitation number before cavitation breakdown are explored, and a free streamline model of the flow in a simplified impeller is used to obtain theoretical estimates of the extent of cavitation as a function of blade geometry and angle of attack. Some recent work of the effect of the thermodynamic properties of the fluid on the cavitation performance is examined and the various assumptions used in these theories are criticized. (Author)

DYNAMIC PERFORMANCE OF SCALED SURFACE-PIERCING HYDROFOIL CRAFT IN WAVES, by Paul Kaplan and Winifred R. Jacobs. Rept. on Contract Nonr-263(14). June 59, 121p. 21 refs. Rept. no. 704.
Order from LC mi$6.30, ph$19.80 PB 147 887

This report describes a study of the motions in waves of a group of hydrofoil craft when the geometric size parameters are changed, assuming a constant forward speed. The purpose of the study is to determine how to change craft size in order to obtain sustained motion in the largest possible following sea. Four different methods of changing size (scaling the physical dimensions of the system) are considered, and a simplified analysis is carried out on the basis of the effects of the damping and natural frequency of the free-vibration mode (resonance considerations) and the variation of the wave forcing functions as functions of wave length for different values of the scale ratio.

LONGITUDINAL STABILITY OF SURFACE-PIERCING HYDROFOIL SYSTEMS FOR WATER-BASED AIRCRAFT, by Gerard Fridsma. Rept. on Contract Nonr-263(20). Oct 59, 42p. 12 refs. Rept. no. 732; AD-227 478.
Order from LC mi$3.30, ph$7.80 PB 149 866

A theoretical investigation was conducted on tandem surface-piercing hydrofoil configurations to define qualitatively the importance of geometric and hydrodynamic parameters which influence a system's longitudinal stability in smooth water. The hydrofoil system was analyzed on the basis of the linear theory of small disturbances without the presence of controls. A wide range of parameters including lift curve slope, dihedral, foil spacing, load, speed, equilibrium lift coefficient and chord and area distributions was investigated to determine their effect on the regions of stability. The results of this analysis are put in the form of design charts which illustrate the regions of stability and instability. These regions are bounded by an upper limit curve which is indicative of oscillatory divergent motions and a lower limit curve indicative of a continuously divergent motion. The results presented are applicable to hydrofoil equipped aircraft as well as hydrofoil equipped seacraft. (Author)

EQUATION OF STATE AND PHASE TRANSITION OF THE SPHERICAL LATTICE GAS, by Walter Pressman and Joseph B. Keller. Rept. on Contract AF 49(638)341. Feb 60, 34p. 5 refs. Research rept. no. HT-5; AFOSR-TN-60-297; AD-235 375.
Order from LC mi$3.00, ph$6.30 PB 148 985

The spherical lattice gas is a modification of the ordinary lattice gas in which the occupation number of each cell is permitted to be any real number rather than ±1. However the sum of squares of the occupation numbers is required to equal the number of cells. This permits one to evaluate the partition function by integrating over the surface of a certain sphere rather than by summing over lattice points on that surface. The partition function and the equation of state of the gas are evaluated in this way. It is found that in 3 dimensions the gas condenses, but not in 1 or 2 dimensions. Graphs of the phase transition curve and of the isotherms in 3, 2 and 1 dimensions are presented. The analytical work is simplified by taking advantage of the relationship between the properties of the lattice gas and of the Ising model of a ferromagnet. This relationship, demonstrated by C. N. Yang and T. D. Lee [Phys. Rev. 87:410-419, 1952] for the ordinary lattice gas and Ising model, also applies to the spherical lattice gas and the spherical model of a ferromagnet. The properties of the latter were evaluated by T. H. Berlin and M. Kac [Phys. Rev. 86:821-835, 1952]. Graphs of the isotherms of the spherical model of the magnet, which were found in the course of the work, are also presented. (Author)

ON THE THEORY OF CLASSICAL FLUIDS, by Loup Verlet. Technical note no. 18 on Contract AF 61(052)173. [1959] 35p. 16 refs. AFOSR-TN-60-689; AD-240 348.
Order from LC mi$3.00, ph$6.30 PB 149 589

An integral equation is established for the three-body correlation function in classical fluids. This equation contains a main equation which is very simple and correction terms. The solution of the main equation appears at first rather easy, but it is a highly non linear equation.

Princeton U., N. J.
CONCENTRATION DISTRIBUTION IN TWO-PHASE PIPE FLOW, by S. L. Soo and J. A. Regalbuto. Rept. on Project Squid, Contract Nonr-1858(25). Nov 59, 30p. 10 refs. Technical rept. PR-101-P; AD-229 223.
Order from LC mi$2.70, ph$4.80 PB 149 495

Concentration distribution of solid particles in 2 phase turbulence pipe flow was studied. Analytical consideration of momentum transport from the wall suggests a force field toward the center of the pipe opposing the mechanism of turbulent diffusion of solid particles. This gives rise to a nonuniform distribution of solid particles in steady and fully developed turbulent pipe flow. Experimental determination of concentration distribution was made with an impact disk particle counter system. (Author)

Princeton U., N. J.
SOME EFFECTS OF PARTICLE-PARTICLE AND PARTICLE-FLUID INTERACTION IN TWO PHASE FLOW SYSTEMS, by Richard L. Peskin. Rept. on Project Squid, Contract Nonr-1858(25). Oct 59, 151p. 41 refs. Technical rept. PR-97-T-R; AD-226 990.
Order from LC mi$7.50, ph$24.30 PB 149 869

The intensity of motion and the diffusivity of a single particle suspended in a turbulent fluid is discussed. The statistical behavior of particle motion is considered for the case of an isolated particle and for the case in which other similar particles present in the fluid exert pressure forces on the particle. (Author)

Rocketdyne, Canoga Park, Calif.
SOME COMMENTS ON PUMP CAVITATION RESEARCH, by A. J. Acosta (Calif. Inst. of Tech.) and G. F. Wislicenus (Pennsylvania State U.). Rept. on Study of Unconventional Methods for Alleviating Cavitation Problems in Rocket Pump Systems, Contract AF 33(616)5785. June 60, 25p. 28 refs. Excerpts from rept. R-1705; WADD Technical note 60-23.
Order from OTS $0.75 PB 161 952

Comments by Prof. A. J. Acosta and Prof. G. F. Wislicenus concerning pump cavitation research are presented. They are excerpts from a contract status report by Rocketdyne Division and originated in connection with a proposed study of fluid injection around a single cavitating hydrofoil. Both commentators question very strongly the value of such tests for present day pump cavitation research. Prof. Acosta points out in particular the general ineffectiveness of fluid injection as a means for cavitation control. As an extension to his comment, a theoretical analysis, previously advanced by Prof. Acosta, for the flow in a cavitating cascade is added. Prof. Wislicenus discusses in detail three-dimensional effects in pump cavitation and suggests also ways for attacking the associated problems. (Author)

INSTABILITY OF VENTILATED CAVITIES, by E. Silberman and C. S. Song. Rept. on Contract Nonr-710(24). Nov 59, 47p. 6 refs. Technical Paper no. 29, Series B; AD-237 387.
Order from LC mi$3.30, ph$7.80 PB 148 010

Cavitation number σ is defined by $\sigma = (p_o - p_k)/q$. It can be controlled by controlling the dynamic pressure q, the ambient pressure p_o, or the internal cavity pressure p_k. Controlling p_k by adding air to the wakes of fully submerged bodies (called ventilation) is investigated. With p_o and q fixed, p_k increases nearly linearly with the rate of air supply. Once σ was decreased to a certain critical value, further increase in the air supply rate would not produce a continuing linear decrease in σ. Rather, σ remained nearly constant and the cavities began to vibrate. Both two-dimensional and finite aspect-ratio bodies were tested in the two-dimensional, vertical, free-jet water tunnel.

Technion Research and Development Foundation, Ltd. (Israel).
RESEARCH ON CROSS-STRESSES IN THE FLOW OF LIQUIDS, by Markus Reiner. Technical rept. for 1 Mar 59-28 Feb 60 on Contract AF 61(052)223. [1960] 24p. 6 refs. AFOSR-TN-60-996.
Order from LC mi$2.70, ph$4.80 PB 150 357

Cross-stresses in the laminar flow of liquids. It is shown that cross-elasticity effects exist in a simple homogeneous liquid such as toluene. These effects manifest themselves in cross-stresses observed in an instrument consisting of two circular metal plates, one stationary, the other rotating opposite it. The stator can be displaced along the axis of rotation against forces exerted by springs. Stator and rotor are in contact when at rest. When the rotor is brought into rotation, cross-stresses in the liquid separate stator and rotor and a bearing effect is produced. Centripetal air-pump operated electromagnetically. Reprinted from the British Jnl. of Applied Physics 10:54-55, Jan 59.

AN EXPERIMENTAL DESIGN FOR VIBRATORY LIQUID SINTERING, by Dogan E. Gücer. Rept. on Contract DA 19-020-ORD-4888. June 60, 24p. 6 refs DA-4888/4; OOR rept. 2060. 4-Met.
Order from LC mi$2.70, ph$4.80 PB 150 398

This report describes an experimental set-up for measuring and controlling the vibrational energy input into a WC-Co liquid sintering specimen inside a high temperature hydrogen furnace. The control of input energy is achieved by proper acoustic design of the wave path and the measurement of dynamic strain amplitudes along this path. A method of calculation of the energy transmitted through the interface between the transmission bar and liquid sintering specimen and of the dynamic variables inside the specimen is proposed. The reproducibility of dynamical measurements and of alloy microstructures are also discussed. The same arrangement can easily be adapted to other applications. (Author)

RECENT DEVELOPMENTS IN SUPERALLOYS, by H. L. Wagner. Rept. on Contract [AF 18(600)1375]. 8 Sep 60, 14p. DMIC memo. 64.
Order from OTS $0.50 PB 161 214

A significant expansion of the operating limits of superalloys has been brought about in the past few years with the development of over a dozen new nickel-base and cobalt-base materials. Some of these alloys are fabricable into sheet, while others are suitable only for precision casting. Both, of course, have their advantages and disadvantages. The purpose of this memorandum is to highlight some of the newer superalloys and to discuss some of their important properties and characteristics.

Institute of Metals and Explosives Research, U. of Utah, Salt Lake City.
OBSERVATION OF VAPORIZATION ACCOMPANYING ULTRA-HIGH VELOCITY IMPACT, by R. W. Bartlett. Rept. on Contract AF 18(603)100. 4 Jan 60, 26p. 9 refs. AFOSR-TN-60-327; AD-237 546.
Order from LC mi$2.70, ph$4.80 PB 148 013

The explosive techniques employed were capable of generating velocities sufficiently high to produce target vaporization in many metals. These impact-generated vapors were sufficiently luminous for short periods of time to be photographed, and they exhibited considerable electrical conductance evidencing a high degree of ionization which decayed faster in air and various inert gases than in vacuum. Because of the high luminosity and the ionization of the impact-generated metal vapors or plasmas high-speed framing camera techniques and electrical conductivity measurements were employed. Small quantities of the condensed vapors also were collected and analyzed quantitatively to determine the ratios of the projectile or jet to target metals in the vapor condensate as a function of impact velocity. In most cases mixtures of metal oxides were indicated but the X-ray diffraction patterns did not permit conclusive identification of specific compounds. Some condensation of reduced metal also was observed (aluminum, iron and zinc) and a substitutional solid solution alloy, alpha brass, was produced by the simultaneous condensation of copper and zinc vapors originating from different targets impacted in tandem. (Author)

PHYSICAL METALLURGY OF TUNGSTEN AND TUNGSTEN BASE ALLOYS, by Russell H. Atkinson. Rept. for 1 Apr 58-30 Nov 59 on Metallic Materials, Contract AF 33(616)5632. May 60, 251p. 90 refs. WADD Technical rept. 60-37.
Order from OTS $4.00 PB 161 978

The program provided base line data and fundamental physical metallurgical information on tungsten of various purity levels. High temperature tensile properties and recrystallization temperature could not be directly correlated with the impurity level. The tensile transition temperature of tungsten single crystals lies between - 196°C and 107°C, the main influence being surface condition. Polycrystalline tungsten internal friction peaks of undetermined origin in the 20° - 800°C region. Annealed single crystals show no such behavior. Alloying with a dispersed second phase was studied; at present W-2% ThO_2 offers the greatest improvement in high temperature properties data on alloying studies are incomplete. (Author)

A STUDY OF THE MINIMIZATION OF THE ADVERSE EFFECTS OF CHROME PLATING ON THE FATIGUE LIFE OF AISI 4340 STEEL AND THE CORRELATION OF FATIGUE AND ELASTIC LIMITS, by Joseph Viglione. Rept. on Proj. TED NAM AE 4110, pt. 13. 20 July 59, 38p. 3 refs. Rept. no. NAMC-AML-AE-1098.
Order from LC mi$3.00, ph$6.30 PB 150 787

This report released for sale to the public 11 Oct 60.

The effect of shot-peening prior to and baking after chrome plating AISI 4340 steel was investigated at strength levels up to 295,000 psi. It was found that this treatment had excellent beneficial effects on the fatigue limits of chrome plated 4340 steel at all the strength levels likely to be used in aircraft construction. It was determined that there was no relationship between the fatigue limits and any of the other mechanical properties of the plated steel. In the case of the unplated steel, it was established that there was a definite straight-line functional correlation between the fatigue limit to elastic limit ratios and the tensile strength levels of the steel. (Author)

DETERMINATION OF THE CAUSES OF WELD-METAL CRACKING IN HIGH-STRENGTH STEELS AND THE DEVELOPMENT OF HEAT-TREATABLE LOW-ALLOY-STEEL FILLER WIRES FOR USE WITH THE INERT-GAS-SHIELDED ARC-WELDING PROCESS, by Herbert W. Mishler, Robert E. Monroe, and Perry J. Rieppel. Rept. for 16 June 58-30 July 59 on Welding, Brazing, and Solering of Metals, Contract AF 33(616)5878. May 60, 60p. 12 refs. WADC Technical rept. 59-531.
Order from OTS $1.50 PB 161 981

The work conducted under this contract was divided into four phases: three dealt with the study of the causes of weld-metal-cracking in SAE 4340 steel and the fourth was concerned with the study of filler wires for producing welds heat treatable to ultimate-tensile-strength levels greater than 225,000 psi. Freezing-cycle hot-tension studies were made on various heats of SAE 4340 steel containing various sulfur and phosphorus contents. Results indicated that the combined sulfur and phosphorus contents of SAE 4340 steel should be kept below 0.025 per cent to prevent weld-metal hot cracking. An intergranular phase believed to be associated with hot cracking was found during light and electron microscopy of high-phosphorus SAE 4340 steels. This phase was tentatively identified as the iron-iron phosphide euctectic. Two new restrained weld-metal-cracking tests were developed that will give a quantitative measure of weld-metal-cracking resistance and which also will be inexpensive to conduct. Filler wires were developed which can produce weld metals capable of being heat treated to various strength levels in the range of 225,000 to 280,000 psi ultimate tensile strength. (Author)

AN X-RAY ANALYSIS OF THE STRAIN IN STEEL DUE TO IMPULSIVE LOADS, by G. Moss, S. Golaski and C. Glass. June 60, 12p, 5 refs. Technical note no. 1320.
Order from LC mi$2.40, ph$3.30 PB 149 884

A rod of pearlitic 1030 steel was subjected to an impulsive load, recovered, and analyzed for X-ray diffraction line broadening at a cross section which had been exposed to a maximum pressure of approximately 35 kilobars. The broadening of the diffraction peaks was then plotted versus $\sec\theta$ and θ in order to establish whether or not the primary mode of deformation was due to lattice fragmentation or micro-strain. The results indicated that deformation was not simple enough to be interpreted according to either of these models, for the broadening was probably due to both micro-strain and lattice fragmentation. CRACK PROPAGATION TESTS OF HIGH-STRENGTH SHEET MATERIALS. PART V. AIR-MELTED AND CONSUTRODE AMS 6434 STEEL, by C. D. Beachem and J.E. Srawley. 18 Aug 60, 22p. 4 refs. NRL rept. 5507.
Order from OTS $0.75 PB 161 697

Crack propagation tests were conducted on air-melted and consumable-electrode vacuum-remelted SAE Aeronautical Materials Specification 6434 (modified AISI 4335 with vanadium), using specimens 1/2 in. or 1-1/2 in. wide and up to 0.125 in. thick, and heat-treated to have yield strength in the range 180 to 210 ksi. The full shear temperatures obtained with the different thicknesses and heat treatments were lower than those of any other steels of comparable thicknesses and yield strengths that have been tested to date, and the net fracture stress values were similarly superior. The consutrode material was significantly better than the air-melted material. Limited data indicated that the transverse properties were not significantly inferior to the longitudinal properties. The FST was higher the thicker the material, as previously observed for other materials. Austenitizing at 1620°F gave better results than at 1575°F, and tempering at 400°F gave better results than at 725°F. (Author) (See also PB 161 355)

IMPROVED STEELMAKING PRACTICES ENHANCE THE MECHANICAL PROPERTIES OF HIGH STRENGTH STEEL CASTINGS, by John Zotos, and Kenneth D. Holmes. May 60, 26p. 13 refs. Rept. RPL 10/25.
Order from LC mi$2.70, ph$4.80 PB 149 560

Recent advances in the basic-electric and basic-induction atmospheric and vacuum steelmaking practices have, (1) clarified the necessity of minimizing phosphorus and sulphur contents in cast low alloy steels to maximize ductility and toughness at low, medium and high strength levels, (2) shown that the ductility and toughness of these cast steels can be further significantly improved through the use of vacuum melting and casting techniques, and (3) indicated that the mechanical properties of heat treated castings with low sulphur contents compare favorably with the properties of forgings having similar analyses. THE EFFECT OF RATE OF HEATING TO AGING TEMPERATURE ON THE TENSILE PROPERTIES OF Ti-2, 5Al-16V ALLOY SHEET, by G. S. Root and H. R. Ogden. Rept. on [Contract AF 18(600)1375]. 18 Aug 60, 11p. 3 refs. DMIC memo. 62.
Order from OTS $0.50 PB 161 212

The experiment described in this memorandum was designed to correlate tensile properties of aged Ti-2.5Al-16V alloy sheet, heated to aging temperature at various rates, with the quench and reheat time-temperature-transformation diagram developed for this alloy by the Armour Research Foundation. Specifically, the effects of three variables on aged strength and elongation were studied: (1) The effect of rate of heating to aging temperature, (2) the effect of minor variations in total time during aging, and (3) the effect of a low-temperature pre-aging treatment to obtain omega phase.

TANTALUM AND TANTALUM ALLOYS, by F. F. Schmidt. Rept. on Contract AF 18(600)1375. 25 July 60, 334p. 287 refs. DMIC rept. 133.
Order from OTS $5.00 PB 151 091

A descriptive literature survy has been made covering physical properties, process metallurgy, binary and ternary alloy systems, chemical properties and metallurgical properties of tantalum and tantalum alloys. The properties of tantalum are well reported; however, investigations concerned with the effects of interstitial and substitutional alloying elements on the properties of tantalum are limited. Tantalum has only moderate strength at room temperature; however, the elevated-temperature strength decreases slowly in comparison with that of many other metals. The low ductile-to-brittle behavior, excellent fabricability, high melting point, and high solubility for interstitial and substitutional elements make tantalum an attractive candidate for use in high-temperature high-strength alloys. Refractory metals that exhibit brittle behavior at room temperature, such as molybdenum and tungsten, can be alloyed with tantalum to form tantalum-base alloys with a combination of high-temperature strength and low-temperature ductility not found in many metallic materials designed for ultra-high-temperature service. PROPERTIES OF ZONE REFINED TITANIUM AND ZIRCONIUM. PART I, by J. L. Rutherford, R. L. Smith, and M. Herman. Rept. on Contract AF 18(600)1581. July 60, 33p. 4 refs. Interim rept. I-A1878-6; AFOSR-TN-60-694.
Order from LC mi$3.00, ph$6.30 PB 149 955

The properties of zone refined titanium and zirconium are presented and evaluated. Surveys of the properties along the length of the zone refined bars are shown which indicate a definite redistribution of impurities as well as some actual purification. The results of tensile tests at 4.2°K and the origin of the serrations appearing in these tensile curves are discussed. (Author)

RADIATION INDUCED RESISTIVITY CHANGES IN NICKEL, by D. B. Rosenblatt. Mar 60, 10p. 7 refs. Memo. rept. M60-29-1; AD-239 656.
Order from LC mi$1.80, ph$1.80 PB 149 792

Previous research with room temperature irradiations of nickel wire revealed anomalies in the increase of the electrical resistivity of this material. Comparison of results obtained by different investigators suggests that the excess resistivity saturates at very low values of integrated flux and does not anneal out in a reproducible fashion. The experiments reported here verify the existence of this anomalous behavior and provide additional data for various radiation doses. The annealing of the excess resistivity produced by cold work is studied and found to follow a smooth curve, with significant rates of disappearance of defects in the temperature range right above room temperature. The relationship between this behavior and the irreproducibility of data obtained with irradiated specimens is discussed. (Author)

ULTRA-SHORT-TIME CREEP RUPTURE, by Joseph S. Ives, Jr. Rept. for 2 Feb-31 Oct 59 on Materials Analysis and Evaluation Techniques; Contract AF AF 33(616)5557. May 60, 131p. WADC Technical rept. 59-762, Pt. 2.
Order from OTS $2.75 PB 161 983

The short time creep behavior of eight structural sheet materials when subjected to temperatures up to 2,000°F was determined for time periods of 10 seconds to three minutes. The test specimens were preloaded and subsequently heated to the desired test temperature within 100 milliseconds through capacitance discharge. Test temperature was then maintained by an a.c. current. Strain-time, isochronous stress-strain and stress-time curves are presented. Initial transient behavior due to thermal expansion is also reported. (Author) (See also PB 161 789)

Armour Research Foundation, Chicago, Ill.
THE DETERMINATION OF THE EFFECTS OF ELEVATED TEMPERATURES ON THE STRESS CORROSION BEHAVIOR OF STRUCTURAL MATERIALS, by Frank A. Crossley, Carl J. Reichel, and Charles R. Simcoe. Rept. on Materials Application, Contract AF 33(616)6392. May 60, 59p. 39 refs. WADD Technical rept. 60-191.
Order from OTS $1.50 PB 161 962

The dissolution rates of anodized oxide films on Ti-6Al-4V alloy were determined from 800° to 1000°F. Coefficients for oxygen diffusion in Ti-6Al-4V alloy are given by D, $cm^2/sec = 2.87 \times 10^4 \exp(-67,900 \pm 300/RT)$. Experiments showed conclusively that oxide film protection is lost by direct reaction with chloride salt. Elevated-temperature creep testing in the presence of chloride salt was found to be detrimental to post-exposure tensile properties of the materials: 17-7 PH, stainless Type 321, Inconel-X, and B 120-VCA. Materials exhibiting premature failure with greatly reduced ductility in tension static fatigue tests at room temperature in the presence of 10% chloride salt aqueous solution were: 2024T-86 Al alloy, ZK-60 Mg alloy, 17-7 PH, and B 120-VCA. The materails 2024T-86, Ni-plated 17-22 AS, 17-7 PH, Lapelloy, Type 321 stainless, and B 120-VCA were tested for JP-4 fuel stress-corrosion. Except possibly for 2024T-86, no susceptibility was found. (Author)

SOME MICROSCOPIC OBSERVATIONS OF CRACKS DEVELOPED IN METALS BY VERY INTENSE STRESS WAVES, by G. Moss and C. M. Glass. Apr 60, 19p. 4 refs. Technical note no. 1312; AD-237 943.
Order from LC mi$2.40, ph$3.30 PB 148 913

Explosively induced stress waves were propagated through various metals so that scab type fractures resulted. Microscopic examinations were then made of the metal adjacent to the fracture surfaces. In each case, the fractures began at imperfections within a thin plate of metal that was parallel to and included the observable fracture surface. The thickness and position of this plate within the metal appears to be a function of the inclusions present, subboundaries and crystal orientation. It is concluded that these metallurgical factors influence the response of metals even under explosive loading. (Author)

Food Machinery and Chemical Corp., Buffalo, N. Y.
EFFECT OF COUPLING OF ALUMINUM OR STAINLESS STEEL ALLOYS TO ALUMINUM ON CORROSION BY 90% HYDROGEN PEROXIDE, by L. Goldschlag. Final rept. for 1 Feb-28 Oct 58 on Contract NObs-72383. [1958] 50p. 5 refs. Rept. 91:49-4; AD-212 846.
Order from LC mi$3.30, ph$7.80 PB 150 293

A study of the galvanic corrosion caused by coupling of stainless steels to aluminum alloys and of aluminum alloys to other aluminum alloys in 90% hydrogen peroxide containing chloride and nitrate ions has been completed. During a one-month period, galvanic corrosion was essentially unnoticeable in solutions containing 0 and 3 mg/l chloride but apparent at 10 mg/l. Data on the pronounced effect of chloride, and of anodizing the aluminum, and general data on chemical corrosion of aluminum was obtained. (Author).

A CINEPHOTOMICROGRAPHIC STUDY OF THE ETCHING OF ZINC, by S. Tint and V. V. Damiano. Rept. on Contract AF 18(600)1581. July 60, 12p. 4 refs. Interim rept. I-A1878-8; AFOSR-TN-60-696.
Order from LC mi$2.40, ph$3.30 PB 149 956

A device was constructed to photograph, on motion picture film, the continuous formation of etch patterns on zinc monocrystals. This apparatus consists of: (1) a transparent cell to hold sample and etchant; (2) a microscope with vertical illuminator; and (3) a motion picture camera driven by an electric motor. Several sequences of these pictures are reproduced, showing looplike patterns similar in appearance to the Frank-Read dislocation source. (Author)

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
DISLOCATIONS AND IMPURITY BOUNDARIES IN ZINC CRYSTALS GROWN FROM THE MELT, by V. V. Damiano and S. Tint. Rept. on Contract AF 18(600)1581. July 60, 15p. 10 refs. Interim rept. I-A1878-9; AFOSR-TN-60-697.
Order from LC mi$2.40, ph$3.30 PB 150 127

Using etch pit techniques, the arrangement of dislocations in cadmium doped high purity zinc crystals grown from the melt was investigated. Crystals which exhibit a cellular segregation structure at a decanted interface were progressively polished and etched to a depth of several millimeters behind the interface. The location of the etch pits at microsegregation and their arrangement into networks is in agreement with Tiller's hypothesis that dislocations are introduced during solidification to accommodate the lattice strain induced by the inhomogeneous distribution of impurities. Networks form when the dislocations are set free after homogenization occurs behind the solid-liquid interface. The dislocations then become arranged in walls perpendicular to the slip plane by climbing away from the impurity boundaries. This secondary substructure fully developed 3 mm behind the solid-liquid interface increases in size as the crystal continues to grow and the dislocations climb and glide. (Author)

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
PROPERTIES OF ZONE REFINED TITANIUM. PART II, by G. Spangler and M. Herman. Rept. on Contract AF 18(600)1581. July 60, 38p. 22 refs. Interim rept. I-A1878-7; AFOSR-TN-60-695.
Order from LC mi$3.00, ph$6.30 PB 150 126

The recrystallization characteristics, grain growth kinetics, residual resistivity ratio and mechanical deformation characteristics of zone refined titanium are presented and discussed. Both the ultimate purification and the redistribution of impurities in the zone refined material have been evaluated in terms of these operational parameters. Observations are presented and discussed on the effect of purity and grain size on the tendency for discontinuous plastic flow at 4.2°K. (Author)

GAS ATMOSPHERE EFFECTS ON MATERIALS, by R. A. Baughman. Rept. for Apr 58-Apr 60 on Aircraft Fuels, Contract AF 33(616)5667. May 60, 232p. 11 refs. WADC Technical rept. 59-511.
Order from OTS $3.50 PB 161 980

Effects of a special water saturated gas atmosphere on the properties of structural materials was studied at elevated and low temperatures. Parent material as well as welded and brazed joints were subjected to tensile, impact and strain aging tests. Fundamental mechanism and coating study was accomplished on Inco 702, which had proved the most sensitive to the gas environment. This report includes all data obtained and detailed discussion of results. The high temperature rupture strength of each alloy studied was shown to be reduced below the corresponding air atmosphere strength by the special gas. Low temperature properties were shown to be independent of the environmental effects studied. The basic mechanism effecting the high temperature properties has not been clearly determined. (Author)

OXIDATION OF METALS AND ALLOYS, by C. E. Birchenall. Final rept. for 1 Jan 59-30 June 60 on Contract AF 49(638)533. 1960, 19p. AFOSR-TR-60-96.
Order from LC mi$2.40, ph$3.30 PB 150 138

This project has contributed to the following subjects: (1) the establishment of an unusual variation in self-diffusion coefficient in alpha iron in the temperature range containing the Curie point; (2) effects of disorder on thermodynamic properties in manganous oxide and on diffusion in ferrous sulfide; (3) the mechanism and kinetics of oxidation of iron-chromium alloys containing up to ten percent chromium; (4) the mechanism of sulfidation of iron; (5) equilibria in the chromium-sulfur system; (6) the effects of interstitial sites, in which ions are nearly as stable as in lattice sites, on the frequency factor in the rate equation for diffusion; (7) self-diffusion of iron in spinel ferrites of several compositions; and (8) self-diffusion in delta-iron.

Metals and Ceramics Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
ELEVATED TEMPERATURE DYNAMIC MODULI OF VANADIUM TITANIUM AND V-Ti ALLOYS, by W. H. Hill and B. A. Wilcox. Rept. for Oct 59-Apr 60 on Metallic Materials. May 60, 16p. 9 refs. WADD Technical rept. 60-245.
Order from OTS $0.50 PB 171 014

The dynamic moduli of calcium-reduced vanadium, high grade aluminothermic vanadium, iodide titanium and Ti-75A alloy were determined over the temperature range R. T. to 1250°F. In addition, elevated temperature dynamic modulus data were obtained for five V-Ti alloys, having nominal compositions of V-8Ti, V-17Ti, V-25Ti, V-32Ti, and V-48Ti. The decrease in modulus of vanadium with increasing temperature was found to be relatively small as compared to iodide Ti and Ti-75A. Solid solution additions of Ti were observed to lower the modulus of V over the entire temperature range studied, but the additions did not affect the slope of the modulus versus temperature curve. An empirical correlation relating modulus to density, absolute melting point, and atomic weight was successfully applied to vanadium and V-Ti alloys, such that good agreement was realized between the ratios of E_v/E_{alloy} (calculated) and E_v/E_{alloy} (measured). (Author)

STRESS CORROSION OF NOTCHED AND UNNOTCHED AM-350 ALLOY, by Robert T. Ault. Rept. for Sep-Dec 59 on Materials Analysis and Evaluation Techniques. May 60, 14p. 3 refs. WADD Technical note 60-95.
Order from OTS $0.50 PB 161 998

One of the precipitation hardness stainless steel alloys (AM-350) was tested for stress corrosion susceptability in the notched and unnotched condition. A 3 1/2% sodium chloride solution was used. With the specimen stressed to 60% of the 0.2% offset Y. S., it was found that all of the unnotched specimens had failed within 150 hours and none of the notched specimens had failed after 800 hours. It was concluded that stress-raisers such as mechanically induced notches do not have an appreciable effect on the susceptability of an alloy to stress corrosion cracking (SCC). Rather the more important factor is local surface defects or inhomogeneities in the material. It was also found that concentration cell corrosion may be an important consideration for the AM-350 alloy. (Author)

Naval Engineering Experiment Station, Annapolis, Md.
EVALUATION OF TITANIUM AS A SALT WATER PIPING MATERIAL, by Frank Sutton. 15 Sep 58, 12p. 9 refs. Evaluation rept. 910037D; AD-212 792.
Order from LC mi$2.40, ph$3.30 PB 147 563

An experimental salt water piping system to evaluate titanium for piping applications operated for 39 months at a water velocity of 20 ft/sec. The titanium pipe and fittings exhibited complete resistance to salt water corrosion and erosion.

New York U. Coll. of Engineering, N. Y.
FURTHER STUDIES ON ACTIVE-EUTECTOID ALLOYS OF TITANIUM, by R. F. Bunshah, D. Osterberg and others. Rept. for 15 Apr 58-30 Sep 59 on Metallic Materials, Contract AF 33(616)5655. May 60, 80p. 26 refs. WADD Technical rept. 60-95.
Order from OTS $2.00, PB 161 964

This report covers work on active eutectoid titanium-copper alloys in which the decomposition of the beta phase to alpha plus compound occurs rapidly. The current program is divided into two parts. Part I deals with the properties of active eutectoid alloys. The effect of stepwise additions of Al and/or Zr to binary Ti-5Cu, Ti-6Cu, Ti-6Ni, Ti-2Ni-2Cu and Ti-4Ni-2Cu alloys on the tensile strength at room and elevated temperatures, creep-rupture properties and thermal stability under stress were studied. Several alloys exhibited outstanding short time tensile strengths up to 1200°F much superior to the best competition. The creep-rupture properties were correspondingly good. These alloys which exhibited highest strengths also showed instability. Stability could be restored partially by some sacrifices in strength. (Author)

Physical Science Lab., Ordnance Tank-Automotive Command, Center Line, Mich.
VACUUM DEPOSITION OF CORROSION RESISTANT TITANIUM COATINGS, by David K. Wilburn and Charles W. Horn. Rept. on Contract DA 20-089-ORD-39246. Feb 60, 57p. 23 refs. Rept. no. RR-12.
Order from LC mi$3.60, ph$9.30 PB 149 809

A process has been developed for the production of vacuum metallized coatings of titanium for application on ferrous basis metals. Conditions of surface preparation, degassing of basis metal and the vaporization of the titanium are discussed in detail. Metallized titanium coatings are examined by spectrographic and X-ray diffraction techniques. An important phase of the titanium metallization process is the diffusion treatment of the coating which produces adhesion and reduces porosity. Laboratory samples metallized in accordance with this procedure satisfactorily pass the 200 hour salt-fog corrosion test and exhibit excellent adhesion and uniformity. (Author)

Rock Island Arsenal Lab., Ill.
EFFECTS OF VARIATIONS IN SILICON AND MANGANESE ON THE AS-CAST PROPERTIES OF NODULAR CAST IRONS, by P. E. Goettsch. 17 Feb 60, 17p. Rept. no. 60-406; AD-234 987.
Order from LC mi$2.40, ph$3.30 PB 147 342

Silicon levels ranging from 2.4 to 3.5% with manganese levels of 0.2 to 2.0% were used in a series of sixteen separate heats of nodular cast iron in order to study the effects of various concentrations of these elements on as-cast microstructure and tensile properties. Increases of manganese at any level of silicon increased the ratio of pearlite to ferrite, raised the yield strength, and lowered ductility. The mechanical property requirements for Classes 3, 4, and 5 of nodular iron Specification MIL-I-11466 were obtained in the as-cast condition. As-cast ductility was severely impaired when additive silicon-manganese totals exceeded 4.0%. (Author)

NUCLEAR PHYSICS AND NUCLEAR CHEMISTRY

Aerojet-General Nucleonics, San Ramon, Calif.
STANDARDIZATION OF FABRICATION TECHNIQUES (THRESHOLD FOILS) by I. E. Lamb and R. R. Tsukimura. Rept. for Jan 58-22 Sep 59 on Nuclear Instrumentation, Contract AF 33(600)35917. May 60, 101p. 4 refs. WADC Technical rept. 59-607.
Order from OTS $2.50 PB 161 982

The techniques used to develop and standardize a series of neutron detection foils for measurement of neutron spectra are described. The series includes gold and cobalt foils, and plutonium-239, uranium-238, and sulfur threshold foils. A method of calibrating the foils with a low-flux research reactor is discussed. The instrumentation required to obtain data from the foils is presented, together with the neutron intensities that may be explored with these detectors. (Author)

Chicago U., Ill.
RADIOLYSIS OF METHANOL ADSORBED IN SYNTHETIC ZEOLITE-ENERGY TRANSFER EFFECTS by Weldon G. Brown and Helen E. Krizek. Rept. for Aug-Dec 59 on Contract AF 33(616)3875. June 60, 16p. 10 refs. WADD Technical note 60-28.
Order from OTS $0.50 PB 161 953

Samples of Linde Type 5A Synthetic Zeolite, containing methanol at loadings from 2 to 23%, have been subjected to Co-60 gamma irradiation. Analytical data are given for the major products, hydrogen, formaldehyde and ethylene glycol. The data from these experiments, which were of a preliminary nature, are not sufficiently reliable to establish a significant difference with respect to product distribution as compared with the radiolysis of pure methanol. The yields indicate that a substantial fraction of the increase in total energy absorption due to the zeolite is utilized in product formation. The results, with respect to effect of adsorbent on yields, are generally similar to those previously reported by Caffrey and Allen for pentane on silica gel. Under the assumption that similar mechanisms operate with efficiencies comparable with the liquid state, estimates can be made of the energy transfer efficiency. These range from 10 to 65% over the range of methanol concentrations employed and are approximately linear with respect to methanol concentration up to saturation. Reference is made to some potential practical applications of the energy transfer effect. (Author)

Palmer Physical Lab., Princeton U., N. J.
COMPARISON OF THE STRANGE PARTICLE PRODUCTION IN CLOUD CHAMBERS WITH THE OBSERVATIONS OF DECAY γ-RAYS NEAR INTERNAL COSMOTRON TARGETS, by Theodore Bowen. Technical rept. no. 24 on Cosmic Ray and Elementary Particle Group, Contract Nonr-1858(06). 25 June 59, 33p. 11 refs. AD-217 593.
Order from LC mi$3.00, ph$6.30 PB 147 610

A detailed comparison is presented of strange particle production in cloud chambers with the observations of

decay γ-rays near internal cosmotron targets. The γ-rays were counted in a known geometry; the threshold of the γ counter was low enough (~10 Mev) so that the detection efficiency was essentially constant independent of γ-ray energy. For each of the 35 A^o's and 20 Θ_1^o's observed in the cloud chambers, the probability of counting a γ-ray was calculated for several target-to-occulter distances. Since the cloud chamber events were also used to determine production cross-sections, the total path length of material traversed by protons was determined for each plate material. The absolute comparison of numbers of γ-counts from C, Fe (Cu) and Pb, and the relative comparison of the shapes of the decay curves support a consistent interpretation, making use of currently accepted values of lifetimes and decay branching ratios. Since the production angular distributions and the γ-counts vs distance decay curves are very similar for A^o's and Θ_1^o's, the γ-counting results cannot directly reveal the relative contributions from A^o's and Θ_1^o's. The low upper limits on total production cross sections for strange particles from p-p collisions, in combination with the high K^+ yields observed by others, seem to indicate that the matrix element is not constant, but favors K mesons with low cms momentum.

A MODEL FOR THE CALCULATION OF THE OPTICAL POTENTIAL IN SOME FINITE NUCLEI, by B. Jancovici. Technical note no. 20 on Contract AF 61(052)173. [1960] 27p. 13 refs. AFOSR-TN-60-941.
Order from LC mi$2.70, ph$4.80 PB 150 352

The imaginary part of the optical potential is computed in second order in an harmonic oscillator shell model for He^4, O^{16}, Ca^{40}; finite nucleus shell model wave functions are consistently used. The results show a good agreement with those of the Thomas-Fermi approximation, providing a check for the validity of the latter. A stronger absorption in the surface is predicted; this effect is therefore not a spurious effect of the Thomas-Fermi approximation. (Author)

Johns Hopkins U., Baltimore, Md.
THE MASS OF THE SIGMA-PLUS HYPERON, by H. F. Perry and A. Pevsner. Rept. on Contract AF 18(603)143. June 60, 17p. 7 refs. AFOSR-TN-60-530; AD-239 905.
Order from LC mi$2.40, ph$3.30 PB 149 358

The stars produced by K-minus mesons stopping in nuclear emulsion were investigated to find examples of the decay at rest of $\Sigma^+ \rightarrow p + \pi^o$. Fourteen examples of this decay were obtained. The mean weighted range of the proton, corrected to the range in emulsion of standard density, is 1676.3 ± 7.7 microns. This corresponds to a kinetic energy of 18.85 Mev. The mass of the Sigma-plus hyperon was found to be 1189.41 ± 0.54 Mev. (Author)

RESEARCH ON COLLISION PROCESSES OF ELECTRONS AND ATOMS, by James R. Peterson, Otto Heinz, and Charles J. Cook. Annual rept. on Contract Nonr-2588(00). 31 July 59, 43p. 17 refs. SRI Project no. SU-2557; AD-226 525.
Order from LC mi$3.30, ph$7.80 PB 149 727

An apparatus for use in experimental studies of low-energy particle impact phenomena is described: investigation of collisions between electrons and ionized or neutral atoms or molecules will employ crossed-beam techniques, using modulated beams and phase-sensitive detection. The approach represents a departure from conventional atomic beam methods in that the atoms are obtained from a fast ion beam rather than from a thermal source. An analysis of the application of the method to the determination of electron-atom ionization cross sections demonstrates the feasibility of the method. (Author)

MICROWAVE GAMMA-RAY ION CHAMBER, by Conald A. Brown, Karl A. Speh, and Jesse J. Taub. Rept. for May 58-Nov 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5758. May 60, 70p. 7 refs. WADD Technical rept. 60-98.
Order from OTS $1.75 PB 161 986

A microwave gamma-ray ion chamber and its associated equipment has been developed that is capable of measuring gamma radiation in the range from 10^6 to 10^{10} ergs per gm-hr (carbon). This equipment operates at a microwave frequency of about 9 kmc and

measures radiation by using the changes in the reflection coefficient looking into a gas-filled microwave resonant cavity caused by ionization of the gas due to radiation. Data on gas conductivity and resonant frequency shift have been taken for different gas mixtures. (Author).

A VARIABLE SENSITIVITY GAS THERMOMETER FOR USE AT LOW TEMPERATURES, by F. Rothwarf and J. Steinberg. Sep 59, 13p. 7 refs. Memo. rept. no. M60-1-7; AD-229 586.
Order from LC mi$2.40, ph$3.30 PB 150 306

A variable sensitivity gas thermometer is described which is designed for use in low temperature experiments in the difficult region between liquid helium and room temperatures. The device makes use of the high sensitivity, dP/dT, that can be achieved by having the volume of gas which remains at room temperature considerably larger than that of the thermometer bulb proper. The theoretical analysis is presented, from which design criteria are obtained for various sensitivities and temperature ranges. It is further shown that higher sensitivities can be achieved for a given thermometer by charging the system with the bulb at low temperatures while the dead space is kept at room temperature. Corrections for the various errors that arise in constant volume gas thermometers are discussed. It is found that by increasing the dead space as the temperature is lowered, a fairly constant accuracy can be maintained over the range from 300° K to 4.2° K. (Author).

Lockheed Aircraft Corp., Sunnyvale, Calif.
FEASIBILITY OF A RADIATION DETECTION SYSTEM FOR SPACE TRAVEL. Rept. on Contract AF 29(600)2049. July 60, 50p. 17 refs. LMSD-703014; AFMDC-TR-60-15.
Order from LC mi$3.30, ph$7.80 PB 150 050

Preliminary design criteria are presented for a system of instruments for the measurement of the species, intensities, and energies of space radiation which may be expected on the basis of current understanding of radiation phenomena in space.

Naval Civil Engineering Lab., Port Hueneme, Calif.
RADIATION SLIDE RULE FOR ATOMIC FALLOUT PROBLEMS, by J. C. LeDoux. Final rept. 24 May 60, 24p. 5 refs. Technical rept. 083.
Order from LC mi$2.70, ph$4.80 PB 148 660

The theory, construction, and use of a circular slide rule is presented. It is designed to solve passive-defense residual-radiation problems. The rule is based on the $t^{-1.2}$ law of radioactive decay and can solve an infinite number of problems without recourse to tables, construction, or graphic plots. Several typical problems are worked with the slide rule to demonstrate it. (Author)

TASK PERFORMANCE WITH THE CRL MODEL 8 MASTER-SLAVE MANIPULATOR AS A FUNCTION OF OBJECT SIZE, ANGLE, AND HEIGHT OF DISPLAY, by D. Frederick Baker. Rept. on Human Factors in Advanced Flight. May 60, 20p. 13 refs. WADD Technical rept. 60-167.
Order from OTS $0.50 PB 171 013

This experiment was undertaken to investigate criteria for design of equipment to be handled and tasks to be performed with remote-handling equipment. Three variables in remote-handling task performance were studied: size of object handled, height, and angle of display. A CRL Model 8 Master-Slave Manipulator was used for a performance task in which subjects removed three sizes of hexagonal nuts from a display panel presented at three different heights and five different angles. Task performance times were analyzed in relation to joint range limitations of shoulder, elbow, forearm and wrist movements. Within the limits of this study, the size of the object to be handled remotely has little effect on performance. Change in angle of display brings about significant differences in performance time. Performance time tends to improve as angle moves from horizontal to vertical at the upper height; and from vertical to horizontal at the lower height. (Author)

A DETERMINATION OF BACKGROUND RADIATION AND THE EFFECT OF SHIELDING, by H. F. Perry and A. Pevsner. Rept. on Contract AF 18(603)143. June 60, 12p. 3 refs. AFOSR-TN-60-548.
Order from LC mi$2.40, ph$3.30 PB 149 360

An investigation of the background radiation, in particular that due to "slow electrons," was undertaken to determine the rate of contamination of undeveloped nuclear emulsions. Unshielded emulsions were found to pick up 4×10^5 tracks/cm^3/day in the 35-200 kev energy range. In a specially constructed iron safe the background was reduced and emulsions picked up only $.09 \times 10^5$ tracks/cm^3/day. Under the shielded conditions, the latent images faded at a faster rate than the background was acquired. (Author)

A BORON DETERMINATION FOR THE APPR-1. Rept. on Contract DA 44-009-eng-3318. 25 May 59, 37p. MND-E-1718-1; AD-217 691.
Order from LC mi$3.00, ph$6.30 PB 150 550

This report released for sale to the public 13 Oct 60.

An investigation was made of the problem of B loss determination resulting from the fabrication of stainless steel - UO_2 dispersion-type fuel elements for the Army Packaged Power Reactor (APPR-1) in which B is employed as a burnable poison. Comparisons were made between the results of analyses of fuel elements by the Martin Company, Oak Ridge National Laboratory, and the Lucius Pitkin Company. Radiographs showed no detectable reactivity difference between two sets of APPR-1 fuel plates which were fabricated at ORNL. Based on reactivity measurements and compared with the Martin APPR-1 mockup, the amount of B in an average 18-plate APPR-1 element composed of ORNL plates is 71% of the design amount for a B loss of 29%. Chemical analysis of fabricated fuel plates by ORNL and Martin Nuclear showed an average B loss per plate of 22.4% for 100% design B loading or 25.9% for 103.5% of design B loading.

ANGULAR CORRELATION STUDY OF THE Mg^{24} (d, p γ)Mg^{25} STRIPPING REACTION AS A TEST OF THE DISTORTED WAVE THEORY, by Joseph Pourcher Martin. Doctoral thesis. Technical rept. no. 1 on Precision Scattering of Nuclear Particles, Contract Nonr-624(10). Oct 59, 66p. 27 refs. AD-227 922.
Order from LC mi$3.90, ph$10.80 PB 149 936

Angular correlations between protons from the Mg^{24}(d, p)Mg^{25} reaction leading to the 3.40 Mev excited state of Mg^{25} and the resulting de-excitation gamma rays were investigated to test the validity of the distorted wave stripping theory. A natural magnesium target was bombarded by 15 Mev deuterons and proton-gamma coincidences were counted using scintillation detectors in conjunction with conventional fast-slow coincidence circuitry. The correlations were studied at laboratory proton scattering angles of 15° and 45°, each in two mutually perpendicular planes: the reaction plane and the plane perpendicular to it containing the deuteron axis. The angular distribution of protons from the same level was measured and fitted by a Butler stripping curve with $l_n = 1$ and $r_o = 5.0$ fermis. (Author)

A STUDY OF THE ENGINEERING ASPECTS OF EXPEDIENT GAMMA-SHIELDING MATERIALS, by Cluey D. Hargrove and Allen F. Grum. Rept. for 1 Feb-1 June 59. 7 Apr 60, 69p. 6 refs. Technical rept. 1622-TR. AD-238 440.
Order from LC mi$3.90, ph$10.80 PB 149 317

The purposes of the tests covered in this report were (1) to determine attenuation (absorption) coefficients and (2) to determine dose rates as a function of shield thickness for 10 shielding materials that can be found in the field, such as water, rock, dirt, or wood. Measurements were made with a sodium iodide, thallium-activated crystal and a 128-channel pulse height analyzer. Point sources were used for the attenuation coefficient measurements and 12-inch-diameter uniformly distributed sources for the dose rate measurements. The report concludes that: (a) It is uneconomical to try for a "good" gradation of rock when using rock as an expedient shield because the differences in density between a good and poor gradation in most cases would be only 10 to 20 percent. In rare cases where the good gradation has a density appreciably greater than the poor gradation, it would be worthwhile to achieve a good gradation, (b) any effort spent on compacting soil in an expedient shield would be effort well spent; (c) sand should be used in its driest natural state for effective gamma attenuation; and (d) the curves as presented by WKNL may be unconservative for some applications. (Author)

Army Rocket and Guided Missile Agency, Redstone Arsenal, Ala.
THE DISINTEGRATION OF Ba^{131}, by J. Richard Haskins. 1 Aug 59, 44p. 21 refs. ARGMA TR-1C32R; AD-220 888.
Order from LC mi$3.30, ph$7.80 PB 149 094

The energies of the high energy gamma rays in the decay of Ba^{131} were measured and found to be: 810 ± 10, 925 ± 10 and 1050 ± 15 Kev. The existence of a 405 Kev. gamma ray in coincidence with the 214 Kev. gamma ray was confirmed. It was determined that there are two gamma rays with energies of approximately 250 Kev., one in coincidence with the 122 Kev. gamma ray and the other in coincidence with the 372 Kev. gamma ray. The 496 Kev. -122 Kev. cascade was investigated. The K conversion coefficient for the 496 Kev. gamma ray was determined to be $(10.5 \pm 1.0) \times 10^{-3}$. The gamma-gamma angular correlation was found to be isotropic with both liquid and metallic barium sources. The K/L conversion ratio for the 122 Kev. gamma ray was determined to be 2.7 ± 0.5. These results are consistent with a 3/2 (M1) 1/2 (E2) 5/2 cascade or a 3/2 (M1 + E2) 5/2 (M1 + E2) 5/2 cascade with certain possible mixing ratios. Additional experiments are proposed, the results of which should make a decision between these two cases possible. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
PLOTTING SCALE ML-556(XE-1)/UM, by Bruce F. Watson. 1 Aug 59, 26p. 2 refs. USASRDL Technical rept. 2059; AD-226 417.
Order from LC mi$2.70, ph$4.80 PB 147 824

Plotting Scale ML-556(XE-1)/UM is designed to speed and simplify the construction of the fallout wind plot for the Army method of fallout prediction. The fallout wind plot is a configuration through means of which the location of close-in fallout can be predicted by considering the vertical and horizontal velocities of fallout particles. The plotting scale is developed to fulfill the requirement for a convenient method of accounting for the changing rates of descent and horizontal displacements of fallout particles as they move through the atmosphere.

AIR AND CONCRETE SCATTERING OF GAMMA RAYS, by M. B. Wells. Rept. on Contract AF 33(600)32054. 20 Mar 59, 107p. 13 refs. ANP doc. no. NARF-59-11T; MR-N-229.
Order from LC mi$5.70, ph$16.80 PB 150 674

This report released for sale to the public 12 Oct 60.

This report describes a Monte Carlo method of computing the angular distribution and energy spectrum of gamma rays scattered in air and ground. The development of the integrals representing the contribution of each order of scattering to the total scattered flux, and the application of random sampling methods to the evaluation of these integrals, are outlined in detail. Calculation of the flux arising from pair-production interactions is also described. Results obtained in a parameter study for a source-detector height of 12.5 feet above a concrete slab are presented in both graphical and tabular form for various source energies and separation distances. RADIOACTIVE FALLOUT FROM NUCLEAR EXPLOSIONS, by Edward N. Parker. 1 Aug 60, 32p. DASA-1188.
Order from OTS $1.00 PB 161 970

This report is a non-technical description of Fallout from Nuclear Explosions. The mechanisms of local and world-wide fallout are described. The relative importance of local fallout in a nuclear war is discussed. The effects upon man of world-wide fallout from past nuclear testing is discussed. It is pointed out that doses to man from testing have been quite small when compared to the natural radiation background. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
PROBABILITY DISTRIBUTIONS USING A COUNTING SYSTEM WITH A FINITE RESOLVING TIME, by Arthur Hausner. 15 Aug 60, 13p. 3 refs. Technical rept. TR-853.
Order from LC mi$2.40, ph$3.30 PB 149 294

Analysis is made of the probability distributions of a counting system that requires two particles to be separated by a time, τ, for both to be counted. If a radioactive source emits particles that satisfy a Poisson distribution and an average of ν particles per unit time arrive at the counter, then counting for a period, T, results in a non-Poisson distribution of counts as a result of the dead time, τ. The distribution of counts is slightly skewed to the right, but for sufficiently large T, the skewness diminishes and the distribution approaches a normal one. Exact computations with the IBM 704 digital computer are in good agreement with results given.

COMPUTER PROGRAM FOR RANKING VALUES AND DETERMINING PROBABILITY FREQUENCIES OF DOSE AND INTENSITY OBTAINED FROM A MONTE CARLO CALCULATION, by R. C. Grassi. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 2 Feb 59, 37p. Series no. 2, issue no. 3.
Order from LC mi$3.00, ph$6.30 PB 149 913

A program has been developed which will give ranked values of dose after an infinite time and ranked values of intensity one hour following burst for a given location (monitoring point). Each value of dose and/or intensity calculated represents the fallout received from a Monte Carlo iteration. In addition, the program will calculate the number of values of dose and intensity, respectively, for each throw or iteration, which are above a specified level of radiation. The computing procedure uses a modification of a program previously reported for plotting iso-intensity and iso-dose contours resulting from the effects of radioactive fallout. (Author)

THE INFLUENCE OF A FIRE-INDUCED CONVECTION COLUMN ON RADIOLOGICAL FALLOUT PATTERNS, by A. Broido and A. W. McMasters. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 2 Feb 59, 49p. 10 refs. Series no. 2, issue no. 13.
Order from LC mi$3.30, ph$7.80 PB 149 923

Since no nuclear devices have been detonated by the United States under conditions leading to both mass fires and radiological fallout, a theoretical and small-scale experimental study was undertaken to see if fire-induced convection columns could significantly effect fallout patterns. Experiments were conducted in a 6- by 6-foot low-velocity wind tunnel using full-scale fallout simulants. Values of characteristic parameters of fallout patterns were compared for experiments conducted with and without fire, all other factors being held constant. As predicted by theory, a fire upwind of the region of deposition introduced a further downwind movement and lateral dispersion of the fallout. In a few experiments in which the fire was located at the edge of the no-fire pattern, air flow into the convection column shifted the pattern peak upwind. These results suggest quite strongly that effects which can markedly alter civil defense planning will be found for large-scale fires. Since this effect can be significantly influenced by the air flow into and around the column, open air experiments on a larger scale should be performed so that such flow will not be affected by tunnel walls and ceiling. (Author)

PARTICLE FALL RATE CALCULATION, by M. L. Katz and R. R. Read. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 15 Apr 59, 17p. 12 refs. Series no. 2, issue no. 12.
Order from LC mi$2.40, ph$3.30 PB 149 922

An examination is made of the present methods of calculating fall rates for irregularly shaped particles and it is pointed out that the present methods are not reliable. Brief mention is made of planned experimental work to rectify this situation. (Author)

Institute of Engineering Research, U. of California, Berkeley.
A PROBABILISTIC BASIS FOR DESCRIBING THE RADIATION INTENSITIES OF FALLOUT, by Robert R. Read and Ronald W. Shepherd. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 7 Apr 59, 55p. 16 refs. Series no. 2, issue no. 20.
Order from LC mi$3.60, ph$9.30 PB 149 927

The report contains the application of statistical regression techniques to the problem of finding minimum variance linear estimators for positions of deposited fallout particles given some meteorological information in the form of hodographs. It is indicated how these methods can be integrated with stabilized cloud models to obtain probabilistic fallout models. The mathematical problems that arise when converting particle position estimators into radiation intensity estimators are exhibited for purposes of presenting the meanings of certain simplifying assumptions that are often made. Methods for calculating variances and covariances of radiation intensity residuals from the estimated values are presented. A formula for the joint probability density function of distances of deposited cloud slice centers from a particular point is derived, under the assumption that wind velocities form a Gaussian process. (Author)

VERTICAL AIR FLOW AND FALLOUT, by Arnold Court. Rept. on Civil Defense Research Project, Contract CD-SR-58-40. 1 June 60, 13p. 17 refs. Series no. 2, issue no. 29.
Order from LC mi$2.40, ph$3.30 PB 149 933

Techniques for the prediction of radiological fallout patterns usually ignore the effects of the vertical component of winds. The purpose of this study is to determine the magnitude of such vertical motions and estimate the consequences of neglecting them in civil defense problems. Using data computed daily by the Joint Numerical Weather Prediction Unit of the National Meteorological Center, this study has determined that the monthly average of the vertical air movement at 600 mb (in the middle of the troposphere) is about 0.5 cm/sec over continental areas of the Northern Hemisphere; the standard deviation is roughly the same magnitude. Averages computed separately for the 00 and 12 GMT observations show good agreement in the various months, and change slowly from month to month during the six months, December 1958 through May 1959, that are analyzed. The analysis tends to support the assumption that average vertical wind motions as described by the available data may be neglected for civil defense purposes. (Author)

Naval Radiological Defense Lab., San Francisco, Calif.
THE CONDENSATION OF RUBIDIUM VAPOR ONTO HOT OXIDE SURFACES, by C. E. Adams. 7 Aug 59, 31p. 26 refs. Research and development technical rept. USNRDL-TR-355; AD-226 430.
Order from LC mi$3.00, ph$6.30 PB 150 303

By use of an atomic beam technique, an investigation was made of the condensability of vaporized rubidium in a slightly oxidizing atmosphere upon the surfaces of different oxides at varying temperatures. It was found that rubidium vapor was effectively condensed at high temperatures upon oxides with which rubidium oxide could form thermally stable complex compounds. Rubidium vapor was not condensed at high temperatures upon oxides with which rubidium oxide does not form stable complex compounds. A method of predicting the relative tendency for rubidium oxide to form complexes with a series of different oxides was devised. (Author).

DIATOMITE FILTER, TEST TO DETERMINE FEASIBILITY OF USE IN REMOVING Y^{91} FROM FRESH WATER, by M. M. Bigger and A. J. Hodges, Jr.. Memo. rept. 17 Aug 50, declassified 10p. AD-229(OE).
Order from LC mi$1.80, ph$1.80 PB 149 982

The test indicates that flocculation may be expected to remove Y^{91} or similar fission products from fresh water with a factor of approximately 100. Diatomite filtration was less effective, with a factor of approximately 8. The flocculation results are in agreement with small-scale laboratory tests.

Naval Research Lab., Washington, D. C.
ATMOSPHERIC RADIOACTIVITY IN SOUTH AMERICA AND ANTARCTICA, by L. B. Lockhart, Jr. 15 Aug 60, 10p. 8 refs. NRL rept. 5526.
Order from LC mi$1.80, ph$1.80 PB 148 664

Information on the concentration of the major natural radioactive species and of gross fission product β activity in the ground-level air at several sites in South America and Antarctica is reported. These data have been obtained through a cooperative program between the U. S. Naval Research Laboratory and groups at the various collecting sites utilizing equipment designed and supplied by NRL. Fission products have been found to be a minor contributor to the radioactivity of the air in the Southern Hemisphere except that in the antarctic region (and presumably at some island sites) it assumes relatively more importance because of the low concentrations of natural activity there. Seasonal variations in one or more of the radioactive components of the atmosphere are evident at each of the various sites. (Author)

Naval Research Lab., Washington, D. C.
FISSION PRODUCT RADIOACTIVITY IN THE AIR ALONG THE 80th MERIDIAN (WEST) DURING 1959, by L. B. Lockhart, Jr., R. L. Patterson, Jr. and others. 15 Aug 60, 19p. 11 refs. NRL rept. 5528.
Order from LC mi$2.40, ph$3.30 PB 148 665

The program of measurement of the fission product concentration in the air at ground level at sites along the 80th meridian was continued during 1959. During this period no fresh nuclear debris was added to the atmosphere, with the result that seasonal changes in deposition rates from stratospheric sources were more apparent. The radioactivity levels in the Northern Hemisphere reached the highest average during the operation of this network (started May 1956) in the spring of 1959. Radiochemical analyses indicated that the bulk of this debris was introduced into the stratosphere during the October 1958 series of high-yield nuclear tests held in the arctic region of the Soviet Union. There has been obtained evidence of a definite seasonal dependence for

stratospheric deposition with debris in the arctic stratosphere being more strongly influenced than that in the tropic stratosphere. No such definite conclusions can be made from radioactivity collected in the Southern Hemisphere. Evidence indicates that mixing of the stratospheric sources in the Northern Hemisphere was not complete by the end of 1959; and though radioactivity levels in the two hemispheres were approaching unity during the fall of 1959, the isotopic composition of the collections indicated the average age of the debris in the Southern Hemisphere to be much greater. THEORETICAL EVALUATION OF THE VARIANCE FOR THE STATISTICAL CORRELATION METHOD FOR MEASURING DAUGHTER HALF-LIVES IN THE 10^{-4} - 10^{-1} SECOND RANGE, PART I, by Robert P. Kennel (Master's thesis) Wesley O. Doggett, and Linus K. Han. Technical rept. no. 2 on Contract DA 01-009-ORD-820. July 60, 75p. 8 refs. OOR rept. no. 2543.2-P.
Order from LC mi$4.50, ph$12.30 PB 150 401

A time correlation method proposed by Petroff and Doggett ("Application of a statistical correlation function for determining daughter half-lives in the range 10^{-1} - 10^{-4} second." Rev. Sci. Instr., Vol. 27, No. 10, 838, October, 1956.) for investigating two connected nuclear disintegrations was studied. The method permits determination of half-lives in the 10^{-4} - 10^{-1} second range for daughters in equilibrium with long lived parents without the count rate restrictions imposed on the usual delayed coincidence method by the occurrence of accidental coincidences. The variance and fractional standard deviation of the correlation measurement are theoretically evaluated for a radioactive source cascade with negligible background and constant source strength, and the variance is determined for background activity with no cascade present. EFFECTS OF NUCLEAR RADIATION ON SOME COMMON MATERIALS AND ELECTRONICS COMPONENTS, by Newell Hart Smith. 4 Feb 58, 27p. 18 refs. Rept. GM-TR-0165-00358.
Order from LC mi$2.70, ph$4.80 PB 148 960

This report has been written to provide guidance for those doing preliminary design of equipment to be exposed to nuclear radiation. It is based upon a review of many of the documents from the extensive literature on radiation damage, and presents information from the literature concerning radiation damage to a few common materials and to typical electronic equipment. In addition, an example illustrating the way in which this information may be useful for space vehicle design is also given.

EFFECTIVE DEAD SPACE IN THE MA-3 HELMET, by Elizabeth Comfort. Rept. on Pressure Suits and Accessories. May 60, 8p. 3 refs. WADD Technical rept. 60-362.
Order from OTS $0.50 PB 171 018

The respiratory response of a group of subjects wearing the MA-3 full-head helmet was compared with the response to known dead space volumes. Comparison of these data showed that the average effective dead space or volume of rebreathed air was approximately 235 cc. when the MA-3 helmet was supplied with oxygen at 3 to 4 inches of water positive pressure from a standard pressure suit regulator. The concentration of inspired CO_2 was calculated to be 0.8 percent. (Author)

VENTILATION OF INSULATED BOOTS, by A. H. Woodcock and R. L. Pratt. June 60, 10p.. 1 ref. Technical rept. EP-135.
Order from LC mi$1.80, ph$1.80 PB 150 119

An investigation has been made of the quantity of air which must be pumped into the insulated boot to evaporate the sweat secreted by the foot in a warm environment. At an ambient temperature of 80°F an unventilated boot accumulated approximately 44 gm of sweat in 2 hours. In a ventilated boot, ventilation rates as high as 20 liters per minute failed to evaporate this moisture and left an accumulation of at least 10 gm of sweat within the boot. Complete change of air within the boot at each step at normal walking rate would produce a ventilation rate of considerably less than 20 liters per minute. At a lower ambient temperature (67°F) sweat secretion was somewhat less, but the cooler ambient air which was supplied was less efficient in removing moisture, so that the net accumulation was almost the same as at the higher temperature. CURRENT INDUCED SWITCHING OF SUPERCONDUCTIVE THIN FILMS, by Frederick W. Schmidlin and Arthur J. Learn. Eugene C. Crittenden, Jr. and John N. Cooper (Naval Postgraduate School). 15 June 60, 30p. 4 refs. STL/TR-60-0000-NR165.
Order from LC mi$2.40, ph$3.30 PB 150 042

Currents required to cause superconducting to normal transitions of thin films have been measured as a function of temperature for various widths and thicknesses. Normal to superconducting transition times for the same films have also been measured as a function of the magnitude of drive current. In spite of the lack of a satisfactory theoretical model for the initiation of the transition, the bulk of the results can

be understood in terms of temperature changes in the film, as governed by factors limiting the flow of heat (generated subsequent to the initial transition) into the substrate and liquid helium bath. (Author)

INSTRUMENTATION AND TECHNIQUES FOR AIRCRAFT USE IN ACOUSTIC RESEARCH AND IN OCEANOGRAPHIC SURVEYS, by J. J. Coop. Technical note. 28 July 59, 19p. Rept. no. NADC-AW-N5914.
Order from LC mi$2.40, ph$3.30 PB 149 158

Since 70 percent of the earth's surface is covered with water, neither the sonar conditions nor their variations with time are known in most areas of the world. The seasonal trend is known in many areas, but because of meteorological factors and ocean currents prediction of the sonar conditions for a given day are often inaccurate. It is proposed that by use of aircraft the acoustic condition over large areas, commensurate with meteorological factors such as storms, should and could be measured before, during, and after the passage of such storms to correlate cause and effect.

THE EFFECTS OF INTERFERENCE ON SPEECH COMMUNICATION, by George E. Renaud. June 60, 19p. 14 refs. RADC-TN-60-104.
Order from LC mi$2.40, ph$3.30 PB 149 973

This report was written in an attempt to tie together many of the data which pertain to the ability of the operator to derive intelligence from a speech signal when this signal has been altered by processes which occur or could occur in a communication link. No attempt has been made to present a complete summary of all the data in existence in this area. The accent has been on the auditory response of the operator. There were two major purposes in writing this report. The first was to indicate that it is not necessary to build a hi-fi system when the purpose is to transmit information by means of voice. The second is to indicate the lower limits of system performance which can be tolerated and still operate with some degree of efficiency. In other words, the design and subsequent successful operation of any voice communication system can be made easier when the operator is considered as a functional operating link (subsystem) in the system. (Author)

THE EFFECT OF SPEECH AND NOISE LEVEL ON THE MASKING OF SPEECH BY PURE TONES AND RANDOM NOISE, by R. J. Christman, George E. Renaud, and Arthur Rubin. June 60, 24p. 7 refs. RADC TN-60-97.
Order from LC mi$2.70, ph$4.80 PB 149 972

This report describes an experiment on the masking of speech with random noise and pure tones. Harvard PB-50 word lists were used as test material, with masking signals of 100, 175, 250, 350, 500, 700, and 1000 cycles per second and random noise. Speech levels at the ear, ranging from 45 to 115 db and noise from 75 to 120 db (all re 0.0002 dynes/cm^2), were used. Data are presented in the form of curves, illustrating the relationship among the parameters: speech level, interference level, and frequency of interference (for the pure tone masking). It is shown, in general, that masking with random noise is some 30 db superior to masking with pure tones. It is further shown that for low levels of intelligibility pure tone masking is greatest with tones in the 400 to 600 cps range. For intelligibility levels of 85 percent or greater, masking efficiency increases with frequency of the masking tone, at least up to 1000 cps, the highest frequency used in the experiment. (Author)

COMPUTATION OF ACOUSTIC TRANSMISSION THROUGH A PLANE ELASTIC PLATE, by G. B. Thurston and Raya Stern. Rept. on Contract Nonr-1224(24). Oct 59, 24p. 9 refs. 2784-3-T; AD-227 906.
Order from LC mi$2.70, ph$4.80 PB 149 939

Results are presented of a series of computations of the magnitude and phase of the pressure transmitted by a plane wave through a plane plate. The plate is assumed to possess perfect elasticity and to be immersed in a perfect fluid. The procedure for carrying out transmission computations with the equations of H. Reissner is specified. Computations according to the approximate equation of L. Cremer are compared with those of Reissner. Computed results for plates of steel, Lucite, and polyethylene immersed in sea water are presented. (Author)

A METHOD OF DETERMINATION OF THE RADIATED ACOUSTIC FIELD OF A SOURCE TRANSMITTING THROUGH A FINITE PLATE, by George B. Thurston. Rept. on Contract Nonr-1224(24). Oct 59, 33p. 23 refs. 2784-4-T; AD-227 907.
Order from LC mi$3.00, ph$6.30 PB 149 940

A method is given for the determination of the radiated acoustic field of a course transmitting through a finite plate. The method is based on the use of the Helmholtz formula together with appropriate assumptions concerning the part played by a transmitting plate in modifying the transmitted wave. The method involves the use of information on plane-wave transmission properties of infinite plane plates. The procedure is specifically set up for use of high-speed computing equipment in carrying out computations of the radiated field. A numerical example is given of the determination of the acoustic field of a modified spherical source transmitted through a plane circular steel plate immersed in sea water. (Author)

THE MAGNETIC SUSCEPTIBILITIES OF SINGLE CRYSTAL $NiCl_2 \cdot 6H_2O$ AND $CoCl_2 \cdot 6H_2O$ AT LOW TEMPERATURES, by R. B. Flippen and S. A. Friedberg. Technical rept. no. 6 on Contract Nonr-760(05). 29 Oct 59, 9p. 6 refs. AD-228 108.
Order from LC mi$1.80, ph$1.80 PB 149 867

The magnetic susceptibilities of single crystal $NiCl_2 \cdot 6H_2O$ and $CoCl_2 \cdot 6H_2O$ were measured down to 1.3°K for various orientations. The occurrence of antiferromagnetism in $CoCl_2 \cdot 6H_2O$ below ~2.3°K is confirmed as is the anisotropy of the g-factor of the Co^{++} ion over the whole range. It is concluded that $NiCl_2 \cdot 6H_2O$ is antiferromagnetic in the helium region and that the temperature-independence of the powder susceptibility here is due to the fact that $\chi_\perp$ rises as T falls below T_N. In both salts the c-axis is apparently the preferred direction of spin alignment in the antiferromagnetic state. (Author)

EARTH CURRENT ACTIVITY AT COLLEGE, ALASKA, JULY 1959, by V. P. Hessler. Scientific rept. no. 4 on Contract AF 19(604)3075. 15 June 60, 42p. 11 refs. UAG-R110; AFCRC-TN-60-481.
Order from LC mi$3.30, ph$7.80 PB 149 758

This report presents College N-S earth current records for the month of July 1959. The scale of 1 inch per hour permits detailed scaling directly from the reproductions in the report. Scalings of hourly range in amplitude and rapid fluctuation activity are given. The amplitude scalings are also presented as curves together with average curves for a period of several years to show the relative magnitudes of the July 1959 activity. The earth current always displays much more pronounced fine structure than the corresponding geomagnetic activity. (Author) (See also PB 147 513)

FIELD DISPLACEMENT EFFECTS IN DIELECTRIC AND FERRITE LOADED WAVEGUIDES, by T. M. Straus. Doctoral thesis. Technical rept. no. 1, Series 2, on Contract AF 19(604)5487. 25 sep 59, 98p. 35 refs. AFCRC-TN-60-582.
Order from LC mi$5.40, ph$15.30 PB 149 787

The only available calculations concerning propagation in ferrite slab loaded waveguides are those of Lax, Button and Roth which are limited to transverse electric type modes. Due to its imcompleteness the theory leads to certain anomalies which have been the subject of considerable discussion in recent years. It is the purpose of the work herein reported to solve the anomalies dealing with one-way transmission and with the field displacement isolator. This is done largely through experiments which indicate the extent to which the theory is able to predict the actual mode configurations.

A SPIN WAVE ANALYSIS OF FERROMAGNETIC RESONANCE RELAXATION, by Charles R. Buffler. Scientific rept. no. 3, Series 2, on Contract AF 19(604)5487. 25 Feb 60, 161p. 161 refs. AFCRC-TN-60-589.
Order from LC mi$7.80, ph$25.80 PB 149 788

The work reported is primarily an investigation of the mechanisms involved in ferromagnetic resonance line width processes in both single crystal and polycrystalline materials. Experimental work has been performed to indicate how the line width is related to the recent theories of ferromagnetic resonance. These experiments have primarily taken the form of line width and g value versus frequency studies. By investigating the behavior of these spectrums, the validity of the various theoretical explanations are indicated.

NEW FLUX-GATE MAGNETOMETERS FOR USE WITH SINGLE STRIP PERMEAMETERS, by C. Q. Adams. 21 Mar 60, 27p. 3 refs. NAVORD rept. 6835; AD-239 498.
Order from LC mi$2.70, ph$4.80 PB 149 226

Two new sensitive flux-gate magnetometers of the second harmonic type have been developed for use as H-measuring systems of a d-c single-strip permeameter. Both are employed with a simple bridge circuit which eliminates the necessity of complex filters and selective amplifiers and allows operation over a wide range of frequencies independent of source frequency stability. The first magnetometer is an open-magnetic-circuit type of two Supermalloy cores. The second magnetometer is a closed-magnetic-circuit type which does not influence the field being measured. The magnetometers were designed to measure fields from 1 milli-oersted to about 10 oersteds, although these are not physical limits of sensitivity. (Author)

THERMOMETERS FOR THE TEMPERATURE RANGE 0.1°K TO 20°K, by J. G. Daunt. Final rept. for 1 Sep 56-31 Aug 59 on Contract Nonr-495(13). 21 Oct 59, 16p. 22 refs. Rept. 712; AD-228 661.
Order from LC mi$2.40, ph$5.30 PB 149 504

An experimental investigation was made of the synthetic ruby as the working substance for a magnetic thermometer. An experimental study was conducted at low temperatures of some magnetic properties of a number of other gems and aluminas. The Cr ions in the synthetic ruby showed a paramagnetic behavior in the liquid He temperature region. The data obtained indicated the following advantages: (1) complete coverage of the entire range 0.1°K to 20°K, (2) extreme stability and reproducibility of the working thermometric substance, (3) ease of thermal contact with other materials, since ruby can be readily metallized, (4) good sensitivity, as ruby has a relatively high Curie constant, (5) high precision since the susceptibility can be accurately measured by ac bridges, (6) short time constant, since the material has a very small specific heat, (7) excellent temperature homogeneity throughout the thermometric specimen, and (8) cheapness and availability of the material.

Stanford Research Inst. [Menlo Park] Calif.
RADIO INTERFERENCE FROM CORONA DISCHARGES, by R. L. Tanner. Technical rept. no. 37 on Contract AF 19(604)266. Apr 53, 122p. 32 refs. SRI Proj. 591; AD-12 600.
Order from LC mi$6.30, ph$19.80 PB 149 057

Corona-discharge studies are described that were devoted specifically to the mechanisms by which electromagnetic disturbances are produced that cause interference with radio reception. The means by which these disturbances are coupled into a receiver are treated as well as the nature of the dependence of this coupling upon the geometrical configuration of the body on which the discharge occurs. A fundamental coupling theorem of considerable generality is developed which is based directly on Maxwell's field equations. The theorem can be applied in studying the noise signals coupled into the receiver from a discharge occurring at some remote corner of an aircraft; in addition, it is applicable to the converse situation: the dipole moment of the discharge can be inferred from the current pulse measured at the base of a discharge point and from certain supplemental electric-field investigations for the discharge electrode system.

THE BANDWIDTH OF LONG, UNIFORM ARRAYS OF PARASITIC DIPOLES, by Francesco Serracchioli. Rept. on Contract DA 36-039-sc-70174. 30 June 59, 38p. 8 refs. Rept. 662-33.
Order from LC mi$3.00, ph$6.30 PB 146 455

The introduction of surface waves in the study of end-fire arrays has led to the result that an infinity of array configurations, for a given over-all length, are equivalent with respect to far-field radiation at a given frequency. In this report a study is carried out on the behavior of end-fire arrays with respect to frequency variations about the design frequency. It is then shown that the aforementioned equivalence in general holds no longer if the frequency is varied about the design frequency. A definition of bandwidth is given for a uniform end-fire array, and accordingly a number of figures are calculated for different uniform dipole arrays. It is also shown that the condition of optimum directivity is a slowly varying function of the array length, so that is does not become a critical one to realize, even when the array is very long. (Author).

EXTENSIONS IN SYNTHESIS TECHNIQUES FOR LINEAR SYSTEMS. PART I, by M. D. Schwartz and C. T. Leondes. Rept. on Contract AF 49(638)438. May 60, 60p. Dept. of Engineering rept. no. 60-38; AFOSR-TN-60-610.
Order from LC mi$3.60, ph$9.30 PB 150 253

Synthesis techniques for linear control systems with deterministic inputs have been based in main, thus far, on such highly idealized inputs as steps or ramps and such criteria as overshoot, rise time, and settling time. It would be desirable if analytical synthesis techniques were to be available for inputs which are arbitrary polynomial functions of time and for extended design criteria such as guarantying that the absolute value of system error is less than a specified required amount. This report presents such synthesis techniques, and in the process, establishes methods for guarantying that the minimum size power actuator is selected in the synthesis procedure. An additional consideration introduced in the synthesis techniques presented is the minimization of the complexity of the required compensation networks.

EXTENSIONS IN SYNTHESIS TECHNIQUES FOR LINEAR SYSTEMS. PART II, by M. D. Schwartz. Rept. on Contract AF 49(638)438. May 60, 39p. 3 refs. Dept. of Engineering rept. no. 60-39; AFOSR-TN-60-609.
Order from LC mi$3.00, ph$6.30 PB 150 254

This report presents extensions in synthesis techniques for linear control systems for more general inputs and more general error criteria than were heretofore available in the control literature. (Author) (See also PB 150 253)

California U., Los Angeles.
ON THE SYNTHESIS OF OPTIMUM MULTIPOLE FILTERS, by Edwin B. Stear. Rept. on Contract AF 49(638)438. May 60, 10p. 7 refs. Dept. of Engineering rept. no. 60-27; AFOSR-TN-60-617.
Order from LC mi$1.80, ph$1.80 PB 150 250

Most of the developments in control systems theory in the past have been based on the one input-one output control system problem. However, in a great number of modern complex control system's problems, it is essential to approach the system design as a multipole or "n" input-"m" output design problem. For example, the optimal design of guidance and control systems for aerospace vehicles must be approached in this manner. Numerous results of basic importance to the design of such systems have been developed. This report presents some of the results obtained in the overall program.

California U., Los Angeles.
ON THE THEORY OF PROCESS ADAPTIVE CONTROL SYSTEMS, THE LEARNING MODEL APPROACH, by M. Margolis. Doctoral thesis. Rept. on Contract AF 49(638)438. May 60, 161p, 31 refs. Dept. of Engineering rept. no. 60-32; AFOSR-TN-60-618.
Order from LC mi$7.80, ph$25.80 PB 150 252

This dissertation attempts to extend the theory of feedback control to those systems that operate in a widely changing environment. The particular method devised for determining the dynamic characteristics of the process makes use of a model, referred to as the learning model, and a mechanism for adjusting the parameters of the learning model. The model is an analog of the process but with undetermined parameters. Both the model and the process are subjected to the same actuator signals. The response of the model is compared to the response of the process and the resulting error is used to activate the adjusting mechanism. It is the function of the adjusting mechanism to so set the parameters of the model that the model will behave as much like the process as possible. The particular method for adjusting the parameters of the learning model is based on an approximation to the method of steepest descent. The equations describing the operation of the adjusting mechanism are derived and result in a nonlinear nonautonomous system. The stability and dynamic response of the learning mechanism are examined by both analytic methods and computer experiments. The learning mechanism was found capable of tracking the parameters describing the process for a wide variety of actuating signals. (Author).

A STUDY OF THE HALL EFFECT IN GASEOUS CONDUCTORS, by B. N. Edwards. Scientific rept. no. 6 on Contract AF 19(604)2270. 30 Sep 59, 161p. 29 refs. Series no. 60; issue no. 253; AFCRC-TN-59-783.
Order from LC mi$7.80, ph$25.80 PB 149 559

An expression is derived for the dc Hall voltage across the positive column of a glow discharge tube. Experimental results are reported with a tube containing neon. Depending on the pressure and the current, these results show that the Hall voltage in different regions of the tube has opposite polarities; for example, the gaseous conductor may be p-type toward the cathode and n-type toward the anode. The use of the Hall effect in a gaseous conductor as a magnetometer is discussed. The conclusion is reached that such a device could have advantageous results in certain circumstances. The dc component of the Hall voltage at high frequency (without an external magnetic field) is derived by using both the radiation pressure concept and Lorentz's force equation, yielding identical results. Specific limitations on the applicability of the expression are deduced. The expression differs from that which appears in the literature. The result is interpreted to various situations of interest, viz., a plasma, a solid semiconductor, and a dielectric, for which numerical examples are given. The high-frequency conductivity of a gaseous conductor, including the effect of the high-frequency magnetic field, is calculated using Boltzmann's transport equation. Experimental attempts to measure the Hall voltage at high frequency in a plasma are described, and some experimental results are given. (Author)

SURFACE WAVES ON A REACTIVE HALF PLANE, by Julius Kane. Rept. on Contract AF 19(604)5238. May 60, 31p. 4 refs. Research rept. no. EM-159; AFCRC-TN-60-554.
Order from LC mi$3.00, ph$6.30 PB 150 057

The following two-dimensional problem is considered: An arbitrary antenna is located at the origin which launches surface waves on a reactive half-plane $y = 0$, $x < 0$. It is assumed that the other half-plane, $y = 0$, $x > 0$ is occupied by a perfect conductor. The antenna is approximated by a distribution of multipoles easily found from the antenna's radiation pattern. With this approximation, simple algebraic expressions are obtained for the ratio of the power delivered to the surface waves as compared to the power in the radiated cylindrical field. (Author)

THE D-C PUMPED QUADRUPOLE AMPLIFIER: A WAVE ANALYSIS, by A. E. Siegman. Rept. on Contract DA 36-039-sc-73178. 2 Mar 60, 13p. 5 refs. Technical rept. no. 159-1; AD-237 238.
Order from LC mi$2.40, ph$3.30 PB 147 751

The 'Larmatron' is a quasi-parametric electron-beam amplifier recently announced by Gordon and others. It uses the same transverse beam waves as the Adler-Wade quadrupole amplifier, but the pumping is done by d-c voltages applied via a twisted quadrupole structure. This paper analyzes the d-c pumped case in terms of the four transverse beam waves and their coupling. Amplification is found to be the result of coupling between the fast and slow cyclotron waves. The pump voltage does not really pump, i.e., it does not supply any energy. Another d-c pumping scheme is also examined and found not to give amplification. (Author)

ON SOLUTIONS OF THE HEAT EQUATION, James A. Clarkson and Dawson G. Fulton. Scientific rept. no. 2 on Contract AF 19(604)1578. 21 July 59, 29p. AFCRC-TN-59-449; AD-235 068
Order from LC mi$2.70, ph$4.80 PB 147 877

Let $H(f;x,t)$ be the temperature, at point x and time t, in a semi-infinite rod, initially at temperature zero, whose free end is maintained at temperature given by the function f(t). The solution given by

$$H(f;x,t) = \frac{x}{2\sqrt{\pi}} \int_0^t s^{-3/2}\, e^{-x^2/4s}\, f(t-s)\,ds$$

is considered. For many simple functions f(t) it is true that

$$I(f;x,T) = \int_0^T (H_x^2 - HH_{xx})\,dt \geq 0 \text{ for all } x, T>0.$$

It is shown that $I(f;x,T)$ can be negative for certain values of x and T, even for comparatively uncomplicated drive functions f(t).

THE DEVELOPMENT OF A MASS SPECTROMETER FOR ION STUDIES, by R. J. Sunderland and J. R. Radbill. Rept. on Contract AF 49(638)214. June 60, 24p. 2 refs. Aerojet rept. TN-35; AFOSR-TN-60-702; AD-240 229.
Order from LC mi$2.70, ph$4.80 PB 149 561

Mechanisms for the production of positive ions on metallic and nonmetallic surfaces are being investigated. In order to determine the mass spectrum of the emission from a particular source, a magnetic-sector-field mass spectrometer has been constructed. This instrument is a first-order-focusing type, having a 60°-sector magnetic field in which the ion trajectories have a 5-in. radius of curvature. The spectrometer is constructed entirely of metal, with the central portion of the tube forming the pole faces of the magnet, which has high-impedance windings. The magnet-current power supply, regulated to 1 part in 10^4, is capable of generating fields greater than 16,000 gauss in the focusing region. The precision accelerating voltage is also regulated to 1 part in 10^4 up to 15 kv at 10 ma. The system is evacuated by a 6-in. oil-diffusion pump which is well trapped with liquid nitrogen; pressures throughout the system are of the order of 10^{-6} mm Hg.

Battelle-Institut E. V., Frankfurt-am-Main (West Germany).
DEVELOPMENT OF AN ANALYTICAL METHOD FOR EMISSION-SPECTROGRAPHIC DETERMINATION OF ALKALI WITHOUT CLASSICAL CHEMICAL METHODS OF PREVIOUS FUSION OR DISSOLVING. Final rept. for 1 Dec 59-15 May 60 on Contract DA 91-591-EUC-1346. [1960] 23p.
Order from LC mi$2.70, ph$4.80 PB 149 430

Two methods are described for the rapid spectrographic analysis of alkali in a variety of test materials. If the Na 3302 and K 4044 spectral lines are used for analysis, standard spectrographic equipment with ultra-violet sensitive film can be used. The precision of this method permits quantitative analyses to as low as 0.1 per cent Na_2O. If the Na 5890 and K 7655 lines are used, even smaller alkali concentrations can be determined and the preparation of the samples is easier because the analytical sample is merely diluted with graphite powder. As it is often difficult to procure special films sensitive to infrared light, this method is only recommended for routine work. With slight variations, the second method can also be used for determinations of very small alkali concentrations in organic substances.

ELECTRON SPIN RESONANCE OF Gd^{+++} IN LANTHANUM FLUORIDE, by D. A. Jones, J. M. Baker, and D. F. D. Pope. Technical (Scientific) note no. 1 on Contract AF 61(052)92. Mar 59, 18p. 9 refs. AFCRC-TN-59-580; AD-234 549.
Order from LC mi$2.40, ph$3.30 PB 147 876

Electron spin resonance in a single crystal of LaF_3 containing 0.01% Gd^{+++} shows 3 magnetically distinguishable ions per unit cell in a rhombic crystalline electric field which is consistent with a hexamolecular unit cell of symmetry $O6/mcm$. This is in disagreement with recent crystallographic measurements, but in agreement with the interpretation of the Faraday rotation given by Van Vleck and Hebb (Phys. Rev. 46.17, 1934). The parameters of the spin Hamiltonian are given. The crystal field splitting in zero magnetic field is $\sim 0.3\ cm^{-1}$ which makes this a possible salt for maser operation in low magnetic field. PARAMAGNETIC RESONANCE AND OPTICAL SPECTRA OF DIVALENT IRON IN CUBIC FIELDS. I. THEORY. II. EXPERIMENTAL RESULTS, by W. Low and M. Weger. Technical note no. 14 on Contract AF 61(052)59. May 60, 99p. 23 refs. AFOSR-TN-60-801.
Order from LC mi$5.40, ph$15.30 PB 150 344

The energy level splittings of the ground state of the d^6 configuration in cubic and axial fields are given. The Zeeman splittings of the various levels are calculated for weak and strong magnetic fields. In the case of tetrahedral symmetry the effect of the perturbation of the odd parity configurations d^5p and d^5f on the ground state is estimated. The paramagnetic resonance absorption of Fe^{2+} in MgO is observed at $g = 3.428$ and 6.86. The optical absorption line is found at 10,000 cm. The paramagnetic resonance spectrum indicates considerable covalent bonding. The origin of the line at 6.86 is discussed. In tetrahedral ZnS a paramagnetic line is found at $g = 2.25$ and optical absorption at 3μ and 0.7μ. Possible explanations of this spectrum are discussed. A short discussion of the optical absorption spectra of trivalent iron in MgO is presented. (Author)

Hebrew U. (Israel).
PARAMAGNETIC RESONANCE SPECTRUM OF Mn^{2+} IN $ZnSiF_6{:}6H_2O$, $\Delta m = \pm 1$ TRANSITION, by E. Friedman and W. Low. Technical note no. 15 on Contract AF 61(052)59. June 60, 12p. 3 refs. AFOSR-TN-60-995.
Order from LC mi$2.40, ph$3.30 PB 150 356

In the spectrum of Mn^{2+} in $ZnSiF_6{:}6H_2O$ a number of weaker lines are observed at intermediate angles of the magnetic field H with respect to the crystal axis, in addition to the 30 allowed transitions $\Delta M = \pm 1$, $\Delta m = 0$. These lines have been measured and assigned

to $\Delta M = \pm 1$, $\Delta m = \pm 1$ transitions. The relatively strong intensity is explained and the intensity of the lines is shown to be proportional to $(D/A)^2 \cos^2\theta \sin^2\theta$. These forbidden transitions can be utilized for dynamic polarization of manganese nuclei. (Author)

APPLICATION OF SUMMABILITY METHODS TO SPECIFIC HEAT CALCULATIONS, by A. A. Maradudin, G. H. Weiss, and R. A. Sack. (Laboratory for Molecular Studies). Rept. on Contract AF 18(600)1315. Mar 60, 16p. 5 refs. Technical note BN-201; AFOSR-TN-60-345; AD-235 771.
Order from LC mi$2.40, ph$3.30 PB 148 996

Thirring obtained an expansion for the vibrational contribution to the specific heat of a crystalline solid in powers of 1/T. The coefficients of this Taylor series are proportional to successive moments of the frequency spectrum. Thirring's expansion converges only for $T > \Theta/2\pi$, where $\Theta = h\omega_L/k$ and ω_L is the maximum normal mode frequency. The series converges very poorly near the radius of convergence and is completely useless there. The series can be analytically continued beyond its radius of convergence by means of the Euler transformation, which, greatly increases the rate of convergence of the series near the radius, so that only about 7 moments are required for better than 3 figure accuracy for the specific heat of a body-centered cubic lattice at this point. Other methods for summing divergent series can also be used effectively. Some examples of the use of these methods are presented. (Author)

SATURATION OF THE MAGNETIC RESONANCE ABSORPTION IN DILUTE INHOMOGENEOUSLY BROADENED SYSTEMS [AND] MAGNETIC RESONANCE AND RAPID PASSAGE IN IRRADIATED LiF, by James S. Hyde. Rept. on Contract Nonr-1841(10). Oct 59, 49p. 29 refs. Technical rept. nos. 141, 142; AD-228 364.
Order from LC mi$3.30, ph$7.80 PB 149 938

Portis proposed a theory of inhomogeneous saturation in which an integration is carried out of the contributions to the magnetic loss by spin packets precessing at a distribution of Larmor frequencies. The shape of the spin packets critically determines the saturation behavior. In this paper the theory of Portis is reviewed and a number of criticisms and modifications of the theory are presented. The experimental result of Portis that at room temperature the paramagnetic dispersion signal ($d\chi'_m/dH$) of radiation-induced paramagnetic centers in LiF has the shape of an undifferentiated Gaussian curve and lags the modulation field by 90 degrees has been confirmed.

DIRECT DETERMINATION OF LINE SHAPES OF ROTATIONAL SPECTRA FROM INTERFEROMETRIC MEASUREMENTS, by Trevor Williams. Technical rept. on Contract AF 18(600)1307. 30 Sep 59, 22p. 2 refs. AFOSR-TN-60-349; AD-239 732.
Order from LC mi$2.70, ph$4.80 PB 149 161

Much idealized, the rotational spectrum of a linear molecule may be considered to consist of a number of equally-spaced lines of identical shapes and intensities. We have been scanning such spectra with an interferometer rather than a conventional grating spectrometer. It is consequently of interest to know what kind of interferogram may be expected to arise from a periodic spectrum. It is shown that all the structure in the interferogram is contained in a sequency of "signatures" at path differences of 0, 1/2B, 2/2B, $\cdots$ For a symmetric line shape the signatures are all symmetric and homologous, but asymmetry in the line shape introduces increasing asymmetry in the successive signatures. These predictions are in agreement with experience. By measuring two vertical distances on each signature it is possible to determine as many harmonics in the Fourier expansion of the line shape as there are signatures. Comparison with experimental results from the large interferometric modulator at The Johns Hopkins University will be given. (Author)

DELTA FUNCTION MODEL OF CHEMICAL BINDING, by Ellis R. Lippincott and Margaret Oakley Dayhoff. Rept. on Contract DA 36-034-ORD-2175. Mar 59, 56p. 16 refs. OOR rept. 1607.6C; AD-214 751.
Order from LC mi$3.60, ph$9.30 PB 149 653

A semi-empirical delta function model of chemical binding is presented from which a large number of bond properties may be calculated for diatomic molecules and the bonds of polyatomic molecules. The predicted properties are dissociation energy, bond length, vibrational frequency and anharmonicity.

Minnesota U. School of Chemistry, Minneapolis.
CARBON-13 HYPERFINE SPLITTING IN SEMIQUINONES, by D. C. Reitz, F. Dravnieks, and J. E. Wertz. Rept. on Contract AF 18(603)17. 31 Aug 60, 7p. 5 refs. AFOSR-TN-60-929.
Order from LC mi$1.80, ph$1.80 PB 150 238

The electron spin resonance spectra of 2,5-dihydroxysemiquinone and semiquinone exhibit hyperfine splittings consistent with the number of ring protons on each molecule. In addition, there are lines of weak intensity in both spectra which may be attributed to the natural abundance of C^{13} in ring carbon atoms.

Oregon U., Eugene.
THE POSITION DEPENDENCE OF COLLISION INDUCED SATELLITES OF ALKALI LINES ON THE NATURE OF THE ALKALI, by Shang-Yi Ch'en and Ralph A. Wilson, Jr. Interim technical rept. no. 4 on Contract DA 04-200-ORD-713. June 60, 28p. 3 refs. OOR rept. no. 1981.5-P.
Order from LC mi$2.70, ph$4.80 PB 150 394

The dependence of the positions of both the red and the violet satellite bands of alkali lines in absorption, resulted from collisions between the alkali atoms and various foreign gases, on the nature of alkalis was investigated from the microphotometer traces of over 100 satellites of the absorption lines of Li, Na, K, Rb and Cs in the presence of He, Ne, Ar, Kr, and Xe. For a given foreign gas, the absolute magnitudes of satellite-line separation, $|\Delta\nu|$ in cm^{-1} for both red and violet satellites decreased with increasing atomic weight of the alkalis; while for a given alkali, the $|\Delta\nu|$ increased for red satellites but decreased for violet satellites with the atomic weights of the foreign (perturbing) gas. Red satellites were observable only for heavy gases (Kr and Xe).

IMPURITY STATES IN SOLID NEON, by Albert Gold. Rept. no. 6 on Contract AF 49(638)432. June 60, 68p. 45 refs. AFOSR-TN-60-705.
Order from LC mi$3.90, ph$10.80 PB 150 201

A formalism for the treatment of optical absorption by an isolated substitutional impurity center is given. The tight-binding approximation is used and the method of constructing one-electron trial functions for the system is outlined. The first-order absorption energies, oscillator strengths, and integrated absorption coefficients are computed in an approximation which includes spin-orbit interaction and the overlapping of heterocentric atomic wave functions through terms of order S^2. The first-order energies are corrected for van der Waals interactions using a variational formalism. A phenomenological method for computing the emission energies of the system is given. The specific example of an argon impurity atom in solid neon is treated numerically. The computation predicts absorption lines at 11.7 and 11.6 eV due, respectively to the $^1P_1$ and $^3P_1$ states of the argon impurity, with an uncertainty of 1.3 eV. The oscillator strengths for these transitions are calculated to be 0.164 and 0.017 respectively, giving rise to integrated absorption coefficients of 0.84×10^6 N_O and 0.09×10^6 N_O eV cm^{-1} for the two states, where N_O is the (small) fractional concentration of impurities in the host lattice. INFRARED FILTER MATERIALS FOR APPLICATION TO LOPAIR (LONG-PATH INFRARED) SYSTEMS, by Hugh R. Carlon. 1 June 59, 20p. 4 refs. CWL Technical memo. no. 32-42; AD-217 807.
Order from LC mi$2.40, ph$3.30 PB 150 103

The physical, optical and spectral characteristics of various filter materials for use in the construction of infrared detector filter wheels (fluorothene, talc, Teflon, polyethylene, indium antimonide, calcium fluoride, and barium fluoride) were discussed. The types discussed were plastic films, fused salts, minerals, and special alloys. Wherever possible, spectral characteristics were shown for various thicknesses of the materials. Teflon, polyethylene, indium antimonide, and calcium fluoride were in the infrared beam. No attempt was made to correct the curves to represent the actual radiation seen by the detector as a result of radiation characteristics of the infrared source. If such a correction were made, the area under both curves would be equal, and the condition of optical balance would be verified mathematically. Peak efficiency for the system discussed was 35%, but it is possible to select materials resulting in 50% efficiency.

FUNDAMENTAL LIMITATION IN THE POINTING ACCURACY OF A RADIO TELESCOPE, by Nicholas George. Scientific rept. no. 2 on Contract AF 19(604)5725. 1 Apr 60, 22p. 7 refs. AFCRC-TN-60-585.
Order from LC mi$2.70, ph$4.80 PB 149 912

The angular pointing accuracy of a radio telescope is limited by the finite angular width of the diffraction pattern of the receiving aperture and by the presence of noise in the receiver. A formula is derived which expresses the angular uncertainty inherent in training a radio telescope toward a point source as a function of the flux level of the source, the bandwidth and the sensitivity of the receiver, the observation time, and the angular rate of change of the diffraction pattern. This formula is applied to the case of a weak source of cosmic radio waves, and it is found that if the source spectral intensity varies as $1/f^{\mu}$, then the angular pointing accuracy varies with frequency as $1/f^{1-\mu}$. For non-thermal sources, an average value of $\mu = 0.8$ is reported in the literature, and thus one finds only a slight frequency dependence of the angular pointing accuracy, i.e., as $1/f^{0.2}$. This result is valid for any aperture shape, and in this paper appropriate formulas are given for the linear, rectangular, and circular apertures. Finally, a sample computation indicates that an angular pointing accuracy of 30 seconds of arc is possible using present-day receiver components and an aperture size of 3.4 meters (approximately). The effects of atmospheric turbulence, dimensional tolerance, and mechanical stability are not considered. (Author)

This report attempts to present solutions to certain problems in visible optics which in the course of events should prove to be of considerable interest to those in the microwave field. Chapter I is concerned

with an extension of the Maréchal scheme for phase error balancing to fifth order terms: In Chapter II, the transfer functions for representative high numerical aperture systems are calculated and plotted. Chapters III and IV are concerned with the numerical evaluation of the axial energy distribution and the contours of constant encircled energy for various amounts of spherical aberration at several focal positions. Chapter V deals with the solution of three problems of scalar diffraction theory posed by Luneberg but not completed.

PREPARATION AND PERFORMANCE OF SINTERED CdS PHOTOCONDUCTORS, by R. R. Billups, W. L. Gardner, and M. D. Zimmerman. Rept. on Contract AF 19(604)5200. 12 Mar 59, 15p. 10 refs. Technical rept. no. 200; AD-212 580.
Order from LC mi$2.40, ph$3.30 PB 147 010

This report released for sale to the public 13 Oct 60.

The performance of sintered CdS layers is dependent upon their activation and the parameters of the sintering process. A procedure of activation of Cds powders is given with an accompanying discussion of techniques used in the production of sintered layers. Data are presented relating the dependency of the electrical and optical characteristics of the sintered layer with variations in activation and in the sintering parameters, such as atmosphere, temperature and time of bake, and method of cooling. Sintered layers of desired characteristics can be produced and data from such layers are discussed. Examples are given as to how these layers are utilized in device applications. (Author)

INTERFEROMETRIC MEASUREMENT OF WAVELENGTHS OF INFRARED EMISSION LINES IN THE 1- TO 2- MICRON REGION, by Curtis J. Humphreys and Edward Paul, Jr. 19 Feb 58, 31p. 15 refs. NAVORD rept. 4636; NOLC rept. 390; AD-162 994.
Order from LC mi$3.00, ph$6.30 PB 149 771

A method was developed for the precise evaluation of spectral emission lines in the 1- to 2-μ region by interferometric intercomparison with selected internationally adopted wavelength standards. The essential feature of the method is the provision for scanning the interference pattern by uniform rotation of a Fabry-Perot interferometer so that a diametral section of the system of circular fringes moves across the slit of a high-resolution infrared spectrometer. Data are obtained in the form of chart records of the fringe positions. NOLC digital computer facilities are utilized for reduction. Aluminum coatings proved satisfactory. Interferometer separations up to 30 mm were used in reported work. Wavelengths are reported as follows: argon, 19 lines; krypton, 15 lines; natural mercury, 10 lines, mercury 198, 8 lines; cadmium, 4 lines; helium, 1 line, namely, λ 20581A. The absolute accuracy now being achieved is 1 part in 10^7 in favorable cases. (Author)

A STUDY OF THE FAR INFRARED PROPERTIES OF CRYSTALS, by J. H. Rohrbaugh. Scientific rept. no. 9, 1 Sep-31 Nov 59, on Millimeter Wave Project, Contract AF 19(604)2673. [1959] 25p. 7 refs. AFCRC-TN-60-157; AD-234 816.
Order from LC mi$2.70, ph$4.80 PB 147 880

The optical behavior of the NaCl crystal in the infrared is investigated at various temperatures. Neuberger's [J. Neuberger, Absorption of NaCl in the Infrared, Thesis, New York Univ., 1957] derivation is used near room temperature. Neuberger applies the Blackman anharmonic theory to the Kellerman model of the NaCl crystal for his derivation of the optical constants. At low temperatures, his damping factor had to be modified by including the zero point energy. This was obtained by the use of the previously derived 20°K frequency spectrum of the normal modes of vibration. It is seen that the change of the optical constants is already experimentally detectable with the experimental accuracy currently achievable for a difference of 20°K near room temperature. (Author)

MECHANISM OF WEAR OF NONMETALLIC MATERIALS, by C. H. Riesz. Rept. for May 59-Jan 60 on Research on Interface Phenomena, Contract AF 33(616)5962. May 60, 25p. 14 refs. WADC Technical rept. 59-316, Part II.
Order from OTS $0.75 PB 161 955

A fundamental study was made of the wear mechanism of nonmetallic materials at high temperatures. Single-crystal sapphire was examined in a friction apparatus made for studies up to 2200°C. A sapphire ball loaded at 22, 50, and 127 g was passed over a sapphire plate at .0053 cm/sec at 29-921°C. Both slider and plate were oriented such that the C_O-axis was normal to the direction of traverse. With cleaned, as-received materials coefficient of friction values were scattered. Prior heat treatment at 900-925°C reduced scatter and gave peak values of .25-.30 near 600°C. The results suggest that the surfaces of the sapphire were imperfect. Observations by other investigators on variation of modulus of rupture appear to have a common basis. Wear areas on ball and plate were 6μ wide; subsurface changes extended to 30μ. Electron microscopy inspection suggests high surface temperatures occurred coincidently with the friction process, but direct evidence of an adhesion mechanism is inconclusive. (Author)

EFFECT OF HIGH PRESSURE ON ELECTRICAL PROPERTIES OF NiO, CoO AND Cu_2O, by A. P. Young, W. B. Wilson, and C. M. Schwartz. Technical note no. 1 on Contract AF 49(638)441. 1 Sep 60, 27p. 20 refs. Technical Document AFOSR-TN-60-629.
Order from LC mi$2.70, ph$4.80 PB 150 266

The effect of pressure on electrical resistance and Seebeck coefficient at or near room temperature in NiO, CoO, CuO, and Cu_2O has been determined. Equations relating the Seebeck coefficient to hole concentration have been used to calculate the effect of pressure on hole mobility. In all materials examined, hole mobility was decreased by pressures to 60 000 atm. It has been proposed that NiO charge transport occurs by the motion of holes trapped at local sites by polarization of the surrounding lattice. The effect of pressure on the diffusion of self-trapped holes has been considered. Motion of self-trapped holes in an ionic crystal and of vacancies in a metal may be similar to the extent that the motion of either probably involves cooperative movements of surrounding ions or atoms. Some inward relaxation probably occurs around either a hole trapped at a local site in an ionic crystal or around a vacancy in a metal. In either case pressure would be expected to decrease the jump frequency for motion of the defect. It is proposed that in NiO, CoO, and CuO, the decreased hole mobility with pressure was due to a decrease in diffusion rate of self-trapped holes. The explanation for pressure effects in Cu_2O may be more complicated since Cu_2O is generally regarded as a wide band semiconductor. (Author).

INVESTIGATIONS OF SURFACE PROPERTIES OF SILICON AND OTHER SEMICONDUCTORS, PHASE I AND II, by H. E. Farnsworth, D. Haneman and others. Scientific rept. no. 3, 30 Apr-30 June 60, on Contract AF 19(604)5986. July 60, 19p. 12 refs. ERD TN-60-775.
Order from LC mi$2.40, ph$3.30 PB 150 208

Measurements on a $(11\bar{1})$ GaSb face have been extended to include secondary emission observed as a function of oxygen and carbon dioxide adsorption. Diffraction and adsorption measurements have also been made on a (111) GaSb face. The adsorption rates of oxygen and carbon dioxide were greater by about a factor of 10 for the $(11\bar{1})$ face than for the (111) face. A germanium crystal was subjected to wet and dry cycles of nitrogen and oxygen. The effects of these ambients on the surface recombination states was determined by combined measurements of surface recombination velocity and surface conductivity. Studies of the formation of p-type films on vacuum-heated silicon have continued. The original baking temperature of the vacuum system has been varied over the range from 300°C to 450°C without influencing the number of diffused acceptors. Results have been obtained for a (110) silicon crystal which are in conformity with those previously obtained for the (100) and (111) crystal faces. (See also PB 147 758)

DIMENSIONAL CHANGES IN CRYSTALS DUE TO DISLOCATIONS, by R. A. Toupin and R. S. Rivlin. Technical rept. no. 51 on Contract Nonr-562(10). Oct 59, 28p. 4 refs. C11-51; AD-228 130.
Order from LC mi$2.70, ph$4.80 PB 149 945

The second-order elasticity theory is used to show how changes in the average dimensions of elastic bodies, either isotropic or anisotropic, due to the introduction of dislocations, can be calculated when the displacement gradients produced by the dislocations are sufficiently small. It is shown that the average value of each of the stress components, in a rectangular Cartesian coordinate system, is zero. This result is then used, within the framework of the second-order theory, to obtain an expression for the average value of each of the infinitesimal strain components as the average value of an expression of second degree in the displacement gradients which are associated with the dislocations in the body according to the classical theory. (Author)

Brown U. Div. of Applied Mathematics, Providence, R. I.
STRESS ANALYSIS IN THE PLASTIC RANGE, by William Prager. Technical rept. no. [52] on Contract Nonr-562(10). Oct 59, 24p. 28refs. C11-52; AD-228 129.
Order from LC mi$2.70, ph$4.80 PB 149 946

Problems of plastic stress analysis are illustrated by using a truss as an example. The state of stress can be specified by the values of a finite number of parameters. For this discrete model, linear programming, quadratic programming, and differential quadratic programming are shown to be important tools of plastic stress analysis. In discs, plates, and shells, and in the 3-dimensional continuum, the state of stress is specified by functions of position. While extreme characterizations of the state of stress were given and individual problems were solved for these continuous models, efficient methods of plastic stress analysis have yet to be developed. In view of the complexity of the problem, there is no doubt that these methods will have to be numerical rather than analytical. (Author)

Colorado U., Boulder.
NUCLEAR RESONANCE OF Al IN SYNTHETIC RUBY. Technical note on Contract AF 49(638)611. June 60, 8p. 6 refs. AFOSR-TN-60-724.
Order from LC mi$1.80, ph$1.80 PB 149 837

The quadrupole coupling constant $\Delta\nu$ and the line widths of Al were investigated at 300°K, 77°K, and 4.2°K and Cr^{3+} impurity concentrations of 0.1%, 1.5%, and 4%. The results indicated that the most significant contribution to the line width was the nuclear dipole-dipole interaction except for the 4% crystal at 4.2°K where the paramagnetic dipole-nuclear dipole interaction became important.

PREPARATION OF II-IV SEMI-CONDUCTOR COMPOUND MIXTURES AND MEASUREMENT OF THEIR ELECTRICAL AND THERMAL PROPERTIES. Quarterly status technical rept. no. 4, 1 Jan-30 Mar 60, on Contract AF 61(052)243. [1960] 24p. AD-237 885.
Order from LC mi$2.70, ph$4.80 PB 148 213

Single crystals of Mg_2Sn about 8 cm long were obtained regularly by using a heating element whose interior tube was of alumina and in which the interval between tubes was filled with powdered alumina. The

first crystals obtained were n type with the number of carriers of the order of 10^{18}/cc. Spectrographic analysis revealed traces of Cu and Ca and extremely faint traces of Si, Fe, and Ni. After fusion with the same heating element, n or p type crystals with the number of carriers of the order of 10^{17}/cc were obtained. The type is apparently imposed by stoichiometric departure so that if the speed of cooling is controlled, crystals of Mg_2Sn which are very close to the theoretical composition may be obtained. Measurements of resistivity and Hall coefficient were made on 2 single crystals, one each of the n and p types. The samples, A_1 and A_2, were taken from the head and tail of the same ingot. At liquid air temperature, the number of A_1 carriers was one-tenth that of the A_2. Phase studies indicated Pb and Sn are unequally distributed along the length of a crystal if the ingot is slowly recrystallized, starting at one end. A method for measuring semiconductor thermal diffusivity is appended; one end of a cylindrical bar is maintained at constant temperature and the other receives a periodic thermal flux of energy. The solution is derived by superposing the nonperiodic and periodic states, given the characteristic linear heat equation and boundary conditions. (See also AD-236 763)

Conservatoire des Arts et Métiers, Paris (France).
X-RAY DIFFRACTION IMAGES OF A CRYSTALLINE SURFACE, by M. Cagnon and A. Guinier. Technical note no. 2 on Contract AF 61(052)51. Jan 60, 27p. 7 refs. AFOSR-TN-60-681.
Order from LC mi$2.70, ph$4.80 PB 149 588

The influence on the X-ray image of defects such as superficial scratches, subboundaries, slip planes has been studied in detail with a lithium flouride crystal. The first part of the work has been the construction of a convenient camera and the study of the conditions necessary to obtain a satisfactory geometrical resolving power.

Detroit U. [Mich.]
DEVELOPMENT OF A MATHEMATICAL THEORY OF PLASTICITY BASED ON THE CONCEPT OF SLIP III, by H. Payne, S. J. Czyzak and others. Rept. on Contract AF 19(600)1466. 1 Sep 60, 58p. 24 refs. AFOSR-TR-60-107.
Order from LC mi$3.60, ph$9.30 PB 150 242

The Taylor model can be considered as the more realistic one of the several which have been proposed and the modifications of this model by Lin, Bishop and Hill, and Payne have made it possible to solve the stress-strain relation for certain problems. The fact that good agreement between theory and experiment has been obtained for these problems justifies acceptance of the model as one which describes the behavior of material under stress. The Taylor model has been investigated quantitatively for face centered cubic crystals only. (See also PB 144 773)

Electronic Systems Lab., Mass. Inst. of Tech., Cambridge.
AN INVESTIGATION INTO THE THERMAL AND ELECTRICAL PROPERTIES OF THE MERCURY-TELLURIDE CADMIUM-TELLURIDE SEMI-CONDUCTOR SOLID SOLUTION SYSTEM, by John Blair. Scientific rept. no. 2 on Contract AF 19(604)4153. 15 June 60, 99p. 66 refs. AFCRC-TN-60-753; DSR-7994.
Order from LC mi$5.40, ph$15.30 PB 150 051

This report deals with three separate but essentially interrelated subjects. The thermal and electrical properties of dilute solid solutions of cadmium telluride in mercury telluride are investigated, and techniques are developed for the preparation and evaluation of single crystals in this material system. The common focal point in this investigation was provided by thermoelectric energy conversion.

General Electric Research Lab., Schenectady, N.Y.
DIFFUSION OF Li IN Si AT HIGH T AND THE ISOTOPE EFFECT, by E. M. Pell. Scientific rept. no. 2 on Contract AF 19(604)5551. 25 Feb 60, 31p. 25 refs. AFCRC-TN-60-182; AD-234 621.
Order from LC mi$3.00, ph$6.30 PB 148 247

The diffusion rate of Li in Si at high temperatures has been re-investigated using an outdiffusion technique. The resulting D for Li-7 is $(2.21 \pm 0.07) \times 10^{-6}$ cm^2/sec at $(800 \pm 5)^oC$ and 2.4×10^{-5} cm^2/sec at $(1350 \pm 5)^oC$. At 800°C, the value for D_{Li-6}/D_{Li-7} is $1.075 \pm .02$, in accordance with the expected inverse dependence on the square root of the mass. The ionic charge of the Li and the atomic mechamism for Li diffusion is discussed in the light of these and other results.

General Telephone and Electronics Labs., Inc., Bayside, N. Y.
INFRARED SCATTERING STUDY, by G. H. Schwuttke. Final rept. on Contract AF 19(604)3482. 30 Apr 60, 72p. 30 refs. TR 60-300.7; AFCRC-TR-60-157.
Order from LC mi$4.50, ph$12.30 PB 150 094

Imperfections in silicon single crystals have been studied by means of infrared light scattering, copper decoration, and X-ray extinction microscopy. Scope and limitations of these three methods have been explored and compared with etching techniques. Measurements have been conducted to check the reliability of etching and decoration techniques in crystals of low and high oxygen concentration, using X-ray extinction photomicrographs as standards. X-RAY DIFFRACTION STUDIES OF THERMAL MOTIONS IN CRYSTALS, by R. A. Young. Annual rept. no. 1, 1 June 58-31 May 59, on Contracts Nonr-991(00) and 991(06). [1959] 184p. 50 refs. AD-228 067.
Order from LC mi$8.40, ph$28.80 PB 149 856

A discussion is presented relevant to the literature, theoretical background, and experimental considerations and techniques pertinent to studies of thermal motions in crystals, particularly AgCl, by means of observations of Bragg intensities. A method for determining temperature factors from temperatures dependences of X-ray intensities is derived. Equipment design and performance, design of experiments, experimental techniques, and characteristics of the specimen are discussed with respect to accuracy and reproducibility.

Harvard U. Div. of Engineering and Applied Physics, Cambridge, Mass.
A THEORETICAL STUDY OF PENDELLÖSUNG FRINGES. PART 1. GENERAL CONSIDERATIONS. PART 2. DETAILED DISCUSSION BASED UPON A SPHERICAL WAVE THEORY, by N. Kato. Technical rept. no. 3 on Contract Nonr-1866(39). 10 Nov 59, 64p. 12 refs. AD-237 681.
Order from LC mi$3.90, ph$10.80 PB 148 320

The assumption of an incident plane wave is shown to be inadequate for single crystal experiments of X-ray diffraction (Laue case). A dynamical theory of diffraction is formulated for a general type of monochromatic incident wave. Fundamental aspects of wave behavior are discussed in terms of wave bundle considerations. Diffraction phenomena are classified by $\Delta\theta$ (an angular width of single crystal reflection) and Ω_o (a width in which the angular spectrum of an incident coherent wave takes an appreciable value). If $\Delta\theta' >> \Omega_o$, a plane wave assumption is adequate. This is usually the case for electron diffraction. If $\Delta\theta << \Omega_o$, a spherical wave assumption is more appropriate and most of X-ray cases fall under this alternative. Furthermore, a criterion is given to distinguish between Fresnel and Fraunhofer diffraction in a crystalline medium. "Pendellösung" fringes of X-rays can be interpreted as Fraunhofer diffraction, while those of electrons are observed in a Fresnel diffraction region. The essential features of section patterns, particularly "hook-shaped" fringes, can now be explained. (Author).

ENVIRONMENTAL EFFECTS ON THE MECHANICAL PROPERTIES OF IONIC SOLIDS WITH PARTICULAR REFERENCE TO THE JOPPE EFFECT, by R. J. Stokes, T. L. Johnston, and C. H. Li. Technical rept. no. 6 on Contract Nonr-2456(00). Oct 59, 26p. 14 refs. HR-59-510; AD-228 082.
Order from LC mi$2.70, ph$4.80 PB 149 870

Mechanical properties of sodium chloride crystals are extremely sensitive to the presence of surface microcracks. Removal of these cracks by immersion in water leads to an enhancement of ductility (10-20% tensile elongation) which is retained indefinitely in dry air providing: (a) the crystal is dried without leaving a surface precipitate, (b) microcracks are not reintroduced by mishandling the gauge length. Storage in a damp atmosphere results in a surface deposit and consequent re-embrittlement. Elimination of surface flaws in other ionic solids does not necessarily result in an enhancement of ductility. Instead, there is a change in fracture behavior which is manifested by a change in the location of fracture origin. The Joffe effect is regarded as the action of a solvent in promoting this change in fracture behavior. Other environmental effects on mechanical properties are distinguished in terms of the type of environment and the initial surface condition. (Author)

DISTRIBUTION OF ELECTRONS IN CADMIUM SULFIDE CRYSTALS, by Ganesh P. Mohanty and Leonid V. Azaroff. Rept. on Contract AF 49(638)425. 19 July 60, 8p. 5 refs. AFOSR-TN-60-792.
Order from LC mi$1.80, ph$1.80 PB 149 893

The (0001) electron density projections have been determined for a pure CdS crystal having a high dark resistivity and one doped with chlorine having low resistivity. Extremely accurate intensities (±2%) were obtained so that small variations in the electron distribution could be determined. It was found that the atoms in the doped crystal had larger effective sizes than in the undoped crystal. Also, the presence of a very small peak in an interstitial position of the structure suggests that some of the atoms occupy interstitial sites. This result differs markedly from an earlier investigtion by Shuvalov who reports the formation of "electron bridges" between adjacent atoms in CdS crystals having low dark resistivities The results obtained in this investigation also differ from Shuvalov's in regard to variations in diffraction intensities of certain reflections. Possible reasons for these differences are discussed. (Author)

Illinois U., Urbana.
HALL MOBILITY OF HOLES IN SILVER BROMIDE, by Roland Clements Hanson. Doctoral thesis. Technical note no. 4 on Contract AF 49(638)579. June 60, 78p. 90 refs. AFOSR TN-60-795; AD-240 108.
Order from LC mi$4.50, ph$12.30 PB 149 438

Hall mobility measurements have been made on holes introduced into AgBr by a bromine atmosphere in the temperature range from room temperature to 150°C. These measurements were made using conventional electrode geometry and sensitive high impedance a-c techniques similar to those used by Macdonald and Robinson. The Hall mobility for holes varied from 2.0 ± 0.5 cm^2/volt-sec at room temperature (27°C) to 0.5 ± 0.15 cm^2/volt-sec at 150°C. The hole mobility is about 30 times smaller than the electron mobility determined by other workers at room temperature. The temperature dependence of the hole mobility is about T^{-4}. This is much steeper than the temperature dependence of the electron mobility in this region. Preliminary measurements were also made on the thermoelectric power of AgBr in a bromine atmosphere. If the classical theory used is correct, these measurements indicate that the density of states effective mass for the holes is very small. (Author)

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
VIBRATIONAL THERMODYNAMIC PROPERTIES OF LATTICES WITH DEFECTS. II. TWO- AND THREE-DIMENSIONAL SIMPLE CUBIC LATTICES, by J. Mahanty (Doctoral thesis), A. A. Maradudin, and G. H. Weiss. Rept. on Contracts AF 49(638)399 and AF 18(600)1315. Mar 60, 22p. 7 refs. Technical note BN-198; AFOSR-TN-60-372; AD-235 773.
Order from LC mi$2.70, ph$4.80 PB 148 993

Work is continued and applied to two- and three-dimensional crystals of previously developed methods [J. Mahanty, A. Maradudin, G. Weiss, Prog. Theor. Phys. 20:369, 1958] for the evaluation of the changes in thermodynamic properties of a lattice due to the presence of defects of various kinds. The effects are considered of an isotope defect and a pair of isotope defects on the zero point energy and free energy of two- and three-dimensional cubic lattices. The free energy and self entropy of a vacancy in a three dimensional cubic lattice is evaluated. (Author) (See also PB 135 619)

AN ACCURATE BOUNDARY CONDITION TO REPLACE TRANSITION CONDITIONS AT DIELECTRIC-DIELECTRIC INTERFACES, by Julius Kane and Samuel N. Karp. Rept. on Contract AF 19(604)5238. May 60, 69p. 11 refs. Research rept. no. EM-153; AFCRC-TN-60-391.
Order from LC mi$3.90, ph$10.80 PB 150 033

Most problems involving dielectrics cannot be solved exactly, e.g., diffraction by a dielectric wedge. It is the purpose of this work to describe a technique by which the transition conditions at an interface between two dielectrics can be conveniently and accurately replaced by a single mixed boundary condition.

Institute of Mathematical Sciences, New York U., N. Y.
RADIO PROPAGATION PAST A PAIR OF DIELECTRIC INTERFACES, by Julius Kane and Samuel N. Carp. Rept. on Contract AF 19(604)5238. May 60, 37p. 11 refs. Research rept. no. EM-154; AFCRC-TN-60-392.
Order from LC mi$3.00, ph$6.30 PB 150 054

A previous report introduced a linear boundary condition that serves to accurately replace transition conditions at dielectric-dielectric interfaces. In this work this procedure is applied to obtain an approximate solsolution for an otherwise mathematically intractable problem. The original geometry of the problem is that of a dielectric half space above two dielectric quarter spaces. After the technique of reformulation is applied, the problem reduces to one of obtaining a solution of a two-part boundary value problem, in the upper half space. This problem is solved exactly by the method of Wiener and Hopf. Physically reasonable results are obtained in a form suitable for numerical computation. (Author)

ON THE CRYSTALLIZATION OF POLYETHYLENE, by Marion B. Rhodes and Richard S. Stein. Technical rept. no. 15 on Contract Nonr-2151(00). 13 Oct 59, 9p. 6 refs. AD-232 560.
Order from LC mi$1.80, ph$1.80 PB 149 481

A series of light scattering photographs was made on cooling low-density samples from a polyethylene melt having a density of 0.9203 g/cc, a melt index of 2.1, M_n = 23,000, and M_w = 184,000. The photographs were taken with vertically polarized incident light and with a vertically oriented analyzing polaroid between the sample and the photographic film (Vv polarization). The first scattering pattern developing on cooling showed no preferred orientation with respect to the polarization direction, and was characteristic of scattering resulting from density fluctuations. The cooling patterns obtained with a vertically oriented incident polarizer and a horizontally oriented analyzer (Hv polarizer) exhibited polarization which could arise only from anisotropic structure. These pictures showed a gradual increase in intensity with no maximum, which is in agreement with the density fluctuation interpretation of the maximum. A series of Vv photographs obtained on reheating showed no maximum but a gradual decrease in orientation fluctuation type of scattering. The experiments, which are consistent with the proposed 2-stage crystallization mechanism and the proposed origin of the scattering maximum, afford a means for separating and studying the kinetics of the processes.

INTERMOLECULAR COUPLING OF VIBRATIONS IN MOLECULAR CRYSTALS: A VIBRATIONAL EXCITON APPROACH, by R. M. Hexter. Rept. on Contract AF 49(638)542. 17 Mar 60, 43p. 30 refs. AFOSR-TN-60-325.
Order from LC mi$3.30, ph$7.80 PB 149 830

A vibrational exciton theory is developed which parallels in many ways the electronic exciton theory originally put forward by Davydov and amplified by Craig and Hobbins and by Fox and Schnepp. The kernel of the theory is the adoption of a transition dipole-transition dipole interaction as the potential which perturbs the isolated molecule energies and which thereby couples the motions of pairs of molecules in a crystal. As a result of the quantitative application of this theory, molecular dipole derivatives of several of the parallel modes of methyl chloride are obtained from the correlation field splittings of the corresponding fundamentals in the spectrum of solid methyl chloride. An isotope effect upon correlation field splittings is reported and is accounted for in terms of the same theory.

Mineralogical Lab., U. of Michigan, Ann Arbor.
ULTRAVIOLET PIEZOBIREFRINGENCE OF DIAMOND, by Malcolm Alvin Conrad. Research supported by ONR Contract. 1959, 56p. 31 refs.
Order from LC mi$3.60, ph$9.30 PB 149 855

Measurements of optical properties aid the development of the theory of solid state physics. The importance of stress-optical investigations is augmented by the close association of stress-optical, piezoelectric, and electro-optical properties. With few exceptions, stress-optical studies have been confined to the visible portion of the spectrum. The purpose of this study is to extend these limits by measurement of the piezobirefringence constants of diamond to its transmission limit in the ultraviolet portion of the spectrum.

PARAMAGNETIC RESONANCE IN THE SOLID STATE, by Hartmutt Kallmann. Quarterly progress rept. no. 5, July-Sep 59, on Contract DA 36-039-sc-78056. Oct 59, 8p. AD-229 083.
Order from LC mi$1.80, ph$1.80 PB 150 588

This report released for sale to the public 13 Oct 60.

An analog integrator for the automatic recording of EPR absorption spectra is described in detail. This accessory to the Varian spectrometer makes it possible to compare the spectra of standard samples with unknown spectra to obtain the number of unpaired electron spins in the unknown. The integrator also facilitates the measurement of line widths and line separations. An experiment on the effect of β radiation on the benzene-carbon tetrachloride system was set up. Diphenylpicrylhydrazyl is used as a scavenger for radicals produced. A copper activated zinc sulfide phosphor was examined for trapped electrons by electron paramagnetic resonance. When the phosphor was excited by blue light at room temperature a concentration of about 10^{16} electrons per cm^3 was calculated after comparison with diphenylpicrylhydrazyl. In the dark, the number of trapped electrons decays to about half the initial number in 18 hours. (Author) (See also PB 147 941)

Northwestern Technological Inst., Evanston, Ill.
TRANSFORMATION STUDIES OF GRAY TIN SINGLE CRYSTALS, by R. G. Wolfson, M. E. Fine, and A. W. Ewald. Rept. on Contract AF 49(638)524. June 60, 15p. 5 refs. AFOSR-TN-60-794.
Order from LC mi$2.40, ph$3.30 PB 150 105

Measurements of the linear growth rate of white tin into thin single-crystal wafers of gray tin, over the temperature range 24.2 to 46.5°C, are presented. The rate is not a single-valued function of the temperature. Imposed upon the strong temperature dependence of the average rate is a variation which is well defined at a given temperature; the spread in the observed values decreases sharply with increasing temperature. The variation is attributed to two observed stress-relaxation processes: cleavage in the gray tin and plastic deformation accompanied by recrystallization in the white tin. (Author)

INVESTIGATION OF THE MICROWAVE PROPERTIES OF FERROELECTRICS, by Georg Rupprecht. Scientific rept. no. 1 on Contract AF 19(604)4085. June 60, 36p. AFCRC-TN-60-595.
Order from LC mi$3.00, ph$6.30 PB 149 905

Newly developed measuring techniques are described which make it possible to measure the complex dielectric constant of ferroelectric material over a wide range of temperatures and frequencies. At the same time, non-linear behavior can be studied. Strontium titanate single crystals have been measured in the temperature range from 80°K to about room temperature and over a frequency range from 100 c/sec to 24 kMc/sec. The essential result of these experiments is that there is no dispersion of the dielectric constant

up to K-band frequencies and a relation exists between the change of the dielectric constant above the Curie temperature as a function of external electric field and temperature. The dependence of the non-linear effect on the crystal orientation has been investigated. An interpretation of these results along the lines of Slater's theory of ferroelectricity in perovskite structures gives a qualitative but not a quantitative agreement. X-ray studies on $SrTiO_3$ single crystals are described, which also shed some doubt on the basic assumptions of Slater's theory. (Author)

CHEMISORPTION AND CATALYSIS ON OXIDE SEMICONDUCTORS, by V. Caglioti, A. Cimino and others. Final technical rept. no. 2, 1 Feb 59-31 Jan 60, on Contract DA 91-591-EUC-1057. 27 Feb 60, 57p. 29 refs.
Order from LC mi$3.60, ph$9.30 PB 149 448

Chemisorption of hydrogen on ZnO (powder samples), with and without the addition of Li^+ or Ga^{3+} has been investigated in the temperature range -80° to 350°C, and at pressures between 70 and 715 torr. The electrical conductivity of powdered samples of pure ZnO has been studied as a function of the temperature and of the hydrogen pressure. A model for chemisorption is postulated. According to this model the quasi-free electrons present in ZnO can initiate the chemisorption process. The heat evolved during adsorption may in part be utilized to excite new electrons, which become available for chemisorption (site creation). Another fraction of the heat is utilized for the desorption, a process which also sets in immediately. The observed chemisorption therefore depends on the rate of excitation and of decay of electrons, and on the desorption process. Electrical conductivity measurements on doped samples are presented. An enhancement of conductivity was found which, as for pure ZnO, is more marked at higher temperatures. Photoconductivity (u. v. irradiation) experiments on sintered ZnO pellets were performed at hydrogen pressures of 2 or 25 torr, in the temperature range 30° to 300°C. A decrease of the photo-effect is observed in the presence of hydrogen.

ANALYTICAL TECHNIQUE FOR OPTIMIZING THE HALL EFFECT, by G. M. Krembs. Rept. on Contract Nonr-225(31). 15 Oct 59, 94p. 46 refs. Technical rept. no. 1702-2; AD-228 792.
Order from LC mi$5.40, ph$15.30 PB 149 492

Study is made of signal levels and noise in the Hall effect as a function of the material constants, the geometrical configuration, and the ambient and the operating conditions. An analytical technique is desired for determining the optimum values of these parameters whenever the Hall effect application requires either a large Hall voltage per unit of magnetic field strength or a good signal-to-noise ratio. The major results of this study can be summarized as follows: (1) from a thermal analysis of the signal level in a Hall device mounted on a simple heat-sink structure it is shown that there exists an optimum crystal temperature at which the Hall voltage is a maximum; (2) since no material exists with all the ideal properties desired for a Hall generator, the proper choice of available materials is found to depend strongly on the temperature of the environment; (3) the power spectrum for the noise sources in the Hall device is demonstrated by means of a theoretical analysis of the Hall voltage as a function of the fluctuating charge density to be proportional to the spectrum for the current noise, where the value of this proportionality constant is determined as a function of the material parameters and other variables; and (4) the signal-to-noise ratio, formulated from the investigations of the signal level and Hall noise spectrum, is shown to have an optimum temperature which differs from the maximum signal condition, and to approach a constant value with increasing magnetic field strength, provided the misalignment noise is negligible. PROTON RESONANCE SHIFTS IN DIPHENYL PICRYL HYDRAZYL, by M. E. Anderson, G. E. Pake, and T. R. Tuttle, Jr. Rept. on Paramagnetic Resonance, Contract AF 18(603)131. July 60, 9p. 6 refs. Technical note no. 131-7; AFOSR-TN-60-736.
Order from LC mi$1.80, ph$1.80 PB 150 377

This note reports experiments in the temperature range between 4.2°K and 1.4°K in which a number of components are clearly resolved and the 1/T dependence of these shifts is clearly exhibited. In addition, the first of a series of deuterium substitution experiments has permitted explicit identification of one of the shifted components.

THE STRUCTURES OF Co_2P, Ru_2P AND RELATED PHASES, by Stig Rundqvist. Technical note no. 12 on Contract AF 61(052)40. 4 May 60, 38p. 35 refs. AFOSR-TN-60-338; AD-240 307.
Order from LC mi$3.00, ph$6.30 PB 149 581

The crystal structures of Co_2P and Ru_2P have been refined using single-crystal methods. Both phosphides crystallize in the C 23 structure type. A structural comparison with related phosphides and silicides is given. Co_2P has an extended homogeneity range at higher temperatures, the phosphorus-rich limit at 1000°C corresponds to the formula $Co_{1.94}P$.

There are evidences that the widening of the homogeneity range is connected with random vacancies on metal atom sites. This paper gives an account of single-crystal structure determinations of Co_2P and Ru_2P. Some phase-analytical data for the binary Co_2P and Ru_2P, and the ternary $Co_2(P, Si)$ phases are also reported and discussed. (Author)

AMBIENT HISTORY DEPENDENCE IN THE ELECTRICAL RESISTANCE OF CORUNDUM, by R. N. Tucker and P. Gibbs. Technical rept. no. 11 on Contract Nonr-1288(03). 15 Oct 59, 34p. 7 refs. AD-231 183.
Order from LC mi$3.00, ph$6.30 PB 149 475

The conduction current of single-crystal α-Al_2O_3 was measured over the temperature range 200°C to 900°C. It was observed that the conduction current was strongly dependent upon both the environmental history and the dislocation structure of the sample. Boiling the samples for one hour in various aqueous solutions [6-N HCl, $Mg(NO_3)_2$] and NaCl lead to significant increases in the conduction current as compared to samples which had been cleaned by heating at 1000°C in N. In each of the controlled contamination cases, the conduction current passed through a maximum: for HCl-contamination, the maximum occurred at about 350°C; for $Mg(NO_3)_2$-contamination, at about 570°C; and for NaCl-contamination, at about 705°C. The maxima were sharply followed by pulses in the conduction current, the frequency of which were observed to be sensitive to external mechanical vibrations. The pulses and maxima were absent upon cooling from 1000°C or reheating the cleaned crystal in a dry N atmosphere. Conduction current measurements were made on deformed samples, both parallel and transverse to the bend-induced dislocation structure. The parallel, contaminated conduction current showed a more than ten-fold increase over the other cases. (Author)

PREPARATION OF LARGE AREA SINGLE CRYSTAL CUPROUS OXIDE AND THE ELECTRICAL CONDUCTIVITY OF SINGLE CRYSTAL CUPROUS OXIDE AT HIGH TEMPERATURES, by Robert S. Toth, Rein Kilkson, and Dan Trivich. Technical rept. no. 2 on Contract AF 18(600)481. 30 Apr 60, 97p. 51 refs. AFOSR-TN-60-485.
Order from LC mi$5.40, ph$15.30 PB 149 759

A method has been developed for the preparation of single crystals of cuprous oxide in the form of thin sheets of large area. The cuprous oxide was prepared initially in polycrystalline form by oxidation of copper sheet in air at temperatures below 1050°C. Subsequent annealing of the polycrystalline cuprous oxide sheet at higher temperatures, from 1070 to 1130°C, caused the grains to grow to large size, frequently attaining sizes of greater than a square inch in area. The process for preparing single crystal cuprous oxide was effective only on thin sheets, less than 0.060" thick. The single crystal character of the large grains was verified by X-ray examination, which further showed that the crystals were not strained and that preferred orientations of [211] and [311] existed. The electrical conductivity of the single crystal cuprous oxide was measured in the temperature range of 1100°C to 500°C at oxygen pressures from 152 mm to 10^{-5} mm. The plot of the logarithm of the conductivity against the logarithm of the oxygen pressure at constant temperature was found to be linear over a pressure range of 50 mm to 10^{-2} mm, with a slope of 0.1420 (approximately 1/7). The curve departs from linearity at lower pressures and also goes through a minimum with decreasing pressure. The activation energies, obtained from the straight line plots of the logarithm of the conductivity against the reciprocal of the absolute temperature, gave essentially constant values of 0.65 ev. at oxygen pressures from 50 mm to 10^{-2} mm. At pressures of 10^{-3} and 10^{-4} mm., the activation energy increased sharply to 1.05 ev. The conductivity in air at temperatures of 1020° to 1100°C gave an activation energy of 0.767 ev.

THE PROPERTIES OF ELECTROLYTICALLY PREPARED CUPROUS OXIDE AND THE EFFECT OF SULFIDING ON THE PROPERTIES OF CUPROUS OXIDE PHOTOVOLTAIC CELLS, by Robert S. Toth, Nicolaos Economou, and Dab Trivich. Technical rept. no. 3 on Contract AF 18(600)481. 30 Apr 60, 50p. 31 refs. AFOSR-TN-60-725.
Order from LC mi$3.30, ph$7.80 PB 149 760

A method of preparing thin films of Cu_2O by an electrodeposition technique has been developed for the study of these films. The basic properties of these films differ only slightly from results on thermally prepared Cu_2O except that water has been found to be incorporated in the deposit. This can be eliminated by annealing at a proper temperature. The sulfide treatment of the Cu_2O surface of a copper oxide photovoltaic cell has been found to affect only slightly the output of thermally prepared cells. Sulfiding on electrolytically prepared cells was found to increase the power output by a factor of 10^2 to 10^3. The reason for the increased output is the lowering of the series resistance of the cells by the sulfide layer and a consequent increase in the efficiency of collection of the carriers produced at the photosensitive junction. This effect is larger for high resistance electrolytic Cu_2O than for the lower resistance thermal Cu_2O. The effect of the sulfiding treatment on the photovoltaic output can be maximized by proper selection of sulfide layer thickness and geometry of the top contact. (Author)

INVERSION BY FAST PASSAGE IN A MULTILEVEL SYSTEM [AND] ELECTRON PARAMAGNETIC RESONANCE IN SEMICONDUCTING RUTILE, by P. E. Wagner, P. F. Chester and others. Quarterly rept. on Contract AF 19(604)5589. 14 Apr 60, 19p. 7 refs. Research rept. 403FD449-R5; ERD-TN-60-755.
Order from LC mi$2.40, ph$3.30 PB 149 812

Observations of Cr^{+++} resonances in ruby following adiabatic fast passage show inversion of the 2-4 transition when fast passage is applied to the 2-3 and 3-4 transitions, but only when the 2-3 and 3-4 transitions coincide during fast passage. Analysis is given for the inversion requirements in the two cases: sequential passage, as proposed by Siegman and Morris, and coincident passage. Electron paramagnetic resonance has been observed in oxygen deficient rutile at helium temperatures. The paramagnetic center is discussed in terms of Ti^{+++} associated with certain oxygen vacancies. The study is continuing. (Author)

MAGNETO-OPTICAL EFFECTS IN FERRIMAGNETIC OXIDES, by P. C. Bailey and A. Goldman. Final rept. for 15 Mar 59-15 Mar 60 on Contract AF 19(604)552. [1960] 85p. 30 refs. AFCRC-TR-60-147.
Order from LC mi$4.80, ph$13.80 PB 149 572

The optical properties of thin transparent sections of many of the rare earth garnets and orthoferrites were investigated. Single crystals grown for this purpose were the garnets of yttrium and the rare earths from samarium to europium, and the corresponding orthoferrites. In addition, crystals of α-Fe_2O_3 were grown and investigated. The properties studied included optical absorption, Faraday rotation, reflectivity, circular dichroism and magnetic birefringence. Measurements were made at room and liquid nitrogen temperatures in the visible and infra-red (1-25μ) region, and the results correlated with existing theories. The absorption and rotation of all the garnets were similar with anomalies present in the cases of dysprosium, erbium, thulium and ytterbium. (Author)

ON THE DECAY OF PLANE SHOCK WAVES, by S. Chandrasekhar. 8 Nov 43, 14p. Rept. no. 423.
Order from LC mi$2.40, ph$3.30 PB 150 453

This report released for sale to the public 11 Oct 60.

The problem of the decay of plane shock waves is considered and it is shown that there exists a special class of shock pulses for which the problem of decay admits of an explicit solution. The case in question arises when shocks of moderate intensities (Mach numbers less than 1.5 if an accuracy of one per cent is demanded) are considered. In these cases the changes in entropy as well as in the quantity 5 c - u (where c denotes the local velocity of sound and u the mass velocity) as the shock front is crossed can be neglected. The case of linear shock pulses in which both u and c are linear functions of x behind the shock front is considered particularly in some detail.

A DISCUSSION OF DUAL DIAGRAMS IN PERTURBATION THEORY, by P. V. Landshoff. Technical scientific note no. 8 on Contract AF 61(052)233. May 60, 11p. 9 refs. AFOSR-TN-60-729.
Order from LC mi$2.40, ph$3.30 PB 150 343

A discussion is given of the dual diagram method of finding singularities corresponding to a contribution to the S-matrix from a Feynman graph in perturbation theory. It is shown that it may be necessary to draw the dual diagram in a space of greater dimensions than that spanned by the external momentum vectors of the Feynman graph, but that this possibility does not affect previous conclusions concerning anomalous thresholds in vertex parts. The effects are considered of the dimensionality of space on the singularities for processes involving many external particles. (Author)

SOME PROPERTIES OF SINGLE LOOP DIAGRAMS IN PERTURBATION THEORY, by M. Fowler, P. V. Landshoff, and R. W. Lardner. Technical scientific note no. 7 on Contract AF 61(052)233. May 60, 11p. 6 refs. AFOSR-TN-60-728.
Order from LC mi$2.40, ph$3.30 PB 150 342

Methods are summarized for finding singularities of a contribution to the S-matrix for a Feynman diagram in perturbation theory, with particular reference to single-loop diagrams. They are then applied to the third order vertex function and to an extension of the work of Tarski on scattering in fourth order, with internal stability conditions relaxed. The results for the vertex function are used to show that the S-matrix for production processes does not have a two-variable spectral representation. Finally, it is shown that the leading singularities for the fifth order contribution to single pion-production in π-N scattering do not produce anomalous thresholds. (Author)

IRREVERSIBILITY IN INTERACTING SPIN SYSTEMS, by J. Philippot. Rept. on Contract AF 18(600)1315. Mar 60, 16p. 14 refs. Technical note BN-200; AFOSR-TN-60-346; AD-235 772.
Order from LC mi$2.40, ph$3.30 PB 148 995

A system whose hamiltonian is split into two terms $H = H_0 + \lambda V$ exhibits two types of irreversible processes. The first processes are described by the unperturbed hamiltonian, H_0, only. The second processes, which result from the perturbation, lead to an increase of the entropy of the system. These processes are illustrated by the examples of free precession and cross relaxation. General formula are given for transition probabilities. The expressions applied to cross relaxation in lithium fluoride agree with the results obtained by Bloembergen (Physica 15:410, 1949) and Pershan.

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
ON VAN HOVE'S DIAGONAL SINGULARITY CONDITION, by J. Philippot. Rept. on Contract AF 18(600)1315. Mar 60, 13p. 4 refs. Technical note BN-199; AFOSR-TN-60-344; AD-235 770.
Order from LC mi$2.40, ph$3.30 PB 148 994

The diagonal singularity property of Van Hove (Physica 21:517, 1955; 23:441, 1957, 25:268, 1959) is shown not to be represented by a singularity of the δ type in the many body systems of interacting particles or phonons. This property is verified in certain scattering problems, and is a consequence of the random distribution of the scattering centers.

QUASI-PARTICLE APPROACH TO INTERACTION IN AN IDEALIZED METAL, by John J. Quinn and Richard A. Ferrell. Rept. on Contracts Nonr-1797(00) and AF 49(638)399. Sep 59, 25p. 17 refs. Physics Dept. technical rept. no. 156; AD-229 342.
Order from LC mi$2.70, ph$4.80 PB 148 890

The properties of a degenerate electron gas with a background of positive charge capable of propagating phonons are studied by means of a quasi-partical approach. The ground state of the system is pictured as a vacuum state, and any additional particles or holes together with their polarization clouds are thought of as quasi-particles. The Coulomb repulsion and the effective electron-electron attraction due to phonon exchange are treated separately. The specific heat, spin susceptibility, and compressibility are determined in terms of the effective energy of interaction $V_{pp'}$ of two quasi-particles. Considering only the lowest order process contributing to $V_{pp'}$ reproduces known results for the high density limit Coulomb correction to specific heat and spin susceptibility, but gives a new result for the phonon correction. To lowest order, the electron-phonon interaction produces no change in the spin susceptibility, in contrast to general expectation. For real metallic densities higher order graphs must be included; however for this case it may be possible to choose $V_{pp'}$ empirically. (Author)

STRICT LOCALIZATION IN QUANTUM FIELD THEORY, by James Milton Knight. Doctoral thesis. Rept. on Contract AF 49(638)24. July 60, 55p. 15 refs. Physics Dept. technical rept. no. 187; AFOSR-TN-60-818.
Order from LC mi$3.60, ph$9.30 PB 149 835

A definition of strict localization of states in quantum field theory is presented. This definition is based on considering products of field operators as the primary measurable quantities of the theory. An example of a localized state is given, showing that such a state arises when a free field interacts with an external current that is limited to a bounded region of space-time. It is shown by means of a graphical technique that a state having a finite number of particles cannot satisfy the definition of localization. A simple representation of localized states is investigated, and arguments are given to support its generality and uniqueness. (Author)

INVESTIGATION OF MICROWAVE PROPERTIES OF PLASMAS. Scientific rept. no. 8, 1 Feb-30 Apr 60, on Contract AF 19(604)5226. May 60, 16p. M. L. rept. 725; AFCRC TN-60-590.
Order from LC mi$2.40, ph$3.30 PB 150 376

A cesium plasma with a high percentage of ionization has been obtained, and measurements were consistently repeatable over long long periods of time. The characteristics of density and impedance of the ionized plasma are discussed. Various possible noise measurement experiments have been examined. The experimental apparatus for generating harmonics has been built. Some aspects of the apparatus and some early experiements with the apparatus are discussed. Theoretical analysis is continuing and an equation for the case of no magnetic field has been derived. A better theoretical understanding has been obtained of the requirements necessary for improved parametric gain. Three basic requirements are discussed. Some low frequency properties of hot cathode mercury vapor discharge tubes are now being investigated. A new discharge tube has been used to determine the effect of frequency upon the sheath interaction. These findings were studied and interpreted. The role of temperature in the theory of nonlinear effects in plasma is reviewed. (Author) (See also PB 148 168).

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
ENERGY TRANSFER IN PLASMAS. Technical note no. 5 on Contract AF 30(602)2050. 23 May 60, 19p. 3 refs. RADC TN-60-124.
Order from LC mi$2.40, ph$3.30 PB 149 299

A continuation of the mathematical analysis of microwave propagation in a non-uniform plasma, in which the confluent hypergeometric function approximation is discussed, is presented. Anomalous high absorption of microwaves in helium gas excited at one boundary by microwave radiation at cyclotron frequency has been observed. The addition of small amounts of argon caused this absorption to decrease, indicating that the cause for the high absorption may be in the unusually large population of excited states produced at the hot boundary. Similar experiments are being conducted with air. Experimental designs for the study of non-uniform plasmas and for plasma-acoustical experiment are described. (Author)

Microwave Lab., Stanford U., Calif.
MILLIMETER WAVE GENERATION AND AMPLIFICATION IN PLASMAS, by G. S. Kino. Scientific rept. no. 6 on Contract AF 19(604)5226. Dec 59, 24p. 14 refs. M. L. Rept. no. 676; AFCRC-TN-60-114; AD-234 973.
Order from LC mi$2.70, ph$4.80 PB 147 884

A review of two possibilities for millimeter wave generation in a gas discharge plasma is given. The encouraging experimental results obtained so far with harmonic conversion in a plasma are discussed, and the nonlinear effects are explained in terms of a simple zero temperature theory. The amplification which occurs when an electron beam passes through a plasma is discussed in the light of millimeter wave

applications. The use of sound waves in a plasma to set up an artificial periodic system in the plasma is described as a possible way in which the coupling problem may be solved.

LONGITUDINAL ION OSCILLATIONS IN HOT PLASMA, by Burton D. Fried and Roy W. Gould. 28 June 60, 37p. 12 refs. STL/TR-60-0000-GR185.
Order from LC mi$3.00, ph$6.30 PB 150 278

The linearized, longitudinal waves in a hot plasma include, besides the familiar electron plasma oscillations (epo), ion plasma oscillations (ipo) with $\omega \approx \omega_p(m/M)^{1/2}$. The properties of these ipo are explored using a Vlasov equation description of the plasma.

Scuola di Perfezionamento in Fisica Teorica e Nucleare, Naples (Italy).
FINAL TECHNICAL REPORT. Rept. for 1 May 59-31 July 60, on Contract DA 91-591-EUC-1096.
Order from LC mi$1.80, ph$1.80 PB 150 373

The main results of the two-year research reported here are: (1) a consistent formulation of field theory, totally rid of ambiguities and infinities, susceptible of exact mathematical treatment, (2) the proof that the ultraviolet divergences are eliminated correctly by an appropriate re-definition of the concept of integral, such as is imposed by the hyperbolic nature of the field equations. As a by-product one obtains the Lie equations of the renormalization group: these, tested on the Lee model, have given the expected answers, (3) a similar procedure permits to factor out, in a rigorous and perturbation-independent manner, the infrared divergences of electrodynamics, yielding a strict and very simple proof of the conjecture of many authors on this subject. (Author).

Syracuse U., N. Y.
THE CONSTRUCTION AND PROPERTIES OF NON-EQUILIBRIUM GIBBSIAN ENSEMBLES, by Robert L. W. Chen. Rept. on Contract AF 49(638)461. July 60, 33p. 7 refs. AFOSR[TN]60-746.
Order from LC mi$3.00, ph$6.30 PB 149 872

The methods of constructing Gibbsian ensembles are discussed for isolated systems undergoing irreversible processes and then the properties of these ensembles are examined in detail. Different kinds of physical situations call for different types of representative ensembles. In particular, situations are contrasted in which: (1) the system is just beginning an irreversible process, and (2) the system has had some uninterrupted past history. These basic considerations would enable one to resolve some apparent contradictions described in current literatures. (Author)

A STATIONARY GIBBSIAN ENSEMBLE, by Walter Louis Sadowski. Rept. on Contract AF 49(638)461. July 60, 54p. 8 refs. AFOSR-TN-60-824.
Order from LC mi$3.60, ph$9.30 PB 149 885

The Bergmann-Lebowitz equation is derived by integrating the Liouville equation over domains of collision of system particles with those of the reservoir. On the basis of a specific physical model the stationary non-equilibrium distribution function is investigated. The kernel of the non-equilibrium problem is expanded in a power series of the temperature difference across the system. The expansion obtained contains the temperatures of the two reservoirs in the zeroth-order of the distribution function. The resulting zeroth-order distribution function contains numerical factors which make it slightly different from the equilibrium distribution. The physical significance of these factors is discussed. A specific property of the perturbative kernel is used to find the approximate solution to the first-order perturbative equation. The one-particle distribution function in μ-space is obtained by integrating the first-order n-particle distribution function.

THE EFFECTS OF A PLASMA SHEATH ON THE IMPEDANCE PROPERTIES OF SOME SLOT ANTENNAS. PART I. ANALYTICAL FORMULATION, by Sylven Cutler. Scientific rept. no. 1 on Contract AF 19(604)4574, SA no. 1. Dec 59, 32p. 12 refs. TRG-127-SR-1; AFCRC-TN-59-993; AD-234 593.
Order from LC mi$3.00, ph$6.30 PB 147 885

The impedance properties of a slot antenna radiating into a plasma layer in space are obtained by determining the equivalent admittance of a slot radiating into a layer of complex refractive index. The equations are derived which give the equivalent admittance for a simplified problem whose solution can be used to obtain the impedance properties for practical antennas. The simplified problem consists of a single slot formed by the open end of a waveguide radiating into the layer of complex refractive index in a planar half space. The admittance is given in a variational expression in terms of the slot field. (Author)

THE CONFORMAL INVARIANCE IN QUANTUM FIELD THEORY, by J. Wess. Scientific note no. 6 on Contract AF 61(052)265. 20 June 60, 26p. 8 refs. AFOSR-TN-60-1003.
Order from LC mi$2.70, ph$4.80 PB 150 358

The properties of a conformal invariant quantum field theory are considered. A short discussion of the conformal group in four dimensions and of the topology, introduced into the pseudo-euclidean space by this group, is given. With the help of the commutation relations the spectrum of the generators in the Hilbert-space is investigated. The only possible discrete eigenvalue of P^2 and of the P^ν's is zero and the generator for scale transformations S has a continuous spectrum. The eigenfunctions of S in the x-representation are calculated; they form a complete set. The conservation laws valid in an invariant theory and the commutation relations predict a certain form of the conserved quantities expressed in terms of the energy-momentum tensor and

of the coordinates. For scalar, spinor and vector fields the generators are derived by the action principle of Schwinger. (Author).

MANY BODY PERTURBATION METHODS IN SOLUBLE MODEL, by Amnon Katz. Technical note. no. 2 on Contract AF 61(052)337. 1 Mar 60, 54p. 18 refs. AFOSR-TN-60-802.
Order from LC mi$3.60, ph$9.30 PB 150 041

It is pointed out that because statistics should not be obeyed in Goldstone's perturbation expansion there exist two-body contributions from diagrams other than ladders. The role of diagrams with "wrong" statistics is investigated in a model in which the perturbation is a single particle potential. A summation of all diagrams is carried out in this model and compared to the sum of all ladders. It is found that the "wrong statistics" contributions are important in deciding the region of convergence of the series and the location and nature of the singularities which limit it. In the case of two-body interactions with short range and low density the most important contributions with wrong statistics are the two-body contributions of "many body diagrams". Their inclusion is equivalent to using the Cooper type solution of a Bethe Goldstone equation.

COLLISION INTEGRALS FOR SPHERICALLY SYMMETRIC MOLECULES INTERACTING WITH AN EXPONENTIAL REPULSIVE POTENTIAL, by Louis Monchick. Rept. on Contract NOrd-7386. July 59, 26p. 13 refs. CM-956; AD-225 995.
Order from LC mi$2.40, ph$7.80 PB 149 619

The exponential potential function $A e^{-r/\rho}$ is regarded as the true qualitative form of the repulsive intermolecular potential at moderately small internuclear distances (or equivalently, high temperatures). Because of the increasing interest in gases at high temperatures it has become desirable to be able to evaluate the transport properties under these conditions. The calculation of integrals related to the usual collision integrals $\Omega(l,s)$ and cross-sections Q(l) was carried out for the exponential repulsive potential. Some high temperature viscosities were calculated and compared to the calculated results of Amdur and Mason (The Physics of Fluids 1:370-383, Sept. -Oct. 1958), which are based on an experimental scattering potential. PERFORMANCE OF A D-C ARC-EXCITED PLASMA GENERATOR, by W. K. McGregor, J. J. Ehrlich, and M. T. Dooley. Rept. on ARO, Inc. Contract AF 40(600)800S/A 11(60-110). Aug 60, 47p. 4 refs. AEDC-TN-60-112.
Order from LC mi$3.30, ph$7.80 PB 149 976

A direct-current, arc-excited plasma generator, designed and fabricated at the Rocket Test Facility, Arnold Engineering Development Center is described. The voltage vs current relationship at different pressures is examined in the light of previous work on simple enclosed arcs. Also an energy balance is presented from which the enthalpy increase of the gas and the energy conversion efficiency is determined. For this generator the arc voltage ranged from 30 to 100 volts, the current ranged from 60 to 1000 amperes, and the chamber pressure was adjusted between 1.1 and 2.4 atmospheres. Power inputs of from 2 to 60 kw to 0.0025 to 0.01 kg sec of argon produced enthalpy rises of from 50 to 1000 kcal/kgm with efficiencies in the range of 65 to 90 percent. Data are reported for both argon and helium used as the working gas. A study of gas contamination due to electrode erosion is also presented; the percentage by weight of contamination at normal operating conditions is shown to be less than 0.05 percent using tungsten and carbon electrodes and 0.003 percent using tungsten and copper electrodes. THERMODYNAMIC AND ELECTRICAL PROPERTIES OF MERCURY VAPOR AT PRESSURES BELOW ATMOSPHERIC AND HIGH TEMPERATURES, by A. Sherman and F. Martinek. Technical note for 1 Feb 59-28 Feb 60 on High Temperature Heat Transfer to Tubes and Nozzles, Contract AF 49(638)243. 1960, 43p. 16 refs. AFOSR-TN-60-657.
Order from LC mi$3.30, ph$7.80 PB 149 815

The thermodynamic properties of mercury vapor have been calculated for temperatures up to 15,000 °K and pressures between 1 and 10^{-4} atmospheres. The first ionization is shown to be essentially complete at 15,000 °K. At the lower pressures the ionization is completed earlier. Corrections have been included to account for the lowering ionization potential and the finite limit of the electronic term series. The largest corrections occur at the higher pressures; the correction at 10^{-4} atmospheres being negligible. For example, the temperature required to give 95% degree of ionization at one atmosphere is corrected by approximately 2%. (Author)

HEAT TRANSFER TO SUPERCRITICAL FREON-12, by J. V. Del Bene and J. P. Barger. Technical rept. no. 2 on Contract Nonr-1841(14). Oct 59, 87p. 6 refs. AD-230 557.
Order from LC mi$4.80, ph$13.80 PB 149 512

The experimental results support data for heat transfer to supercritical water obtained by N. L. Dickinson and C. P. Welch [Trans Am Soc Mech Engrs 80:746-752, 1958]. Both data show a peaking of the local heat transfer coefficient when plotted against wall temperature. Since the theoretical analyses do not predict this behavior, it appears as though these analyses have not simulated the correct physics of the flow and heat transfer mechanisms. Further, the experimental results show that heat transfer to supercritical fluids is extremely complex. The report outlines a procedure for analyzing new data to obtain a better understanding of the phenomena occurring in supercritical heat transfer. The investigation brings to light the problem of decomposition of Freon-12 at high pressures and temperatures. However, it also shows by carefully planning runs, rematching certain "master" runs, and frequently examining the test-section for cleanliness, that Freon-12 can definitely be used to obtain experimental data. Evidence is also given as regards a variation in the critical point of Freon-12 from one bottle of fluid to another. Finally, the details for constructing a detailed pressure-enthalpy diagram for supercritical Freon-12 are presented. (Author)

North American Aviation, Los Angeles, Calif.
DESIGN, CONSTRUCTION, AND TEST OF AN ABSORPTION-EMISSION PYROMETER. 31 July 47, rev. 11 Sep 47. 30p. 1 ref. Rept. no. AL-248.
Order from LC mi$2.70, ph$4.80 PB 152 013

This report released for sale to the public 11 Oct 60.

Experimental data on the instrument is included. The results of comparison tests between the Absorption-Emission Pyrometer and sodium D-line equipment have been taken as evidence of the correctness of the theory underlying the operation of the former. It has proven satisfactory for measuring the temperature of acetylene flames.

[Space Sciences Lab., General Electric Co., Philadelphia, Pa.]
ON THE APPROXIMATE SOLUTION TO THE PROBLEM OF AERODYNAMIC SURFACE MELTING OF A MATERIAL OF LARGE PRANDTL NUMBER, by George W. Sutton. Rept. on Contract AF 04(645)24. 8 Aug 58, 8p. 2 refs. Aerophysics Operation Research Memo. no. 17.
Order from LC mi$1.80, ph$1.80 PB 150 043

The approximate solution may be used only for order of magnitude estimates, since it underestimates the rate of vaporization, and overestimates the energy absorbtion capacity of the melting material.

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
SOME UNEXPECTED RESULTS OF SHOCK-HEATING XENON, by Per Gloersen. Rept. on Contract AF 04(647)269. 26 Apr 60, 56p. 29 refs. Technical Information Series R60SD364.
Order from LC mi$3.60, ph$9.30 PB 148 654

Results from a detailed experimental study of the structure of pressure-driven, incident shock waves in very pure xenon contained in a thoroughly pumped Pyrex shock tube are presented and discussed. As a result of some optical measurements, the following features of the luminosity delay time were discovered: independence of the pressure in the undisturbed xenon in the range 0.75 to 4.0 mm of Hg, dependence on shock velocity in a way not explainable on the basis of reasonable volume processes alone, and dependence on shock tube diameter.

Stanford U., Calif.
TEMPERATURE STRESSES IN SHELLS CAUSED BY LOCAL HEATING, by W. Flügge and G. E. Strickland, Jr. Rept. on Contract Nonr-225(16). 15 June 59, 88p. 15 refs. Div. of Engineering Mechanics Technical rept. no. 118; AD-228 391.

VISCOSITY OF TWO COMPONENT GASEOUS MIXTURES, by Joseph O. Hirschfelder, Marion H. Taylor, and Taro Kihara. Rept. on Contract DA 11-022-ORD-2526. 8 July 60, 18p. 9 refs. WIS-OOR-29; OOR rept. no. 1898.11-C.
Order from LC mi$2.40, ph$3.30 PB 150 411

The conditions are found where the viscosity of a binary mixture of dilute gases either has a maximum or a minimum with respect to variations in the composition. A maximum in the viscosity is most likely to occur for a mixture of a polar and non-polar gas in which the viscosities of the pure components are nearly equal and their molecular weights are quite different. A minimum should occur for a mixture of two non-polar gases in which both the viscosities and molecular weights of the pure components are nearly equal. There are many experimental examples of maxima in the viscosity but up to the present time no cases have been discovered where the viscosity has a minimum. The maximum value of the viscosity and the mole fraction at which it occurs can be used to determine the energy of interaction between unlike molecules. (Author).

BISTATIC REFLECTION CHARACTERISTICS. Final engineering rept. for 1 May 58-31 Oct 59 on Contract AF 19(604)3501. 1 Nov 59, 14p. 5 refs. Rept. 827-7; AFCRC TR-60-116; AD-234 488.
Order from LC mi$2.40, ph$3.30 PB 149 282

Unclassified research is summarized on work performed on the bistatic radar reflection characteristics of simple shapes. Several analytical methods for approximating the echo area were investigated. An echo-measuring system operating from 8.3 to 12.8 kmc in an anechoic chamber was employed for measurements of bistatic radar cross section. A lens-corrected transmitting horn was designed to permit measurements to be taken at close range while maintaining proper illumination of small scatterers. Measurements at any bistatic angle from 0° to 150° can be made as a continuous function of aspect. A method was developed for accurate measurement of relative echo signal phase by comparison with the phase of a nulling signal used to balance the system. Bistatic echo patterns of simple shape such as spheroids, cones, hemispheres, and combinations of these were measured in the principal scattering planes. All measurements were calibrated by comparison with standard spheres, whose echo areas as a function of bistatic angle can be calculated. A pictorial representation is given of the bistatic cross section of small spheres relative to their geometrical cross section for ka (circumference in wavelengths) from 0.8 to 2.9. (Author)

VOLUME DENSITY OF RADIO ECHOES FROM METEOR TRAILS, by N. Carrara, P. F. Checcacci and others. Technical note no. 3 on Contract AF 61(052)227. Oct 59, 24p. 12 refs. AFCRC-TN-60-150; AD-234 545.
Order from LC mi$2.70, ph$4.80 PB 147 886

The volume density of radio echoes from meteor trails has been evaluated by taking into account not only the orientation of the trails, but also the meteor evaporation process and the characteristics of the transmitter-receiver system.

Columbia U. School of Engineering, New York.
RADIO STAR SCINTILLATION AND MULTIPLE SCATTERING IN THE IONOSPHERE, by Dmitri S. Bugnolo. Technical rept. T-5/D on Contract AF 49(638)350. 1 Apr 60, 42p. 10 refs. CU-12-60-AF-350-EE; AFOSR-TN-60-451; AD-237 587.
Order from LC mi$3.30, ph$7.80 PB 148 067

Recent experimental evidence of radio star scintillation indicates that multiple scattering effects are of importance in the ionosphere. It is therefore of interest to apply the transport equation for the expectation of the photon density function to this problem. The solution of the transport equation is used to predict the mean squared scattering angle and corresponding size of the ionospheric irregularities as measured on the earth. The particular example discussed in detail is based on a Gallet model for turbulence in the underside of the F layer under night time conditions. However, it should be noted that the general theoretical results can be applied to any other model as well. (Author)

SURFACE WAVES ON RADIALLY INHOMOGENEOUS DIELECTRIC CYLINDERS: FORMULATION OF PROBLEM, by Arvids Vigants. Technical rept. no. 2 on Contract AF 19(604)3879. 1 June 60, 31p. 18 refs. CU-10-60-AF-3879-EE; AFCRC-TN-60-584.
Order from LC mi$3.00, ph$6.30 PB 149 807

Differential equations for Hertz potentials describing surface wave propagation in a medium with circular cylindrical symmetry and radial variation of permittivity have been derived. The equations are in the form of a system of two linear second order differential equations with variable coefficients. Series solutions of the differential equations, valid close to cut-off, have been formulated. (Author)

Cornell U. School of Electrical Engineering, Ithaca, N. Y.
REFLECTION OF RADIO WAVES FROM THE SUN. by Takeo Hatanaka. Technical rept. no. 2 on Contract Nonr-401(27). 15 Oct 59, 14p. 6 refs. Research rept. EE-450; AD-230 795.
Order from LC mi$2.40, ph$3.30 PB 149 873

The possibility of receiving a radio echo from the sun, especially at a frequency of 400 Mc/s, is discussed. Attenuation in the solar atomosphere, assuming a smooth atmosphere, is found to be so large that no echo is expected from the sun. This is in agreement with previous results where echoes at lower frequencies were predicted. Reflections from prominences and coronal condensations, and incoherent scattering from electrons are also considered, with almost negative results. (Author)

Electrical Engineering Research Lab., U. of Illinois, Urbana.
USE OF THE SMITH CHART AND OTHER GRAPHICAL CONSTRUCTIONS IN THE MAGNETO-IONIC THEORY, by G. A. Deschamps and W. L. Weeks. Scientific rept. no. 1 on Contract AF 19(606)5565. 20 Apr 60, 61p. 7 refs. AFCRC-TN-60-468.
Order from LC mi$3.90, ph$10.80 PB 150 095

The complex refractive index of a magnetoionic medium for various directions of propagation is evaluated graphically. Most of the constructions make use of a Smith Chart on which the scales have been suitably relabled. The directions considered are longitudinal, quasi-longitudinal, transverse, and quasi-transverse with respect to the applied magnetic field. The losses are taken into account. The energy transferred to the medium is characterized by conductivity coefficients that are also evaluated graphically. By using an overlay the refractive index is converted into the reflection coefficient at a plane boundary of the medium. (Author)

SOME EFFECTS OF TREES ON LOW ANGLE RADIO PROPAGATION AT A WAVELENGTH OF 10.4 CM, by A. H. LaGrone and C. W. Chapman. Rept. on Contract AF 19(604)5504. 15 July 60, 32p. 4 refs. Rept. no. 6-36; ERD-TN-60-766.
Order from LC mi$3.00, ph$6.30 PB 149 977

Results are reported of measurements made at very low angles of 2, 880 mcps signals over wooded areas with the elevation angle to the transmitter the principal variable. A narrow beam receiving antenna was used to observe the effect of the trees on the apparent location of the signal source. Various measurements were made on the effects of a single large tree on the signal. A hypothetical direction finding system was assumed and its pointing characteristics determined. Theoretical curves were computed and were presented to assist in the evaluation of sights selected for low angle direction finding systems. (Author)

THE VIRTUAL MASS OF A FINITE CONICAL SHELL, by Ellis J. Rich and Samuel N. Karp. Rept. on Contract AF 19(604)5238. May 60, 17p. 5 refs. Research rept. no. EM-158; AFCRC-TN-60-393.
Order from LC mi$2.40, ph$3.30 PB 150 055

The purpose of this paper is to obtain a solution of a hitherto unsolved problem in fluid flow, particularly, in the way a finite conical shell affects the flow of fluid in which the direction of travel at infinity is parallel to the axis of the cone. The solution has applications not only in fluid dynamics but also in the calculation of the scattering of an electromagnetic wave by such a cone at low frequency, the latter being of current technological interest. The principal results obtained are a formula for the dipole coefficient at infinity, and for a related quantity, the virtual mass, in terms of the cone angle. A subsidiary result is the expression of the velocity potential at all points of space. (Author)

Navy Electronics Lab., San Diego, Calif.
ATMOSPHERIC REFRACTION ERROR IN RADAR ELEVATION ANGLES, by W. F. Moler and E. E. Gossard. Rept. for 1 July 56-1 May 57. 12 July 57, 24p. 4 refs. Research rept. no. 795; AD-205 222.
Order from LC mi$2.70, ph$4.80 PB 147 572

The theory of radar range and angular tracking errors for high elevation angles is reviewed. Several modifications of the theory, for use in practical applications, are introduced. It is shown that the surface refractive index can be used to predict angular error for targets above 10^5 feet for ground-sited radars. Radiosonde data from five arctic stations were analyzed in terms of frequency distribution of angular error by seasons. Radiosonde data previously analyzed by the Air Defense Command Forecast Center were used to obtain approximate frequency distributions of angular error for stations along the northern border of the United States. Surface weather observations taken hourly from three arctic stations were

analyzed to determine the period and magnitude of angular error changes for periods shorter than those which could be analyzed from the radiosonde data. (Author)

A MAGNETICALLY INSULATED SHOCK TUBE, by Richard G. Fowler and Eugene B. Turner. Rept. on Contract AF 04(647)309. [1959] 48p. 7 refs. STL/TR-60-0000-09180.
Order from LC mi$3.30, ph$7.80 PB 149 762

This report describes experimental results obtained with a magnetically insulated shock tube. The one-inch diameter tube is enclosed by a solenoid field coil which produces a longitudinal magnetic field of up to 20,000 Gauss throughout both the electrical discharge and expansion chambers. Peak currents of up to 95,000 amperes are produced in the discharge tube by a 50 μf capacitor bank charged up to about 8 kv. The electrical characteristics of the discharge were determined from voltage and current signals. The magnetic field was found to substantially reduce the attenuation of the shock wave moving down the tube, presumably by a reduction of the boundary layer thickness behind the shock wave. With a magnetic field strength of 7500 Gauss and higher, a contact surface, such as occurs in diaphragm type shock tubes, is clearly defined in the wave speed pictures, while at zero and low magnetic field strengths the contact surface is not visible. There was evidence from the reflected shock velocities and from the convex shape of the shock front that the magnetic field was inhibiting the degrees of freedom perpendicular to the field lines resulting in a gas with a higher effective γ. (Author)

A RAPID BEAM-SWINGING EXPERIMENTIN TRANS-HORIZON PROPAGATION, by A. T. Waterman, Jr. Rept. on Contract DA 36-039-sc-73151. 23 July 58, 10p. 9 refs. Technical rept. no. 770-1; AD-203 173.
Order from LC mi$1.80, ph$1.80 PB 149 404

By using a broadside phased array for an antenna, a narrow beam can be swung, rapidly and in quick succession through a limited sector by fast control of the phasing, rather than by movement of the entire antenna structure. This technique is used at the receiving end of a 101-mile beyond-the-horizon transmission path in order to probe the portion of the troposphere through which the signal is propagated. At the frequency employed of 3.12kMc, a 0.49^{o} beam is swung in azimuth through a 4.2^{o} sector each tenth of a second. A variety of phenomena are observed with this technique which have not been directly apparent in slower beam-swinging experiments.

Stanford Electronics Labs., Stanford U., Calif.
SOME PROPERTIES OF RADIO WAVES REFLECTED FROM THE MOON AND THEIR RELATION TO THE LUNAR SURFACE, by Tor Hagfors. Scientific rept. no. 8 on Contract AF 19(604)2193. 8 Aug 60, 30p. 12 refs.
Order from LC mi$2.70, ph$4.80 PB 150 239

This report presents a theoretical discussion of the statistical properties of radio waves reflected from the moon. This discussion is based on the assumption of a large number of scattering areas simultaneously contributing to the signal. The properties of the echoes are usually described in terms of pulse broadening or by means of an average-power pulse-response when very short pulses are transmitted. Here it is shown that the same type of information may be obtained by studying the correlation of complex amplitudes of two sine waves reflected from the moon at frequencies separated by $\Delta\omega$. By studying this correlation as a function of $\Delta\omega$ it is possible to compute the power pulse response of the earth-moon-earth propagation circuit. It is suggusted that this method will prove particularly useful in the study of the surface properties of distant targets such as the planets of our solar system. It is also shown how the correlation technique can be extended to a two-dimensional mapping of a rotating rough body. (Author).

Stanford Electronics Labs., Stanford U., Calif.
THE USE OF NOSE WHISTLERS IN THE STUDY OF THE OUTER IONOSPHERE, by R. L. Smith, Technical rept. no. 6 on Contract AF 18(603)126. 11 July 60, 127p. 85 refs. AFOSR-TN-60-861.
Order from LC mi$6.30, ph$19.80 PB 149 752

Electromagnetic energy at very low frequencies can be propagated from one hemisphere to the other along the earth's magnetic field lines in the outer ionosphere. The action of free electrons disperses the original impulse-like signal (from a lightning discharge) to form descending gliding tones, called whistlers. If the highest frequency of the whistler is comparable with the minimum electron gyrofrequency along the propagation path, the dispersion at the higher frequencies causes rising tones which are contiguous with the descending tones at the lower frequencies. The whistler is then called a "nose" whistler. Spectrographic analysis of whistlers and nose whistlers often reveals a number of pure isolated components which have a common source. Examination of whistler data and a new theory of the propagation path lead to the conclusion that each component represents energy from the lightning source which has been trapped in a field-aligned column of enhanced ionization in the outer ionosphere. The data indicate that the lifetime of these columns is a few hours. The theory suggests that enhancements of approximately five per cent are sufficient to explain the observed whistlers. The theory further indicates that the average group velocity of energy trapped in a column can be closely approximated by assuming that the energy travels along the maximum of ionization in the column with wave normals aligned with the magnetic field. The frequency of minimum time delay, called the nose frequency, indicates the location of the field line path. The minimum time delay gives a measure of the ionization density in the region near the top of the path. Examination of nose whistler data from a number of stations leads to a model of electron density in the outer ionosphere. The data also show an annual variation of 2:1 in the ionization density during sunspot maximum. (Author).

RESEARCH METHODS, TECHNIQUES AND EQUIPMENT

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
MARK I PERCEPTRON OPERATORS' MANUAL, by John C. Hay, Ben E. Lynch and others. Rept. on Proj. PARA, Contract Nonr-2381(00). 15 Feb 60, 62p. 6 refs. Rept. no. VG-1196-G-5; AD-236 965.
Order from OTS $1.75 PB 161 997

This report released for sale to the public 16 Sep 60 (USGRR, v. 34, p. 350)

The Mark I Perceptron is a pattern learning and recognition device. It is intended as an experimental tool for the direct study of a limited class of perceptrons. This manual is intended primarily as a guide to the setting up and operation of the machine. It does not require extensive familiarity with the theory of perceptron systems. For those familiar with the theory, but not necessarily concerned with actually operating the machine, the manual should serve to indicate the machine's potentialities as a research instrument.

ON THE CONVERGENCE OF REINFORCEMENT PROCEDURES IN SIMPLE PERCEPTRONS, by Frank Rosenblatt. Rept. on Project PARA, Contract Nonr-2381(00). 15 Feb 60, 72p. 9 refs. Rept. no. VG-1196-G-4 and amendments 1, 2; AD-234 874.
Order from OTS $2.00 PB 161 996

This report released for sale to the public 16 Sep 60, (USGRR, v. 34, p. 350)

Previous reports have described a number of theoretical nerve nets called perceptrons, and have attempted to analyze their ability to associate responses to stimuli using a variety of training procedures and memory functions. Proofs have been found for a number of theorems of fundamental importance for the theory of such networks. The main findings are summarized: (1) there exist certain simple memory functions and training procedures by which it can be guaranteed that a perceptron will ultimately arrive at a solution to any given response-association problem; (2) a variety of problems are shown to be soluble; (3) the same procedures which yield solutions for binary classification problems can be employed to assign arbitrary response functions to stimuli; and (4) a considerable variety of perceptron models, differing from one another in the transfer functions of their association units, are shown to be identical with respect to their ability to arrive at solutions to learning problems. Included are amendment 1 (Technical memo. no. 12, AD-236 736), and amendment 2, Improved Error Correction Procedure, (Technical memo. no. 13).

Institute for the Study of Metals, U. of Chicago, Ill.
HIGH PRESSURE RESEARCH, SERIES II. Annual rept. no. 3, Series 2, Oct 58-Oct 59, on Contract Nonr-2121(03). [1959] 87p. 103 refs.
Order from LC mi$4.80, ph$13.80 PB 149 485

Contents:
On the dynamical theory of diffusion in crystals. III. Some model calculations and relation to continuum theory
Preliminary experiment on the quenching of lattice defects in noble metals under hydrostatic pressure up to 8500 bars
Diffusion measurements under pressure in the temperature range 800-1000°C
Internal friction in iron at low temperatures
The formation of an amorphous form of quartz under shock conditions
A note on the behavior of iron under static high pressures
Diffusion of cadmium in pure and cadmium doped AgBr
The relation between the Eyring and Doolittle diffusion equations
The effect of pressure on self-diffusion in lead
A new device for obtaining X-ray diffraction patterns from substances exposed to high pressure
A high-pressure microwave window
Diffusion of impurities in amorphous polymers
(See also PB 143 063)

Institute of Mathematical Sciences, New York U., N. Y.
TOPICS IN THE THEORY OF DISCRETE INFORMATION CHANNELS, by Richard A. Silverman and Sze-Hou Chang. Rept. on Contracts AF 19(604)5238 and AF 19(604)3053. Apr 60, 45p. 17 refs. Research rept. no. EM-152; AFCRC-TN-60-366.
Order from LC mi$3.30, ph$7.80 PB 150 034

The present article discusses various topics in the theory of discrete information channels, including the general binary channel, channels with fading, cascaded channels, and channels with memory. (Author)

Statistical Techniques Research Group, Princeton U., N. J.
AUTOCORRELATION ANALYSIS AND THE DESIGN OF EXPERIMENTS, by G. M. Jenkins and J. Chanmugam. Technical rept. no. 37 on Contract DA 36-034-ORD-2297. June 60, 76p. 26 refs. OOR rept. no. 1715:34; AD-239 911.
Order from LC mi$4.50, ph$12.30 PB 150 403

These are many examples in industry and in the sciences of situations where the uncontrolled variation in the observed responses is subject to autocorrelation when the independent variables are kept constant. The present work is concerned with the investigation into the effect of this autocorrelation on the strategy of experimentation.

Communication Theory

Applied Mathematics and Statistics Labs., Stanford U., Calif.
SPECTRAL ANALYSIS OF A PROCESS OF RANDOMLY DELAYED PULSES, by M. V. Johns, Jr. Technical rept. no. 51 on Contract N6onr-25140. 10 Oct 59, 15p. 5 refs.
Order from LC mi$2.40, ph$3.30 PB 149 944

The purpose of this report is to obtain formulae for the covariance and asymptotic spectral distribution functions of a process consisting of a sequence of pulses separated by random time delays.

Ohio State U. Research Foundation, Columbus.
ORTHOGRAPHIC REPRESENTATIONS OF ENGLISH PRONUNCIATION AS AN AID IN TEACHING ILA, by Henry M. Moser, Herbert J. Oyer, and Wallace C. Fotheringham. Technical rept. no. 56 on Contract AF 19(604)4575. Dec 59, 110p. AFCRC-TN-59-75.
Order from LC mi$5.70, ph$16.80 PB 150 248

Specially devised orthographies in Chinese, Dutch, French, German, Italian, Japanese, Korean, Spanish, and Thai were constructed for a list of common English aviation words as an aid to their pronunciation by foreign nationals. Those prepared for German, Japanese, and Spanish were employed with native speakers of these three languages at the AF Language School, Lackland AFB, Texas. It was found that for each of these three groups, the specially designed orthographies, with or without the additional aid of auditory stimulation, resulted in significantly more intelligible pronunciations than the reading of these aviation words from only a printed list. Additionally, each individual speaker in this study improved the intelligibility of his pronunciations when aided by the appropriate orthography. The comparative value of orthography alone vs. orthography plus auditory stimulation varies considerably among language groups. The average improvement would make a distinguishable difference in the air traffic communication setting. (Author)

Photographic Equipment

Ballistic Research Labs., Aberdeen Proving Ground, Md.
BALLISTIC CAMERA (BC-4) SYNCHRONIZATION SYSTEM, by Ralph E. A. Putnam. May 60, 37p. 2 refs. Rept. no. 1108; AD-240 010.
Order from LC mi$3.00, ph$6.30 PB 149 765

Prospects for utilizing ballistic cameras in precision tracking of missiles and satellites, as well as in geodetic work, have been enhanced by the development of a high precision camera (Wild BC-4) with optical properties suitable for these applications. While these cameras have proved useful in night-time tracking of targets carrying short duration flashing lamps, full utilization of their potential capabilities has been restricted by lack of means to synchronize exposures of widely spaced cameras to the high degree of accuracy necessary. This report describes a synchronization system developed for these cameras, and presents test data on a laboratory setup of the essential system elements.

Johns Hopkins U., Baltimore, Md.
INCREASED FIELD DEPTH IN TRACK PHOTOGRAPHY BY MEANS OF SPHERICAL ABERRATION, by F. Rasetti. Rept. on Contract AF 18(603)143. May 60, 5p. AFOSR-TN-60-531.
Order from LC mi$1.80, ph$1.80 PB 149 359

A considerable increase in depth of field for a given luminosity of the lens can be obtained by using a lens provided with convenient spherical aberration instead of a perfectly corrected lens.

SOCIAL SCIENCES

Documentation

Center for Documentation and Communication Research, Western Reserve U., Cleveland, Ohio.
TEST PROGRAM FOR EVALUATING PROCEDURES FOR THE EXPLOITATION OF LITERATURE OF INTEREST TO METALLURGIST. II. ACQUISITION OF DOCUMENTS FOR MACHINE SEARCHING, by Allen Kent, Alan M. Rees and Jessica Melton. Rept. on National Science Foundation Grant NSF-G-10338. [1960] 47p.
Order from LC mi$3.30, ph$7.80 PB 149 845

In order to permit a significant test, it was necessary first to expand substantially the subject coverage of the service to provide literature of interest to metallurgists. The activity involved in this preparatory program include identification and acquisition of documents of potential interest.

Center for Documentation and Communication Research, Western Reserve U., Cleveland, Ohio.
TEST PROGRAM FOR EVALUATING PROCEDURES FOR THE EXPLOITATION OF LITERATURE OF INTEREST TO METALLURGISTS, III, ANALYSIS AND QUALITY CONTROL, by Allen Kent, Jessica Melton, and Alan M. Rees. Rept. on National Science Foundation Grant NSF-G-10338. [1960] 54p 4 refs.
Order from LC mi$3.60, ph$9.30 PB 150 260

In two earlier reports, there were described the background and plans and the acquisitions program of the ASM mechanized searching service which is to be evaluated. The present report covers the procedures for analysis and quality control of abstracts of documents included in this service, and discusses the alterations in procedures that have been necessitated by the expansion of the service to fields allied to, but outside of the core of metallurgy. (Author).

Michelson Labs., Naval Ordnance Test Station, China Lake, Calif.
WRITING THE TECHNICAL ARTICLE: A MATTER OF DESIGN, by Gerard A. Pottebaum. July 60, 12p. 6 refs. Technical Article 6; NOTS TP-2432.
Order from LC mi$2.40, ph$3.30 PB 150 169

This article discusses some fundamental practices that apply in both fiction and exposition. The design of the formal report is briefly reviewed, the design of the article is analyzed, and the two are compared. (Author)

Office of Scientific Research and Development.
MICROFILM INDEX. 1946, declassified 24 Aug 60. 770p. 18000 refs.
Order from OTS $8.00 ($10.00 foreign) PB 161 976

This volume is an index of the technical laboratory and field reports and other reference material which appeared in the bibliographies for the Summary Technical Reports of NDRC. It is divided into three separate sections: (1) a microfilm index and bibliographical listing of reports for each division, panel, and committee; (2) a cross reference composed of microfilm index headings and items culled from information contained in the report titles; and (3) a microfilm reel catalogue.

Zator Co., Cambridge, Mass.
SOME MATHEMATICAL FUNDAMENTALS OF THE USE OF SYMBOLS IN INFORMATION RETRIEVAL, by Calvin N. Mooers. Rept. on Contract AF 30(602)1900 Apr 59, 22p. 10 refs. ZTB-123; RADC-TN-59-133; AD-213 782.
Order from LC mi$2.70, ph$4.80 PB 147 541

A mathematical model and formalism is presented for the process of gaining information through observation, reporting the information, and retrieving it. The model makes use of observational operators H acting upon a hypothetical space of events $\{e\}$. A digital representation of the events and operators is introduced and a formalism of their interaction is developed. The action of the operators H on $\{e\}$ is shown to produce open sets. In terms of the open sets, the possibility of achieving smoothness or continuity in the transformation from the imagined event p prescribing retrieval to the retrieved information is developed. A number of theorems result.

REPORT OF NRL PROGRESS. Nov 60.
Order from OTS $1.25, $10.00/year PB 161 287

Contents:
Articles:
Multichannel, Multicolor Oscilloscope, by S. H. Hersh
Summary of Rocket Astronomy and Astrophysics Research at NRL (March 1959-October 1960), Staff Written
Scientific program:
Atmosphere and Astrophysics: Measurement of water vapor distribution in the stratosphere
Chemistry: Radiant transfer of heat and the thermal conductivity of "flinak". Anodic oxidation of the Ag-Ag_2O electrode in alkaline solutions. Isothermal study of the concentration and transport of radioactive steel components in liquid lithium. Removal of organic contaminants from the atmosphere of a submarine by a sodium zeolite (Type 13X molecular sieve)
Mechanics: Effect of chamfered bolt holes on bolts in shear under dynamic load. Dynamics of the lower yield strength of mild steel. Thermoelectric power of indium-lead alloys
Metallurgy and Ceramics: Validity of a cyclic heating-cooling method of measuring the electronic specific heat of nickel-palladium alloys. New method for analyzing small, metallic, irradiated specimens. Thermodynamic analysis of solubility in liquid metal systems
Optics: Photometry at low levels of intensity. A closed-circuit TV system for passive use at night
Radio: Ocean wave-profiling radar system. Electrical breakdown in high vacuum (electron tubes)
Solid-State Physics: Variation of effective mass ratio with magnetic field for InAs at room temperature. Model for describing the effect of pressure on the absorption and emission spectra of alkali halide phosphors
Sound: Digital amplitude probability distribution analyzer. Effect of hydrostatic pressure on ten groups of electrical and electronic components to be used in oceanographic experiments

ATOMIC ENERGY COMMISSION REPORTS

Reports may be purchased in accordance with instructions on the inside front cover of the U. S. GOVERNMENT RESEARCH REPORTS. As PB numbers are not indicated, order by series and number. These reports may also be consulted at any AEC Depository Library. A list of these libraries may be obtained from the U. S. Department of Commerce, Office of Technical Services, Washington 25, D. C.

Reproduction in whole or part of any report listed herein is encouraged by the U. S. Atomic Energy Commission, subject to the approval of authors or originating sites. General inquiries from the industrial press about AEC-developed information should be directed to the Industrial Information Branch, Atomic Energy Commission, Washington 25, D. C.

General

Report number series. Used by the Office of Technical Information in Cataloging Reports. Report number system, by F. E. Stratton. Office of Technical Information Extension, Oak Ridge, Tenn. Aug 60. 23p. Order from OTS. 50 cents. TID-85 (2nd Rev., Suppl.)

Biology and Medicine

Description of facilities and mechanical components medical research reactor (MRR), by J. B. Godel. Brookhaven National Laboratory, Upton, New York. Feb 60. 64p. Order from OTS. $1.75. BNL-600 (T-173)

Biological effects of Sr^{90} in miniature swine. I. Experimental designs and preliminary observations, by W. J. Clarke and J. R. McKenney.. Hanford Atomic Products Operation, Richland, Wash. Jan 60. Contract AT(45-1)-1350. 10p. Order from OTS. 50 cents. HW-63499

Literature search on the relative biological effectiveness (RBE) of ionizing radiations, by W. H. Langham, and others. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Mar 60. Contract W-7405-ENG-36. 251p. Order from OTS. $3.50. LAMS-2343

Biology and Medicine semiannual report for October 1959 through March 1960, by J. H. Lawrence and A. Pfau. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 210p. Order from OTS. $3.00. UCRL-9235

Relation of adrenal cortical volume to survival following x-irradiation, by A. P. Casarett and F. T. Brayer. The University of Rochester, Rochester, N. Y. June 60. Contract W-7401-eng-49. 31p. Order from OTS. 75 cents. UR-574

Chemistry—General

Analysis of yttrium metal and yttrium oxide (No. 3 of a Series), by J. O. Hibbits and others. General Electric Co., Aircraft Nuclear Propulsion Department, Cincinnati 15, Ohio. July.60. Contracts AT(11-1)-171 and AF 33(600)-38062. 15p. Order from OTS. 50 cents. APEX-571

Measuring the release of short-lived fission gases during capsule irradiations, by C. W. Townley and other. Battelle Memorial Institute, Columbus, Ohio. Sep 60. Contract W-7405-eng-92. 9p. Order from OTS. 50 cents. BMI-1466

X-ray spectrographic determination of potassium, uranium, and thorium in pyrochemical samples, by M. C. Lambert. Hanford Atomic Products Operation, Richland, Wash. June 60. Contract AT(45-1)-1350. 23p. Order from OTS. 75 cents. HW-65801

A high-temperature vacuum extensometer, by J. R. Bohn and G. Murphy. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. July 60. Contract W-7405-eng-82. 24p. Order from OTS. 50 cents. IS-167

Performance characteristics of an electromagnetic pump, by D. H. Thompson and R. W. Fisher. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. Aug 60. Contract W-7405-eng-82. 49p. Order from OTS. $1.25. IS-188

The heats of fusion of the cadmium halides, mercuric chloride, and bismuth bromide, by L. E. Topol and L. D. Ransom. Atomics International A Division of North American Aviation, Inc., Canoga Park, Calif. Sep 60. Contract AT(11-1)-GEN-8. 7p. Order from OTS. 50 cents. NAA-SR-5111

A vibrational potential function for symmetrically substituted biphenyls, by R. H. Shudde and G. W. Lehman. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 19p. Order from OTS. 50 cents. NAA-SR-5153

Thermal decomposition of uranyl sulfate, by K. J. Notz, Jr. National Lead Company of Ohio, Technical Division, Cincinnati, Ohio. Mar 60. Con-AT(30-1)-1156. 48p. Order form OTS. $1.25. NLCO-814

Dichlorobenzidine as a curing agent for adiprene L-100, by A. J. Quant. Sandia Corporation, Albuquerque, N. Mex. Sep 60. 14p. Order from OTS. 50 cents. SCR-187

Master Analytical Manual. Oak Ridge National Laboratory, Oak Ridge, Tenn. May 60. 612p. Order from OTS. $6.75. TID-7015 (Suppl. 2)

Micro determination of carbon in metals, by J. W. Frazer and R. T. Holzmann. University of California, Lawrence Radiation Laboratory, Livermore, Calif. June 60. Contract W-7405-eng- 48. 7p. Order from OTS. 50 cents. UCRL-6020

Analysis of current distribution in electrolytic cells with flowing mercury cathodes, Thesis, by E. A. Grens II. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 78p. Order from OTS. $2.00. UCRL-9187

Fractional crystallization from melts, by W. R. Wilcox. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 239p. Order from OTS. $3.00. UCRL-9213

The electronic structure of octahedrally coordinated protactinium (IV). Thesis, by J. D. Axe. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 68p. Order from OTS. $1.75. UCRL-9293

The effect of angular momentum on fission probability. Thesis, by J. Gilmore. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 84p. Order from OTS. $2.00. UCRL-9304

The performance of base-form ion exchangers for pH control and removal of radioisotopes from a pressurized water reactor system, by G. P. simon, C. S. Abrams, and W. T. Lindsay, Jr. Westinghouse Electric Corporation, Bettis Atomic Power Laboratory, Pittsburgh, Pa. July 60. Contract AT-11-1-GEN-14. 69p. Order from OTS. $1.50. WAPD-TM-215

Air lift pumps - characteristics and application to liquid-liquid extraction systems, by J. S. Hurst. Union Carbide Nuclear Company, Division of Union Carbide Corporation, Y-12 Plant, Oak Ridge, Tenn. May 60. Contract W-7405-eng-26. 23p. Order from OTS. 50 cents. Y-1304

Chemistry—Radiation and Radiochemistry

Photoproduction of calcium-47, by M. S. Foster, D. L. Weaver and A. F. Voigt. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. Aug 60. Contract W-7405-eng-82. 16p. Order from OTS. 50 cents. IS-184

Chemistry—Separation Processes for Plutonium and Uranium

The fluorination of uranium from dried solids and its application to the fluoride volatility process, by C. E. Johnson and J. Fischer. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 19p. Order from OTS. 50 cents. ANL-6117

Reprocessing of power reactor fuels. Ninth quarterly progress report for October 1, 1959 to January 1, 1960, by L. H. Meyer and others. E. I. du Pont de Nemours & Co., Explosives Department, Atomic Energy Division, Technical Division, Savannah River Laboratory, Aiken, S. C. Mar 60. Contract AT(07-2)-1. 11p. Order from OTS. 50 cents. DP-479

Study of the feasibility of aqueous recovery of spent fuels. Part 4. Equipment design data, by R. J. Annesser and others. University of Michigan, Engineering Research Institute, Ann Arbor, Mich. July 54. Decl. August 22, 1960. 295p. Order from OTS. $1.60. ERI-2240-4-F

Study of the feasibility of aqueous recovery of spent fuels. Part 7. Analysis of costs and engineering evaluation of results of study, by J. G. Lewis and H. A. Ohlgren. University of Michigan, Engineering Research Institute, Ann Arbor, Mich. July 54. Decl. August 24, 1960. 144p. Order from OTS. 80 cents. ERI-2240-7-F

Nitric acid dissolution of uranium-aluminum alloy, by R. E. Burns and C. H. Holm. Hanford Works, Nucleonics Division, Richland, Wash. Aug 52. Decl. August 12, 1960 Contract W-31-109-Eng-52. 19p. Order from OTS. 30 cents. HW-18414

Darex pilot plant studies, by J. J. Shefcik. Hanford Atomic Products Operation, Richland, Wash. Feb 60. Contract AT(45-1)-1350. 34p. Order from OTS. $1.00. HW-64010

Yankee band cutting, by V. L. Hammond and V. P. Kelly. Hanford Atomic Products Operation, Richland, Washington. June 60. Contract AT (45-1)-1350. 20p. Order from OTS. 50 cents. HW-65380

Idaho Chemical Processing Plant technical progress report for January through March 1960, by C. M. Slansky and others. Phillips Petroleum Company, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 61p. Order from OTS. $1.50. IDO-14520

Processing of high-fired uranium dioxide fuels by a reduction--mercury extraction--oxidation process, by A. F. Messing and O. C. Dean. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-25. 13p. Order from OTS. 50 cents. ORNL-2909

Recovery of uranium from DI (2-ethylhexyl) phosphoric acid (Dapex) extractant with ammonium carbonate, by F. J. Hurst and D. J. Crouse. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 19p. Order from OTS. 50 cents. ORNL-2952

Controlled Thermonuclear Processes

Crowbar code, by D. A. Baker and L. W. Mann. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. May 60. Contract W-7405-ENG-36. 32p. Order from OTS. 75 cents. LAMS-2435

Quarterly report covering the period January 1 through March 31, 1960, by K. Bernstein and others. Project Matterhorn, Princeton University. Princeton, N. J. Sep 60. Contract AT(30-1)-1238. 32p. Order from OTS. 75 cents. MATT-Q-10

Diagnostic methods for space potentials in ion beams, by T. O. Passell. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Feb 60. Contract W-7405-eng-48. 44p. Order from OTS. $1.25. UCRL-5819-T

Electron beam pinch. Thesis by E. R. Horton and R. L. Spoerlein. University of California, Lawrence Radiation Laboratory, Livermore, Calif. June 60. Contract W-7405-eng-48. 27p. Order from OTS. $1.00. UCRL-6011

Instability of a positive column in a magnetic field, by T. K. Allen, G. A. Paulikas, and R. V. Pyle. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 22p. Order from OTS. 50 cents. UCRL-9110

Criticality Studies

Results of critical experiments in loose lattices of UO_2 rods in H_2O, by V. E. Grob and others. Westinghouse Electric Corporation, Atomic Power Department, Pittsburgh, Pa. Mar 60. Contract AT(30-1)-2176. 51p. Order from OTS. $1.50. WCAP-1412

Equipment, Methods and Techniques

Status of Sandia Laboratory hypersonic facilities, by R. C. Maydew. Sandia Corporation, Albuquerque, N. Mex. Aug 60. 15p. Order from OTS. 50 cents. SCR-230

Enclosure and sealing methods, by G. S. Wallace. Sandia Corporation, Albuquerque, N. Mex. July 60. 23p. Order from OTS. 75 cents. SCTM-184-60(25)

Capability improvement study of a tracer-controlled duplicating lathe, by E. B. Del Grande and other others. Union Carbide Nuclear Company, Y-12 Plant, Oak Ridge, Tenn. Apr 60. Contract W-7405-eng-26. 53p. Order from OTS. $1.25. Y-1297

Geology and Mineralogy

Airborne and ground reconnaissance in the Espanola area, Sante Fe County, New Mexico, by G. E. Collins and R. E. Freeland. Production Evaluation Division, , Grand Junction Operations Office, Denver, Colo. Oct 56. 16p. Order from OTS. 50 cents. RME-1075 (Rev.)

Health and Safety

Metal recovery plant radiation report for January to March, 1957, by C. D. Hylton. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 57. Decl. July 26, 1960. Contract W-7405-eng-26. 6p. Order from OTS. 25 cents. ORNL-2359

A system for automated presentation of a vigilance task and recording of subject performance, by H. E. Anderson. Sandia Corporation, Albuquerque, N. Mex. July 60. 17p. Order from OTS. 75 cents. SCTM-188-60(14)

Inspection of a fire-damaged radiation source, by P. W. Howe, J. E. Rainey, and H. F. Soule. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 11p. Order from OTS. 50 cents. UCRL-9291

Instruments

Logarithmic spiral light pipe for scintillators, by W. C. Kaiser, A. J. MacKay and W. W. Managan. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 11p. Order from OTS. 50 cents. ANL-6196

A precision current integrator, by I. T. Myers and G. T. Orton. Hanford Atomic Products Operation, Richland, Wash. Feb 60. Contract AT(45-1)-1350. 11p. Order from OTS. 50 cents. HW-65802

Revised neutron flux, spectrum, and tissue dose measurements at the Godiva II critical assembly, by J. A. Sayeg. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Sep 60. Contract W-7405-ENG-36. 23p. Order from OTS. 50 cents. LA-2432

A multichannel digital recording system, by R. W. Truitt. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Sep 60. Contract AT(11-1)-GEN-8. 21p. Order from OTS. 50 cents. NAA-SR-5354

Instrumentation and controls division semiannual progress report for period ending July 31, 1953, by C. J. Borkowski. Oak Ridge National Laboratory, Oak Ridge, Tenn. May 54. Decl. May 10. 1960. Contract W-74-5-eng-26. 33p. Order from OTS. 40 cents. ORNL-1694

A method for calculating the cutting force component parallel to the plane of motion of the cutter, by C. I. Millard. Sandia Corporation, Albuquerque, N. Mex. Aug 60. 6p. Order from OTS. 50 cents. SCDR-204-60

An investigation of long-term stability of zener voltage references, by R. P. Baker and J. Nagy, Jr. Sandia Corporation, Albuquerque, N. Mex. June 60. 21p. Order from OTS. 75 cents. SCR-194

Inertial power supplies for ballistic missile reentry vehicles, by R. J. Martin. Sandia Corporation, Albuquerque, N. Mex. July 60. 15p. Order from OTS. 50 cents. SCR-219

A method for ascertaining the effect of large targets present in terrain return signals, by D. M. Gragg. Sandia Corporation, Albuquerque, N. Mex. Sep 54. 12p. Order from OTS. 50 cents. SCTM-187-54(54)

Pulse response of terrain return program receivers, by F. J. Janza, R. A. Hessemer, Jr., and C. S. Williams, Jr. Sandia Corporation, Albuquerque, N. Mex. Sep 54. 14p. Order from OTS. 50 cents. SCTM-208-54(54)

Instrumentation application of carrier-erase magnetic-tape recording, by R. S. Reynolds. Sandia Corporation, Albu querque, N. Mex. Aug 60. 10p. Order from OTS. 50 cents. SCTM-237-60(52)

Low noise amplifiers for use with solid state detectors, by J. L. Blankenship and others. Oak Ridge National Laboratory, Union Carbide Nuclear Company, Oak Ridge, Tenn. and Office of Technical Information Extension, Oak Ridge, Tenn. Aug 60. 41p. Order from OTS. 50 cents. TID-6119

Metallurgy and Ceramics

The response of concrete shear keys to dynamic loading, by E. G. Nawy and J. M. Shah. Massachusetts Institute of Technology, Cambridge, Mass. Jan 59. Contract AT(29-2)-616. 65p. Order from LC. Mi $3.90, ph $10.80. AECU-4562

Behavior of bond under dynamic loading, by A. A. Lippins. Massachusetts Institute of Technology, Department of Civil and Sanitary Engineering, Cambridge, Mass. Sep 59. Contract AT(29-2)-616. 101p. Order from LC. Mi $5. 70, Mi $16.80. AECU-4563

Thorium bismuthide--ultrasonic control of crystal size. Aeroprojects, Inc., West Chester, Pa. Mar 59. 12p. Order from LC. Mi $2.40, ph $3.30. AECU-4605

Review of the intermetallic compounds of plutonium, by F. H. Ellinger. Los Alamos Scientific Lab., Los Alamos, N. Mex. 1959. 49p. Order from LC. Mi $3.30, ph $7.80. AECU-4629

A survey of non-fuel-bearing materials for the marine gas-cooled reactor, by J. C. Bokros, L. Dijkstra, and U. Merten. General Atomic Div., General Dynamics Corporation, San Diego, Calif. May 58. Contract AT(04-3)-187. 52p. Order from LC. Mi $3.60, ph $9.30. AECU-4692

Results of experiments made with U.S.B.M. electrocerium, by W. N. Miner. Los Alamos Scientific Laboratory, N. Mex. Feb 59. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4669

Electron diffraction study of the removal and formation in vacuo of oxide films on uranium and plutonium, by J. T. Waber, C. Olsen, and D. D. Whyte. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. 1959. 29p. Contract W-7405-eng-36. 29p. Order from LC. Mi $2.70, ph $4.80. AECU-4742

The manufacture of centrifugally cast alloy fuel slugs (Mark-II fuel loading for EBR-I), by F. L. Yaggee. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 37p. Order from OTS. $1.00. ANL-5724

Examination of irradiated EBWR Core-I fuel elements, by C. F. Reinke and R. Carlander. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 31p. Order from OTS. 75 cents. ANL-6091

The adiabatic elastic moduli of single-crystal alpha uranium at 25°C, by E. S. Fisher. Argonne National Laboratory, Argonne, Ill. June 60. Contract W-31-109-eng-38. 91p. Order from OTS. $2.00. ANL-6096

A study of irradiation effects in type "A" nickel and type 347 stainless steel tensile specimens, by S. H. Paine, W. F. Murphy and D. W. Hackett. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 43p. Order from OTS. $1.00. ANL-6102

Self-diffusion in Beta uranium, by S. J. Rothman, J. Gray, Jr., J. P. Hughes, and A. L. Harkness. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 20p. Order from OTS. 50 cents. ANL-6126

Dispersed phase strengthening of corrosion-resistant aluminum, from Armour Research Foundation of Illinois Institute of Technology. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 42p. Order from OTS. $1.25. ANL-6188

Fundamental alloy development studies. Quarterly progress report no. 5 for November 1, 1956 to January 31, 1957, by C. E. Lundin and D. T. Klodt. University of Denver, Denver Research Institute, Denver, Colo. Feb 57. Decl. with deletions November 4, 1959. 39p. Order from LC. Mi $3.00, ph $6.30. APEX-300(Del.)

Fundamental alloy development studies. Quarterly progress report no. 7 for May 1, 1957 to July 31, 1957, by C. E. Lundin and D. T. Klodt. University of Denver, Denver Research Institite, Denver, Colo. Aug 57. Decl. with detetions November 4, 1959. 28p. Order from LC. Mi $2.70, ph $4.80. APEX-334(Del.)

Fundamental alloy development studies. Quarterly progress report no. 9 for November 1, 1957 to January 31, 1958, by C. E. Lundin, D. T. Klodt, R. D. Seibel, and M. M. Mote. University of Denver. Denver Research Institute, Denver, Colo. Feb 58. Decl. with deletions November 4, 1959. 65p. Order from LC. Mi $3.90, ph $10.80. APEX-360(Del.)

Component development. Progress report no. 4, by J. D. Roach. Titanium Alloy Manufacturers. Division of National Lead Company, Niagara Falls, N. Y. May 58. Decl. with deletions November 4, 1959, Contracts AT(11-1)-171 and

AF 33(600)-38062. 18p. Order from LC. Mi $2.40, ph $3.30. APEX-423(Del.)

Fundamental alloy development studies. Quarterly progress report no. 4 for May 1, 1958 to July 31, 1958, by C. E. Lundin, D. T. Klodt, R. D. Seibel, and M. W. Mote. University of Denver, Denver Research Institute, Denver, Colo. Aug 58. Decl. with deletions November 4, 1959. Contracts AT(11-1)-171 and AF 33(600)-38062. 94p. Order from LC. Mi $5.40, ph $15.30. APEX-424(Del.)

Fundamental alloy development studies. Quarterly progress report no. 10 for February 1, 1958 to April 30, 1958, by C. E. Lundin, D. T. Klodt, R. D. Seibel, and M. M. Mote. University of Denver. Denver Research Institute, Denver, Colo. May 58. Decl. with deletions November 4, 1959. Contracts AT(11-1)-171 and AF 33(600)-38062. 52p. Order from LC. Mi $3.60, ph $9.30. APEX-449(Del.)

Evaluation of rolling contacts in the range of 550°F to 1000°F, by S. F. Murray and P. Lewis. General Electric Co., Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. Feb 58. Contracts AT(11-1)-171 and AF 33(600)-38062. 90p. Order from OTS. $2.00. APEX-560

Structural analysis of molybdenum-base alloys by use of a material constant and the least-square error, by A. L. Ross and B. R. Thompson. General Electric Co., Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. Feb 57. Contracts AT(11-1)-171 and AF 33(600)-38062. 24p. Order from OTS. 50 cents. APEX-568

Investigation of solid film lubricants and sliding contacts at temperatures above 1000°F, by M. B. Peterson. General Electric Co., Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. Aug 60. Contracts AT(11-1)-171 and AF 33(600)-38062. 63p. Order from OTS. $1.50. APEX-569

Evaluation of oxidation-resistant ceramics for high-temperature reactor elements, by C. G. Harman, E. F. Ferrell, H. E. Wagner, and J. F. Quirk. Battelle Memorial Institute, Columbus, Ohio. Dec 52. Decl. December 15, 1959. Contract W-7405-eng-92. 39p. Order from LC. Mi $3.00, ph $6.30. BMI-787

The effects of chemical impurities on the quality rolled uranium rod, by H. A. Saller, J. R. Keeler, and L. J. Cuddy. Battelle Memorial Institute, Columbus, Ohio. Oct 54. Decl. December 15, 1959. Contract W-7405-eng-92. 18p. Order from LC. Mi $2.40, ph $3.30. BMI-952

Progress relating to civilian applications during December, 1956, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. Jan 57. Decl. August 15, 1960. Contract W-7405-eng-92. 55p. Order from OTS. 55 cents. BMI-1152

Progress relating to civilian applications during January, 1957, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. Feb 57. Decl. August 15, 1960. Contract W-7405-eng-92. 75p. Order from OTS. 55 cents. BMI-1161

Process relating to civilian applications during February, 1957, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. Mar 57. Decl. August 16, 1960. Contract W-7405-eng-92. 71p. Order from OTS. 55 cents. BMI-1173

Progress relating to civilian applications during March, 1957, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. Apr 57. Decl. August 15, 1960. Contract W-7405-eng-92. 80p. Order from OTS. 55 cents. BMI-1176

Progress relating to civilian applications during June, 1957, by R. W. Dayton and C. R. Tiptons, Jr. Battelle Memorial Institute, Columbus, Ohio. July 57. Decl. August 15, 1960. Contract W-7405-eng-92. 58p. Order from OTS. 50 cents. BMI-1201

Progress relating to civilian applications during July, 1957, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. Aug 57. Decl. August 15, 1960. Contract W-7405-eng-92. 69p. Order from OTS. 50 cents. BMI-1213

Progress on ceramic coated fuel particles at Battelle. Presented at the AEC Information Meeting held at Battelle Memorial Institute on July 12, 1960, by W. S. Diethorn and others. Battelle Memorial Institute, Columbus, Ohio. Sep 60. Contract W-7405-eng-92. 31p. Order from OTS. 75 cents. BMI-1468

Creep and corrosion properties of Zircaloy-2 in steam at 750 F, by E. J. Jablonowski and F. R. Shober. Battelle Memorial Institute, Columbus, Ohio. Aug 60. Contract W-7405-eng-92. 20p. Order from OTS. 50 cents. BMI-1457

Monthly progress report, by R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Aug 55. Decl. August 12, 1960. Contract AT(30-1)-1405. 14p. Order from OTS. 30 cents. BRB-13

Extrusion of uranium for Hanford cored slug program - II, by G. T. Murray and R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Nov 55. Decl. August 15, 1960. Contract AT (30-1)-1405. 47p. Order from OTS. 45 cents. BRB-16

Extrusion of uranium for Hanford cored slug program--III and IV, by G. T. Murray and R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Dec 55. Decl. August 12, 1960. Contract AT(30-1)-1405. 33p. Order from OTS. 40 cents. BRB-17

Extrusion of uranium for Hanford cored slug program - VII, by G. T. Murray and R. M. Treco. Brideeport Brass Company, Bridgeport, Conn. Feb 56. Decl. August 12, 1960. Contract AT (30-1)-1405. 28p. Order from OTS. 35 cents. BRB-20

Monthly progress report for January 1956, by R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Feb 56. Decl. May 17, 1960. Contract AT(30-1)-1405. 33p. Order from OTS. 40 cents. BRB-29

Monthly progress report for April - May 1956, by R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. June 56. Decl. August 15, 1960. Contract AT(30-1)-1405. 39p. Order from OTS. 40 cents. BRB-31

A Nonbond detector for hollow slugs, by J. D. Ross and R. W. Leep. E. I. du Pont de Nemours & Co., Explosives Department, Atomic Energy Division, Technical Division, Savannah River Laboratory, Aiken, S. C. Oct 56. Decl. August 12, 1960. Contract AT(07-2)-1. 12p. Order from OTS. 25 cents. DP-164

An evaluation of nickel-copper alloys for use as graphite-cladding materials at elevated temperatures, by D. G. Guggisberg, and J. C. Bokros. General Dynamics Corporation, San Diego, Calif. Apr 60. Contract AT(04-3)-187. 19p. Order from OTS. 75 cents. GA-1281

Carbon steel for the Hanford new production reactor, by W. D. Gilbert and others. Hanford Atomic Products Operation, Richland, Wash. Nov 58. Contract W-31-109-Eng-52. 17p. Order from OTS. 50 cents. HW-58299REV

Casting aluminum-plutonium alloys, by C. H. Bloomster. Hanford Atomic Products Operation, Richland, Wash. Mar 60. Contract AT(45-1)-1350. 19p. Order from OTS. 75 cents. HW-63166

Weld alloying improvement with square type current waves on alternating-current tungsten-arc inert-gas-shielded welding, by T. B. Correy. Hanford Atomic Products Operation, Richland, Wash. May 60. Contract AT(45-1)-1350. 71p. Order from OTS. $2.00. HW-64252

Ultrasonic inspection of PRTR fuel element cladding, by P. L. Farnsworth. Hanford Atomic Products Operation, Richland, Wash. Apr 60. Contract AT(45-1)-1350. 19p. Order from OTS. 75 cents. HW-64562

Progress report on fuel element development and associated projects, by W. C. Francis and S. E. Craig. Phillips Petroleum Company, Idaho Operations Office, Idaho Falls, Idaho. Aug 60. Contract AT(10-1)-205. 151p. Order from OTS. $2.25. IDO-16574

Uranium glasses: II. Uranium silicate glasses, by C. D. Wirkus and D. R. Wilder. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. June 60. Contract W-7405-eng-82. 30p. Order from OTS. 75 cents. IS-158

High temperature corrison of some metals and ceramics in fluorinating atmospheres, by C. F. Hale and others. Union Carbide Nuclear Company pany, Division of Union Carbide Corporation, Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. Sep 60. Contract W-7405-eng-26. 63p. Order from OTS. $1.75. K-1459

Aluminum canning of nickel-plated, Hanford four-inch uranium fuel slugs by hot-pressing, by H. T. Sumsion, C. J. Beck, and L. S. DeLuca. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. May 55. Decl. August 25, 1960. Contract W-31-109-Eng-52. 42p. Order from OTS. 35 cents. KAPL-1335

The application of cold-powder extrusion and sintering to the fabrication of stainless steel- UO_2 fuel elements, by H. G. Sowman and G. L. Ploetz. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. June 55. Decl. August 19, 1960. Contract W-31-109-Eng-52. 15p. Order from OTS. 25 cents. KAPL-1345

Zirconium coating of uranium by iodide decomposition, by W. L. Robb, and A. C. Schafer. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Dec 55. Decl. August 25, 1960. Contract W-31-109-Eng-52. 74p. Order from OTS. 55 cents. KAPL-1424

Burnable poison additives to uranium dioxide, by G. L. Ploetz and H. C. Sowman. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Nov 55. Decl. August 20, 1960. Contract W-31-109-Eng-52. 18p. Order from OTS. 30 cents. KAPL-1447

Fabrication of uranium-rich, uranium-zirconium dispersion fuels by hydrostatic hot pressing, by R. N. Honeyman. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Nov 56. Decl. August 25, 1960. Contract W-31-109-Eng-92. 35p. Order from OTS. 40 cents. KAPL-1670

Cyclic strain fatigue of inconel at 75 to 600°F, by A. E. Dinerman. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Aug 60. Contract W-31-109-Ebg-52. 13p. Order from OTS. 50 cents. KAPL-2084

Welding type 410 stainless steel to inconel, by J. D. Casey. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Mar 60. Contract W-31-109-Eng-52. 8p. Order from OTS. 50 cents. KAPL-2087

Production of molybdenum-uranium and zirconium-uranium alloys, by C. W. Loveland and J. E. Owen. Union Carbide Nuclear Company, Division of Union Carbide Corporation, Paducah, Ky. Aug 60. Contract W-7405-eng-26. 26p. Order from OTS. 50 cents. KY-348

Process development and fabrication of Th-7.6 WT % U fuel elements for the second core loading of the sodium reactor experiment, by J. A. Stanley and M. H. Binstock. Atomics International A Division of North American Aviation, Inc., Canoga Park, Calif. Sep 60. Contract AT(11-1)-GEN-8. 30p. 50 cents. NAA-SR-5144

Briquetted uranium tetrafluoride-magnesium blend for batch reduction charges, by G. E. Wuller, Jr. National Lead Company of Ohio, Technical Division, Cincinnati, Ohio. Dec 56. Decl. August 25, 1960. Contract AT(30-1)-1156. 21p. Order from OTS. 35 cents. NLCO-672

Papers presented at the X-ray preferred orientation meeting held at National Lead Company of Ohio, November 9 and 10, 1959, by P. R. Morris and others. National Lead Company of Ohio, Cincinnati, Ohio. July 60. Contract AT(30-1)-1156. 64p. Order from OTS. $1.50. NLCO-804

Grain refinement of cast uranium by heat treatment, by G. W. Powell, J. L. Klein, and D. Krashes. Nuclear Metals, Inc. Cambridge, Mass. July 57. Decl. August 25, 1960. Contract AT(30-1)-1565. 32p. Order from OTS. 65 cents. NMI-1180

Thermal coefficient of expansion of uranium by means of bonded wire resistance strain gages, by M. R. Goodman. Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 49. Decl. May 10, 1960. Contract W-7405-eng-26. 55p. Order from OTS. 50 cents. ORNL-518

Alloying of zirconium-containing fuels with zinc and magnesium, by R. G. Wymer and J. F. Land. Oak Ridge National Laboratory, Oak Ridge, Tenn. May 57. Decl. May 18, 1960. Contract W-7405-eng-26. 11p. Order from OTS. 30 cents. ORNL-2184

The stability of europium oxide in silicon-bearing stainless steel, by C. F. Leitten, Jr. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd. Contract W-7405-eng-26. 83p. Order from OTS. $2.25. ORNL-2946

Development of a compartmented type flat plate fuel element, by W. G. Lidman, R. L. Harmon, and H. S. Kalish. Sylvania-Corning Nuclear Corp., Bayside; Long Island, N. Y. Apr 57. Decl. August 18, 60. Contract AT-30-1-GEN-366. 31p. Order from OTS. 35 cents. SCNC-246

The control of grain size in sintered uranium compacts, by J. L. Zambrow and H. H. Hausner. Sylvania Electric Products, Inc., Bayside, N. Y. Aug 51. Decl. July 13, 1960. Contract AT-30-1-Gen-366. 24p. Order from OTS. 35 cents. SEP-72

Preferred orientation in zirconium alloy wire fuel elements, by R. W. Campbell and W. P. Chernock. Technical Information Service, Oak Ridge, Tenn. [nd., Decl. July 14, 1960. 38p. Order from OTS. 35 cents. SEP-111

The canning of UO_3 powder for sampling, by H. H. Hausner, J. L. Zambrow and S. Storchheim. Sylvania Electric Porducts Inc., Metallurgical Laboratory, Bayside, New York. Mov 51. Decl. July 13, 1960. Contract AT-30-1-Gen-366. 19p. Order from OTS. 30 cents. SEP-79

Zirconium: A bibliography of confidential U. S. Atomic Energy Commission Reports Available through the Civilian Application Program, by Technical Information Service Extension, Oak Ridge, Tenn. July 56. Decl. May 24, 1960. 62p. Order from OTS. 50 cents. TID-3204

Proceedings of the metallurgy information meeting held at Oak Ridge, April 11-13, 1955, by L. K. Jetter and others. Atomic Energy Technical Information Service Extension, Oak Ridge, Tenn. 1955. Decl. December 1, 1959. 533p. in Pt. 1, and 423p. in Pt. II. Order from OTS. Total price $9.00. TID-7502 (Pt. I & II) (Del. 2)

AEC-Euratom conference on aqueous corrosion of reactor materials held in Brussels, Belgium on October 14-17, 1959, by R. R. Nash and others. Office of Technical Information Extension, Oak Ridge, Tenn. July 60. 465p. Order from OTS. $4.75. TID-7587

Summary technical report for the period October 1, 1954 to December 31, 1954, by J. W. Simmons and others. National Lead Company of Ohio, Technical Division, Cincinnati, Ohio. Jan 55. Decl. August 18, 1960. Contract AT(30-1)-1156. 220p. Order from OTS. $1.10. TID-10111

Metallurgical progress report no. 7 for the period of Apr 1, 1960 to June 30, 1960, by M. L. Wright and others. U. S. Department of the Interior, Bureau of Mines, Albany Metallurgy Research Center, Albany, Ore. June 60. Contract AT(11-1)-599. 47p. Order from OTS. $1.50. USBM-U-745

Outline of alternate control material information obtained at Bettis Plant. Westinghouse Electric Corporation, Bettis Plant, Pittsburgh, Pa. July 56. Decl. May 23, 1960. 102p. Order from OTS. 60 cents. WAPD-SFR-Fs-173

Nuclear Explosions—Peaceful Applications

Proceedings of the conference on scientific applications of nuclear explosions held July 6-8, 1959, Los Alamos, New Mexico, by G. A. Cowan. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Sep 60. Contract W-7405-ENG-36. 75p. Order from OTS. $1.75. LAMS-2443

Oak Ridge National Laboratory sampler for the tamalpais underground nuclear detonation experiment, by J. W. Landry. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 19p. Order from OTS. 50 cents. ORNL-2881

Geologic investigations in support of project chariot in the vicinity of Cape Thompson, northwestern Alaska--Preliminary report, by R. Kachadoorian and others. Geological Survey, Washington, D. C. Jan 60. 94p. Order from OTS. $2.00. TEI-753

Some effects of underground nuclear explosions on tuff, by V. R. Wilmarth. Geological Survey, Washington, D. C. Dec 59. 34p. Order from OTS. 75 cents. TEI-756

Nuclear explosives and mining costs, by F. L. Smith and T. R. Young. University of California, Lawrence Radiation Laboratory, Livermore, Calif. July 60. Contract W-7405-eng-48. 37p. Order from OTS. $1.00. UCRL-5928

Postshot disturbances and surface motions--Operation Hardtack-II, by L. M. Swift and others. Stanford Research Institute, Menlo Park, Calif. Feb 60. 28p. Order from OTS. 75 cents. WT-1740

Particle Accelerators and High-Voltage Machines

Particle accelerator Division, summary report for May 1959 through March 1960, by A. V. Crewe, and others. Argonne National Laboratory, Argonne, Ill. 1960. Contract W-31-109-eng-38. 56p. Order from OTS. $1.25. ANL-6152

Integral scaling magnetic field using distributed windings, by S. C. Snowdon. Midwestern Universities Research Association, Madison, Wis. Aug 60. Contract AT(11-1)-384. 19p. Order from OTS. 50 cents. MURA-583

The use of filamentary targets to produce prolonged secondary-particle beams in the Bevatron, by H. C. Heard. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 12p. Order from OTS. 50 cents. UCRL-9237

Physics and Mathematics

Table of asymmetric rotor E2 transition probabilities, by P. P. Day and C. A. Mallmann. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 54p. Order from OTS. $1.25. ANL-6184

Introduction to electronic analogue computing, by L. T. Bryant and others. Argonne National Laboratory, Argonne, Ill. July 60. Contract

W-31-109-eng-38. July 60. 81p. Order from OTS. $2.00. ANL-6187

Applied Mathematics Division summary report for July 1, 1959 through June 30, 1960, by W. F. Miller. Argonne National Laboratory, Argonne, Ill. 1960. Contract W-31-109-eng-38. 65p. Order from OTS. $1.50. ANL-6195

Design studies on cesium-137 as a source for high level gamma irradiators. Quarterly progress report no. 3 covering the period from December 1, 1959 to March 1, 1960, by L. Voyvodic. Illinois Institute of Technology, Armour Research Foundation, Chicago, Ill. Mar 60. Contract AT(11-1)-779. 8p. Order from LC. Mi $1.80, ph $1.80. ARF-1150-9

Energy and angular distribution of particles produced by 25-BEV protons, by R. M. Sternheimer. Brookhaven National Laboratory, Upton, N. Y. Feb 60. 12p. Order from LC. Mi $2.40, ph $3.30. BNL-4664

Intermediate heat exchanger test results, by B. M. Wilmer and H. J. Stumpf. Oak Ridge National Laboratory, Oak Ridge, Tenn. Jan 54. Decl. July 16, 1959. Contract W-7405-eng-26. 35p. Order from LC. Mi $3.00, ph $6.30. CF-54-1-155

HRT process flowsheets - revised edition, by R. C. Robertson and J. E. Jones. Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 59. 18p. Order from LC. Mi $3.00, ph $6.30. CF-55-5-156 (Rev. 5)

Electrical insulation characteristics of helium gas at high pressure and temperatures, by R. D. Stulting. Oak Ridge National Laboratory, Oak Ridge, Tenn. Feb 59. Contract W-7405-eng-26. 15p. Order from LC. Mi $2.40, ph $3.30. CF-59-2-22

Thermal neutron fluxes in HRE-2 determined from Zircaloy-2 induced activity measurements, runs 16 and 17, by J. E. Baker and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 59. 8p. Order from LC. Mi $1.80, ph $1.80. CF-59-2-54

Shielding properties of ferrophosphorus concrete as a function of temperature, by E. G. Peterson Hanford Atomic Products Operation, Richland, Wash. July 60. Contract AT(45-1)-1350. 79p. Order from OTS. $2.00. HW-64774

An IBM 650 computer program for determining the thermal diffusivity of finite-length samples, by W. L. Kennedy. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. June 60. Contract W-7405-eng-82. 59p. Order from OTS. $1.50. IS-137

Ion fragmentation patterns of N_2^{22}, N_2^{29}, and N_2^{30}, by G. D. Flesch and H. J. Svec. Ames Laboratory, Ames, Iowa. Mar 59. Contract W-7405-eng-82. 5p. Order from LC. Mi $1.80, ph $1.80. ISC-1141

NLLS: A 704 program for fitting non-linear curves by least squares, by P. B. Wood. Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. Jan 60. Contract W-7405-eng-26. 62p. Order from LC. Mi $3.60, ph $9.30. K-1440

The depletion of burnable poison in endurnace calculations, by R. C. Dahlberg and F. D. Judge. General Electric Company, Knolls Atomic Power Laboratory, Schenectady, N. Y. Mar 60. Contract W-31-109-Eng-92. 9p. Order from OTS. 75 cents. KAPL-2058

Effect of ship attitutde and ship motion on primary coolant system flow rates, by H. E. Stevens, Jr. Feb 60. Appendix A: Derivation of effect on angular acceleration on driving head in a natural circulation reactor, by J. H. Pigott. Jan 60. Knolls Atomic Power Laboratory, Schenectady, N. Y. Contract 31-109-Eng-52. 32p. Order from LC. Mi $3.00, ph $6.30. KAPL-M-HS-12

Slab rectifier calculations, by M. E. Way. Knolls Atomic Power Laboratory, Schenectady, N. Y. Nov 57. Decl. February 24, 1960. Contract W-31-109-Eng-52. 13p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-MEW-3

Results of tests of D1G/D2G reactor: Compartment component support model, by R. M. Mains. Knolls Atomic Power Laboratory, Schenectady, N. Y. Nov 59. Contract W-31-109-Eng-52. 42p. Order from LC. Mi $3.30, ph $7.80. KAPL-M-RMM-5

Some numerical studies of simultaneous two group inversion, by S. Baron. Knolls Atomic Power Laboratory, Schenectady, N. Y. Feb 60. Contract W-31-109-Eng-52. 20p. Order from LC. Mi $2.70, ph $4.80. KAPL-M-SXB-1

Activation experiments in an NCR-type lattice, by W. B. Wright, S. F. Weinstein and A. D. Musto. Knolls Atomic Power Laboratory, Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 25p. Order from LC. Mi $2.70, ph $4.80. KAPL-M-WBW-8.

Water gap peaking in the presence of hydrogen density gradients, by W. B. Wright and S. F. Weinstein. Knolls Atomic Power Laboratory, Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 16p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-WBW-9

A simplified technique for calculating spectrum-dependent water-gap peaking, by W. J. Levedahl. Knolls Atomic Power Laboratory, Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 15p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-WIL-5

A study of solution multiplicity in some problems of mathematical physics, by G. H. Pimbley. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Sep 60. Contract W-7405-ENG-36. 40p. Order from OTS. $1.00. LA-2431

The flow of fluids through channels with porous walls, by F. A. Guevara and W. E. Wageman. The University of California, Los Alamos Scientific Laboratory, Los Alamos, Calif. July 60. Contract W-7405-ENG-36. 27p. Order from OTS. 75 cents. LA-2449

Approximate calculation of the temperature distribution surrounding coolant holes in a heat generating solid with finite value of fluid heat tranfer coefficient, by T. R. Regenie and J. C. Rowley. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 22p. Order from OTS. 50 cents. LAMS-2436

On a method of measuring diffusion coefficients for fission products in powdered or sintered materials, by L. Miller. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 13p. Order from OTS. 50 cents. LAMS-2437

Stability of difference equations selected topics, by F. H. Harlow and others. The University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 39p. Order from OTS. $1.00. LAMS-2452

Gamma assay by coincidence counting, by L. N. Russell and G. R. Grove. Mound Laboratory, Miamisburg, Ohio. Aug 53. Decl. March 7, 1960. Contract AT-33-1-GEN-53. 6p. Order from LC. Mi $1.80, ph $1.80. MLM-882

Snap-III--Thermoelectric generator environmental test, by L. W. Gross. Martin Company, Nuclear Division, Baltimore, Md. Aug 59. 68p. Order from LC. Mi $3.90, ph $10.80. MND-P-2101

Snap-III--Thermoelectric generator safe handling procedures, by T. J. Dobry, Jr. and P. Guinn. Martin Company, Nuclear Division, Baltimore, Md. Apr 59. 18p. Order from LC. Mi $2.40, ph $3.30. MND-P-2514

Neutron flux distributions in a 19 rod fuel element, by O. R. Hillig. Atomics International Division, North American Aviation, Inc., Canoga Park, Calif. Aug 59. 13p. Order from LC. Mi $2.40, ph $3.30. NAA-SR-Memo-4246

Grace II--An IBM 709 program for computing gamma-ray attenuation and heating in cylindrical and spherical geometries, by D. S. Duncan and A. B. Speir. Atomics International Division, North American Aviation, Inc., Canoga Park, Calif. Nov 59. 61p. Order from LC. Mi $3.60, ph $9.30. NAA-SR-Memo-4649

Dispersion relations for pion scattering, by D. A. Geffen. Carnegie Institute of Technology, Pittsburgh, Pa. July 58. Contract AT(30-1)-882. 23p. Order from LC. Mi $2.70, ph $4.80. NYO-2232

Polarization of the recoil proton in the scattering of 225 MEV π^- mesons from protons, by J. Ashkin, J. Kunze and R. Romanowski. Carnegie Institute of Technology, Pittsburgh, Pa. Nov 58. Contract AT(30-1)-882. 92p. Order from LC. Mi $5.40, ph $15.30. NYO-2233

Heterogeneous reactor calculation methods. Quarterly progress report no. 1 for April - June 30, 1959, by C. N. Klahr. TRG, Inc., Syosset, N. Y. 1959. Contract AT(30-1)-2375. 45p. Order from LC. Mi $3.30, ph $7.80. NYO-2673

Experiments on supersonic plasma flow along magnetic fields. Part II, by D. M. Wetstone. New York University, Atomic Energy Commission Computing and Applied Mathematics Center, New York, N. Y. Sep 59. 112p. Order from LC. Mi $6.00, ph $18.30. NYO-2877

Two methods using power series for solving analytic initial value problems, by G. Lewis. New York University, Atomic Energy Commission Computing and Applied Mathematics Center, New York, N. Y. Jan 60. Contract AT(30-1)-1480. 68p. Order from LC. Mi $3.90, ph $10.80. NYO-2881

The hydromagnetic stability of a toroidal gas discharge, by R. Lust and others. New York University, Atomic Energy Commission Computing and Applied Mathematics Center, New York, N. Y. Feb 60. Contract AT(30-1)-1480. 33p. Order from LC. Mi $3.00, ph $6.30. NYO-2882

A survey of plutonium spectrum data, by J. R. McNally, Jr. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 206p. Order from OTS. $3.00. ORNL-2154

Some x-ray and fast neutron response characteristics of silver metaphosphate glass dosimeters, by W. T. Thornton and J. A. Auxier. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 54p. Order from OTS. $1.50. ORNL-2912

An empirical study of the sampling distributions of some disease incidence estimates, by G. J. Atta. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 66p. Order from OTS. $1.75. ORNL-2957

On the convergence of steady state multiregion diffusion calculations, by A. C. Downing, Jr. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 135p. Order from OTS. $2.50. ORNL-2961

Some properties of infinite, lumped solenoids, by G. R. North. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 14p. Order from OTS. 50 cents. ORNL-2975

Ionization yield in gases. Technical status report for December 1, 1956 - December 31, 1957, by G.H. Miller and R. A. Lowry. University of Virginia. Research Laboratories for the Engineering Sciences, Charlottesville, Va. 1957. Contracts AT(40-1)-1820 and AF 49(638)-22. 14p. Order from LC. Mi $2.40, ph $3.30. ORO-231

Ionization yield in gases. Technical status reports for January 1, 1958 - December 31, 1958, by G. H. Miller and R. A. Lowry. University of Virginia. Research Laboratories for Engineering Sciences, Charlottesville, Va. 1958. Contracts AT(40-1)-1820 and AF 49(638)-22. 21p. Order from LC. Mi $2.70, ph $4.80. ORO-232

The blast wave in air resulting from a high temperature, high pressure sphere of air, by H. L. Brode. RAND Corp., Santa Monica, Calif. Dec 56. Contract AT(29-1)-1477. 69p. Order from LC. Mi $5.70, ph $16.80. RM-1825-AEC

The emissive power of ionized hydrogen gas, by J. M. Green. RAND Corp., Santa Monica, Calif. Aug 59. Contract AT(29-1)-1477. 23p. Order from LC. Mi $2.40, ph $3.30. RM-2447-AEC

A method for computing expected damage from a single bomb, by Sandia Corporation, Albuquerque, N. Mex. Jan 53. Changed from OFFICIAL USE ONLY April 12, 1956. 31p. Order from LC. Mi $3.00, ph $6.30. SC-2663(TR)

Representation of piezoelectricity on a thermodynamically invariant basis--a preliminary review. Numerical applications, by H. G. Baerwald. Clevite Research Center, Cleveland, Ohio. Feb 59. 69p. Order from LC. Mi $3.90, ph $10.80. SC-4376(TR)

Some proposed research activities pertaining to reliability, by R. O. Frantik and Some notes on the estimation of reliability, by R. L. Calvert. Sandia Corporation, Albuquerque, N. Mex. Feb 58. 26p. Order from OTS. 75 cents. SCR-5

Radio-frequency attenuation measurements on high altitude nuclear detonations, by J. L. Dossey. Sandia Corporation Reprint, Albuquerque, N. Mex. 14p. Order from OTS. 50 cents. SCR-172

Homogeneity of the magnetic field of a helmholtz coil, by K.D. Granzow. Sandia Corporation Monograph, Albuquerque, N. Mex. July 60. 11p. Order from OTS. 50 cents. SCR-193

Recent results in information theory, by E. Feinstein. Sandia Corporation Research Colloquium, Albuquerque, N. Mex. June 60. 25p. Order from OTS. 75 cents. SCR-195

The relationship of the binomial probability distribution to other probability distributions with a selected bibliography on the subject, by D. B. Owen and E. J. Gilbert. Sandia Corporation, Albuquerque, N. Mex. May 60. 24p. Order from OTS. 75 cents. SCTM-1-59(51)

Fall of small particles in the upper atmosphere, by J. R. Banister. Sandia Corporation, Albuquerque, N. Mex. Jan 59. Contract AT(29-1)-789. 10p. Order from OTS. 50 cents. SCTM-18-59(51)

Atmospheric moisture data for thermal attenuation problems, by B. N. Charles. Sandia Corporation, Albuquerque, N. Mex. Dec 59. 13p. Order from OTS. 50 cents. SCTM-394-59(51)

Reactor heat transfer conference of 1956. Collected papers and reports of a conference held at New York, November 1 and 2, 1956, by J. E. Viscardi. Nuclear Development Corporation of America, White Plains, N. Y. Nov 57. Decl. August 4, 1960. 24p. Order from OTS. 45 cents. TID-7529(Pt. 2)

Tabulated neutron cross sections. Part I, 0.001 - 14.5 Mev. Replacement sheets for Part I Vol. I, by R. J. Howerton. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Oct 59. Contract W-7405-eng-48. 422p. Order from OTS. $5.00. UCRL-5226(Rev.)

Tabulated neutron cross sections, Part I, 0.001-14.5 Mev. Replacement sheets for Part I, Vol. II, by R. J. Howerton. University of California. Lawrence Radiation Laboratory, Livermore, Calif. Oct 59. Contract W-7405-eng-48. 346p. Order from OTS. $5.00. UCRL-5226(Rev.)

Tabulated neutron cross sections. Part I, 0.001 - 14-5 Mev. Replacement sheets for Part I, Vol. III, by R. J. Howerton. University of California. Lawrence Radiation Laboratory, Livermore, Calif. Oct 59. Contract W-7405-eng-48. 254p. Order from OTS. $4.00. UCRL-5226(Rev.)

Ignitron discharge growth during 10^8-watt pulses, by D. B. Cummings. University of California. Lawrence Radiation Laboratory, Livermore, Calif. June 60. Contract W-7405-eng-48. 88p. Order from OTS. $2.25. UCRL-5687

A table of some spherical harmonics, by D. F. Abell. University of California. Lawrence Radiation Laboratory, Livermore, Calif. Nov 59. Contract W-7405-eng-48. 5p. Order from OTS. 50 cents. UCRL-5713 Rev.

A Monte Carlo method for determining the efficiency of a spherical "dish" arrangement of neutron detectors, by J. Fleck, Jr. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Feb 60. Contract W-7405-eng-48 22p. Order from OTS. 75 cents. UCRL-5898

Effect of the π - π resonance in the reaction $\pi + N \rightarrow 2\ \pi + N$, by Y. Kim. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Feb 60. Contract W-7405-eng-48. 15p. Order from OTS. 75 cents. UCRL-9080 Rev.

Dissociation of molecular ions by electric fields, Thesis - Part II, by J. R. Hiskes. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 63p. Order from OTS. $1.50. UCRL-9182

Physics division semiannual report for November 1959 through April 1960, by L.W. Alvarez and others. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 41p. Order from OTS. $1.00. UCRL-9215

The two-pion exchange contribution to the higher partial waves of nucleon-nucleon scattering. Thesis, by P. Cziffra. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 78p. Order from OTS. $2.00. URCL-9249

The liquid-drop model of fission: Equilibrium configurations and energetics of uniform rotating charged drops. Thesis: Part I, by J. R. Hiskes. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 56p. Order from OTS. $1.25. UCRL-9275

Heat transfer to flowing gas-solids mixtures in a vertical circular duct. Thesis, by C. A. Depew. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 103p. Order from OTS. $2.25. UCRL-9280

Antiproton-nucleon cross sections from 0.5 to 1.0 Bev. Thesis, by T. Elioff. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 90p. Order from OTS. $2.00. UCRL-9288

Experiments on neutron-proton scattering and determination of the pion-nucleon coupling constant, Thesis, by R. R. Larsen. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 80p. Order from OTS. $2.00. UCRL-9292

The Λ-hyperon mass and energy spectrum from the nuclear capture of negative K mesons. Thesis, by C. J. Mason. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. July 60. Contract W-7405-eng-48. 49p. Order from OTS. $1.25. UCRL-9297

Radiation Effects on Materials

Irradiation of an aluminum alloy-clad, aluminum-uranium alloy-fueled plate, by A. P. Gavin and C. C. Crothers. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 46p. Order from OTS. $1.00. ANL-6180

Thermally activated point defect migration in copper, by C. J. Meechan, A. Sosin, and J. A. Brinkman. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Oct 60. Contract AT(11-1)-GEN-8. 30p. Order from OTS. 50 cents. NAA-SR-5377

Summary of findings on strontium-90 and cesium-137 process control devices, by S. A. Goldblith and others. Massachusetts Institute of Technology, Department of Food Technology, Cambridge, Mass. Dec 59. Contract AT(30-1)-2329, Task V. 19p. Order from OTS. 50 cents. NYO-9181

Evaluation of the technical, economic and practical feasibility of radiation preservation of fish, by B. E. Proctor and others. Massachusetts Institute of Technology, Department of Food, Camb bridge, Mass. [nd.] Contract AT(30-1)-2329. 77p. Order from OTS. $1.75. NYO-9182

Radioactive Waste

Chemical decontamination of the ANL-2 high-pressure water loop, by C. C. Crothers. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 12p. Order from OTS. 50 cents. ANL-6151

Underground storage of low level radioactive wastes at the Savannah River Plant. Engineering considerations, by A. N. Daniel. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Wilmington, Del. June 60. Contract AT(07-2)-1. 59p. Order from OTS. $1.50. DP-478

Quarterly progress report. Research and development activities fixation of radioactive residues for January through March, 1960, by D. W. Pearce. General Electric Company, Hanford Atomic Products Operation, Richland, Wash. Apr 60. Contract AT(45-1)-1350. 31p. Order from OTS. 75 cents. HW-65209

Idaho chemical Processing Plant technical progress report radioactive waste disposal projects for July through September 1959, by C. M. Slansky and others. Phillips Petroleum Company, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 25p. Order from OTS. 50 cents. IDO-14514

Reactors—General

Design summary report on the transient reactor test facility (treat), by G. A. Freund and others. Argonne National Laboratory, Argonne, Ill. Feb 60. Contract W-31-109-eng-38. 124p. Order from OTS. $2.50. ANL-6034

A proposed fuel assay reactor, by F. H. Martens and H. A. Sandmeier. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 15p. Order from OTS. 50 cents. ANL-6203

An experimental investigation of heat transfer to superheated steam in round and rectangular channels, by J. B. Heineman. Argonne National Laboratory, Argonne, Ill. Sep 60. Contract W-31-109-eng-38. 90p. Order from OTS. $2.25. ANL-6213

Spert project: Quarterly technical report for October, November, December, 1959, by F. Schroeder. Phillips Petroleum Company, Atomic Energy Division, Idaho Falls, Idaho. Aug 60. Contract AT(10-1)-205. 31p. Order from OTS. 75 cents. IDO-16616

A proposed fast reactor installation project FRE-EX by R. J. Watt . The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Aug 60. Contract W-7405-ENG-36. 13p. Order from OTS. 50 cents. LAMS-2433

A combination strainer and blocking valve for liquid metal systems, by F. S. Nayor and J. S. McDonald. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 20p. Order Order from OTS. 50 cents. NAA-SR-5241

Operational safety of the ORNL graphite reactor using enriched-uranium fuel, by P. R. Kasten. and others. Oak Ridge National Laboratory, Reactor Experimental Engineering Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 26p. Order from OTS. 75 cents. ORNL-2478

The Sandia pulsed reactor facility (SPRF), by J. L. Colp and P. D. O'Brien. Sandia Corporation, Albuquerque, N. Mex. Aug 60. 18p. Order from OTS. 75 cents. SCR-229

3 Design studies for selecting a prototype reactor for a nuclear tanker. Summary and evaluation report. Prepared by, Division of Reactor Development, U. S. Atomic Energy Commission, and U. S. Maritime Administration, Department of Commerce. Sep 60. 67p. Order from OTS. $1.25. TID-8528

Reactors—Power

Electric power supply and national security. A study in public policy (Thesis), by B. S. Loeb. Columbia University, New York, N. Y. 1959. 205p. Order from OTS. $3.50. AECU-4642

Preliminary design and hazards report boiling reactor experiment V (BORAX V), by R. E. Rice and others. Argonne National Laboratory, Lemont, Ill. Feb 60. Contract W-31-109-eng-38. 162p. Order from OTS. $2.75. ANL-6120

Review of the status of supercritical water reactor technology, by J. F. Marchaterre and M. Petrick. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 37p. Order from OTS. $1.00. ANL-6202

Heavy water moderated power reactors. Progress report for May 1960, by D. F. Babcock and other others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. July 60. Contract AT(07-2)-1. 75p. Order from OTS. $1.75. DP-505

Nuclear powered tanker design and economic analysis direct cycle boiling water reactor, by B. S. Voorhees and others. General Electric Company. San Jose, Calif. Dec 59. Contract AT(04-3)-189. 280p. Order from OTS. $6.00. Limited number of copies. GEAP-3294

Supercritical pressure power reactor. A conceptual design, by The Staff of Reactor Engineering Development Operation, Hanford Atomic Products Operation, Richland, Wash. Mar 59. Contract W-31-109-Eng-52. 37p. Order from OTS. $1.25. HW-59684

Army gas-cooled reactor systems program: Semi-annual progress report for 1 January through 30 June 1960, by G. A. Linenberger and others. Aerojet-General Nucleonics, Engineering Divisio sion, San Ramon, Calif. July 60. Contract AT (10-1)-880. 211p. Order from OTS. $3.00. IDO-28558

Quarterly status report on LAMPRE program for period ending August 20, 1960, by S. Glasstone. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Sep 60. Contract W-7405-ENG-36. 22p. Order from OTS. 50 cents. LAMS-2462

PM-1 Nuclear power plant program 4th quarterly progress report for 1 Decemger 1959 to 29 February 1960, by E. H. Smith and others. Martin Company, Nuclear Power Plant, Nuclear Division, Baltimore, Md. April 60. Contract AT(30-1)-2345. 302p. Order from OTS. $4.00. MND-M-1815

Piqua OMR high boiler handling, by R. R. Steins. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 54p. Order from OTS. $1.25. NAA-SR-4791

Nuclear Powered Tanker: Design and economic analysis pressurized water reactor, by George G. Sharp, Inc., New York, N. Y. and Combustion Engineering, Inc., Nuclear Division, Windsor, Conn. Jan 60. Contract AT(30-1)-2379, Task V. 480p. Order from OTS. $8.00. Limited number of copies. NYO-2860

Study of remote military power applications. Report No. 1. Summary for United States AEC, New York Operations Office. Kaiser Engineers Div. of Henry J. Kaiser Co., Oakland, Calif. Jan 60. Revised July, 1960. Contract AT(30-1)-2441. 93p. Order from OTS. $2.00. NYO-2937

Study of remote military power applications. Report No. 2, Okinawa, Ryukyu Islands for United States AEC, New York Operations Office. Kaiser Engineers, Div. of Henry J. Kaiser Co., Oakland, Calif. Jan 60. Revised July, 1960. Contract AT(30-1)-2441. 93p. Order from OTS. $2.50. NYO-2938

Study of remote military power applications. Report No. 3, Guam. Mariana Islands for United States AEC, New York Operations Office. Kaiser Engineers, Div. of Henry J. Kaiser Co., Oakland, Calif. Jan 60. Revised July, 1960. Contract AT(30-1)-2441. 98p. Order from OTS. $2.50. NYO-2939

Radiation Effects on Materials

Irradiation of an aluminum alloy-clad, aluminum-uranium alloy-fueled plate, by A. P. Gavin and C. C. Crothers. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 46p. Order from OTS. $1.00. ANL-6180

Thermally activated point defect migration in copper, by C. J. Meechan, A. Sosin, and J. A. Brinkman. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Oct 60. Contract AT(11-1)-GEN-8. 30p. Order from OTS. 50 cents. NAA-SR-5377

Summary of findings on strontium-90 and cesium-137 process control devices, by S. A. Goldblith and others. Massachusetts Institute of Technology, Department of Food Technology, Cambridge, Mass. Dec 59. Contract AT(30-1)-2329, Task V. 19p. Order from OTS. 50 cents. NYO-9181

Evaluation of the technical, economic and practical feasibility of radiation preservation of fish, by B. E. Proctor and others. Massachusetts Institute of Technology, Department of Food, Cambridge, Mass. [nd.] Contract AT(30-1)-2329. 77p. Order from OTS. $1.75. NYO-9182

Radioactive Waste

Chemical decontamination of the ANL-2 high-pressure water loop, by C. C. Crothers. Argonne National Laboratory, Argonne, Ill. July 60. Contract W-31-109-eng-38. 12p. Order from OTS. 50 cents. ANL-6151

Underground storage of low level radioactive wastes at the Savannah River Plant. Engineering considerations, by A. N. Daniel. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Wilmington, Del. June 60. Contract AT(07-2)-1. 59p. Order from OTS. $1.50. DP-478

Quarterly progress report. Research and development activities fixation of radioactive residues for January through March, 1960, by D. W. Pearce. General Electric Company, Hanford Atomic Products Operation, Richland, Wash. Apr 60. Contract AT(45-1)-1350. 31p. Order from OTS. 75 cents. HW-65209

Idaho chemical Processing Plant technical progress report radioactive waste disposal projects for July through September 1959, by C. M. Slansky and others. Phillips Petroleum Company, Idaho Falls, Idaho. July 60. Contract AT(10-1)-205. 25p. Order from OTS. 50 cents. IDO-14514

Reactors—General

Design summary report on the transient reactor test facility (treat), by G. A. Freund and others. Argonne National Laboratory, Argonne, Ill. Feb 60. Contract W-31-109-eng-38. 124p. Order from OTS. $2.50. ANL-6034

A proposed fuel assay reactor, by F. H. Martens and H. A. Sandmeier. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 15p. Order from OTS. 50 cents. ANL-6203

An experimental investigation of heat transfer to superheated steam in round and rectangular channels, by J. B. Heineman. Argonne National Laboratory, Argonne, Ill. Sep 60. Contract W-31-109-eng-38. 90p. Order from OTS. $2.25. ANL-6213

Spert project: Quarterly technical report for October, November, December, 1959, by F. Schroeder. Phillips Petroleum Company, Atomic Energy Division, Idaho Falls, Idaho. Aug 60. Contract AT(10-1)-205. 31p. Order from OTS. 75 cents. IDO-16616

A proposed fast reactor installation project FRE-EX by R. J. Watt . The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Aug 60. Contract W-7405-ENG-36. 13p. Order from OTS. 50 cents. LAMS-2433

A combination strainer and blocking valve for liquid metal systems, by F. S. Nayor and J. S. McDonald. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 20p. Order Order from OTS. 50 cents. NAA-SR-5241

Operational safety of the ORNL graphite reactor using enriched-uranium fuel, by P. R. Kasten. and others. Oak Ridge National Laboratory, Reactor Experimental Engineering Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 26p. Order from OTS. 75 cents. ORNL-2478

The Sandia pulsed reactor facility (SPRF), by J. L. Colp and P. D. O'Brien. Sandia Corporation, Albuquerque, N. Mex. Aug 60. 18p. Order from OTS. 75 cents. SCR-229

3 Design studies for selecting a prototype reactor for a nuclear tanker. Summary and evaluation report. Prepared by, Division of Reactor Development, U. S. Atomic Energy Commission, and U. S. Maritime Administration, Department of Commerce. Sep 60. 67p. Order from OTS. $1.25. TID-8528

Reactors—Power

Electric power supply and national security. A study in public policy (Thesis), by B. S. Loeb. Columbia University, New York, N. Y. 1959. 205p. Order from OTS. $3.50. AECU-4642

Preliminary design and hazards report boiling reactor experiment V (BORAX V), by R. E. Rice and others. Argonne National Laboratory, Lemont, Ill. Feb 60. Contract W-31-109-eng-38. 162p. Order from OTS. $2.75. ANL-6120

Review of the status of supercritical water reactor technology, by J. F. Marchaterre and M. Petrick. Argonne National Laboratory, Argonne, Ill. Aug 60. Contract W-31-109-eng-38. 37p. Order from OTS. $1.00. ANL-6202

Heavy water moderated power reactors. Progress report for May 1960, by D. F. Babcock and other others. E. I. du Pont de Nemours & Co. Explosives Department, Atomic Energy Division, Technical Division, Wilmington, Del. July 60. Contract AT(07-2)-1. 75p. Order from OTS. $1.75. DP-505

Nuclear powered tanker design and economic analysis direct cycle boiling water reactor, by B. S. Voorhees and others. General Electric Company. San Jose, Calif. Dec 59. Contract AT(04-3)-189. 280p. Order from OTS. $6.00. Limited number of copies. GEAP-3294

Supercritical pressure power reactor. A conceptual design, by The Staff of Reactor Engineering Development Operation, Hanford Atomic Products Operation, Richland, Wash. Mar 59. Contract W-31-109-Eng-52. 37p. Order from OTS. $1.25. HW-59684

Army gas-cooled reactor systems program: Semiannual progress report for 1 January through 30 June 1960, by G. A. Linenberger and others. Aerojet-General Nucleonics, Engineering Divisio sion, San Ramon, Calif. July 60. Contract AT (10-1)-880. 211p. Order from OTS. $3.00. IDO-28558

Quarterly status report on LAMPRE program for period ending August 20, 1960, by S. Glasstone. The University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Sep 60. Contract W-7405-ENG-36. 22p. Order from OTS. 50 cents. LAMS-2462

PM-1 Nuclear power plant program 4th quarterly progress report for 1 Decemger 1959 to 29 February 1960, by E. H. Smith and others. Martin Company, Nuclear Power Plant, Nuclear Division, Baltimore, Md. April 60. Contract AT(30-1)-2345. 302p. Order from OTS. $4.00. MND-M-1815

Piqua OMR high boiler handling, by R. R. Steins. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Aug 60. Contract AT(11-1)-GEN-8. 54p. Order from OTS. $1.25. NAA-SR-4791

Nuclear Powered Tanker: Design and economic analysis pressurized water reactor, by George G. Sharp, Inc., New York, N. Y. and Combustion Engineering, Inc., Nuclear Division, Windsor, Conn. Jan 60. Contract AT(30-1)-2379, Task V. 480p. Order from OTS. $8.00. Limited number of copies. NYO-2860

Study of remote military power applications. Report No. 1. Summary for United States AEC, New York Operations Office. Kaiser Engineers Div. of Henry J. Kaiser Co., Oakland, Calif. Jan 60. Revised July, 1960. Contract AT(30-1)-2441. 93p. Order from OTS. $2.00. NYO-2937

Study of remote military power applications. Report No. 2, Okinawa, Ryukyu Islands for United States AEC, New York Operations Office. Kaiser Engineers, Div. of Henry J. Kaiser Co., Oakland, Calif. Jan 60. Revised July, 1960. Contract AT(30-1)-2441. 93p. Order from OTS. $2.50. NYO-2938

Study of remote military power applications. Report No. 3, Guam. Mariana Islands for United States AEC, New York Operations Office. Kaiser Engineers, Div. of Henry J. Kaiser Co., Oakland, Calif. Jan 60. Revised July, 1960. Contract AT(30-1)-2441. 98p. Order from OTS. $2.50. NYO-2939

Fission-product release from UO_2, by W. B. Cottrell and others. Oak Ridge National Laboratory. Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 135p. Order from OTS. $2.50. ORNL-2935

Gas-cooled reactor project quarterly progress report for period ending June 30, 1960. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 253p. Order from OTS. $3.50. ORNL-2964

The feasibility of an unattended nuclear power plant, by M. W. Rosenthal and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 61p. Order from OTS. $1.75. ORNL-2985

The first refueling of the Shippingport Atomic Power Station, by H. Feinroth and T. D. Sutter, Jr. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. July 60. Contract AT-11-1-GEN-14. 267p. Order from OTS. $3.50. WAPD-233

Stable Isotope Separation

Basic and applied isotope technology, by P. C. Aebersold and others. William H. Johnston Laboratories, Inc., Baltimore, Md. June 59. Contract AT(11-1)-650. 216p. Order from OTS. $3.00. JLI-650-1-3

Ion-molecule reactions, by P. C. Aerbersold and others. William H. Johnston Laboratories, Inc., Lafayette, Ind. Oct 59. Contract AT(11-1)-650-Sec. 3. 92p. Order from OTS. $2.00. JLI-650-3-7

Strontium 90 power project. Final summary report, by J. J. Keenan and others. Martin Nuclear Division, Baltimore, Md. Mar 60. Contract AT(30-1)-2220-Task II. 143p. Order from OTS. $2.75. MND-SR-1676

Study of the general feasibility of radioisotopes methods in the natural gas industry, by C. R. Barnett and others. Isotopes, Inc., Westwood, N. J. July 60. Contract AT(30-1)-2400. 116p. Order from OTS. $2.75. NYO-2753

Applications of nuclear radiation and radioisotopes to textile materials and processes, period covered from November 1, 1958 to November 1, 1959, by North Carolina State College of Agriculture and Engineering of the University of North Carolina, Raleigh, N. C. 1959. Contract AT(40-1)-2477. 71p. Order from OTS. $2.00. ORO-305

Technology—Feed Materials

A fluidized bed of UF_4 for removal of UF_6 and F_2 from a dilute gas stream, by R. P. Bell. Goodyear Atomic Corporation, Portsmouth, Ohio. Aug 60. Contract AT(33-2)-1. 20p. Order from OTS. 50 cents. GAT-298

Continuous denitration - design specification letter no. 1, by M. J. Szulinski and R. G. Geier. Hanford Atomic Products Operation, Richland, Wash. Jan 55. Decl. September 19, 1960. Contract W-31-109-Eng-52. 7p. Order from OTS. 25 cents. HW-34313(Rev.)

An electrostatic precipitator for the collection of uranium tetrafluoride dust, by R. C. Smith. Union Carbide Nuclear Company. A Division of Uninn Carbide and Carbon Corporation, Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. Apr 56. Contract W-7405-eng-26. 16p. Order from OTS. 50 cents. K-1229

Slag residue plant design criteria, by Mallinckrodt Chemical Works. St. Louis, Mo. Feb 56. Decl. May 2, 1960. 63p. Order from OTS. 50 cents. MCW-1386
